Every useful invention, every new instrument for investigating the operations of nature, every new discovery in the earth, or in the heavens, every exploration of an unknown region of the globe, every branch of commerce and manufacture, every new mode of facilitating labor and improving the productions of the soil; every improvement in the ease and rapidity of traveling, and of conveying intelligence from one region to another, and every art and science, would be consecrated, in some form or other, to the service of God, and to the accomplishment of the objects of general benevolence. One grand diffusive principle, manifesting itself in numberless ramifications, would pervade the whole mass of society; and one grand aim, the honor and glory of the Creator, and the universal diffusion of happiness in every direction, and among every rank of sentient and intelligent beings, would be the unceasing endeavor of men of all nations, and kindreds, and languages. The whole mass of this world’s inhabitants would appear like one vast celestial army marching forward in harmony to the regions of bliss, every one, in his appointed order, passing in peace and tranquillity through the gates of death, to join the general assembly above, and to augment and enliven the congregation of the heavens.

On such a world the God of heaven would look down with complacency, and his providential care would be exercised in averting those physical evils which now increase the moral wretchedness of mankind. His eye would be continually upon them for good, and his ear would be ever open to their requests. Then that glorious scene presented to the view of the apostle John, would be fully realized,—“Behold the tabernacle of God is with men, and he will dwell with them; and they shall be his people, and God himself shall be with them, and be their God. And God shall wipe away all tears from their eyes, and there shall be no more curse, neither sorrow nor crying, neither shall there be any more pain; for the former things have passed away.” To such a world celestial messengers would rejoice to wing their downward flight, on messages of love. Their visits, which have been “few and far between,” and which have been long interrupted by the malevolence of men, would be again resumed; and those “morning stars” that shouted for joy when this fair creation arose into existence, would be filled with unutterable delight when they beheld moral order restored, and the smiles of universal love irradiating the inhabitants of our globe, and

would shout even with more ecstatic joy than they did before, “Glory to God in the highest, peace on earth, and good will among men!”

Alas! such a picture as that which we have now faintly sketched, has never yet been realized in the moral aspect of the inhabitants of this world. To the eye of an angelic intelligence, while he hovers over our globe in his flight through the planetary regions, nothing appears but a vast cloud of moral darkness and depravity, with here and there only a few faint radiations of truth and love emerging from the general gloom. He beholds throughout the whole extent of Africa, from the shores of Barbary and Egypt to the Cape of Good Hope—throughout the vast regions of Asia and its numerous islands, and throughout four-fifths of the continent of America, little else than one wide scene of moral desolation, where idolatry and superstition, tyranny and ambition, treachery and cruelty, war and dissension, reign triumphant among almost every tribe; and where scarcely a ray of divine light and divine love gilds the horizon, from the one end of these extensive regions to the other. Even in Europe, where the light of science and of revelation is converged to a focus, what an immense cloud of moral darkness still appears enveloping its population? The fields of Waterloo, of Leipsic, of Borodino, and of Smolensko—where so many thousands of human beings were sacrificed to the demon of war—the vales of Switzerland and Hungary, the plains of France and Italy, the anarchy and commotions of Spain and Portugal, and the ensanguined shores of Turkey and Greece, where massacres have been perpetrated with the rage and fury of infernal demons, bear witness to the melancholy fact, that hatred and malignity still hold the ascendancy over the nations of Europe, and over all the efforts of benevolence and love.

But, we trust, that the period is fast approaching, when the breath of a new spirit shall pervade the inhabitants of every clime, and when holy love shall unite all the tribes of mankind in one harmonious society. When the messengers of the Prince of Peace “shall run to and fro” from the north to the south, and from the rising to the setting sun: when the sound of the gospel-trumpet shall re-echo throughout every land; when the light of divine revelation shall diffuse its radiance on the benighted nations; when its sublime doctrines and moral requisitions shall be fully understood and recognized in all their practical bearings, and when the energy of that Almighty spirit which reduced to light and order the dark and shapeless chaos, shall be exerted on the depraved and benighted minds of the mass of this world’s population—then the death-like slumber which has seized upon the race of Adam shall be broken; the dead in trespasses and sins shall awake to new life and activity; this bedlam of the universe will be restored to reason and intellectual freedom, and to the society of angelic messengers, and the face of the moral creation will be renewed after the image of its Maker. Then wars shall cease to the ends of the earth, and anarchy and dissension shall convulse the nations no more; violence will no more be heard in any land, “liberty will be proclaimed to the captives, and the opening of the prison-doors to them that are bound.” The spirit of malevolence will be vanquished, its power will be broken, and its operations demolished. The order and beauty of the celestial system will be restored. “Holiness to the Lord” will be inscribed on all the implements and employments of mankind. Kindness and compassion will form the amiable characteristic

of every rank of social life. Love will spread her benignant wings over the globe, and reign uncontrolled in the hearts of all its inhabitants. For thus saith the voice of Him who sits on the throne of the universe, "Behold I make all things new—I create new heavens and a new earth, and the former shall not be remembered, nor come into mind. Be ye glad, and rejoice forever in that which I create; for behold, I create Jerusalem as rejoicing, and her people a joy, and the voice of weeping shall be no more heard in her, nor the voice of crying."

SECTION VI.

UNIVERSALITY OF THE PRINCIPLES OF LOVE TO GOD, AND TO FELLOW-INTELLIGENCES.

THE grand principles of morality to which I have now adverted, are not to be viewed as confined merely to the inhabitants of our globe, but as extending to all intellectual beings. They form the basis of the moral laws, which govern all intelligences throughout the vast universe, in whatever world or region of infinite space they may have their physical residence; and they constitute the bond which unites to the supreme intelligence, and to one another, all holy beings, wherever existing in the wide empire of Omnipotence. This will at once appear, if we reflect for a moment, on what has been stated in the preceding sections. We have seen, that, if those laws or principles were reversed, and were the moral agents of our world to act accordingly, nothing would ensue, but anarchy, wretchedness, horror, and devastation, and ultimately a complete extermination of the race of mankind. And by parity of reason, it will follow, that were the same principles to operate in any other world, however different the capacities, relations, and physical circumstances of its inhabitants might be, similar disastrous effects would be the inevitable result; and were they to pervade all worlds, disorder and misery would reign uncontrolled throughout the whole intelligent system.

When the Creator brought any particular world into existence, and peopled it with inhabitants, we must suppose, that the laws to which I am now adverting, were either formally addressed to them by some external revelation, or so powerfully impressed upon their moral constitution, as to become the mainspring of all their actions, so long as they might retain the original principles implanted in their minds by the Author of their existence. Any other supposition would be fraught with the most absurd and horrible consequences. It would be subversive of every idea we are led to form of the character of the Divine Being, inconsistent with the perfect benevolence and rectitude of his nature, and incompatible with the relations in which rational beings stand to Him and to one another, and with the harmony and happiness of the universe, to suppose, that any creatures now exist, or ever can exist, to whom such commands as these would be given,—"Thou shalt hate thy Creator, who is the source of thine existence;" and "Thou shalt hate all thy fellow-intelligences with whom thou mayest associate." And if the mind would recoil with horror, at the idea of such laws issuing forth from the throne of the Eternal to any class of moral agents, it must necessarily be admitted, that the opposite principles or laws, to which I allude, are promulgated to all intelligences, and are obligatory on

every inhabitant of all the worlds which lie between the range of Jehovah's empire. The natural scenery with which the inhabitants of other worlds are surrounded, the organization of their corporeal frames, the intellectual capacities with which they are endowed, the stated employments in which they engage, and the relations in which they stand to each other, may be very different from those which obtain in our terrestrial sphere; but the grand principles to which I refer, must necessarily pervade every faculty of their minds, every active exertion, and every relation that subsists among them, by whatever character it may be distinguished, if they be found existing in a state of happiness.

The moral code of laws in other worlds may be somewhat differently modified from ours, according to the circumstances in which the inhabitants of each respective world are placed, and the relations which obtain among them; but the same general principles will run through every ramification of their moral precepts, and appear in the minutest actions they perform, as the sap which proceeds from the trunk of a tree diffuses itself among the minutest and the most distant branches. The *seventh* commandment of our moral code can have no place in a world where the inhabitants "neither marry nor are given in marriage;" where the succession of intelligent beings is not carried on by any process analogous to human generation, where death is unknown, and where rational agents have a fixed and permanent abode. The *fifth* precept of our law cannot be recognized in a world where the relations of parents and children, princes and subjects, superiors and inferiors, have no existence. And in those worlds where the bounties of Divine Providence are equally enjoyed by all, or where external comforts are not necessary for the happiness of the individual, as in our world, or where the slightest temptation to interfere with the property of another does not exist, there will be no necessity for a distinct moral regulation corresponding to the *eighth* commandment of our moral code.—But in every world where happiness exists, and where the inhabitants have retained their original integrity, love to God, and love to all subordinate intelligences with which they are connected, will animate every heart, regulate every desire, and run through every action. And in those worlds (if any such exist beside our own) where these principles are counteracted, or not recognized as the foundation of moral action, misery and disorder, in a greater or less degree, must be the inevitable consequence.

The greater part, however, of the precepts, comprised in the moral law given to man, must be considered as obligatory upon all the rational inhabitants of the universe. The *first* commandment, which forbids the recognition of any object of adoration, or of supreme affection, beside the eternal Jehovah—the *second*, which forbids the representation of this incomprehensible Being by any visible or material objects—the *third*, which enjoins reverence of the name or attributes of God—and the spirit of the *fourth*, which enjoins a certain portion of duration to be set apart for solemn acts of worship and adoration, are applicable to all the moral agents that Jehovah has created. The *sixth* commandment, which forbids malice, revenge, and injurious actions of every description—the *ninth*, which forbids falsehood, and inculcates truth, which is the basis of the moral universe—and the *tenth*, which forbids envy, and every unhallowed desire to deprive our neighbor of any portion of his happiness—are also binding upon every class of moral intelligences,

wherever existing, throughout the unlimited empire of God. For, if we suppose any one of these precepts to be reversed, and moral agents to act on the principle of this subversion, their moral order and harmony would be interrupted, and consequently, their happiness destroyed.—For example, let the law, which inculcates truth, be supposed to be universally violated among any class of rational beings, and instantly all improvement in wisdom and knowledge would cease; nothing could be depended upon as fact but what was obvious to the senses of every individual; social compacts would be dissolved; a mutual repulsion would ensue, and every social affection and enjoyment would be unhinged and destroyed.

By overlooking considerations of this kind, the celebrated Dr. Chalmers, in his "Discourses on the Christian Revelation viewed in connection with Modern Astronomy," deprived himself of an important argument to prove that Christianity is not confined to this sublunary region. For, as it is the great object of the Christian Revelation to bring into full effect, in all their practical bearings, the principles I have been endeavoring to illustrate, and as these principles must be interwoven with the moral code of all worlds—it follows, that the spirit and essence of our religion must be common to all the holy inhabitants of the universe.

From what has been now stated respecting the universality of the principle of love, the following conclusions may be deduced:—

1. That the man in whose heart this principle is predominant, and whose actions are directed by its influence, is qualified for associating with the pure intelligences of all worlds. Were we transported to the surface of the planet Jupiter, and had we access to mingle with its vast population; or were we conveyed to one of the planets which revolve around the star *Sirius*—if the inhabitants of these globes have retained the primeval purity of their natures, and if the principle of love reigned supreme in *our* hearts, we should be assured of a welcome reception from those distant intelligences, and be qualified to mingle with them in their adorations of our common Creator, and in all their affectionate and harmonious intercourse. We should only have to learn the mode by which they communicate to each other their ideas and emotions. Love would form the basis of every union, and amalgamate us with every department of their society. With pleasure, and with the most endearing affection, would they point out to us the peculiar glories of the world they inhabit, and rehearse the history of the Creator's dispensations in that portion of his empire; and with equal pleasure should we listen to the instructions which flow from the lips of Benevolence, and survey those transporting objects and arrangements which decorate a world where love pervades the breasts of all its inhabitants. To visit a distant world, although it were in our power, where the inhabitants were of an opposite description, could afford no gratification to an intelligent and benevolent mind, but would overwhelm it with anguish and dismay. What enjoyment would the capacious mind of a pure intelligence from the regions of the constellation *Orion*, derive from visiting a world inhabited by such beings as the inhabitants of Nootka Sound, New Guinea, or New Zealand, where the moral and intellectual principle is completely debased, and where the beauties of Nature are defaced with interminable forests and marshes, and the haunts of beasts of prey? He would be filled with disappointment and horror—he might drop a tear of

pity over the wretched inhabitants; but he would soon wing his flight back to a more delectable region. A similar disappointment would be felt, were an inhabitant of our world, in whose mind hatred and cruelty, avarice and ambition, reigned without control—to be conveyed to a world of happiness and love. The novel scenes of beauty and grandeur, which would burst upon his sight, might captivate his senses for a little: but he would feel no enjoyment in the exercise of virtuous affections and rapturous adorations, to which he was never accustomed; he would find no objects on which to gratify his cruel and ambitious desires, and he would be glad to escape from the abodes of affection and bliss, to the depraved society from whence he came. Hence we may learn, that, however expansive views we may have acquired of the range of the Creator's operations, and of the immensity of worlds which are diffused through boundless space, and however ardent desires we may indulge of visiting the distant regions of creation, we never can indulge a rational hope of enjoying such a privilege, were it possible, unless love to God and to man become the predominant disposition of our minds. For, although we were invested by the Almighty with corporeal vehicles, capable of transporting us from one region of creation to another, with the most rapid motion, we could enjoy no solid satisfaction, while we remained unqualified for relishing the exercises, and mingling in the associations of holy intelligences. In every happy world on which we alighted, we should feel ourselves in a situation similar to that of a rude and ignorant boor, were he conveyed to a palace, and introduced into an assembly of courtiers and princes.

2. Another conclusion deducible from this subject is, that by virtue of this grand and governing principle, man is connected with the highest order of intelligences, and with the inhabitants of the most distant worlds; and his happiness perpetually secured. When we take a view of the universe by the light of modern science, our minds are overpowered and confounded at the idea of its vast and unlimited range. When we consider that it would require several millions of years for a cannon ball, flying at the rate of five hundred miles an hour, to reach the nearest stars—when we consider that there are stars visible to the naked eye, at least fifty times farther distant than these—when we consider that there are stars visible by the telescope a thousand times farther distant than any of the former—and when we consider that all the suns and worlds which lie within this unfathomable range are, in all probability, only as a grain of sand to the whole earth, when compared with the immensity of systems which lie beyond them in the unexplored abyss of infinite space,—we are lost in the immensity of creation, and can set no bounds to the empire of the Almighty Sovereign. When we look forward to that eternal state to which we are destined—when we consider that after thousands of millions of centuries have run their rounds, eternity will be no nearer to a termination, and that ages, numerous as the drops of the ocean, will still roll on in interminable succession,—we behold a lapse of duration, and a succession of events stretching out before us, which correspond with the immeasurable spaces of the universe, and the number and magnitude of the worlds with which it is stored. When we view ourselves as thus connected with the immensity of creation on the one hand, and with infinite duration on the other; and when we reflect on the numerous changes that have happened, both in the physical

and moral aspect of our globe, within the period of six thousand years, we cannot but conclude that we are destined to pass through new scenes and changes in that eternity which lies before us, of which at present we can form no conception. After remaining for thousands of millions of years in that world which will be prepared for the righteous at the general resurrection, we may be transported to another system as far distant from that abode as we now are from the most distant stars visible to our sight, in order to contemplate new displays of the attributes of God, in another province of his empire. We may afterward be conveyed to an unoccupied region of immensity, where new creations, displaying new objects of glory and magnificence are starting into existence. We may afterward be invested with the wings of a seraph, and be enabled to wing our way, in company with angels, from world to world, and to visit the most distant regions of that immense universe over which Omnipotence presides. In short, the imagination can set no limits to its excursions, when it attempts to survey the revolutions and changes that may take place, and the new scenes of glory which may burst upon the view, throughout the lapse of duration which will have no end.

Now, in whatever relation man may stand to any portion of the universal system, throughout every future period of his existence, and during all the revolutions of eternity, love will unite him to all other holy beings with whom he may associate, however distant their abode from the spot he now occupies, however different its scenery and arrangements, and however superior they may be in point of corporeal organization and intellectual capacity. For no intelligence, in any region of the universe, in whom the principle of love predominates, can ever be supposed to disdain to associate with another, of whatever rank or order, who is actuated by a similar affection; otherwise his love would degenerate into malevolence. This principle will unite him to angels and archangels, to cherubim and seraphim, to thrones, dominions, principalities, and powers, from whose discourses he will learn the history of the divine dispensations, the wonders of Almighty power, and the "manifold wisdom of God." So long as it reigns uncontrolled in his heart, it will secure his happiness in all places, and in every period of his existence, by a law established by the Almighty, and founded on his perfections; a law which binds together the whole intelligent system, and forms the basis of the felicity of the moral universe. So that his future blessedness is forever secure, beyond the reach of danger, and rests upon a foundation stable and permanent as the throne of the Eternal.

3. From what has been now stated, we may learn that *there is but one religion throughout the universe*, however vast its magnitude and boundless its extension. In this world, numerous systems of religion prevail, and thousands of different opinions in relation to its ceremonies and objects; but experience has demonstrated, that all of them, except *one*, are insufficient to guide rational beings to substantial felicity. And of this one system, how many foolish and inaccurate, and even contradictory opinions, have been formed, through the ignorance and perversity of the human mind! Though all its parts have a direct reference to the *actions* of intelligent agents, and to the cultivation of *benevolent affections*, yet it has been represented, even by its professed abettors, as a congeries of metaphysical dogmas and speculative opinions; and in this

point of view it has been the source of perpetual wrangling and contentions. Though it is calculated to expand the understanding, to warm the heart, and to elevate the soul to God, yet it has been reduced, by the cunning artifice of man, to a mass of mere quibbles and unmeaning ceremonies. And though it breathes nothing but peace and good-will to man, it has been employed as an engine of persecution and of human destruction. It is only in proportion as our religion approximates to the character of the religion which is common to all holy beings, that it is worthy of our veneration and our ardent pursuit. And therefore, in order to determine the truth and importance of any particular system of religious opinions, the best test we can apply to it is, to ascertain what bearings it has upon the grand principles to which we have been adverting. "Do all the sentiments and tenets which it strenuously supports, like the lines from the circumference to the center of a circle, converge toward the promotion of *love* in all of its practical ramifications? Are the opinions we now so fiercely maintain of such a nature, that we shall probably recognize them as important practical principles a million of years hence, in the regions of distant worlds?" If such a test were applied to hundreds of opinions which have agitated the religious world, and obstructed the operations of the benevolent affections, they would be driven away from the Christian system as chaff before the whirlwind; and Christians would feel ashamed of the importance they attached to their "mint, and anise, and cummin," while they neglected the weightier matters of the law, "judgment, mercy, and the love of God." How many false and foolish opinions shall we leave behind us in this region of darkness and contention, when we enter within the confines of the eternal state? How sublime, how lovely, and how beautifying will religion appear in that world, where it will be contemplated in its native simplicity, and stripped of all the foreign and adventitious circumstances which now obscure its brightness and glory! I need scarcely say, that the one religion to which I allude is *Christianity*, considered, not so much in the scheme of mediation which it unfolds, which may have a relation solely to man viewed in his character as a sinner, but in the *leading dispositions and virtues* it inculcates, and in the *great objects* which all its doctrines, facts, and supernatural communications have a tendency to accomplish. In these points of view, it must be considered as embodying principles and laws which pervade the religious systems of all worlds.

Finally, Love is a principle in the moral and intelligent system which bears a striking analogy to the principle of *attraction* in the material world. Each of them unites, in its respective sphere, all the beings which compose it in one grand and harmonious system; and both of them combined give birth to all the moral and physical phenomena which diversify the intellectual and the material universe. By the principle of attraction, the inhabitants of the earth, along with their habitations, are retained to its surface, and prevented from flying off in wild confusion through the voids of space. By the same power the mountains rest on a solid basis, the rivers flow from the mountains to the plains, and the ocean is confined within its appointed channels. It produces the various phenomena which arise from the meandering rill, the majestic river, and the roaring cataract. It produces the descent of rain and dew, and the alternate flux and reflux of the tides. It prevents the waters of the great deep

from covering the mountain-tops, and mingling in confusion with the clouds of heaven. It binds together the infinity of atoms which constitute the globe on which we tread; it regulates the various movements of men and other animated beings; it forms mechanical powers, and gives impulsion to numerous machines and engines. It rolls the moon in regular succession around the earth, and prevents her from running lawlessly through the sky. It extends its influence from the sun to the remotest planets, conducting revolving worlds, with all their satellites, in their ample circuits, and preserving them all in one harmonious system. It connects the earth and the planetary globes with other systems in the distant regions of space; and carries the sun, with all his attendant orbs, around the center of that *nebula* to which it belongs, and all the systems and *nebulae* of the universe around the throne of God.

In like manner, love unites all holy intelligences, wherever dispersed through the amplitudes of creation, in one amiable and harmonious system. It unites man to God, and God to man. It unites the renovated inhabitants of our globe to angels and archangels, and qualifies them for entering into the closest bonds of friendship and affection with superior intelligences that people the regions of distant worlds. It produces an expansive and harmonious spirit, and an ardent desire to diffuse happiness among all surrounding beings. It gives birth to those sublime emotions which flow out toward the Creator in the various forms of adoration, complacency, hope, confidence, humility, joy, submission, and reverence; and it is the spring of all those virtuous dispositions which flow out toward our fellow-creatures in the form of mercy, compassion, sincerity, candor, sympathy, kindness, long-suffering, gentleness, meekness, charity, generosity, justice, and active beneficence. It impels its possessor to run to the assistance of the distressed, to support the weak, to console the desponding, to comfort the dying, to diffuse the rays of heavenly light over the benighted mind, and to rejoice in the prosperity of all around. It is "the bond of perfection" which unites the members of an affectionate family, and preserves the union of the faithful in all the churches of the saints. It unites man to man by the closest ties, however different in language, customs, color, and complexion, and however far removed from each other in point of place. It enables the Greenland-er, the Iceland-er, the African, the inhabitant of Hindostan, and the inhabitant of the British Isles, in whose hearts it resides, to recognize each other as "the sons of God," and as "brethren in Christ Jesus." It sends forth the imagination over every quarter of the globe, carrying benevolent wishes, fervent prayers, and intercessions for men of all kindreds and ranks; and employs every active endeavor to promote the present enjoyment and the eternal felicity of the family of mankind. It inspires the soul with emotions of delight, when it becomes the instrument of communicating happiness to all within the sphere of its influence.—It unites the host of seraphim and cherubim in one vast and harmonious association; so that no jarring affection is ever felt, and no discordant voice is ever heard, among the thousands and ten thousands of these exalted intelligences. It preserves every member of the holy and intelligent system in the rank and orbit prescribed by Infinite Wisdom, and leads them all to rejoice in accomplishing the plans of their benevolent Creator. Around him, as the sun of the moral sys-

tem—the center of light, and love, and joy—they all revolve in their appointed order, cheered by the emanation of his love, enlightened by his beams, and reflecting a radiance upon all the beings with which they are surrounded. Though one orb differs from another in motion, in magnitude, and in glory, yet no one interferes with another to impede its progress, or to intercept the emanations of light and joy from the Uncreated Source and Center of all enjoyment.

Were the principle of attraction which binds together the atoms of our globe, and connects the planetary orbs with the sun, to be completely dissolved, the earth would be shattered to its center; the waters of the ocean would fly upward, and be dispersed through the highest regions of the atmosphere; rocks and mountains would be detached from their bases, and raised aloft above the clouds; forests would be torn up from their roots, and tossed about in confusion through the sky; the moon would forsake her ancient course; the planets would run lawlessly through the immensity of space, and mighty worlds would be seen dashing against each other, until they were shattered to pieces, and their fragments tossed about in disorder throughout surrounding systems. Effects equally disastrous to the intelligent system would be produced, were the influence of love, in all its varied emanations, to be completely suspended or annihilated. War would be proclaimed in heaven, and myriads of angels hurled from their seats of bliss. The rapturous songs and adorations of seraphs would be changed into the howlings and execrations of demons.—The population of the universe would be transformed into one vast assemblage of fiends; its regions of beauty and fertility would become one wide scene of desolation and horror, and the voice of lamentation and misery would be heard resounding throughout all worlds. On earth kingdoms would be shaken and convulsed; governments overturned; societies dissolved; families dispersed; the bonds of friendship burst asunder; husbands torn from their wives, and parents from their children; the intercourse of nations suspended; the pursuits of science and religion abandoned; every rank and relation overturned, and virtue banished from the abodes of men. Deserting all social beings, and forsaken by all, man would become a solitary monster, wandering without plan or object, an enemy to himself and to his species. Anarchy and disorder would reign triumphant over the whole race of human beings, and the howlings of wretchedness and despair would re-echo from every land.

Such a scene of moral desolation, *selfishness* and *maliginity* have a natural tendency to create; and such a scene they have actually created in our world, *in so far as their influence has extended*. The power of attraction has never been completely suspended in relation to our globe, nor has the moral Governor of the universe suffered the principle of love to be entirely eradicated from the minds of its inhabitants. But, as when the law of gravitation is counteracted in case of earthquakes and volcanoes, the most destructive and desolating convulsions ensue,—so it happens in the moral world, when the law of benevolence is trampled under foot. "Nation rises against nation, and kingdom against kingdom;" hostile armies encounter like tigers rushing on their prey; "firebrands, arrows, and death," are scattered in every direction; a confused noise of chariots, and horsemen, and of engines of destruction, is wafted on every breeze; garments are rolled in blood, and whole plains drenched with

human gore, and covered with the carcasses of the slain. But wherever love diffuses its powerful and benign influence, there harmony, happiness and peace are enjoyed by every rank of sensitive and intellectual existence. In every world where it reigns supreme, the intellectual faculty is irradiated, the affections are purified and expanded, transporting joys are felt, and, like the planetary orbs and their trains of satellites, all shine with a steady luster, and move onward in harmonious order, around the Supreme Source of intelligence, and the Eternal Center of all felicity.

SECTION VII.

THE PRECEDING VIEWS CORROBORATED BY DIVINE REVELATION.

IN the preceding sections I have endeavored to illustrate the two grand principles of the Moral Law, and to demonstrate their reasonableness, and the necessity of their universal operation, in order to the promotion of the happiness of the intelligent system. I have proceeded all along on the ground of revelation, as well as of reason, and the nature of things. But since these important principles form the basis of the system of religion, and of all the practical conclusions I may afterward deduce in the remaining part of this work, it may be expedient to advert a little more explicitly to the declarations of Scripture on this subject. And here I propose very briefly to show, that it is the great end of Divine Revelation to illustrate these principles in all their various bearings, and to bring them into practical operation.

This position is expressly stated by our Saviour himself, in his reply to the scribe, who proposed the question, "Which is the great commandment in the law?" "Thou shalt love the Lord thy God with all thy heart, and with all thy soul, and with all thy mind. This is the first and great commandment. And the second is like unto it; Thou shalt love thy neighbor as thyself. ON THESE TWO COMMANDMENTS HANG ALL THE LAW AND THE PROPHETS." This declaration evidently implies, that it is the design of the whole of the Old Testament Revelation, to illustrate and enforce these laws, and to produce all those holy tempers which are comprised in the love of God, and of our neighbor. This appears to be the grand object of all the historical facts, religious institutions, devotional exercises, moral maxims, prophecies, exhortations, promises, and threatenings, which it records. The history of the formation of the universe, and of the beautiful arrangement of our globe, as detailed in the Book of Genesis, is calculated to display the wisdom and goodness of the Creator, and to draw forth our affections toward Him who is the Author of our enjoyments, and who pronounced everything he had made to be "very good." The history of the wickedness of the antediluvian world, of the dreadful effects it produced in the state of society, and of the awful catastrophe by which its inhabitants were swept from existence, and buried in the waters of the deluge, is calculated to illustrate, in the most striking manner, the guilt and the danger of withdrawing the affections from God, and of indulging a principle of malevolence toward man. The history of the crimes of Sodom, and of the fate of its wretched inhabitants; the destruction of Pharaoh and his armies at the Red Sea; the history of the idolatrous practices of the Israelites, of their murmurings in the

wilderness, and of the punishments inflicted for their rebellion; the fate of Korah, Dathan, and Abiram, and of the worshippers of Baal: The destruction of the nations of Canaan; the judgments which pursued the Jewish nation, during the whole period of their history, on account of their defection from God, and the calamities which befell them at the period of the Babylonish captivity—together with all the other facts connected with the history of that people and of the surrounding nations, are intended to exhibit the dismal consequences, and the moral wretchedness which inevitably follow, when the affections of mankind are withdrawn from the God of Heaven, and left to grovel in the mire of depravity and vice.

The institutions of the Jewish Church were appointed for promoting the knowledge and the love of God, and for exciting an abhorrence of everything which is contrary to the rectitude and purity of his nature. Among the tribes that inhabited the land of Canaan, prior to the entrance of the Israelites, and among all the surrounding nations, the worship of false gods, the grossest superstitions, and the most abominable vices universally prevailed. It was one great end of the laws and ceremonies enjoined upon Israel, to excite the highest degree of abhorrence at everything which was connected with idolatry, to portray its wickedness and folly, to rivet the affections of the people to the worship of the true God, to preserve them uncontaminated from the malignant disposition, and the vile practices of the neighboring nations, and to instruct them in the nature and attributes of the Deity; that they might be "a *peculiar* people to Jehovah, separated from all the people that were on the face of the earth." Hence, the following intimation and injunction are placed on the front of the moral code of laws delivered to that nation, "Hear, O Israel, the Lord our God is one Lord. Thou shalt have no other gods before me." To promote harmony and affection between man and man; to enforce the exercise of justice and equity in all their dealings; to inculcate chastity and purity of affection, kindness to strangers, compassion, tenderness, and sympathy; obedience to parents, charitable dispositions toward the poor and needy, and tenderness and mercy toward the inferior animals, were the great objects of the various laws and regulations comprised in their moral and political code.

The devotional portions of the Old Testament, particularly those contained in the book of Psalms, have the same general tendency. The descriptions of the work of creation and providence, the adorations of the majesty of the God of Israel, the celebration of the divine character and excellencies, and the ascriptions of thanksgiving and praise for the mercy, long-suffering, and goodness of God, with which these divine compositions abound, are calculated to raise the affections to Jehovah as the source of every blessing, and to inspire the soul with love, admiration, and reverence. In many of these sublime odes, particularly in the 119th Psalm, the mind of the Psalmist is absorbed in meditation on the excellency of the divine precepts, and the happiness which the observance of them is calculated to convey to the soul. "O how I love thy law!" says David; "it is my meditation all the day. The law of thy mouth is better unto me than thousands of gold and silver. I have rejoiced in thy testimonies as much as in all riches." The moral maxims contained in the writings of Solomon are likewise intended to draw forth the desires after God, to

counteract the influence of the depraved passions of the human heart, and to promote the exercise of candor, sincerity, justice, and benevolence among mankind. The exhortations, remonstrances, and denunciations of the prophets, were also intended to recall the affections of the people of Israel to the God from whom they had revolted, to show the unreasonableness of their conduct in "forsaking the fountain" of their happiness; to display the purity, the excellence, and the eternal obligation of the divine precepts, and to warn them of the inevitable misery and ruin which will overtake the workers of iniquity. In short, all the promises and threatenings of the word of God, all the considerations addressed to the hopes and the fears of men, all the providential dispensations of God, all the manifestations of the divine character and perfections, and all the descriptions of the glories of heaven, and of the terrors of hell, have a tendency to illustrate the indispensable obligation of love to God, and love to all mankind, in order to secure our present comfort and eternal felicity.

And, as it was the main design of the Old Testament economy to illustrate and enforce the principle of love to God and to man, so it is, in a particular manner, the great object of the Christian Revelation, to exhibit the law of love in all its bearings and practical applications. In one of the first sermons delivered by our Saviour, and the longest one recorded in the Evangelical History, the Sermon on the Mount, the main design is to explain and enforce these principles, in relation both to God and to man, and to sweep away all the false glosses which Ignorance and Prejudice had mingled with their interpretations of the Divine Law. In one part of this discourse, our Lord declares, that we may as soon expect to see "heaven and earth pass away," or the whole frame of the universe dissolved, as that "one jot or one tittle shall pass from the law." For, as it is a law founded on the nature of God, it must be of eternal obligation, and can never be abrogated with regard to any class of rational beings, in consistency with the perfections of the divine nature. As it is a law absolutely perfect, comprehending within its range every disposition and affection, and every duty which is requisite for promoting the order and happiness of intelligent agents, nothing can be taken from it without destroying its perfection; and nothing can be added to it without supposing that it was originally imperfect. And as it was intended to preserve the harmony and to secure the felicity of the intellectual beings that people the earth and the heavens, the fabric of universal nature must be destroyed, before this law can be set aside or canceled. For we have already seen (Sect. IV), that, were it reversed, the whole intelligent system would be transformed into a scene of confusion, misery, and horror. For the purpose of affording an immense theater, on which the operations of this law might be displayed, the earth with all its furniture and decorations, and the heavens, with all their hosts, were called into existence; and, therefore, were it either canceled or reversed, neither the glory of the Creator would be displayed, nor the happiness of his intelligent creation secured. The mighty expanse of the universe, enclosing so many spacious worlds, would become one boundless moral desert, in which no "fruits of righteousness" would appear, nor any trace of the beauty and benevolence of the Eternal Mind.—In the same discourse, our Saviour enforces the duty of love toward even our most bitter enemies and most furious persecutors. "Ye have heard that it hath been said,

Thou shalt love thy neighbor, and hate thine enemy. But I say unto you, Love your enemies; bless them that curse you; do good to them that hate you; and pray for them that despitefully use you, and persecute you; that you may be the children of your Father who is in heaven; for he maketh his sun to arise on the evil and on the good, and sendeth rain on the just and on the unjust." This is one of the most sublime exercises of the principle of love, in reference to our fellow-men; and it is enforced from the most sublime motive and consideration—the conduct of Benevolence itself toward a race of rebellious and ungrateful creatures.

All the other instructions of this Divine Teacher—his parables, exhortations, admonitions, warnings, and consolatory addresses, though referring to particular cases and circumstances—had the same general object in view. When his disciples would have called for fire from heaven, to consume the Samaritans, he kindly, but with energy and decision, reminded them, that a principle of malignity was embodied in their unhallowed desires, which is directly opposed to the law of love. "Ye know not what manner of spirit ye are of; for the Son of man is not come to destroy men's lives, but to save them." Among his last instructions to his followers, when he was about to depart from the scene of his earthly pilgrimage, love was the grand theme on which he repeatedly expatiated. "A new commandment give I unto you, that ye love one another; as I have loved you, that ye also love one another. By this shall all men know that ye are my disciples, if ye have love one to another." "These things I command you, that ye love one another."

And, as the promotion of the spirit of love was the great object of his instructions, so his whole life was an uninterrupted exemplification of the purest *benevolence*, both toward friends and toward enemies. Never did that holy affection which unites the angelic tribes, and diffuses joy among the poor inhabitants of all worlds, appear within the confines of *our* world, so amiable, so disinterested, and so ardent, as during the period of the public ministry of Jesus, and particularly toward the close of his earthly career. In the immediate prospect of sufferings, dreadful beyond our conceptions, his love to mankind was "strong as death," which the many waters of affliction which surrounded him were unable to quench. His whole soul seemed to be absorbed in affection toward his disconsolate disciples, and in a desire to cheer and animate their drooping spirits. His last addresses, as recorded by the Evangelist John, breathe a spirit of tenderness and compassion, and of Divine benignity, of which we have no parallel in the annals of our race.

To display his kindness and condescension, and to teach his disciples to perform with cheerfulness the humblest offices of friendship, he rose from supper; he laid aside his garments; he took a towel; he girded himself; he poured water into a basin; he began to wash the disciples' feet; and he wiped them with the towel wherewith he was girded. He then addressed them in such language as this:—"Let not your heart be troubled; in my Father's house are many mansions; I go to prepare a place for you. And, if I go and prepare a place for you, I will come again and receive you to myself; that where I am there ye may be also. I will not leave you comfortless; I will pray the Father, and he shall give you another comforter, even the Spirit of truth, which shall abide with you forever. Whatsoever ye shall ask in my name, I will do it. Peace I leave with you;

my peace I give unto you; not as the world giveth, give I unto you. Let not your heart be troubled, neither let it be afraid." In his last prayer, which accompanied these benedictions, the same ardent flow of affection burst from his benevolent heart—"Holy Father! keep, through thine own name, those whom thou hast given me, that they may be one as we are." But his love was not confined to the select few with whom he was surrounded at this interesting hour. His mental eye surveyed the various tribes which people this department of creation—it pierced through all the succeeding generations of mankind—and he embraced in his expansive affections the whole race of the faithful until the close of time. "Neither pray I for these alone; but for them also who shall believe on me through their word; that they all may be one, as thou, Father, art in me, and I in thee; that they also may be one in us." Even toward his bitterest enemies his benevolent emotions flowed out, in earnest supplications for their forgiveness. Neither "the floods of ungodly men," which compassed him, nor the torrents of abuse which were poured upon him while he was nailing to the cross, could overpower that heavenly flame which burned in his holy breast. In the midst of all the mockeries, insults, and indignities which he endured, when he was made "a spectacle to angels and to men," his affectionate desires ascended, with the smoke of the evening sacrifice, to the throne of God, in behalf of his murderers—"Father, forgive them; for they know not what they do." O, what a striking contrast is here presented, to those scenes of pride, malignity, and revenge, which have so long disgraced the race of Adam, and spread lamentation, and mourning, and terror, among families, societies, and nations! What a happy world would this become, were it peopled with such amiable characters, and were all who profess to be followers of Jesus, instead of contending about "questions which gender strife," to vie with each other in imitating his mild and benevolent spirit! Then Christianity would appear in its native luster, and receive the homage due to its divine character: and the name of Jehovah would soon be proclaimed throughout all the earth, and the joys of his salvation felt in every clime.

Again, it is one great end of the death of Christ to destroy the principle of malignity in the human heart, and to promote the operation of the law of love. "While we were enemies (says the Apostle Paul), we were reconciled to God by the death of his Son." "We are sanctified through the offering of the body of Jesus Christ once for all." "He loved us, and washed us from our sins in his own blood." "They who were enemies in their mind, and by wicked works, he reconciled in the body of his flesh through death, to present them holy and unblamable, and unreprouvable in his sight." Love to his heavenly Father, and love to mankind, impelled him to "humble himself, and to become obedient to death, even the death of the cross." And, in order that this divine principle might be kept alive, and form a bond of union among all his followers, he appointed an ordinance, consisting of sensible signs, in commemoration of his death, to be observed in all ages as a memorial of his love, and to remind his friends of the indispensable obligation under which they are laid to love one another. To promote the same benevolent design, he arose from the dead, ascended to heaven, sent down the Spirit of Holiness to abide in the Church, and now presides in the celestial

world as "a Prince and a Saviour, to give repentance and the remission of sins."

And, as the instructions and the example of Jesus Christ were calculated to exhibit the principle of love in all its interesting aspects, and to promote its practical influence, so the preaching and the writings of his Apostles had the same important object in view, as the ultimate scope of all their ministrations. The one half of every epistle to the Christian churches is occupied in delineating the practical bearings of this holy affection. Like the lines which proceed from the center to the circumference of a circle, the various radiations of Christian affection are traced from love, as the grand central point, and exhibited in all their benign influence on individuals, families, churches, and the diversified relations which subsist in civil and Christian society. "Above all things," says the Apostle, "put on love, which is the bond of perfection. Though we speak with the tongues of men and angels, and have not love, we are become as sounding brass, or a tinkling cymbal. And though we understand all mysteries, and all knowledge, and bestow all our goods to feed the poor, and have not love, it profiteth nothing. Love suffereth long, and is kind; love envieth not, vaunteth not itself, doth not behave itself unseemly, seeketh not her own, is not easily provoked, thinketh no evil. Prophecies shall fail, languages shall cease, earthly knowledge shall vanish away, but love *never faileth*." "Love worketh no ill to his neighbor; therefore, love is the fulfilling of the law. All the law is comprehended in this saying, namely, Thou shalt love thy neighbor as thyself." "The works of the flesh," or those which flow from a principle of malignity, "are these: fornication, uncleanness, idolatry, hatred, variance, emulations, wrath, strife, seditions, envyings, murders, revelings, and such like. But the fruit of the spirit is love, joy, peace, long-suffering, gentleness, goodness, fidelity, meekness, and temperance." "Let love be without dissimulation, and walk in love as Christ also hath loved us. Be kindly affectioned one toward another with brotherly love, in honor preferring one another. Distributing to the necessity of saints; given to hospitality. Bless them that persecute you; bless, and curse not. Rejoice with them that do rejoice, and weep with them that weep. Husbands, love your wives, even as Christ also loved the church; children, obey your parents in the Lord; fathers, provoke not your children to wrath, but bring them up in the nurture and admonition of the Lord. Servants, be obedient to your masters, with good will doing service as to the Lord, and not unto men; and ye masters, do the same thing unto them, forbearing threatening, knowing that your master also is in heaven." "Put on, as the elect of God, holy and beloved, bowels of mercies, kindness, humbleness of mind, meekness, long-suffering; forbearing one another in love, and forgiving one another, if any man have a quarrel against any; even as Christ forgave you, so also do ye."

Such is the general scope of the instructions which the apostles delivered, in all their communications to the Christian churches, whether composed of Jews or Gentiles. And, had it not been for the strong prejudices of the Jews, and the erroneous conceptions of the Gentiles, which the apostles had to combat, it is probable, that the whole of their epistles would have been solely occupied in delineating the practical effects of love to God, and to our brethren of mankind, and its glorious consequences in the future world. And, as it was the great aim of the apostles

themselves, in their writings and personal administrations, to illustrate the numerous bearings of Christian love, so they gave solemn charges to their successors in the work of the ministry, to make all their instructions subservient to the promotion of the same important object. Almost the whole of the epistles addressed to Timothy and Titus, which relate to the duties and the objects of the Christian ministry, has a reference, not to the discussion of metaphysical questions in theology, which "are unprofitable and vain," but to the illustration and the inculcating of those practical duties which flow from the spirit of love, and to the counteracting of those proud, malignant, and speculative dispositions which are opposed to the meekness and benignity of the gospel of peace.

I might also have shown, by numerous quotations, that, in the *general* epistles of Peter, James, and John, the same grand object to which I have been adverting is steadily and uniformly kept in view. The first epistle of John is almost exclusively devoted to the illustration of the love of God and of man; and on this theme, in which his soul appears to be almost entirely absorbed, he expatiates with peculiar energy and delight: "We know that we have passed from death to life, because we love the brethren. He that loveth not his brother abideth in death. Whosoever hateth his brother is a murderer; and ye know that no murderer hath (the principle of) eternal life abiding in him. Behold, what manner of love the Father hath bestowed on us, that we should be called the sons of God! Beloved, let us love one another; for love is of God: and every one that loveth is born of God, and knoweth God. He that loveth not knoweth not God; for God is love. No man hath seen God at any time. If we love one another, God dwelleth in us, and his love is perfected in us. If any man say, I love God, and hateth his brother, he is a liar; for he that loveth not his brother, whom he hath seen, how can he love God, whom he hath not seen?" It is recorded, by some ancient authors, that when this apostle was grown old, and unable to preach, he used to be led to the church at Ephesus, and only to say these words to the people, "*Little children, love one another.*" Such was the importance which this venerable apostle attached to love, as the grand and governing principle in the Christian system.

Finally, The procedure of the last judgment will be conducted on evidence, deduced from the manifestations of love. At that solemn period, when the present economy of Divine Providence shall come to a termination; when the elements shall melt with fervent heat, and the great globe on which we tread shall be wrapt in flames; when the archangel shall descend, and sound an alarm with "the trump of God;" when the graves shall open, and give forth their dead; and when all the generations of men, "both small and great," shall stand before the throne of God; the eternal destiny of all the millions of mankind will be unalterably determined, on the ground of the manifestations which have been given of the existence and the operation of the principle of love, and of the affections and conduct to which it is opposed. "When the Son of man shall come in his glory, and all the holy angels with him, then shall he sit upon the throne of his glory. And before him shall be assembled all nations. Then shall he say to them on his right hand, Come, ye blessed of my Father, inherit the kingdom prepared for you from the foundation of the world. For I was an hungred, and ye gave me meat; I was thirsty,

and ye gave me drink; I was a stranger, and ye took me in; naked, and ye clothed me; I was sick, and ye visited me; I was in prison, and ye came unto me." And, though ye had no opportunity of performing these offices to me in person, yet, "inasmuch as ye did it to one of the least of these my brethren, ye did it unto me." "Then shall he also say to them on the left hand, Depart from me, ye cursed; for I was an hungred, and ye gave me no meat; I was thirsty, and ye gave me no drink; I was a stranger, and ye took me not in; naked, and ye clothed me not; sick, and in prison, and ye visited me not. Verily, I say unto you, inasmuch as ye did it not to one of the least of these, ye did it not to me. And these shall go away into everlasting punishment, but the righteous into life eternal." For every one shall be rewarded according to his works.—Such is the importance which will be attached to the influence of this holy affection over the human mind, at that "day of dread, decision, and despair;" for it is quite obvious, that every action here specified in relation to the righteous, is an effect of the love of God and of man presiding in the heart; and, therefore, if we shall ultimately be found destitute of this holy principle, we cannot expect the reward of the faithful, nor "have boldness in the day of judgment."

Thus it appears that it is the great end of all the historical facts, the religious institutions, the devotional writings, the moral maxims, the instructions of the prophets, the warnings, exhortations, promises, and threatenings, comprised in the Jewish revelation, to illustrate and enforce the law of love in its references both to God and to man—that it is explained and illustrated in the various instructions delivered by our blessed Saviour, and enforced by his example—that its numerous bearings and modifications are displayed in the writings of all the apostles, and in their instructions to Christian teachers—and, that its existence in the heart, and its operation in active life, will form the decisive test of our character at the final judgment.

SECTION VIII.

ON THE PRACTICAL OPERATION OF LOVE, AND THE VARIOUS MODES IN WHICH IT SHOULD BE DISPLAYED TOWARD MANKIND.

WE have already seen, that love is a most noble and expansive affection. It is not like a blazing meteor which dazzles the eye for a few moments, and then vanishes from the sight. It does not consist merely in a few transient emotions, and fruitless wishes for the good of others. It does not waste its energies in eloquent harangues on the beauty of virtue, in theorizing speculations on the principles of morals, in framing Quixotic schemes of philanthropy, or in weeping over tales of fictitious woe. It is a substantial and an ever active principle; its energies are exerted for the purpose of communicating happiness to every rank of sensitive and intellectual beings; and the moral world, as it actually exists, is the grand theater of its operations. I have already endeavored to illustrate some of the modifications of this affection, in its relation to God;* and, in the preceding sections of this chapter, have occasionally adverted to some of its benignant effects in reference to man. It may, however, be expe-

* See pages 35—39.

dient, in this place, to enter a little more explicitly into the practical operations of benevolence, and the various modes by which its influence may be manifested in relation to our brethren of mankind.

The grand object which love proposes to accomplish, is the communication of happiness. And, in order to stimulate and direct us in its operations, the character and agency of God are set before us as our exemplar. There is not a more amiable, attractive, nor comprehensive idea of the Divine Being anywhere to be found than that which is exhibited by the Apostle John, in three words—*GOD IS LOVE*. He is the eternal, uncreated Source of felicity, from which flow all those streams of joy which gladden the hearts of angels and archangels, cherubim and seraphim; and whatever portion of happiness, sensitive or intellectual, is enjoyed by man on earth, and by all the subordinate tribes of animated nature, is derived from the same inexhaustible fountain. For the purpose of communicating happiness, he called the material universe into existence, to serve as an immense theater, on which his benevolence might be displayed to countless orders of sensitive and intelligent creatures; and all the perfections of his nature may be considered as so many agents employed for the execution of this noble design. Impelled, as it were, by this essential and characteristic affection of the Divine Mind, all the attributes of Deity are incessantly operating throughout the immensity of creation in the view of the inhabitants of all worlds. His *Omnipotence* is employed in supporting the worlds already created, and in bringing new systems, and new orders of beings into existence; and his *Wisdom*, in devising, selecting, and arranging those means which are requisite for accomplishing the plans of benevolence. Toward those wretched beings who have abused his goodness, and wandered from happiness, his *Mercy* is proclaimed; and his *Patience* and forbearance are long exercised, in order to lead them to repentance, and to the paths of felicity. His *Justice*, conjoined with his power, is exercised for the purpose of restraining the efforts of malevolence, for preventing the inroads of anarchy and confusion, and for preserving the order and happiness of the intelligent creation. In this view, all the judgments, however dreadful and appalling, which have been inflicted on the workers of iniquity in every age, have had a tendency to accomplish the purposes of benevolence, in reference to the universal system. For, the general good of God's universal empire, considered as one whole, must be viewed as the great end which benevolence is accomplishing, and the partial exclusions from happiness, which now happen in the case of certain classes of moral agents, must be regarded as necessary arrangements subservient to this important end. His infinite *Knowledge*, extending to all events, past, present, and to come; and his *Omniscient* eye, piercing into the secret purposes of every heart, surveying the various tribes of men, and the circumstances of all the worlds which float in the immensity of space, and comprehending the remotest consequences of all actions throughout infinite duration, enable Him, in every instance, to form those arrangements by which the objects of benevolence may be accomplished on the most extensive scale, and by which the everlasting happiness of the holy and intelligent system may be most effectually secured.

For the purpose of displaying his love to the moral intelligences of our world, he has given us a revelation of his character and will; he has ex-

hibited his law as a law of love; he has promised the agency of his holy Spirit, to produce in us those dispositions which his law requires; and he has given the most affecting display of his love, in the mission of his Son into the world. "In this," says the Apostle John, "was manifested the love of God toward us; because that God sent his only-begotten Son into the world, that we might live through him. Herein is love; not that we loved God, but that he loved us, and sent his Son to be a propitiation for our sins. Beloved, if God so loved us, how ought we to love one another?"

Now, we are commanded in the sacred Scriptures, to be imitators of God in his benevolent operations, and especially in those cases in which love requires to surmount every obstacle, and to exert all its powers in opposition to hatred, enmity, and ingratitude. "Be ye perfect," says our Saviour, "as your Father who is in heaven is perfect. Love your enemies; bless them who curse you; do good to them who hate you; and pray for them who despitefully use you and persecute you. That you may be the children of your Father who is in heaven: for he maketh his sun to rise on the *evil* and on the good; and sendeth rain on the just and on the *unjust*." So that his enemies subsist on his bounty, and are cheered and refreshed by his providential care. In like manner, the operation of love on the part of man may be considered as the whole energy of an intelligent mind, directing its faculties of perception, judgment, reasoning, and imagination, along with its physical powers, to the production of happiness both among friends and enemies, so far as its influence can extend. In the prosecution of this noble end, man becomes "a worker together with God," a subordinate agent in carrying forward those plans of Infinite Benevolence which will issue in the ultimate happiness of the moral universe. And as the Almighty, in his benevolent operations, preserves the harmony of the universe by certain laws of order which he has established, as is apparent in the arrangement of the planetary system, and in the physical and moral economy of our terrestrial sphere; so it is the duty of man, in all the movements to which love impels him, to imitate his Creator in this respect, and to employ the intellectual faculties with which he is indued, for regulating the exercise of the benevolent principle, for adapting and proportioning means to ends, and for discriminating between rational and enthusiastic schemes of exertion; so that order may facilitate his movements, and that the greatest sum of happiness may result from his active endeavors.

We may now attend more particularly to the practical operations of love, and the objects toward which it should be directed.

The principal objects toward which our benevolence should be directed are, *intelligent beings*; and in the sphere of action to which we are at present confined, *man* is the chief object whom we have it in our power to benefit by our benevolent exertions. Our benevolent affections, indeed, ought to expand toward all the holy intelligences of which we have any intimation; and, in another stage of our existence, we may have an opportunity of mingling with other orders of intellectual beings, and of co-operating with them in diffusing happiness throughout the universe; but while we continue in this sublunary region, the improvement and happiness of our fellow-men is the chief object to which our exertions must necessarily be confined; and when we view the present state of the moral world in all nations and climates, we

behold a field of exertion sufficiently ample to employ all the energies of benevolence that have ever yet been displayed, or perhaps ever will be displayed during the existing economy of our world.

Man may be considered in two points of view; as possessed of a *body*, which is susceptible of agreeable or disagreeable sensations and feelings; and, as indued with a *mind*, or spiritual principle which is capable of perpetual improvement in knowledge and virtue, and which is destined to an endless existence. In both these respects, love will exert its powers in meliorating the condition and promoting the enjoyments of mankind. In regard to his *corporeal system*, man has various *wants*, which require to be supplied, and he is subjected to various *sufferings* which require to be soothed and alleviated. He stands in need of food, raiment, shelter from the blasts of the tempests, comfortable lodging and accommodation, light to cheer and enable him to prosecute his employments, pure atmospheric air to invigorate his animal system, and water to cleanse and refresh him. He is exposed to corporeal weakness and to mental imbecility; to pain, sickness, and disease; to the loss of sight, of hearing, and of bodily feelings; to the decrepitude of old age, and to all those lingering disorders which terminate in dissolution. He is also exposed to the afflictions occasioned by the loss of friends and relatives; to dejection of mind, to remorse of conscience, to doubt, despondency, and despair; and to a long train of anxieties, vexations, perplexities, and troubles of various kinds. Now, in reference to the wants of mankind, love, when genuine and ardent, will endeavor to supply them wherever a deficiency is known to exist; and in reference to their calamities and sorrows, it will use its utmost exertions to relieve and assuage them, in as far as its powers and influence can extend. In this respect, every one, however low his situation in life, however limited the range of his knowledge, and however contracted the sphere of his influence may be, has it in his power, in a greater or less degree, to communicate blessings to his brethren of mankind. He can visit the sick bed of an afflicted neighbor; he can supply a cup of cold water to cool his parched tongue; he can wipe the sweat from his forehead; he can smooth his pillow; he can turn him round on his bed of languishing, that he may enjoy a more comfortable repose; and he can cheer him with those expressions of tenderness and affection, which have a tendency above all other acts of kindness to soothe and revive the downcast spirit. He can assist his neighbor by his strength, or by his skill, by his counsel and advice, and by taking a lively interest in his concerns; he can promote his joy by rejoicing in his prosperity and success, by assisting him in his employment, by rescuing him from danger, by forgiving the injuries he may have received, by acknowledging the worth of the skill, virtues, and endowments of which he is possessed, and by listening with patience and complacency to his sentiments, complaints, or grievances. He can even promote the happiness of his neighbor in a *negative way*, by not injuring him in his character or reputation; by not standing in the way of his prosperity or advancement; by not thwarting him in his schemes and enterprises; by not interrupting him in his innocent amusements; and by refraining from everything that would tend unnecessarily to injure him in his trade or profession. Such friendly attentions to promote the comfort of his fellow-men, every one has it in his power to bestow; and upon such apparently

trivial actions the happiness of mankind in general more immediately depends, than on many of those legislative arrangements which arrest the attention of a whole empire. For, were they universally performed, the greater part of the miseries which afflict humanity would disappear from the world.

But, in cases where a high degree of intellectual talent, of wealth, and of influence is possessed, love is enabled to take a wider range in its beneficent operations, by endeavoring to counteract public evils, and to promote rational schemes of general philanthropy. When we take a survey of the condition of the great mass of the lower orders of society, we find them laboring under many physical evils and inconveniences, which have a tendency to injure their health and their comfort, and to obstruct their moral and intellectual improvement. In their private habitations, we find multitudes of them residing in places where they are almost deprived of light and of pure air, and surrounded with noxious effluvia, putrid smells, and everything that is insalubrious and offensive to the senses. We find whole families packed into a narrow apartment of twelve feet square, in a narrow lane, where the rays of the sun never penetrate, where the refreshing breeze is seldom felt, and where the beauties of nature are never beheld. In public manufactories we find hundreds of men, women, and children, with pale faces and emaciated looks, breathing a polluted atmosphere half-poisoned with deleterious fumes, steam, smoke, or noxious gases. In large cities, we find numbers of children, through the carelessness and unprincipled disposition of their parents, left to wallow in filth and wretchedness, without even rags to cover their nakedness, and encouraged in the habits of pilfering, and of every other vice which can debase their minds and render them pests to society; and we behold others doomed to the degrading employment of chimney-sweeping, deprived of the attentions which flow from the tender affection of parents, and subjected to the harsh treatment of unfeeling masters. We behold multitudes of human beings torn from their families and their native land, cooped up in an infernal floating dungeon, carried to a foreign land, sold like cattle to an avaricious planter, and held in the chains of perpetual slavery. In reference to all these and similar evils which exist in human society, love will exert its energies, either to alleviate or to remove them. It will induce one individual to investigate their causes, to point out the proper means of remedy, and to publish to the world the result of his deliberations and researches. It will induce another to apply the discoveries of natural science and the inventions of art to the purpose of improving the physical condition of mankind. It will induce a third individual, in conjunction with others, to form rational plans of melioration, and to organize societies to carry them into effect; and it will impel others to come forward with their wealth and influence to provide the means for carrying forward on the most extensive scale the plans of general beneficence. In short, the whole machinery of nature and art, of mind and matter, of religion and literature, of science and legislation, would be set in motion to promote the external enjoyments of mankind, were love a predominant principle in human society. Cottages on commodious and healthy plans would be reared for the industrious poor; streets would be formed and gardens allotted them for their pleasure and accommodation; public manufactories would be arranged and regulated in such a man-

ner as to contribute to health, to comfort, and to rational improvement;* the children of the poor would be fed and clothed, and trained up to habits of industry and virtue; employment would be provided for all classes of laborers and mechanics, and subsistence furnished when employment could not be procured; idleness would be universally discouraged, and honorable industry would be rewarded in such a manner as to afford not only the comforts, but even many of the luxuries of life; slavery in every shape, with all its injustice and cruelties, would be abolished, and rational liberty would be proclaimed among all ranks and in every clime.

Thus the man in whose heart love presides, takes a lively and sincere interest in everything that has a tendency to promote the external comfort and welfare of his neighbor. He is compassionate and merciful, gentle and indulgent, kind and tender-hearted, generous and humane; he feels for the sorrows of suffering humanity, and his wealth and activity are directed to relieve the distresses of the poor and the afflicted, to feed the hungry, to clothe the naked, to protect the widow and the orphan, to encourage honest industry, to meliorate the condition of the useful mechanic, and to increase and extend his comforts and enjoyments. Of such a one it may be said, in the language of Job, "He is eyes to the blind, feet to the lame, and a father to the poor. When the ear hears him, then it blesses him, and when the eye sees him, it gives witness to him; because he delivers the poor that cries, and the fatherless, and him that hath none to help him. The blessing of him that was ready to perish comes upon him, and he causes the widow's heart to sing for joy."

But the activities of benevolence are not confined to the communication of sensitive enjoyments. Man is a rational and immortal, as well as a sensitive being; and the operations of genuine love will have for their ultimate object the promotion of his best interests as a moral and intellectual agent, and as an heir of immortality.

When we consider man as an intellectual being, standing in various important relations to his God and to his fellow-creatures, we behold numerous evils which require to be remedied, as well as in the circumstances of his physical condition. Though the human mind is capable of vast expansion, of acquiring an immense number of sublime and interesting ideas, and of enjoying the purest pleasure in contemplating the objects which lie within its range, yet it is a melancholy fact, that in all ages, mental darkness has enveloped the great majority of our race; and that the grossest ignorance of the most important truths, accompanied with the most degrading affections, still prevails among the greater part of the population of every region of the globe. We need not go to the frozen climes of Lapland and Labrador,

to the filthy huts of the Greenlander and the Esquimaux, to the rude savages of Nootka Sound, to the degraded tribes of New-Holland and Van Dieman's Land, to the wild and wretched Boshemens and Caffres, or to the swarthy sons of Central Africa, in order to be convinced of this lamentable truth. We need only to look around us among the various ranks of our own population, and we shall not fail to see ignorance, in all its diversified forms, exerting its malign influence over the minds of men, accompanied with superstition, enthusiasm, bigotry, intolerance, and every groveling affection that can debase the human mind. Multitudes of the young, both in the city and in the country, are suffered to shoot up from infancy to manhood, as if they were mere animal existences, ignorant of the character and operations of God, of the duties they owe to their Creator and to one another, and of the eternal state of existence to which they are destined. Even in many of those places where instruction is attempted to be communicated, what a pitiful picture is exhibited of the results of education, and of the folly which attaches itself to the character of man! The pronunciation of a number of unmeaning words, the reciting of passages which the young cannot understand, the repetition of a few propositions in religion to which no ideas are attached, and the casting of a few accounts, are considered as sufficient to lead them forward in the path of knowledge and virtue; and are substituted in the place of those definite and luminous instructions which are requisite to expand the opening intellect, to convey distinct ideas to the mind, to unfold the scenes of creation and providence, to display the character of God, and to train up the youthful mind to glory and immortality.

Now, in reference to the ignorance which prevails in the world, love to man, as an intellectual being, will excite to active endeavors in order to counteract its influence. It will prove an excitement to the erection of seminaries of instruction wherever they are deficient; it will patronize every scheme and every exertion by which knowledge may be increased; and will diffuse mental illumination as far as the sphere of its influence extends. It will not rest satisfied with the form of instruction, without the substance; with the elements of language, without the elements of thought; with the key of knowledge, without knowledge itself; but will devise rational plans for conveying *substantial* information to the minds of the young, so as to win their affections, arrest their attention, and carry them forward with pleasure in the paths of improvement. It will not offer them stones and ashes instead of bread, but will spread before them an intellectual feast, and "feed them with knowledge and understanding." It will not confine its attention merely to the instruction of the young, but will endeavor, by writing, by conversation, by lectures, by lending and circulating books, by establishing public libraries, and by organizing rational and scientific institutions, to diffuse the rays of intellectual light among men of all ages, ranks, and professions; and will never cease its exertions until ignorance, with all its degrading accompaniments, be banished from society, and until the light of truth illuminate the inhabitants of every land. In a word, it will endeavor to render every branch of knowledge subservient to the illustration of the character and the revelation of God, and to the preparing of mankind for the employments of that nobler state of existence to which they are destined.

Again, as man is possessed of an immortal na-

* Some may be disposed to insinuate, that such attempts would be altogether visionary, and could never be realized. But I would ask such persons, Have such schemes ever been attempted to be realized on an extensive scale? Has the promotion of the health and comfort of the industrious poor ever become a *particular object of attention* to the legislature, to men of rank and influence, and to the whole class of opulent manufacturers? Is it not a fact, that while the acquisition of wealth is made the main object of attention, the melioration of the condition of the industrious laborer and mechanic is either altogether overlooked, or viewed as a very subordinate object of attention? He is generally left to slift for himself the best way he can, and left to breathe in an impure atmosphere without any *particular sacrifice* being made to remedy the evil. I venture to affirm, that were the comfort of the lower orders of society made as *particular an object of attention* as is the acquisition of wealth, every obstacle to its accomplishment would soon be removed.

ture and in his present state of sin and degradation is exposed to misery in the future world, so it is one of the highest offices of love to endeavor to promote the eternal salvation of mankind. For the accomplishment of this important object, all its activities are concentrated, and all its other labors are rendered subservient. To improve the physical condition of man as a sensitive being, and to enlarge his knowledge as an intellectual, while we overlook his eternal interests, is to neglect one of the most important duties of Christian philanthropy. The sensitive enjoyments of man are conducive to his happiness so long as they continue; and "knowledge is pleasant to the soul." But what are all the acquisitions and enjoyments of time, when compared with the concerns of eternity! and what will they avail, if their possessor be found *unqualified* for the employments of an endless life! If the soul of man be an immortal principle, and if the least danger exists of its being deprived, through ignorance and guilt, of happiness in the future world, no words can express the importance which ought to be attached to this "labor of love." "What will it profit a man if he shall gain the whole world, and lose his own soul? or what shall a man give in exchange for his soul?" And therefore, the man in whose breast true benevolence resides, will consider the *eternal* happiness of his fellow-immortals as the grand and ultimate object which ought always to be kept in view, and will exert all his faculties, powers, and influence, in order to its accomplishment. He will not rest satisfied with prayers and wishes for the salvation of men; he will not wait for any extraordinary afflatus of the Divine Spirit; but will prosecute with judgment and perseverance that course of active duty, which has a tendency to produce the desired effect. So far as the circle of his influence extends, he will endeavor to instruct the ignorant, to arouse the careless, to reclaim the dissipated, to convince the skeptic, to train up the young in the knowledge of God and in the paths of virtue, and to encourage and animate every one who is inquiring the way to eternal life. He will exhibit religion in its most amiable, and attractive, and sublime aspects; and will endeavor to fix the attention on the lovely tempers, and the beneficial effects which the observance of its precepts has a tendency to produce. He will not make it his chief object to convert men to the belief of certain metaphysical dogmas in religion, nor to gain them over to embrace the peculiarities of a party; but to produce in their minds a cordial acquiescence in the plan of salvation which the Gospel exhibits, a reverence of the divine character and perfections, a desire to cultivate holy tempers, and a fixed determination to walk in the paths of God's commandments.

Such a character will give every due encouragement by his advice and by his wealth to Christian churches, and to faithful and intelligent ministers of religion. He will patronize every rational scheme which has for its object to propagate the Gospel of peace among all nations. He will encourage the translations of the Scriptures into the languages of all kindreds and tribes; he will give countenance to societies formed for circulating the Bible in foreign lands; and he will assist in sending forth intelligent and philanthropic missionaries to barbarous and unenlightened tribes, for the purpose of diffusing the blessings of knowledge, civilization, and religion; and he will rejoice to co-operate in such benevolent schemes with all who wish to promote the best interests of their fellow-men, by whatever name

they are distinguished, and to whatever section of the Christian church they may belong.

In short, love, when genuine and ardent, will set itself in opposition to every species of bigotry and intolerance, and to all those petty jealousies and bitter animosities which have so long distracted the Christian church, which have thrown an odium on its character, and prevented the harmonious intercourse of the followers of Jesus. It will make every sacrifice consistent with the great objects of Christianity, and will use every appropriate mean to heal the unhappy divisions which exist in the religious world, and to promote an affectionate union of "all who love our Lord Jesus in sincerity;" in order that the church of Christ may form one compact harmonious body, in opposition to atheists, skeptics, and the men of the world, and in order that every plan and effort to diffuse the knowledge and influence of the Christian religion may be carried more speedily and more extensively into effect.

With regard to all the other branches of Christian morality, and to all the virtues which can adorn the human character, in every station and relation in life, they will be found to flow from the exercise of the principle I have now been illustrating, as naturally as the sap flows from the trunk to the remotest ramifications of a tree, or as the gas which now illuminates our streets and churches flows from the main gasometer, through hundreds of pipes, to all the different burners. Sincerity and veracity in our words and actions, honesty and fair dealing in trade and commerce, fidelity to compacts and engagements, a regard to public liberty, an equitable administration of justice, condescension and kindness to inferiors, reverence and respect to superiors, submission to just laws and regulations, friendship, and a cordial interchange of friendly sentiments and affections; courtesy, civility, affability, harmony, and good neighborhood; modesty, chastity, and discretion; forgiveness of injuries, hospitality to strangers, humanity to servants and dependents, compassion to the distressed; parental, filial, and fraternal affection; sympathy, generosity, temperance, and fortitude; together with all the other social virtues which unite man to man, will as naturally flow from the fountain of love, when it exists in the human breast, as water flows from a reservoir, through all the pipes which distribute it to the inhabitants of a large city. For he who withholds the exercise of such virtues, or acts in direct opposition to them, can never be supposed to be sincerely attached to his fellow-creatures, or to consult their happiness; and the meaning of language must be inverted before we can apply to him the epithet *benevolent*; and the order of the moral system deranged, before we can expect happiness to flow from such a conduct.

The cardinal virtues have been arranged by some moralists under the heads of *Prudence*, *Temperance*, *Fortitude*, and *Justice*. *Prudence* consists in judging what is best, in the choice both of ends and means, particularly in reference to our own interests, and to the good or evil which may result from our choice. *Temperance* is that virtue which moderates and restrains the sensual appetites. *Fortitude* is that calm and steady habit of the mind which either enables us bravely to encounter the prospect of ill, or renders us serene and invincible under its immediate pressure. *Justice* is that virtue which impels us to give to every person what is his due. Now, it could easily be shown, that love is the impelling principle which excites to the exercise of all these

virtues. It will lead us to pay a due regard to our own comfort and interest, but not so as to interfere with the interests or to obstruct the happiness of others. It will teach us to preserve the dominion of the soul over sense and passion, and to restrain the influence of the sensual appetites, from considerations drawn from our own happiness, and from the good of others. For, as intemperance kindles the fire of resentment and the flames of lust, excites to boisterous words and to lawless actions, wastes the substance and reduces families to wretchedness and ruin, it must be directly opposed to the principle of benevolence. It will inspire us with a generous and heroic indifference to the precarious possessions of this mortal scene, and will excite to activity and perseverance in promoting human happiness, in the face of every difficulty and obstruction, and in spite of obstinacy and ingratitude, and of all the sneers and reproaches that may be thrown out upon us on account of the singularity of our conduct. And as *Justice* is nothing else than the *measure of benevolence*, it will uniformly direct us to give to every one his due, and restrain us from withholding from our neighbor anything to which he is entitled by equity or by law. And in cases where the division of property is concerned, it will in many instances be induced to relinquish its right when only a few paltry pounds or shillings are at stake, rather than run the risk of dissolving the bonds of affection and friendship.

The duties of morality have by other moralists, particularly by the moderns, been arranged into the *duties we owe to God*, as piety, reverence, and confidence; the *duties we owe to other men*, as fidelity, loyalty, humanity, and justice; and the *duties we owe to ourselves*, as chastity, sobriety, and temperance. From what has been already stated, both in this and in several of the preceding sections, it will obviously appear, that all these classes of duties necessarily flow from the operation of that primary, diffusive, and ever active principle, which resides originally in the Eternal Mind, and which pervades the minds of all holy intelligences.

Finally, The man who is animated by the noble principle of benevolence, will endeavor to discharge with fidelity every social and relative duty, and will feel an interest in the domestic comfort and the moral and religious improvement of all around him. He will display the activities of this holy affection more immediately in the family in which he resides, as a friend, a father, a husband, a son, or a brother; performing with punctuality all the duties which such relations include; promoting unity, harmony, affection, and a reciprocal interchange of all those offices of kindness, which tend to secure mutual confidence, pleasure, and improvement. From the family, his affections will be diffused to the neighborhood around, in all the forms of kindness, compassion, faithfulness, forgiveness, charity, generosity, humanity, and justice. He will contemplate every member of society as a kinsman and a brother; he will feel a fraternal attachment; he will delight in his success and prosperity, and will endeavor to encourage the social virtues, and to multiply the sources of enjoyment wherever his influence extends. From the circle of his immediate neighborhood, his affections will extend over all the nation to which he belongs. Its prosperity and advancement in arts, sciences, and legislation, its peace and tranquillity, and the wisdom and rectitude of its rulers, will be the object of his fervent prayers to the God of heaven. To watch over its interests, to promote the improve-

ment of its constitution and its laws, to expose the intrigues of bribery and corruption, to resist the efforts of tyranny and ambition, and to defeat every encroachment on its rights and liberties, in a manly and Christian manner, he will consider as a duty which he owes to his fellow-subjects, to his rulers, and to succeeding generations. It will be his chief aim, not so much to prevent men from becoming thieves, and robbers, and murderers, as to make them pious, virtuous, and useful members of the general community; that every one may live "a quiet and peaceable life, in all godliness and honesty."

Nor will his benevolence be confined within the limits of a narrow-minded and selfish patriotism:—his affections will expand to surrounding nations, and embrace the interests of every people, and will excite him to co-operate in every scheme by which civilization and science, liberty and Christianity, may be promoted among all the tribes and kindreds of the earth. He will occasionally transport himself in imagination to distant climes, and to the islands scattered over the face of the ocean,—and the joy or sorrow which is felt in the hut of the Greenlander, in the Indian wigwam, or among the tents of the Tartars, will find access to his feeling heart. An inundation, an earthquake, the eruption of a volcano, a destroying pestilence, or the horrors of war, happening in Persia, China, or Japan, will not be viewed with apathy or indifference, because those countries are placed thousands of miles beyond the boundaries of his own; but he will sympathize in the sorrows of those distant sufferers, as well as in the calamities which befall his brethren in his native land. Nor will his affections be confined to the men of the present age, but will stretch forward to embrace the sons and daughters of future times, who are destined to appear on the theater of this world, in successive generations, until time shall be no longer. The plans which he now forms, the ground-works of the improvements which he is now establishing, and the diversified operations of benevolence in which he is now engaged, will have for their ultimate object, the diffusion of the light of science and of religion, and the communication of happiness, in various forms, to unnumbered multitudes of the human race, after his spirit shall have taken its flight beyond the bounds of this terrestrial sphere. Nor will the current of his love toward fellow-intelligences be bounded by the limits of time, and the range of this sublunary system, but will run forward into those interminable ages, which shall succeed the dissolution of our globe, and will rise upward to the inhabitants of those glorious worlds which roll in the distant regions of creation. Contemplating the diversified scenes in which he may hereafter be placed, and the various orders of intellectual beings with which he may mingle, his soul will be transported at the prospect of entering upon a more extensive field for the range of his benevolent affections, and of being qualified to receive and to communicate happiness on a more enlarged scale, in company with other holy intelligences,—where the field of benevolence will be continually expanding, and the most exquisite delight springing up in his bosom, and ever increasing, as eternal ages are rolling on.

Thus, it appears, that Benevolence is an expansive and an ever active principle, diffusing happiness in its train wherever it extends. Were an extensive moral machinery to be set in action by this powerful principle, it is impossible to describe what a variety of blessings would soon be distributed among mankind, and what a mighty

change would be effected in the social state of human beings, and on the whole aspect of the moral world. And from what has been already stated, it is evident, that, although intellectual talent, wealth, and influence, have most in their power, as the prime directors of the moral machine,—yet there is no individual in whom this principle resides, however limited his faculties, and his sphere of action, but has it in his power to communicate happiness to his fellow creatures, and to become at least a subordinate agent in promoting the plans of universal benevolence.

From what has been stated above, and in several of the preceding parts of this work, we may learn, that, in order to acquire a knowledge of our duty, and of the motives which should stimulate us to its performance, there is no need to engage in the study of voluminous systems of ethical science, or to perplex the mind with labored disquisitions on the principles of morals. The general path of duty is plain to every one who is inclined to walk in it; and whoever wishes to be assisted and directed in his progress toward moral perfection, will find, in the Proverbs of Solomon, the sermons of Jesus Christ, and the practical parts of the apostolic epistles, maxims, and precepts, and motives inculcated, infinitely superior in regard both to their authority and their excellence, to those of all other systems of moral philosophy, whether in ancient or in modern times. This seems to be partly admitted even by moral philosophers themselves. The celebrated Dr. Reid, in his "Essays on the Active Powers of Man," after a variety of learned and abstract discussions on active power, and the principles of human action, when treating on the theory of morals, says, "This is an intricate subject, and there have been various theories and much controversy about it in ancient and in modern times. But it has little connection with the knowledge of our duty, and those who differ most in the theory of our moral powers, agree in the practical rules of morals which they dictate. As a man may be a good judge of colors, and of the other visible qualities of objects, without any knowledge of the anatomy of the eye, and of the theory of vision; so a man may have a very clear and comprehensive knowledge of what is right and of what is wrong in human conduct, who never studied the structure of our moral powers. A good ear in music may be much improved by attention and practice in that art; but very little by studying the anatomy of the ear, and the theory of sound. In order to acquire a good eye, or a good ear, in the arts that require them, the theory of vision, and the theory of sound, are by no means necessary, and indeed of very little use. *Of as little necessity or use is what we call the theory of morals, in order to improve our moral judgment.*"—REID, "On the Active Powers," Essay v. chap. 2.

To a man who is familiar with the Scriptures, and whose mind has acquired a relish for the simplicity and excellence of the Christian code of morals, how cold, and frigid, and uninteresting, do the labored disquisitions of our most celebrated ethical writers appear! There is little to be found in such writings to kindle the fire of holy love, and to inspire the soul with a noble ardor, in carrying forward the plan of divine benevolence.—What powerful stimulus to exalted virtue can be expected from abstract discussions on active power, on liberty and necessity, on theories of moral action, on the reason and fitness of things, on self-love, on public and private interest, on the

law of honor, and the like; and of how little practical utility are the results of such disquisitions; since every principle of action, every motive, and every duty conducive to the happiness of the intelligent system, is laid down in the Scriptures, with a plainness and perspicuity, which render them level to the meanest understanding? And what shall we say of those moralists who teach us, that "modesty, humility, and forgiveness of injuries," belong to the class of vices;* and, by consequence, that pride, imprudence, and revenge, are to be ranked among the *virtues*! Such virtue, alas! has too long prevailed in our degenerate world; but were it universally to prevail, it would transform creation into a chaos, and banish happiness from the universe. What beneficial practical effects have ever yet been produced by all the systems of ethics which have hitherto been published to the world? Let us look back on the nations of antiquity, on the schools of Plato, Socrates, Epicurus, and Zeno; let us survey the conduct of our modern skeptical philosophers, and the practices of our youths who attend courses of ethical lectures in our universities and academies, and say, whether the general depravity of human nature has been counteracted, and a spirit of universal benevolence has been cherished and promoted by such instructions. I venture to affirm, that we are far more indebted to our Saviour's sermon on the mount, and to the practical writings of the apostle Paul, for that portion of morality which has given a polish to the manners of modern society, than to all the systems of ethics, detached from Christianity, which have ever been published by the philosophers either of Greece or Rome, or of the British empire: and that it is only by following out the instructions of these divine teachers that we can expect to see the world regenerated, and vice and iniquity banished from our streets.

In throwing out the preceding hints, I have confined my attention chiefly to the intelligent creation. But it is evident, that where a principle of genuine love actuates the mind, it will extend its benevolent regards even to the lower orders of animated existence. Toward them the Creator has displayed his benevolence, as well as toward man. He has framed their bodies in as curious and admirable a manner, as the bodies of mankind. He has bestowed upon them organs of sensation exactly adapted to the situations they occupy, and to their various modes of subsistence. He has formed them with instincts which enable them to construct their habitations, to select their food, to protect themselves from danger, and to choose the fittest places for bringing forth their young. He has provided, in the different departments of nature, all that variety of food which is requisite to supply the wants of the whole of that immense assemblage of living beings which traverse the air, the waters, and the earth. "These all wait upon Him, and he giveth them their meat in due season." Their sportive motions, their varied movements, and the delight with which they seem to exercise their faculties, testify, that they are the objects of the beneficence of their Almighty though unknown Maker. So that God not only takes care of men, but of the fishes of the sea, the creeping insects, and the fowls of heaven, for "a sparrow cannot fall to the ground" without his providential permission.

This benevolent care of the Creator, which

* This sentiment is taught by Mr. Hume, and his followers.

extends to the lowest order of his creatures, instructs us, that our benevolence also should be displayed toward the inferior ranks of sensitive existence—that we should not only abstain from vexing, and torturing, and unnecessarily depriving them of existence; but should endeavor to promote their comfort and enjoyment. It was the object of several of the laws delivered to the Jews, to inculcate compassion and humanity toward their domestic animals: and Solomon lays it down as a moral maxim, that “the righteous man regardeth the life of his beast.” Benevolence will display itself, in the shape of tenderness and humanity toward every creature that is endowed with feeling and sensation; but it cannot be supposed to have a powerful influence over that man who can wantonly torture a poor fly, lash a feeble old horse, wound a bird or hare for mere sport, twirl a cockchaffer on a crooked pin, or even intentionally trample under foot a snail or a worm, that is doing him no injury. The benevolent man rejoices in the happiness of all creation around him; and, were this disposition universally prevalent, not only should we see cock-fighting, dog-fighting, bull-baiting, and other cruel and degrading sports forever abolished, but should form a more delightful intercourse with many of the lower animals than we have ever yet enjoyed. The Arabians never beat their horses; they never cut their tails; they treat them gently; they speak to them, and seem to hold a discourse; they use them as friends; they never attempt to increase their speed by the whip, nor spur them but in cases of great necessity. They never fix them to a stake in the fields, but suffer them to pasture at large around their habitations; and they come running the moment they hear the sound of their master’s voice. In consequence of such treatment, these animals become docile and tractable in the highest degree. They resort at night to their tents, and lie down in the midst of the children, without ever hurting them in the slightest degree. The little boys and girls are often seen upon the body or the neck of the mare, while the beasts continue inoffensive and harmless, permitting them to play with and caress them without injury.—Several species of birds have a natural attachment to the habitations of man; but his malevolence prevents them from entering into any intimate and friendly association; for they seem to be fully aware of his guns, and snares, and other arts of destruction, which make them shy, even in cases of necessity, of trusting themselves to his generosity and protection. How many amusing and instructive associations might be formed with this class of animals, if the kindness and benevolence of man were to secure their confidence! Even the beasts of the forest, the elephant, the lion, and the tiger,* have had their ferocious dispositions softened by kindness and attention, and have become the protectors and the friends of man.

Although the lower animals seem to be incapable of making improvements when left to themselves, yet experience has proved, that, under the tuition of man, they are capable of making considerable advancement in knowledge, and in the exercise of the benevolent affections. Kindness and affection will frequently soften the most savage and obdurate dispositions among mankind; and it is not improbable, that a judicious and uni-

versal display of friendly attentions toward those animals which occasionally associate with man, would go far to counteract their malevolent propensities, and to promote their harmony and affection. I never was more delighted with an exhibition of animals than on a late occasion, when I beheld a *cat*, a *bird*, and a *mouse*, living in the same cage, in the most cordial harmony and peace—a fact which demonstrates that the strongest antipathies of the animal tribes may be overcome by the care and attention of man. And as such an experiment could not have been attempted with success, except when these animals were very young, it shows us the immense importance of an early attention to the training of our youth in habits of kindness and affection toward each other, and of humanity toward every sensitive being; and that it ought to be the great care of parents, nurses, and servants, to counteract the first appearance of malevolent dispositions in very early life, however trivial the circumstances in which such dispositions are manifested.

The famous Baron Trenck, when confined in his dungeon in Magdeburg, had so tamed a mouse, that it would play round him, and eat round him, and eat from his mouth. When he whistled, it would come and jump upon his shoulder. After his cruel keepers had given orders that he should be deprived of its society, and had actually taken it away blindfolded, it found its way back again to the door of his dungeon, waited the hour of visitation, when the door would be opened, and immediately testified its joy, by its antic leaping between his legs. This mouse was afterward carried off, and put into a cage, where it pined, refused all sustenance, and, in a few days, was found dead. “In this small animal,” says the Baron, “I discovered proofs of intelligence too great to easily gain belief. Were I to write them, such philosophers as suppose man alone endowed with the power of thought, allowing nothing but what they call instinct in animals, would proclaim me a fabulous writer, and my opinions heterodox to what they suppose sound philosophy.”—A nobleman of France, a Count Lauzun, was condemned to a rigid imprisonment. Cut off from all human society, and allowed no means of diverting his solitude, he made a companion of a *spider*, who had spun her web in the corner of his cell. He at length familiarized her so far, that she would come upon his hand, and eat from it a portion of his food which he gave her. The jailer, totally devoid of feeling, thought this too great an indulgence for the unfortunate prisoner, and crushed the spider to death.

Many such instances could be brought forward to illustrate the affection of the inferior tribes, and their capability of improvement. But although they were entirely destitute of mental qualities and affections, as they are sensitive beings, susceptible of pleasure and pain, the truly benevolent man will never intentionally inflict upon them unnecessary pain, and far less will he ever enjoy a savage delight, like some monsters in human shape, in beholding them writhing under the agonies occasioned by barbarous treatment. He will feel a joy in their comfort, and will endeavor to counteract their malignant propensities, and to train them up in those habits by which they may be rendered useful to man, and pleasing to each other. Were such a kind and humane disposition toward the lower animals generally to prevail, we might ultimately expect the literal accomplishment of those predictions recorded in ancient prophesy:—“In that day will I make a covenant for them with the beasts of

* An experiment was lately exhibited, by the keeper of the animals in the Tower of London, which demonstrates, that even the *tiger* is capable of being tamed, and rendered susceptible of friendly feelings toward man.

the field, and with the fowls of heaven, and with the creeping things of the ground; and I will break the bow and the sword, and the battle out of the earth, and will make them to lie down safely." "I will cause the evil beasts to cease out of the land, and they shall dwell safely in the wilderness, and sleep in the woods." "The wolf shall dwell with the lamb: the cow and the bear shall feed in one pasture, and their young ones shall lie down together; the sucking child shall play on the hole of the asp, and the weaned child shall put his hand on the adder's den. They shall not hurt nor destroy in all my holy mountain, saith the Lord."

The remarks which have been stated in this section, in reference to the practical influence of the principle of benevolence, are intended merely as a few insulated hints in regard to some of the modes in which it may be made to operate. To illustrate its operation in detail, and to trace its progress in all its diversified bearings and ramifications, would be, to write a Body of Practical Morality, which would fill several volumes—a work which is still a desideratum in Christian literature. I cannot conclude this chapter more appropriately than with the following excellent passage, extracted from Dr. Dwight's "System of Theology."

"The divine law is wholly included in two precepts: *Thou shalt love the Lord thy God with all thy heart; and thy neighbor as thyself.* These are so short, as to be necessarily included in a very short sentence; so intelligible, as to be understood by every moral being who is capable of comprehending the meaning of the words God and

neighbor; so easily remembered as to render it impossible for them to escape from our memory, unless by wanton, criminal negligence of ours; and so easily applicable to every case of moral action, as not to be mistaken unless through indisposition to obey. At the same time, obedience to them is rendered perfectly obvious and perfectly easy to every mind which is not indisposed to obey them. The very disposition itself, if sincere and entire, is either entire obedience, or the unfailing means of that external conduct by which the obedience is in some cases completed. The disposition to obey is also confined to a single affection of the heart, easily distinguished from all other affections, viz. love. Love, saith St. Paul, is the fulfilling of the law. The humblest and most ignorant moral creatures, therefore, are in this manner efficaciously preserved from mistaking their duty.

"In the meantime, these two precepts, notwithstanding their brevity, are so comprehensive as to include every possible action. The archangel is not raised above their control, nor can any action of his exceed that bound which they prescribe.—The child who has passed the verge of moral agency, is not placed beneath their regulation: and whatever virtue he may exercise, is no other than a fulfilling of their requisitions. All the duties which we immediately owe to God, to our fellow-creatures, and to ourselves, are, by these precepts, alike comprehended and required. In a word, endlessly varied as moral action may be, it exists in no form or instance in which he who perfectly obeys these precepts will not have done his duty, and will not find himself justified and accepted by God."

CHAPTER III.

ON THE MORAL LAW AND THE RATIONAL GROUNDS ON WHICH ITS PRECEPTS ARE FOUNDED.

In the preceding chapters, I have endeavored to illustrate the foundation of love to God, from a consideration of his attributes, and the relations in which he stands to his creatures. I have also illustrated the rational grounds of love to our neighbor, from a consideration of the natural equality of mankind, of the various relations in which they stand to one another, and of their eternal destination. The dismal consequences which would result from a total subversion of these laws, the beneficial effects which would flow from their universal operation, their application to the inhabitants of other worlds, the declarations of scripture on this subject, and the various modes in which benevolence should display its activities, have also been the subject of consideration.

The two principles now illustrated, may be considered as two branches proceeding from the same trunk, and spreading into different ramifications. The first four commandments of the moral law may be viewed as flowing from the principle of love to God, and the remaining six as ramifications of the principle of benevolence, or love to man. In the following brief illustrations, I shall endeavor to show the reasonableness of these moral laws in relation to man, from a consideration of the misery which would necessarily result from their universal violation, and of the

happiness which would flow from universal obedience to their requisitions.

These laws were published in the most solemn manner, to the assembled tribes of Israel in the wilderness of Horeb. While mount Sinai was shaking to its center, and smoking like a furnace; while flames of fire were ascending from its summit, and thick darkness surrounding its base; while thunders were rolling in clouds above, and lightnings flashing amidst the surrounding gloom; and while the earth was quaking all around, and the voice of a trumpet waxing louder and louder,—in the midst of this solemn and terrific scene, God spake the commandments with an audible articulate voice, in the hearing of the trembling multitude assembled round the mountain. A combination of objects and events more awful and impressive, the human mind can scarcely conceive; compared with which, the pretended pomp of Pagan deities, and Jupiter shaking Olympus with his imperial nod, are lame, ridiculous, and profane; and never, perhaps, since the commencement of time, was such a striking scene presented to the view of any of the inhabitants of this world. The most solemn preparations were made for this divine manifestation; the people of Israel were commanded to purify themselves from every mental and corporeal pollution, and strictly enjoined to keep within the boundaries marked

out for them, and not rush within the limits assigned to these awful symbols of the Deity. An assemblage of celestial beings, from another region of creation, was present on this occasion, to perform important services, to swell the grandeur of the scene, and to be witness of the impressive transactions of that solemn day.* Moses was appointed as a temporary mediator between God and the people, to explain to them in milder terms the words of the law, and the further intimations of the divine will. Yet so terrible were the symbols of the present Deity, that even Moses was appalled, and said, "I exceedingly fear and quake." In order that the impressive words which were uttered on that day might not be forgotten in future generations, they were written on tables of stone with the finger of God. They were not simply *drawn* on a plane, like the strokes of writing upon paper, but the characters were *engraved*, or cut out of the solid stone, so that they could not be erased. They were not written on paper or parchment, or even on wood, but on *stone*, which is a much more durable material.—"The tables were written upon *both their sides*, on the one side, and on the other were they written; and the tables were the work of God, and the writing was the writing of God, graven upon the tables."† This was intended to prevent the possibility of anything being added to the law, or taken from it. The tables were *two* in number, the one containing the precepts which inculcate love to God, and the other containing those which enjoin the love of our neighbor. These laws, thus engraved on the most durable materials, were deposited in the most sacred part of the tabernacle, in the ark of the covenant under the mercy-seat. All the striking circumstances, now mentioned, were evidently intended to proclaim the Majesty and Grandeur of the Supreme Legislator—the excellency and perfection of his law—that it is the eternal and unalterable rule of rectitude—that it is of perpetual obligation on all the inhabitants of the earth—that it is the rule of action to angels and archangels, and to all other moral intelligences, as well as to the human race—and that the most dreadful consequences must ensue on all those who persist in violating its righteous precepts.

The proclamation of this law was prefaced by these words, "I am Jehovah thy God," which contain a ground and reason for our obedience. They evidently imply, that he is the Self-existent and Eternal Being who brought this vast universe into existence, who "garnished the heavens, and laid the foundations of the earth," and peopled all worlds with their inhabitants—that he has sovereign authority to prescribe a rule of action to his creatures—that he knows best what laws are requisite to preserve the order of his vast empire, and to secure the happiness of the intelligent creation—that he is the former of our bodies, the Father of our spirits, and the director of all the movements of nature and providence, from whose unceasing agency every joy proceeds—and that all his regulations and arrangements are calculated to promote the present and everlasting felicity

of all rational agents that submit to his authority.—That these laws are not mere acts of Divine Sovereignty, but founded on the nature of things, and are calculated to preserve the harmony and order of the intelligent universe, will appear from the following illustrations and remarks.

THE FIRST COMMANDMENT.

"*Thou shalt have no other gods before me.*"

All the commandments, except the fourth and fifth, are expressed in a *negative* form: But it is obvious, that every negative command includes a requisition of the duty which is opposed to the sin forbidden; and those which are *positive* include a prohibition of the conduct which is opposed to the duty required. This first commandment, therefore, though expressed in the negative form, must be considered as including a positive injunction to love God with all our hearts, to offer a tribute of supreme adoration to his perfections, and to exercise the graces of hope, gratitude, submission, and reverence. Having already considered the precept in this point of view (pp. 66—74), it is only necessary, in this place, to attend for a little, to the *negative* form of the command. The prohibition contained in this precept must be considered as extending not only to Polytheism, and the various objects of worship which have prevailed in the heathen world, but to everything which is the object of our supreme affection and regard.

It is a dictate of enlightened and unprejudiced reason, that the Being to whom we are indebted for our existence, on whom we every moment depend, who directs the movements of the system of nature, who daily loads us with his benefits, and on whom our hopes of eternal felicity entirely depend—should be contemplated with the most ardent affection and gratitude, regarded as the most excellent and venerable of all beings, and recognized as the Supreme Legislator, whose laws we are bound, by every tie of gratitude, to obey. Wherever such sentiments and affections pervade the mind, they constitute the first principles of piety, the source of all holy obedience, and the foundation of all true happiness. Were they universally felt, and acted upon by human beings, the Most High God would be adored in every land, his image would be impressed on every heart, his righteous law would never be violated, groveling desires and affections would be eradicated, and our world would be transformed into an abode of felicity, where joys similar to those of angels would succeed to scenes of wretchedness and woe.

On the other hand, where the unity and the attributes of the divine being are not recognized, and where other objects are substituted in his place, the foundations of religion, and of moral order are completely subverted, and a door opened for the introduction of every absurdity, immorality, and vile abomination, that can degrade a rational intelligence. The command under consideration is placed on the front of the divine law as the foundation of all the other precepts; and, therefore, wherever it is violated, or not recognized, a regular obedience to the other subordinate injunctions of religion is not, in the nature of things, to be expected. Were its violation, in our world, complete and universal, it is impossible to say what would be the miserable condition of human beings in their social capacity. To its general violation, may be traced all the evils under which humanity has groaned in every

* Stephen says, that the Jews "received the law by the disposition of angels." Grotius observes, on this passage, that the Greek preposition [eis] here signifies *amidst*, and that [*diatagis angelon*], denotes *troops of angels ranged in military order*; and that there is a reference to Deut. xxxiii. 2. "The Lord came from Sinai, and rose up from Seir unto them; he shined forth from Mount Paran, and he came with ten thousands of his holy ones; from his right hand went a fiery law for them."

† Exod. xxxii. 45.

age, and all the depraved passions, and shocking immoralities which now disfigure the aspect of the moral world.

There is nothing that appears more prominent in the history and the character of almost every nation under heaven, than an infringement of this first and fundamental law of the Creator. A rational and enlightened mind, on the first consideration of this subject, would be apt to surmise, that such a law is almost superfluous and unnecessary. There is such an immense disproportion between a block of marble, or a crawling reptile, and that Being who supports the system of universal nature, that it appears, at first view, next to impossible, that a reasonable being should ever become so stupid and degraded, as to substitute the one for the other, and to offer his adorations to an object completely devoid of life, power, and intelligence. Yet experience teaches us, that there is no disposition to which the human mind is more prone than "to depart from the living God," and to multiply objects of idolatrous worship. This will appear, if we take but the slightest glance of the objects of adoration which have prevailed, and which still prevail in the pagan world.

At one period of the world, with the single exception of the small nation of the Jews, idolatry overspread the face of the whole earth. And how numerous and degrading were the objects which the blinded nations adored! We are informed, by Hesiod, Varro, and other ancient authors, that no less than *thirty thousand* subordinate divinities were comprised within that system of idolatry which prevailed among the Greeks and Romans. They had both celestial and terrestrial deities. They assigned peculiar gods to the fountains, the rivers, the hills, the mountains, the lawns, the groves, the sea, and even to hell itself. To cities, fields, houses, edifices, families, gates, nuptial chambers, marriages, births, deaths, sepulchers, trees, and gardens, they also appropriated distinct and peculiar deities. Their principal *celestial* deities were Jupiter, Mars, Mercury, Apollo, Bacchus, Venus, Juno, and Minerva—their *terrestrial*, Saturn, Ceres, Diana, Neptune, Cybele, Proserpine, and Pluto. Their chief idol was Jupiter, whom they called the father of gods and men; and under his authority, Neptune had the jurisdiction of the *sea*, Juno, of the *air*, Cybele, of the *earth*, and Pluto, of the *realms below*. Instead of worshipping the *living* and immortal God, they deified a host of *dead men*, called heroes, distinguished for nothing so much, as for murder, adultery, sodomy, rapine, drunkenness, and all kinds of debauchery. To such contemptible divinities, splendid temples were erected,* adorations addressed, costly offerings presented, and rites and ceremonies performed, subversive of every principle of decency and morality, and degrading to the reason and the character of man.—A system of idolatry of a similar kind, though under a different form, prevailed among the Egyptians. The meanest and the most contemptible objects—sheep, cats, bulls, dogs, cows, storks, apes, vultures, and other birds of prey; wolves, and several sorts of oxen, were exalted as objects of adoration. "If you go into Egypt," says Lucian, "you will see Jupiter with the face of a *ram*, Mercury as a fine *dog*, Pan,

is become a *goat*; another god is *Ibis*, another the crocodile, and another the ape. There, many shaven priests gravely tell us, that the gods being afraid of the rebellion of the giants, assumed these shapes." Each city and district in Egypt entertained a peculiar devotion for some animal or other, as the object of its adoration. The city of Leontopolis worshiped a lion; the city of Mendez, a goat; Memphis, the Apis; and the people at the lake *Myris*, adored the crocodile. These animals were maintained, in or near their temples, with delicate meats; were bathed, anointed, perfumed, had beds prepared for them; and when any of them happened to die, sumptuous funerals were prepared in honor of the god. Of all these animals, the bull, *Apis*, was held in the greatest veneration. Honors of an extraordinary kind were conferred on him while he lived, and his death gave rise to a general mourning.

Such was the abominable idolatry that prevailed even among the most enlightened nations of antiquity. They changed the glory of the incorruptible God into "the similitude of an ox that eateth grass," and into images made like to corruptible man and to birds, and to four-footed beasts, and creeping things. And if the Egyptians, the Greeks, and the Romans, who are distinguished from the rest of the world for their improvements in literature, science, and the arts, had so far renounced their allegiance to the God of heaven, we may rest assured that the surrounding nations were sunk still farther into the pollutions of idolatry and of mental debasement. The Phenicians, the Syrians, the Canaanites, the Chaldeans and Babylonians, the Arabians, the Scythians, the Ethiopians, and the Carthaginians, the ancient Gauls, Germans, and Britons, were, if possible, more deeply debased; and mingled with their idolatrous rites, many cruel, obscene, and vile abominations.—Such is still the moral and religious debasement, even in modern times, of the greater part of the nations which dwell upon the earth. Even the Hindoos, the Birmans, the Chinese, the Persians, and the Japanese, though ranked among the most polished nations of the heathen world, are sunk into the grossest ignorance of the true God, and are found perpetrating, in their religious worship, deeds revolting to humanity, and stained with horrid cruelty and injustice.

The *moral effects* which were produced by a departure from this fundamental law of the Creator, were such as correspond with the abominations of that religious system which was adopted. Man is an imitative being; and he generally imitates the actions of those whom he conceives to be placed in a superior rank and station. When, therefore, the gods were introduced to his view, as swollen with pride, mad with rage, fired with revenge, inflamed with lust, engaged in wars, battles, and contests, delighting in scenes of blood and rapine, in hatred and mutual contentions, and in all kinds of riot and debauchery, it was natural to suppose that such passions and crimes would be imitated by their blinded votaries. Accordingly we find, that such vices universally prevailed, even among the politest nations of antiquity; and some of their sacred rites, solemnized in honor of their gods, were so bestial and shocking, as to excite horror in every mind possessed of the least sense of decency and virtue. They gloried in the desolation and destruction of neighboring nations. To conquer, and oppress, and enslave their fellow-men, and to aggrandize themselves by slaughter and rapine, was the great object of their ambition. The law of kindness and

*The temple of *Diana* at *Ephesus*, has been always admired as one of the noblest pieces of architecture that the world ever produced. It was 425 feet long, 200 feet broad, and supported by 127 columns of marble 60 feet high; 27 of which were beautifully carved. Diodorus Siculus mentions, that the rich presents made to the temple of *Apollo* at *Delphos*, amounted to one million three hundred and thirty-three thousand pounds.

of universal benevolence was trampled under foot, and even the common dictates of humanity, equity, and justice, were set at defiance. But this was not all—Idolatry soon began to instigate its votaries to the perpetration of the most revolting and unnatural *cruelties*. Dreadful tortures were inflicted on their bodies, to appease their offended deities; human victims, in vast numbers, were sacrificed, and even their infants and little children were thrown into the flames, as an offering to the idol which they adored.

The Mexicans were accustomed to treat themselves with the most inhuman austerities, thinking that the diabolical rage of their deities would be appeased by human blood. "It makes one shudder," says Clavigero, "to read the austerities which they practiced upon themselves, either in atonement for their transgressions, or in preparation for their festivals. They mangled their flesh as if it had been insensible, and let their blood run in such profusion, as if it had been a superfluous fluid in the body. They pierced themselves with the sharpest spines of the aloe, and bored several parts of their bodies, particularly their ears, lips, tongues, and the fat of their arms and legs." The priests of Baal, we are told, in the book of Kings, "cut themselves with knives and lancets, until the blood gushed out upon them." When the Carthaginians were vanquished by Agathocles, king of Sicily, they conceived that their god, Jupiter Latialis was displeased with their conduct. In order to appease him, and propitiate his favor, they sacrificed to him, at once, *two hundred* sons of the first noblemen of their state. On the altars of Mexico, *twenty thousand* human beings are said to have been sacrificed every year; and *fifty thousand* were annually offered up in the various parts of that empire, accompanied with circumstances of such dreadful cruelty and horror, as makes us shudder at the recital. In Hindostan, even at the present day, several thousands of women are annually burned on the funeral piles of their deceased husbands, as victims to the religion they profess; beside multitudes of other human victims, which are crushed to death under the wheels of that infernal engine which supports the idol Juggernaut. Were the one hundredth part of the abominations which have been perpetrated under the system of idolatry, in those countries where it has prevailed, to be fully detailed, it would exhibit a picture of depravity and of infernal agency, at which the human mind would shrink back with horror; and would form a striking commentary on the divine declaration, that "the dark places of the earth are full of the habitations of horrid cruelty."

It appears, then, that a violation of the first precept of the moral law is the greatest crime of which a rational creature can be guilty; for it is the source of all the other crimes which have entailed wretchedness on mankind, and strewed the earth with devastation and carnage. It is a comprehensive summary of wickedness; which includes pride, falsehood, blasphemy, malignity, rebellion, hatred of moral excellence, and the basest ingratitude toward Him from whom we derived our being, and on whom we depend for all our enjoyments. It is a crime which, above all others, has a tendency to *degrade* the character of man; for where it abounds, the human mind is sunk into the lowest state, both of moral and of intellectual debasement. What a pitiful and humiliating sight is it, and what emotions of astonishment must it excite in the mind of an archangel, to be-

hold a rational and immortal intelligence cutting down an oak in the forest, burning part of it in the fire, baking bread, and roasting flesh upon its embers, and forming the residue of it into an idol, falling down and worshipping it, and saying, "Deliver me, for thou art my God!"* And when we behold the same degraded mortal sacrificing the children of his own bowels before this stump of a tree, can we refrain from exclaiming, in the language of the prophet, "Be astonished, O ye heavens, at this; and be ye horribly afraid!" Were idolatry to become *universal* in the world, there is no crime, no species of cruelty, no moral abomination within the compass of the human heart to devise, but would soon be perpetrated without a blush, in the open face of day. Had not God, in his mercy, communicated a revelation of his will, in order to counteract the influence of Pagan theology,—instead of cultivating the powers of our minds, and expanding our conception of the Almighty, by a contemplation of his word and works, we might, at this moment, have been sunk into the lowest depths of moral degradation, been prostrating ourselves, in adoration, before a stupid ox or a block of marble, and sacrificing our sons and daughters to an infernal Moloch. It is one of the glories of Revelation, and a strong proof of its divine origin, that all its promises and threatenings, its admonitions and reproofs, its doctrines, its laws and ordinances, are directly opposed to every idolatrous practice; and that there is not a single instance in which the least countenance is given to any of the abominations of the Pagan world.

In the present age, and in the country in which we reside, we are in little danger of relapsing into the practices to which I have now adverted. But idolatry is not confined to the adoration of Pagan divinities: it has its seat in every heart where God is banished from the thoughts, and where pride, ambition, and avarice occupy the highest place. "*Covetousness*," or an inordinate love of wealth, is declared by the Apostle Paul to be "*idolatry*;" and such mental idolatry, though more refined than that of the heathen world, is almost equally abhorrent to the Divine Being, and equally subversive of the grand principles of Christian morality. If the acquisition of wealth and riches be the constant and *supreme* aim of any individual, Mammon is the god whom he regularly worships, and the God of heaven is dethroned from his seat in the affections. Such moral effects as the following are the natural results of this species of idolatry: It steals the heart against every benevolent and generous emotion; it shuts the ears to the cries of the poor and needy; it engenders cheating, falsehood, and deceit; it prevents the man in whom it predominates from exerting his active powers, and from contributing of his wealth to promote the happiness of mankind; it chains down his noble faculties to the objects of time and sense; it leads him to love and to serve himself more than the Creator; it wraps him up in selfishness, and an indifference to the concerns of all other beings; it destroys the principles of equity and justice; it blunts the feelings of humanity and compassion; and prevents him from attending to the salvation of his soul, and from looking at those things which are unseen and eternal. And in every other case where a similar principle holds the supreme seat in the affections, similar effects will be produced

* See Isaiah xiv. 9—21.

THE SECOND COMMANDMENT.

"Thou shalt not make unto thee any graven image, nor any likeness of anything that is in heaven above, or that is in the earth beneath, or that is in the waters under the earth: thou shalt not bow down thyself to them, nor serve them."

The first commandment, which I have illustrated above, respects the *object* of our worship; forbidding us to substitute any other being in the room of God, or to offer it that homage which is due to the eternal Jehovah. This second commandment respects the *manner* in which he is to be worshiped. And in regard to the manner in which the Divine Being is to be contemplated and adored, it is expressly declared, that no *image* nor *representation* of this incomprehensible Being is at any time, or on any account, to be formed. This command, like the former, might at first sight appear to be unnecessary, if the almost universal practice of mankind had not taught us that there is no disposition which the human mind is more apt to indulge, than to endeavor to bring the invisible Divinity within the range of our senses, and to contemplate him as such a one as ourselves. The necessity of this injunction, its reasonableness, and the folly and absurdity of the practice against which it is directed, will appear from the following considerations.

The Divine Being fills the immensity of space with his presence, and to his essence we can set no bounds. He inhabited eternity, before the earth or the heavens were brought into existence, rejoicing in the contemplation of his own excellencies, and in the future effects of his power and benevolence. He is a spiritual uncompounded substance, and consequently invisible to mortal eyes, and impalpable to every other organ of sensation. His omnipotence neither man nor angel can scan, nor can they explore the depths of his wisdom and intelligence. When universal silence and solitude reigned throughout the infinite void—when not a sound was heard nor an object seen within the immeasurable extent of boundless space—at his command, worlds, numerous as the sand, started into being. Thousands of suns diffused their splendors through the regions of immensity; the ponderous masses of the planetary globes were launched into existence, and impelled in their rapid courses through the sky; their surfaces were adorned with resplendent beauties, and replenished with myriads of delighted inhabitants. The seraphim and the cherubim began to chant their hymns of praise, and "shouted for joy" when they beheld new worlds emerging from the voids of space. Life, motion, activity, beauty, grandeur, splendid illumination, and rapturous joy, among unnumbered intelligences, burst upon the view, where a little before nothing appeared but one immense, dark, and cheerless void. And ever since duration began to be measured, either in heaven or on earth, by the revolutions of celestial orbs, the same omnipotent energy has been incessantly exerted in directing the movements of all worlds and systems, and in upholding them in their vast career. Of a being invested with attributes so glorious and incomprehensible, with power so astonishing in its effects, with goodness so boundless, and with wisdom so unsearchable, what image or representation can possibly be formed which will not tend to contract our conceptions, and to debase the character of the infinite and eternal Mind! "To whom will ye liken me, or shall I be equal, saith the HOLY ONE!"

When a person of dignity and of respectability

of character is *caricatured*, and associated with objects and circumstances that are mean, ridiculous, and grotesque, it has a tendency to degrade his character, and to lessen our veneration. For the respect we entertain for any individual is founded on the view we take of him in all the aspects in which he may be contemplated. For a similar reason, every attempt to represent the Divine Majesty by sensible images, must have a tendency to narrow our conceptions of his glory, to debase his character, and to lessen our reverence and esteem. What possible similitude can there be between that mighty being, who by his word lighted up the sun, and diffused ten thousands of such immense luminaries through the regions of creation, whose hand wields the planets, and rolls them through the tracts of immensity; between him who "meteth out the heavens with a span, and holds the ocean in the hollow of his hand," and the most resplendent image that was ever formed by human hands! Even the sun himself, with all his immensity of splendor, although our minds were expanded to comprehend his vast magnificence, would form but a poor and pitiful image of Him, whose breath has kindled ten thousand times ten thousand suns. How much less can a block of marble or a stupid ox adumbrate the glories of the King eternal, immortal, and invisible! It will doubtless redound to the eternal disgrace of the human character, in every region of the universe where it is known, that ever such an impious attempt was made by the inhabitants of our degenerate world, as to compare the glory of the incorruptible God to an image made like to corruptible man. Wherever such attempts have been made, there we behold human nature in its lowest state of debasement; the intellectual faculties darkened, bewildered, and degraded; the moral powers perverted and depraved; groveling affections predominating over the dictates of reason, and diabolical passions raging without control. Hence, too, the debasing tendency of all those attempts which have been made to introduce into the Christian church, pictures and images, to represent "The invisible things of God," and the sufferings of the Redeemer. For, wherever such practices prevail, the minds of men will generally be found to entertain the grossest conceptions of the Divine Being, and of the solemn realities of religion.

But the principal reason why any representation of God is expressly forbidden in this commandment, is, that whenever such a practice commences, it infallibly ends in adoring the *image itself*, instead of the *object* it was intended to represent. Or, in other words, the breach of this commandment necessarily and uniformly leads to a breach of the first. Notwithstanding the shock which the human mind appears to have received by the fall, it is altogether inconceivable, that any tribe of mankind should have been so debased and brutalized, as, in the first instance, to mistake a crocodile, or the stump of a tree, however beautifully carved, for the Creator of heaven and earth. Such objects appear to have been first used as *symbols* or representations of the Deity, in order to assist the mind in forming a conception of his invisible attributes. But as they had a direct tendency to debase the mind, and to obscure the glory of the Divinity, in process of time they began to be regarded by the ignorant multitude as the very gods themselves, which they were at first intended to represent; and that tribute of adoration was paid to the *symbol* itself, which was originally intended to be given to the invisible God, through this sensible medium. And, when we contemplate kings

and princes, poets and philosophers, heroes and sages, "young men and virgins, old men and children," whole provinces, nations, and continents, prostrating themselves before the shrine of such despicable and abominable idols, and the idea of the true God almost banished from the world, we have reason to feel ashamed, and to be deeply humbled, that we belong to a race of intelligences that have thus so grossly prostituted their rational and moral powers.

The only *natural* image or representation of God which is set before us for our contemplation, is, the boundless universe which his hands have formed; and his *moral* image is displayed in the laws which he has published, in the movements of his providence, and in the face of Jesus Christ his Son, who is "the image of the invisible God, and the brightness of his glory." All these exhibitions of the Divine Majesty, we are commanded to study, to contemplate, and admire; and it is essentially requisite in order to our acquiring correct and comprehensive views of the object of our adoration, that no one of these displays of the Divinity should be overlooked, or thrown into the shade. There are some Christians, who imagine they may acquire a competent knowledge of the character of God, although they should never spend a single moment in contemplating his perfections as displayed in his visible works. In regard to such, I hesitate not to affirm, that they are, to a certain extent, *idolaters*, and remain willful idolaters, contented with the most inadequate and groveling conceptions of the Deity, so long as they refuse to contemplate, with fixed attention, and with intelligence, the operations of his hands. If a man's ideas never extend beyond the bounds of his visible horizon, or beyond the limits of the country in which he resides, and if, at the same time, he has overlooked the most striking displays of divine wisdom and goodness within these bounds—his conceptions of the Divine Being himself, will nearly correspond with the conceptions he forms of his works. If his views be even confined within the limits of the globe on which he dwells, his conceptions of God will still be groveling, distorted, and imperfect. And, therefore, the idea which such an individual forms to himself of God, may be inferior to that which is due to one of the higher orders of created intelligences. And, if so, he has only an image of a creature in his mind, instead of a comprehensive conception of the Great Creator. We have too much reason to believe, that there are multitudes in the religious world, who pass for enlightened Christians, whose ideas of the Supreme Ruler of the universe do not rise beyond the conceptions we ought to form of the powers and capacities of Gabriel the archangel, or of one of the highest order of the seraphim.

We can never expect, from the very nature of things, to be able to explore the depths of Jehovah's essence, or to comprehend the whole range of his dominions and government. But, a large portion of his operations lies open to our inspection; and it is from an enlightened contemplation of what is presented to our view in the visible universe, that we are to form our conceptions of the grandeur of the Eternal Mind. For, it may be admitted as an axiom, both in natural and revealed theology, that *our conceptions of God will nearly correspond with the conceptions we acquire of the nature and extent of his operations.* In the universe around us, we perceive an image of his infinity, in so far as a finite and material existence can adumbrate the attributes of an Infinite and Invisible Existence. When we lift our eyes

toward the midnight sky, we behold a thousand suns diffusing their splendors from regions of space immeasurably distant. When we apply a telescope to any portion of this vast concave, we perceive thousands more which the unassisted eye cannot discern. When we increase the magnifying powers of the instrument, we descry numerous orbs of light, stretching still farther into the unfathomable depths of space; so that there appear no limits to the scene of creating power. When the eye of reason penetrates beyond all that is visible through the most powerful telescopes, it contemplates a boundless region teeming with other resplendent suns and systems, whose number and magnificence overwhelm the imagination; so that no limit can be set to the excursions of the intellect when it wings its flight over the wide empire of Jehovah. Over all this vast assemblage of material splendor, over its movements, and over all the diversified ranks of intelligence it supports, God eternally and unchangeably presides. He is an *Infinite Being*;—and in this immense universe which he has opened to our view, he has given us an image of his infinity, which corresponds with the perfections which the inspired writers ascribe to him—and without a contemplation of which, the mind must have a very unworthy and circumscribed idea of the attributes of the Eternal Mind. Even in many of the objects which surround us in this lower world, we perceive an image of the infinity of the Creator—particularly in those living worlds which are contained in a few drops of water, some of the inhabitants of which are several hundreds of thousands of times smaller than the least grain of sand. To the contemplation of such objects we are directed by God himself, in order to acquire an impressive view of his character and operations "Lift up your eyes on high, and behold who hath created these orbs, that bringeth out their host by number: he calleth them all by names, by the greatness of his might, for that he is strong in power."—And, the prophets, when reasoning against idolatry, present us with a train of thought similar to that to which I have now adverted. They describe the Almighty as "sitting on the circle of the heavens, and the inhabitants of the earth as grasshoppers in his sight." They represent him as "measuring the waters in the hollow of his hand, weighing the mountains in scales, and *meting out the heavens with a span*—before whom all nations are as the drop of a bucket, and are counted to him less than nothing and vanity."

It is strange, indeed, that the duty of contemplating the image of God as impressed upon his works, should be so much overlooked by the great body of the Christian world, notwithstanding the obvious reasonableness of this duty, and the pointed injunctions in relation to it which are reiterated in every department of the word of God. It is still more strange, that the instructions of many religious teachers have a tendency to dissuade Christians from engaging in this duty, by the foolish contrasts they attempt to draw between the word and the works of God; so that the great mass of Christians are left to remain half idolaters for want of those expansive conceptions of God which a knowledge of his works is calculated to produce.

It is also most unaccountable, on every principle of reason, and of Revelation, that the willful neglect of this duty should never be accounted either as a sin, or as a want of that respect which is due to the Majesty of heaven. We have known persons rebuked, and even excluded from a Christian Church, for holding a metaphysical sentiment

different from their brethren respecting the divine plans and decrees; but we never heard of an individual being either reproved or admonished by a Christian society, for neglecting to contemplate the character of God as displayed in his works, although he had lived fifty years amidst the magnificence of creation, and had acquired little more knowledge of his Creator, from this source, than the ox which browses on the grass. Yet, to this neglect is to be imputed a great proportion of those groveling conceptions, superstitious notions, and distorted views of the doctrines of religion which still disgrace the Christian world. This fact is still more unaccountable, when we consider that a knowledge of the abstrusities and technicalities of science is not requisite in order to the performance of this duty. It requires only the eye of sense, of reason, and of devotion to be directed to the scene of divine operation within us, and around us, and to be occasionally fixed on the object we contemplate, in order to appreciate the perfections and the glory of the ever present Deity. Although there were no other striking objects around us, the single fact of the apparent revolution of the celestial concave, with all its magnificent orbs, around the earth every twenty-four hours, is sufficient to overpower the mind of every rational observer with admiration and wonder, if his attention were seriously directed to it only for a single hour. The ideas of majesty, of grandeur, and of omnipotent energy which this single circumstance is calculated to inspire, are such as irresistibly to lead the mind to the contemplation of a Being whose perfections are incomprehensible, and whose ways are past finding out. Yet, I believe, it may be affirmed with truth, that more than one half of the Christian world are ignorant that such a fact exists;* such is the indifference and the apathy with which many religionists view the wonderful works of God.

It was chiefly owing to such criminal inattention to the displays of the Divine Character in the works of creation, that the inhabitants of the Pagan world plunged themselves into all the absurdities and abominations of idolatry. "For the invisible things of God, even his eternal power and godhead, are clearly seen in the things that are made;" if men would but open their eyes, and exercise their powers of intelligence. "The heavens declare the glory of Jehovah," they declare it to all the inhabitants of the earth. "There is no speech nor language where their voice is not heard: their line is gone out through all the earth, and their words to the end of the world."

"In reason's ear they all rejoice,
And utter forth a glorious voice;
Forever singing, as they shine,
'The hand that made us is divine.'"

But the Heathen world did not listen to the instructions thus conveyed, nor did they apply their understandings, as they ought to have done, to trace the invisible things of God, from the visible displays of his character and perfections, in the universe around them. "They became vain in their imaginations, and their foolish hearts were darkened; and professing themselves to be wise, they became fools." While "the harp and the viol, the tabret, the pipe, and the wine were in their feasts, they regarded not the works of the

Lord, nor considered the operations of his hands," "Wherefore they were given up by God to indulge" in vile affections, and "to worship and serve the creature rather than the Creator, who is blessed forever." And, even under the Christian dispensation, we have too much reason to fear, that effects somewhat analogous to these have been produced, and a species of mental idolatry practiced by thousands who have professed the religion of Jesus; owing to their inattention to the visible operations of Jehovah, and to their not connecting them with the displays of his character and agency as exhibited in the revelations of his word.

THE THIRD COMMANDMENT.

"Thou shalt not take the name of the Lord thy God in vain."

The name of any person is that which distinguishes him from other individuals. Whatever word is employed to distinguish any object, whether animate or inanimate, is its name. In like manner, the Name of God is that by which he is distinguished from all other beings. It includes those terms which express his nature and character, as *Jehovah*—those titles by which his relation to his creation is designated, as "The Creator of the ends of the earth,—The Father of mercies,—The God of salvation," &c.—the attributes of which he is possessed, as his Eternity, Omnipotence, Holiness, Justice, &c.—the works which he has exhibited in heaven and on earth—the movements of his Providence, and the Revelations of his word. By every one of these, the character of God is distinguished from that of all other beings in the universe. In relation to this name or character of the Divine Being, it is solemnly commanded that "we are not to take it in vain,"—that is, we are not to use any of the titles or designations of the Divine Majesty, for trifling, vain, or evil purposes; nor are we to treat any displays of his character with levity, profaneness, or irreverence.

We violate this command, when we use the name of God, in common discourse, in a light and irreverent manner, when we interlard our conversations with unnecessary oaths and asseverations in which this name is introduced; when we swear to what we know to be false, or when we multiply oaths in reference to vain and trifling concerns; when we imprecate curses and damnation on our fellow-creatures; when we approach God in prayer, without those feelings of reverence and awe, which his perfections demand; when we swear by any object in heaven or in earth, or by the false deities of the heathen world; when we treat his wonderful works with indifference or contempt; when we endeavor to caricature, and misrepresent them, or attempt to throw a veil over their glory; when we insinuate that his most glorious and magnificent works were made for no end, or for no end worthy of that infinite wisdom and intelligence by which they were contrived; when we overlook or deny the Divine Agency, which is displayed in the operations of nature; when we murmur and repine at his moral dispensations, or treat the mighty movements of his providence, whether in ancient or in modern times, with a spirit of levity, with ridicule, or with contempt; when we treat the revelations of the Bible with indifference or with scorn; when we make the declarations of that book, which unfolds to us the sublime and adorable character of Jehovah, the subject of merriment and jest; when we en-

* Here I refer simply to the apparent motion of the heavens—leaving every one to form his own opinion as to the other alternative—the motion of the earth. In either case the mind is overpowered with ideas of grandeur and of Almighty power. See this topic more particularly illustrated in "Christ. Philosopher."

deavor to throw upon them contempt and ridicule, with the view of undermining their divine authority; and when we sneer at the public and private worship of God, and at the ordinances which he hath appointed.—In all these and many other ways, the name of God is profaned, his character reproached, and that *reverence* of the Divine Being, which is the foundation of all religion and moral order, undermined and subverted.

When the name or the titles by which a fellow-mortal is distinguished, are made the subject of banter and ridicule in every company, when they are brought forward for the purpose of giving an edge to a sarcastic sneer; and when his employments and the works he has constructed are contemned, and associated with everything that is mean and degrading; it is an evidence of the low estimation in which he is held by the individual who does so, and has a tendency to debase his character in the eyes of others. On the same principle, the profanation of the name of God, has an evident tendency to lessen our admiration of the Majesty of Heaven, and to banish from the mind every sentiment of veneration and reverence. The man who can deliberately violate this command, from day to day,—thus offering a continual insult to his Maker—proclaims to all around, that he has no emotions of reverence and affection toward that Almighty Being, whose power upholds the fabric of heaven and earth, and who dispenses life and death to whomsoever he pleases. "He stretcheth out his hand against God, and strengtheneth himself against the Almighty." He proclaims to every reflecting mind, that pride, enmity, rebellion, and irreverence, are deeply seated in his heart, and that "the fear of God," and the solemnities of a future judgment "are not before his eyes."

Were the violation of this law to become *universal* among men—the name of God, among all ranks, ages, and conditions of life, would be associated, not only with every trifling discourse and altercation, but with every species of ribaldry and obscenity. The lisping babe would be taught to insult that Mighty Being, from whom it so lately derived its existence; and the man of hoary hairs, even in the agonies of death, would pass into the eternal state, imprecating the vengeance of his Maker. All reverence for Jehovah, would, of course, be banished from society; no temples would be erected to his honor; no silent adorations of the heart would ascend to his throne; no vows would be paid; no forms of worship appointed; no tribute of thanksgiving and gratitude would be offered to his name,—but the voice of profanity and of execration, among high and low, rich and poor, the young and the old, in every social intercourse, and in every transaction, would resound throughout all lands. No motives to excite to moral action, would be derived from the authority and the omnipresence of God, and from a consideration of his future retributions; for his character would be reproached, and his authority trampled under foot by all people. "They would set their mouths against the heavens in their blasphemous talk," and they would say, "How doth God know, and is there knowledge in the Most High?" "What is the Almighty that we should serve him, and what profit shall we have, if we pray unto him?" "The Lord doth not see, neither doth the God of Jacob regard us." His wonderful works would either be overlooked, or treated with contempt, or ascribed to the blind operation of chance or of fate. They would be represented as accom-

plishing no end, as displaying no wisdom, and as controlled by no intelligent agency. Their *apparent* irregularities and defects would be magnified, and expatiated upon with diabolical delight; while the glorious evidences they exhibit of infinite wisdom and beneficence would be thrown completely into the shade. The dispensations of his providence would be viewed as an inextricable maze, without order or design, directed by chance, and by the ever-varying caprice of human beings. His venerable word would universally become the subject of merriment and laughter,—a topic for the exercise of ribaldry and ridicule, and a theme for enlivening the unhallowed song of the drunkard. The most solemn scenes which it displays, and its most joyful and alarming declarations, would be equally treated with levity and contempt. Such are some of the impious practices, and horrible effects which would follow, if the name of Jehovah were universally profaned. The very name of religion would be blotted out from the earth, its forms abolished, its sanctions disregarded, its laws violated, virtue and piety annihilated, the flood-gates of every evil burst open, and moral order entirely subverted.

On the other hand, universal reverence of the name and character of God would lead to the practice of all the duties of piety and morality. The Most High would be recognized with sentiments of veneration at all times; and the silent adorations of the heart would flow out toward him in all places; in the house, and in the street, in the bosom of the forest, and in the fertile plain, in the city, and in the wilderness, under the shades of night, and amidst the splendors of day. In every place, temples would be erected for his worship, hallelujahs of praise would ascend, and "incense and a pure offering" be presented to his name. With reverence and godly fear, with expansive views of his magnificence and glory, with emotions of affection and of awe would his worshippers approach him in prayer, in praise, in contemplation, and in all the services of his sanctuary. The whole earth would be consecrated as one grand temple, from which a grateful homage would ascend from the hearts and from the lips of millions of devout worshippers, in all places, from the rising to the setting sun. In the domestic circle, in the social club, in the convivial meeting, in the streets, in "the high places of the city," in the public walks, in the councils of the nations, and in every other intercourse of human beings, the name of God would never be mentioned nor his character alluded to, but with feelings of profound and reverential awe. His works would be contemplated with admiration, with reverence, and with gratitude, as proclaiming the glory of his kingdom, the depths of his wisdom, and the extent of his power. His mighty movements among the nations would be regarded with submission and reverence, as accomplishing the eternal purposes of his will, and his holy word would be perused by all classes of men with affection and delight, as the oracle which proclaims the glories of his nature and the excellence of his laws, the blessings of his salvation, and the path which conducts to eternal felicity in the life to come. Such are some of the delightful effects which would follow, were a sentiment of profound reverence to pervade the whole mass of human beings;—and corresponding sentiments of love and affection for each other, would be the necessary and unceasing accompaniments of respect and veneration for their common Parent.

THE FOURTH COMMANDMENT.

"Remember the Sabbath day, to keep it holy. Six days shalt thou labor, and do all thy work; but the seventh day is the Sabbath of the Lord thy God," &c.

This commandment obviously enjoins the setting apart of one day in seven, as a day of rest from worldly labor, and as a portion of time to be devoted to the devotional exercises of religion, and particularly to the public worship of God. It was given forth, not merely to display the Sovereignty of the Lawgiver; but to promote both the sensitive and the intellectual enjoyment of man. "The Sabbath," says our Saviour, "was made for man, and not man for the Sabbath."

It was made for man, in the *first* place, as a *day of rest*. In this point of view, it is a most wise and merciful appointment, especially when we consider the present condition of mankind, as doomed to labor, and toil, and to the endurance of many sorrows. When we reflect on the tyrannical dispositions which prevail among mankind, on the powerful influence of avarice over the human mind, and on the almost total absence of benevolence and compassion toward suffering humanity, wherever such dispositions predominate, we cannot but admire the wisdom and benevolence of the Creator, in the appointment of a weekly jubilee for the rest and refreshment of laborers spent with toil. On this day, the master has an opportunity of divesting his mind of worldly cares and anxieties, the servant of obtaining liberty and respite from his toilsome employments; and laborers of every class, of enjoying repose in the bosom of their families. Such, however, are the avaricious dispositions, and the contracted views of a great proportion of mankind, that they are apt to regard the institution of the Sabbath as an obstruction to the advancement of their worldly interests. They will calculate how much labor has been lost by the rest of one day in seven, and how much wealth might have been gained, had the Sabbath not intervened to interrupt their employments. But all such selfish calculations, even in a worldly point of view, proceed on the principles of a narrow and short-sighted policy. We know by experience, that, on the six days out of seven appointed for labor, all the operations requisite for the cultivation of the fields, and for the manufacture of every useful article for the comfort of mankind, can be performed with ease, and without the least injury to any class of men. And what more could be accomplished, although the Sabbath were converted into a day of labor? Were this violation of the divine command to become universal, it might be shown that, instead of producing an increase of wealth, it would infallibly produce an increase of toil and misery in relation to the great mass of mankind, without any corresponding pecuniary compensation. The laboring class at present receive little more wages than is barely sufficient to procure the necessities of life. If their physical strength would permit them to work eighteen hours a day, instead of twelve, it is beyond a doubt, that, in a very short time, the work of eighteen hours would be demanded by their employers for the price of twelve—particularly in all cases where a sufficient number of laborers can be easily obtained. In like manner, were the Sabbath to be used as a day of labor, the wages of seven days would soon be reduced to what is now given for the labor of six. In the first instance, indeed, before such a change was thoroughly effected, the laboring part of the community would

acquire a seventh part more wages every week than they did before; and men unaccustomed to reflection, and who never look beyond a present temporary advantage, would imagine that they had acquired a new resource for increasing their worldly gain. But, in a very short time, when the affairs of the social state were brought to a certain equilibrium, they would be miserably undeceived; and the abolition of the Sabbath, instead of bringing along with it an increase of wealth, would carry in its train an increase of labor,—a continued series of toilsome and unrelenting exertions, which would waste their animal powers, cut short the years of their mortal existences, "make their lives bitter with hard bondage," and deprive them of some of the sweetest enjoyments which they now possess.

And as the Sabbath was appointed for the rest of *man*, so it was also intended as a season of repose for the *inferior animals* which labor for our profit. "The seventh day is the Sabbath of the Lord thy God; in it thou shalt not do any work, thou, nor thy son, nor thy daughter, thy manservant, nor thy maid-servant, *nor thy cattle*, nor the stranger that is within thy gates." This injunction exhibits the compassionate care and tenderness of the Creator in a very amiable and impressive point of view. It shows us, that the enjoyments of the lowest ranks of sensitive existence are not beneath his notice and regard. As he knew what degree of relaxation was necessary for the comfort of the laboring animals, and as he foresaw that the avarice and cruelty of man would endeavor to deprive them of their due repose, so he has secured to them, by a law which is to continue in force so long as the earth endures, the rest of one day in seven in common with their proprietors and superiors. And this privilege they will undoubtedly enjoy hereafter, in a more eminent degree than they have yet done, when man himself shall be induced to pay a more cordial and unreserved obedience to this divine precept,—when "he shall call the Sabbath a delight, and the holy of the Lord honorable."

Again, the Sabbath was appointed for man, as a *season for pious recollection, and religious contemplation*. "Remember the Sabbath day, to keep it holy." Amidst the numerous cares and laborious employments of human life, it is impossible to fix the mind, for any length of time, on the divine glory, as displayed in the works of creation, on the important facts and doctrines of revealed religion, and on the grand realities of the life to come. And, therefore, if the laboring classes enjoyed no regular season of repose for serious reflection, and religious instruction, the objects of religion would soon be entirely neglected, and the impression of a future world vanish from the mind. But in the wise arrangements of the beneficent Creator, an opportunity is afforded to all ranks of men for cultivating their moral and intellectual powers, and for directing them to the study and contemplation of the most glorious and interesting objects. As the Sabbath was originally instituted as a sacred memorial of the finishing of the work of creation, so it is obvious that the contemplation of the fabric of the universe, and of the perfections of its Almighty Author therein displayed, ought to form one part of the exercises of this holy day; and consequently, that illustrations of this subject ought to be frequently brought before the view of the mind in those discourses which are delivered in the assemblies of the saints. Since the references to this subject, throughout the whole of divine revelation, are so frequent and so explicit, it is evident,

that the Creator intended that this amazing work of his should be contemplated with admiration, and make a deep and reverential impression upon every mind. To call to remembrance a period when there was no terraqueous globe, no sun, nor moon, nor planets, nor starry firmament, when darkness and inanity reigned throughout the infinite void—to listen to the voice of God resounding through the regions of boundless space, “*LET THERE BE LIGHT*; and light was”—to behold ten thousands of spacious suns instantly lighted up at his command—to trace the mighty masses of the planetary worlds projected from the hand of Omnipotence, and running their ample circuits with a rapidity which overwhelms our conceptions—to contemplate the globe on which we stand emerging from darkness and confusion to light and order; adorned with diversified scenes of beauty and of sublimity, with mountains, and plains, with rivers, and seas, and oceans; and with every variety of shade and color; cheered with the melody of the feathered songsters, and with the voice of man, the image of his Maker, where a little before eternal silence had prevailed,—to reflect on the Almighty energy, the boundless intelligence, and the overflowing beneficence displayed in this amazing scene—has a tendency to elevate and expand the faculties of the human mind, and to excite emotions of reverence and adoration of the omnipotent Creator. This is a work which the eternal Jehovah evidently intended to be held in everlasting remembrance, by man on earth, and by all the inhabitants of the heavenly regions. It is the mirror of the Deity, and the natural image of the invisible God; and it forms the *groundwork* of all those moral dispensations toward his intelligent offspring, which will run parallel with eternity itself. And, therefore, to overlook this subject in the exercises of the Sabbath, is to throw a veil over the glories of the Deity, to disregard the admonitions of his word, and to condemn one of the most magnificent and astonishing displays of Divine perfection. “By the word of Jehovah were the heavens made, and all the host of them, by the breath of his mouth. He gathereth the waters of the sea together as a heap, he layeth up the depth in storehouses. Let all the earth fear the Lord; let all the inhabitants of the world stand in awe of him. For he spake, and it was done, he commanded, and it stood fast.”

This is a command which never was abrogated, and which never can be abrogated in relation to any intelligent beings, so long as the Creator exists, and so long as the universe remains as a memorial of his power and intelligence. Those sacred songs which are recorded in Scripture for directing the train of our devotional exercises, are full of this subject, and contain specimens of elevated sentiments, of sublime devotion, incomparably superior to what is to be found in any other record, whether ancient or modern.* But man, whose unhallowed hand pollutes and degrades every portion of revelation which he attempts to improve, has either endeavored to set aside the literal and sublime references of these divine compositions, or to substitute in their place the vague and extravagant fancies of weak and injudicious minds, for directing the devotional exercises of Christian churches.† As the book

of God is the only correct standard of religious worship, so our devotional exercises both in public and in private, ought to be chiefly, if not solely, directed by the examples of devotion contained in the inspired writings, which are calculated to regulate and enliven the pious exercises of men of every age and of every clime.

But, the celebration of the work of creation is not the only, nor the principal exercise to which we are called on the Christian Sabbath. Had man continued in primeval innocence, this would probably have constituted his chief employment. But he is now called to celebrate, in conjunction with this exercise, a most glorious deliverance from sin and misery, effected by the Redeemer of mankind. And, for this reason, the Sabbath has been changed from the seventh to the *first* day of the week, in memorial of the resurrection of Christ, when he was “declared to be the Son of God with power.” In this deliverance, as in the first creation, a variety of the grandest and most interesting objects is presented to our view:—The Son of God manifested in the flesh—the moral image of the invisible Creator embodied in a human form, displaying every heavenly disposition, and every divine virtue, performing a series of the most astonishing and beneficent miracles, giving sight to the blind, and hearing to the deaf, making the lame man leap as a hart, and the tongue of the dumb to sing, restoring the infuriated maniac to the exercise of reason, commanding diseases to fly at the signal of a touch, recalling departed spirits from the invisible world, raising the dead to life, and, on every occasion, imparting heavenly instructions to attending multitudes. We behold this illustrious personage suspended on the cross, encompassed with the waters of affliction, and with the agonies of death; the veil of the temple rent in twain, from the top to the bottom—the rocks of mount Calvary rent asunder—the sun covered with blackness—darkness surrounding the whole land of Judea—the graves opening—the dead arising, and the Prince of Life consigned to the mansions of the tomb. On the third morning after this solemn scene, “a great earthquake” having shaken the sepulcher of the Saviour, we behold him bursting the prison-doors of the tomb, and awakening to a new life, which shall never end—we behold celestial messengers, in resplendent forms, descending from the ethereal regions to announce to his disconsolate disciples, that he who was dead “is alive, and lives for evermore;” we behold him, at length, bestowing his

sentiments, and extravagant fancies, while they entirely omit many of those subjects on which the inspired writers delight to expatiate. This position could easily be illustrated by abundance of examples, were it expedient in this place. I am firmly of opinion, that the praises of the Christian church ought to be celebrated in *Scripture-language*—that selections for this purpose should be made from the book of Psalms, the Prophets, and the New Testament writers, which shall embody every sentiment expressed in the original, without gloss or comment, and be as nearly as possible in the very words of Scripture. This has been partly effected in many of the Psalms contained in metrical version, used in the Scottish Church, in which simplicity, and sublimity, and a strict adherence to the original, are beautifully exemplified. In this case there would be no need for a separate hymn-book for Baptists, Methodists, Independents, Presbyterians, and Episcopalians. But, when a poet takes an insulated passage of Scripture, and spins out a dozen stanzas about it, he may interweave, and most frequently does, as many fancies of his own as he pleases. Were the ideas contained in certain hymns to be painted on canvass, they would represent, either a congeries of clouds and mists, or a group of distorted and unnatural objects. And why should such vague fancies, and injudicious representations, be imposed on a Christian assembly? What a disgrace is thrown upon Christianity, when the different sects of Christians cannot cordially join together in the *same* songs of thanksgiving and praise to their common Father and Lord?

* See particularly Psalms 8, 18, 19, 29, 33, 65, 66, 68, 74, 89, 92, 93, 94, 95, 96, 100, 104, 107, 111, 135, 136, 139, 145, 146, 147, 148, &c. &c.

† I here allude to several collections of *Hymns* which have been introduced into the public worship of Christian societies—many of which, contain a number of vague and injudicious

last benediction on his faithful followers, rising above the confines of this earthly ball, winging his way on a resplendent cloud, attended by myriads of angels, through distant regions which "eye hath not seen;" and entering "into heaven itself, there to appear in the presence of God for us." In the redemption achieved by this glorious person, we are directed to look back on that scene of misery in which sin has involved the human race, and to those "regions of sorrow and doleful shades," from which his mercy has delivered us; and to look forward to a complete deliverance from moral evil, to a resurrection from the grave, to a general assembly of the whole race of Adam—to the destruction and renovation of this vast globe on which we dwell, and to the enjoyment of uninterrupted felicity, in brighter regions, while countless ages roll away.—Such are some of the sublime and interesting objects which we are called upon to contemplate and to celebrate on the day appointed for the Christian Sabbath—objects which have a tendency to inspire the mind with sacred joy, and with an anticipation of noble employments in the life to come.

Again, the Sabbath was appointed as a stated season for the public worship of God. As mankind are connected by innumerable ties, as they are subject to the same wants and infirmities, are exposed to the same sorrows and afflictions, and stand in need of the same blessings from God,—it is highly reasonable and becoming, that they should frequently meet together, to offer up in unison their thanksgiving and praise to their common Benefactor, and to supplicate the throne of his mercy. These exercises are connected with a variety of interesting and important associations. In the public assemblies where religious worship is performed, "the rich and the poor meet together." Within the same walls, those who would never have met in any other circumstances, are placed exactly in the same situation before Him in whose presence all earthly distinctions vanish, and who is the Lord, and "the Maker of them all." Here, pride and haughtiness are abased; all are placed on the same level as sinners before Him "who is of purer eyes than to behold iniquity;" the loftiness of man is humbled, the poor are raised from the dust, and the Lord alone is exalted in the courts of his holiness. Here, cleanliness and decency of apparel are to be seen, and human nature appears, both in its physical and its moral grandeur.* Here, civility of deportment, and kindly affections are generally displayed. Here, we feel ourselves in the immediate presence of Him before whom all nations are as the drop of a bucket; we feel our guilty and dependent character, and stand, as suppliants, for mercy to pardon, and for grace to help us in the time of need. Here, knowledge of the most important kind is communicated to assembled multitudes, almost "without money and without price." Here, the poorest beggar, the youth, and the man of hoary hairs, may learn the character of the true God, and of Jesus Christ whom he hath sent—the way to eternal happiness—the sources of consolation under the afflictions of life—and the duties they owe to their Creator, and to all mankind. In a word, here the sinner, in the midst of his unhallowed courses, is aroused to consideration; and here the saint is animated and encouraged in his Christian journey, and enjoys

a foretaste of the blessedness of heaven, and an earnest of the delightful intercourses and employments of "the saints in light."

Let us now suppose, for a moment, that the Sabbath, and its exercises, were *universally abolished* from the civilized world. What would be the consequences? The knowledge of the true God, which the institution of the Sabbath, more than any other mean, has tended to perpetuate, would soon be lost, his worship abandoned, and religion and moral principle buried in the dust. In Pagan countries, where the Sabbath is unknown, the true God is never adored, the soul of man is debased, and prostrates itself before the sun and moon, and even before demons, monsters, insects, reptiles, and blocks of wood and stone. In France, where the Sabbath was for a season abolished, an impious phantom, called the Goddess of Reason, was substituted in the room of the Omnipotent and Eternal God; the Bible was held up to ridicule, and committed to the flames; man was degraded to the level of the brutes; his mind was assimilated to a piece of clay, and the cheering prospects of immortality were transformed into the shades of an eternal night. Atheism, Skepticism, and Fatalism, almost universally prevailed; the laws of morality were trampled under foot; and anarchy, plots, assassinations, massacres, and legalized plunder, became "the order of the day."—With the loss of the knowledge of God, all impressions of the Divine presence, and all sense of accountability for human actions, would be destroyed. The restraints of religion, and the prospect of a future judgment, would no longer deter from the commission of crimes; and nothing but the dread of the dungeon, the gibbet, or the rack, would restrain mankind from the constant perpetration of cruelty, injustice, and deeds of violence. No social prayers, from assembled multitudes, would be offered up to the Father of mercies; no voice of thanksgiving and praise would ascend to the Ruler of the skies; the work of creation, as displaying the perfections of the Deity, would cease to be admired and commemorated; and the movements of Providence, and the glories of redemption, would be overlooked and disregarded. The pursuit of the objects of time and sense, which can be enjoyed only for a few fleeting years, would absorb every faculty of the soul; and the realities of the eternal world would either be forgotten, or regarded as idle dreams. In short, were the Sabbath abolished, or, were the law which enforces its observance to be reversed, man would be doomed to spend his mortal existence in an unbroken series of incessant labor and toil; his mental powers would languish, and his bodily strength would be speedily wasted. Habits of cleanliness, civility of deportment, and decency of apparel, would be disregarded; and the persons, and the habitations of the laboring classes, would soon resemble the filthiness and the wretched objects which are seen in the kraal of a Hottentot. Their minds would neither be cheered with the prospect of seasons of stated repose in this world, nor with the hope of eternal rest and joy in the world to come.

THE FIFTH COMMANDMENT.

"Honor thy Father and thy Mother."

The four preceding commandments, whose importance I have endeavored to illustrate, were written on a separate tablet from those that follow, and have been generally considered as enjoining the practice of *piety*, or those duties

* What a striking contrast, even in a physical point of view, is presented between a modern assembly of Christian worshippers, and the hideous and filthy group of human beings that are to be seen in the kraal of a Hottentot, or in the cave of a New Hollander.

which more immediately respect God as their object. But they also include the duties we owe to *ourselves*; for in yielding obedience to these requirements, we promote our best interests in this world, and are gradually prepared for participating in the enjoyments of the world to come.—These laws are binding upon angels and archangels, and upon every class of intelligent beings, in whatever quarter of the universe their local residence may be found, as well as upon the inhabitants of the earth. The fourth commandment, indeed, in so far as regards the *particular portion of time* to be set apart for the worship of God, may possibly be peculiar to the inhabitants of our world. Even although the inhabitants of such a world as the planet Jupiter were commanded to set apart every seventh natural day for the stated public worship of God, the proportion of absolute time allotted for this purpose, would not be the same as ours; for the natural day in that world is equal to only ten hours of our time. But the spirit of this precept, or, the principle on which it is founded, must be common to all worlds. For we can conceive of no class of intelligent creatures, on whom it is not obligatory to devote a certain portion of time for the social worship and adoration of their Creator, and for commemorating the displays of his Power and Benevolence; and all holy intelligences will cheerfully join in such exercises, and will consider it as a most ennobling and delightful privilege, to engage at stated seasons, along with their fellow-worshippers, in admiring and extolling the Uncreated Source of their enjoyments. But the stated seasons appointed by the Creator for such solemn acts of worship, the manner and circumstances in which they shall be performed, and the number of worshippers that may assemble on such occasions, may be different in different worlds, according to the situations in which they are placed.

The fifth commandment, to which I am now to advert, is one of those moral regulations which may possibly be peculiar to the relations which exist in our world; at least, it cannot be supposed to apply to the inhabitants of any world where the relations of parents and children, of superiors and inferiors, are altogether unknown. But, in the circumstances in which man is placed, it is a law indispensably requisite for preserving the order and happiness of the social system.—It requires the exercise of those dispositions, and the performance of those duties, which are incumbent upon mankind, *in the various relations in which they stand to each other*. It, consequently, includes within its spirit and references, the duties which children owe to their parents, and parents to their children; the duties of husbands and wives, of masters and servants, of teachers and scholars, of brothers and sisters, of the young and the old, and of governors and their subjects; together with all those dispositions of reverence, submission, affection, gratitude, and respect, with which the performance of these duties ought to be accompanied. It must also be considered as forbidding everything that is opposed to these dispositions, and to the obedience required; as contumacy, rebellion, and want of respect, on the part of children toward their parents; disobedience of servants to the reasonable commands of their masters; and every principle of disaffection and of insubordination among the various ranks of society. That all this is included within the range of this precept, might be proved from the principles on which our Saviour explains the *sixth* and *seventh* commandments, in his Sermon on the

Mount, and from the illustrations of these duties which are given in the Apostolic epistles, and in other parts of Scripture.

As it forms no part of my plan, to enter into any particular explanations of the duties required in the Decalogue, which have frequently been expounded by many respectable writers, in works particularly appropriated to this object,—I shall simply illustrate, in a few words, the reasonableness of this, and the following precepts, from a consideration of the effects which would follow, were these laws either universally observed, or universally violated.

Were this law to be reversed, or universally violated, it is impossible to form an adequate conception of the dreadful scene of anarchy and confusion which would immediately ensue. Every social tie would be torn asunder, every relation inverted, every principle of subordination destroyed, every government overturned, every rank and order of mankind annihilated, and the whole assembly of human beings converted into a discordant mass of lawless banditti. Every family would present a scene of riot, confusion, insubordination, contention, hatred, tumult, and incessant execration. Instead of love, peace, unity, and obedience, the son would rise in rebellion against his father, and the father would insult and trample under foot his son. To use the words of our Saviour, "The brother would deliver up the brother to death, and the father the child; and the children would rise up against their parents, and cause them to be put to death; the daughter would be set at variance against her mother, and the daughter-in-law against her mother-in-law; and a man's foes would be they of his own household." Children would be unprovided with proper food, clothing, and instruction, and left to wander, houseless and forlorn, as vagabonds on the face of the earth; and parents, abandoned by their children, in sickness, poverty, and old age, would sink into the grave in wretchedness and despair. The young, instead of "rising up before the hoary head, and honoring the face of the old man," would treat the aged and infirm with every mark of scorn, derision, and contempt; and would feel a diabolical delight in vexing, thwarting, and overpowering their superiors in age and station. No instructions could be communicated by teachers and guardians to the rising generation; for riot, insolence, insult, derision, and contempt, would frustrate every effort to communicate knowledge to a youthful group. No building or other work of art could be commenced with the certain prospect of being ever finished; for its progress would depend upon the whims and humors of the workmen employed, who, of course, would rejoice in endeavoring to frustrate the plans and wishes of their employers. No regular government nor subordination in a large community, could possibly exist; for the great mass of society would endeavor to protect every delinquent, and would form themselves into a league to prevent the execution of the laws.—These effects would inevitably follow, even although the requisition contained in this precept, were to be viewed as confined solely to the reverence and obedience which children owe to their parents. For, were this obedience withdrawn, and an opposite disposition and conduct uniformly manifested, the young would carry the same dispositions which they displayed toward their parents, into all the other scenes and relations of life, and fill the world with anarchy and confusion. But it would be needless to expatiate on this topic, as it appears obvious to the least reflecting

mind, that a universal violation of this law would quite un hinge the whole fabric of society, and would soon put an end to the harmonious intercourse of human beings.

On the other hand, a constant and universal obedience to this precept would produce such effects on the deformed aspect of our world as would transform it into a paradise of moral beauty, of happiness and love. Every family would exhibit a picture of peace and concord, of harmony and affection. No harsh and bitter language, no strifes, nor jars, nor contentions would ever interrupt the delightful flow of reciprocal affection between parents and children. No longer should we behold the little perverse members of the domestic circle, indulging their sulky humors, and endeavoring to thwart the wishes of their superiors, nor the infuriated parent stamping and raging at the obstinacy of his children; nor should we hear the grating sounds of discord, and insubordination which now so frequently issue from the family mansion. Every parental command would be cheerfully and promptly obeyed. Reverence and filial affection would glow in every youthful breast toward the father that begat him, and toward the mother that gave him birth. Their persons, and their characters would be regarded with veneration and respect, and their admonitions submitted to without a murmur or complaint.—To gladden the hearts of their parents, to run at the least signal of their will, to share in their benignant smile or approbation, and to avoid every species of conduct that would produce the least uneasiness or pain—would be the unceasing aim of all the youthful members of the family circle. In sickness, they would smooth their pillows, and alleviate their sorrows, watch like guardian angels around their bed, drop the tear of affection, and pour the balm of consolation into their wounded spirits. In the decline of life, they would minister with tenderness to their support and enjoyment, guide their feeble steps, sympathize with them in their infirmities, cheer and animate their dejected spirits, and render their passage to the tomb smooth and comfortable. And how delighted would every parent feel amidst such displays of tenderness and affection! There is perhaps nothing in the whole range of human enjoyment that creates a higher and more unmingled gratification to parents, than the dutiful and affectionate conduct of their offspring. It sweetens all the bitter ingredients of human life, and adds a relish to all its other comforts and enjoyments. It imparts a continual satisfaction and serenity to the parental breast; it smooths the wrinkles of age; it cheers the spirits under the infirmities of declining nature, and makes the dying bed of old age comfortable and easy. And the joy and satisfaction thus felt by parents would be reflected into the bosom of their children; which would produce a union of interests, a cordiality of affection, and a peace and tranquillity of mind in every member of the family, which no adverse occurrences in future life could ever effectually destroy.

From the family circle the emanations of filial piety would spread and diffuse themselves through all the other departments of society. The same spirit of love and dutiful respect which united and endeared parents to children, and children to parents, would unite one family to another, one village to another, one city to another, one province to another, one kingdom and empire to another, until all the tribes of the human race were united in kindness and affection, as one great and harmonious family. Every dutiful child would

become a faithful and obedient servant, a docile scholar, and a loyal and submissive subject, when placed in those relations; and would prove a blessing and an ornament to every society of which he was a member. And every dutiful and affectionate parent, when placed in the station of a king, or a subordinate ruler, would display a parental affection toward every member of the community over which he was appointed. Hence it might easily be shown, that an uninterrupted and universal observance of this single precept, viewed in all its connections and bearings, would completely regenerate the world—and that the peace, the harmony, and the prosperity of all the nations of the earth, will ultimately depend on the spirit of filial piety being infused into every family. "Honor thy father and thy mother," says the Apostle, "which is the first commandment with promise; *that it may be well with thee, and that thou mayest live long upon the earth.*"—These words, which are frequently repeated in Scripture, are not empty sounds; nor ought they to be deprived, even under the Christian dispensation, of their obvious and literal meaning. Filial piety has a natural tendency to produce health, long life, and prosperity; and could we trace the whole of the secret history of Providence in reference to this precept, we should, doubtless, find this position abundantly exemplified. At any rate, were it universally practiced, it would carry along with it a train of blessings which would convert the tumults and convulsions of nations into peace and tranquillity, and transform the moral wilderness of this world into a scene of verdure, beauty, and loveliness, which would enrapture the mind of every moral intelligence; and among its other benefits, "length of days, and long life and peace," would undoubtedly "be added" to the other enjoyments of mankind.

THE SIXTH COMMANDMENT.

"Thou shalt not kill."

This precept forbids the taking away of the life of sensitive or intelligent existence. The command is *absolute*, without the least exception, as it stands in the Decalogue; and it is *universal*, extending to every rational and moral agent. It implies, that as every sensitive and every intelligent being derived its existence from the omnipotent Creator of heaven and earth, no one has a right to deprive it of that existence, except that Being by whom it was bestowed. And, whatever exceptions to the universality of this law may be admitted, they can be admitted only on the authority of the Lawgiver himself, who is the Original Fountain of existence to all his creatures. The principal exceptions to this law are the following:—1. The man who has violently taken away the life of another is commanded, by the authority of God, to be put to death. "Whoso sheddeth man's blood, by man shall his blood be shed." This is the dictate of reason as well as of revelation; for no human power can recall the departed spirit, or re-animate the lifeless corpse, and no adequate compensation can ever be given for such a crime.* 2. The life of the lower ani-

* Notwithstanding the considerations here stated, the Author is doubtful whether the Creator has conceded to man the right of taking away the life of another, even in case of murder. If the passage here quoted ought to be considered as a *prediction* rather than a law, as is most probable, it will afford no warrant for the destruction of human life; and there is no other injunction of this kind which has any relation to the New Testament dispensation.

imals is permitted by the same authority to be taken away *when these animals are necessary for our food, or when they endanger our existence.* This permission was first granted, immediately after the flood, to Noah and his descendants. "God said to Noah and his sons, everything that moveth shall be meat for you; even as the green herb have I given you all things." Without such a positive grant from the Creator, man could have had no more right to take away the life of an ox or a sheep, than he has to imbrue his hands in the blood, or to feast on the flesh of his fellow-men. To take the life of any sensitive being, and to feed on its flesh, appears incompatible with a state of innocence; and, therefore, no such grant was given to Adam in paradise; nor does it appear that the Antediluvians, notwithstanding their enormous crimes, ever feasted on the flesh of animals. It appears to have been a grant suited only to the degraded state of man after the deluge; and, it is probable, that as he advances in the scale of moral perfection, in the future ages of the world, the use of animal food will be gradually laid aside, and he will return again to the productions of the vegetable kingdom, as the original food of man, and as that which is best suited to the rank of rational and moral intelligence. And, perhaps, it may have an influence, in combination with other favorable circumstances, in promoting health and longevity.—But, although the inferior animals are, in the meantime, subjected to our use, no permission is granted to treat them with harshness or cruelty, or to kill them for the sake of sport and amusement. And, therefore, the man who wantonly takes away the lives of birds, hares, fishes, and other animals, for the mere gratification of a taste for hunting or fishing, can scarcely be exculpated from the charge of a breach of this commandment.

The above are the principal exceptions which the Creator has made in reference to the law under consideration. And it may not be improper to remark, that, beside the direct act of murder, everything that leads to it, or that has a tendency to endanger life, is to be considered as forbidden in this commandment. All unkindness and harsh treatment exercised toward servants, dependents, and brute animals, by which life may be shortened or rendered intolerable—all furious and revengeful passions, which may lead to acts of violence—all quarreling, fighting, and boxing, either for bets, or for the gratification of hatred or revenge—all wishes for the death of others, and all contrivances either direct or indirect to compass the destruction of our neighbor—all criminal negligence by which our own life or the life of others may be endangered or destroyed—and all those actions by which murder may be committed as a probable effect, as the burning of inhabited houses, and of throwing of the instruments of death into the midst of a crowd—are to be regarded as involving the principle of murder, as well as the direct acts of suicide, dueling, and assassination; and, consequently, as violations of that law which extends to the secret purposes of the heart, as well as to the external actions. Even unreasonable anger, malice, and scurrility are declared by our Saviour to be a species of murder: "Whoever is angry with his brother without a cause, shall be in danger of the judgment, and whosoever shall say to his brother, *Raca*," that is, thou worthless empty fellow, "shall be in danger of the council."* Life is desirable only

as it is connected with enjoyment, and, therefore, when a man treats his brother with such a degree of hatred and scurrility, as to render his existence either unpleasant or intolerable, he ought to be ranked among the class of murderers. For the apostle John declares, without the least limitation, that "whosoever hateth his brother is a murderer, and he that loveth not his brother abideth in death." And, if this criterion be admitted, a train of murderers will be found existing in society far more numerous than is generally supposed.

It would be needless to attempt an illustration of the consequences which would ensue, were the breach of this law to become universal. It is obvious, on the slightest reflection, that were this to happen, human society would soon cease to exist. That prophesy which was given forth respecting Ishmael would then receive a most terrible and extensive accomplishment, in the case of every human agent: "His hand shall be against every man, and every man's hand against him." Every man would assume the character of an infernal fiend; every lethal weapon would be prepared and furnished for slaughter; every peaceful pursuit and employment would be instantly abandoned; the voice of wailing and the yells of fury and despair, would be heard in every family, in every village, in every city, in every field, in every kingdom, and in every clime. Every house, every street, every valley, every forest, every river, every mountain, and every continent, would be strewn with fearful devastation, and with the mangled carcasses of the slain. The work of destruction would go on with dreadful rapidity, until the whole race of man were extirpated from the earth, leaving this vast globe a scene of solitude and desolation, an immense sepulcher, and a spectacle of horror to all superior intelligences.—And, let it be remembered, that such a picture, horrible and revolting as it is, is nothing more than what would be the *natural result* of the principle of *hatred*, were it left to its native energies, and were it not controlled, in the course of providence, by him who sets restraining bounds to the wrath of man.

In order to counteract the tendencies of this baleful principle, it is of the utmost importance that youth be trained up in habits of kindness, tenderness, and compassion, both toward human beings, and toward the inferior animals; that an abhorrence should be excited in their minds of quarreling, fighting, and all mischievous tricks and actions; that they be restrained from the indulgence of malicious and resentful passions; that every indication of a cruel and unfeeling disposition be carefully counteracted; and that every tendency of the heart toward the benevolent affections, and every principle of active beneficence be cultivated and cherished with the most sedulous care and attention. For, in youth, the foundation has generally been laid of those malevolent principles and passions which have led to robbery, assassination, and deeds of violence,—which have filled the earth with blood and carnage; and which have displayed their diabolical energy in so dreadful a manner amidst the contests of communities and nations.

Were the disposition to indulge hatred, which leads to every species of murder, completely

* Math. v. 22. Christ, in this passage, refers to a court among the Jews, composed of *twenty-three men*, wherein

capital sentences might be passed, on which the malefactor might be strangled or beheaded: this was called the *Judgment*. But the Sanhedrim, or *Council*, was the supreme Jewish court, consisting of *seventy-two*; in which the highest crimes were tried, which they, and they alone, punished with *stoning*, which was considered a more terrible death than the former.

counteracted, the greatest proportion of those evils which now afflict our world, would cease to exist. Human sacrifices would no longer bleed upon Pagan altars; the American Indians would no longer torture to death their prisoners taken in war, nor the New Zealanders feast upon the flesh and the blood of their enemies. The widows of Hindostan would no longer be urged to burn themselves alive on the corpses of their deceased husbands; nor would the mothers of China imbrue their hands in the blood of their infant offspring. The practice of *Duelling* would forever cease, and would be universally execrated as an outrage on common sense, and on every generous and humane feeling, and as the silly attempt of a puny mortal to gratify wounded pride or disappointed ambition, at the expense of the life of his fellow-creature. Despotism would throw aside its iron scepter, and the nations would be ruled with the law of love; and plots, conspiracies, treasons, and massacres would be attempted no more. The fires of the Inquisition would cease to be kindled, the supposed heretic would no longer be consigned to the horrors of a gloomy dungeon, racks and gibbets and guillotines would be shivered to pieces and thrown into the flames, and the spirit of cruelty and persecution would be extirpated from the earth. Riot, tumult, and contention would be banished from our streets, and harmony and concord would prevail throughout all our borders. War would forever cease to desolate the nations; the confused noise of invading armies, the sounds of martial music, the groans of dying victims, and the hoarse shouts of conquerors, would be heard no more. Peace would descend from heaven to dwell with man on earth; prosperity would follow in her train, science would enlarge its boundaries and shed its benign influence upon all ranks; the useful arts would flourish and advance toward perfection; philanthropy would diffuse its thousand blessings in every direction, and every man would sit "under his vine and fig-tree" in perfect security from all danger or annoyance.

SEVENTH COMMANDMENT.

"Thou shalt not commit adultery."

This commandment is to be viewed as comprehending within its prohibition, every species of lewdness, both in thought, word, and action; as adultery, fornication, incest, polygamy, &c.; and likewise all those licentious desires and affections from which such actions proceed. In this comprehensive sense it is explained by our Saviour, in his Sermon on the Mount, and by the Apostles, in their letters to the Christian Churches. It is founded on the distinction of sexes which exists among mankind, and on the law of Marriage, which was promulgated immediately after the creation of the first pair—a law which was intended to limit, and to regulate the intercourse of the sexes; and to promote purity, affection, and order, among the several generations of mankind. By this law the marriage union is limited to two individuals. He who made mankind at the beginning, says Christ, made them male and female, and said, "For this cause shall a man leave father and mother and shall cleave to his wife; and they twain shall be one flesh." And, it might easily be shown, from an induction of facts, and from a consideration of the present circumstances of the human race, that this law, and this alone, is calculated to promote the mutual affection of the married pair, and to secure the peace and happiness of families, and the harmony of general so-

ciety. By this law the union is made *permanent*, so long as the parties exist in this world. "What God hath joined, let no man put asunder." This regulation has a tendency to promote union of affection and interests, and to induce the parties to bear with patience the occasional inconveniences and contentions which may arise. Were divorces generally permitted, on the ground of unsuitableness of temper, or occasional jars, society would soon be shaken to its center. Every real or supposed insult, or provocation, would be followed out, until it terminated in the separation of the parties; families would thus be torn into shreds; the education of the young would be neglected; parental authority disregarded; and a door opened for the prevalence of unbounded licentiousness. Soon after the commencement of the Revolution in France, a law, permitting divorces, was passed by the National Assembly; and, in less than three months from its date, nearly as many divorces as marriages were registered in the city of Paris. In the whole kingdom, within the space of eighteen months, upward of twenty thousand divorces were effected; and the nation sunk into a state of moral degradation, from the effects of which it has never yet recovered. This is one of the many practical proofs presented before us, of the danger of infringing on any of the moral arrangements which the Creator has established.

The precept under consideration is to be considered as directly opposed to all promiscuous and licentious intercourse between the sexes. And the reasonableness of this prohibition will appear, if we consider, for a moment, what would be the consequences which would inevitably follow were this law to be set aside, or universally violated. A scene of unbounded licentiousness would ensue, which would degrade the human character, which would destroy almost all the existing relations of society, and unhinge the whole fabric of the moral world.—One end of the institution of marriage was to "replenish the earth" with inhabitants, to perpetuate the successive generations of men, and to train up a virtuous and intelligent race to people the congregation of the heavens. But this end would be ultimately frustrated, were a promiscuous and unlimited intercourse to become either general or universal. For, it has been found, that, wherever such intercourse partially prevails, it strikes at the root of human existence, and has a tendency to prevent the operation of that law which the Creator impressed on all living beings, "Increase and multiply." In the haunts of licentiousness, in large cities, and in all such societies as those which formerly existed in Otaheite, under the name of *Arreej*, the laws of nature are violated, the course of generation obstructed, and numbers of human beings strangled at the very porch of existence. So that were mankind at large to relapse into such licentious practices, the human race, instead of increasing in number, to replenish the desolate wastes of our globe, according to the Creator's intention, would rapidly decrease every succeeding generation, until after the lapse of a few centuries, human beings would be entirely extirpated, and the earth, barren and uncultivated, would be left to the dominion of the beasts of the forest.

But, although such a distant event were to be altogether disregarded, the immediate consequences of such unhallowed courses would be dismal in the extreme. That union of heart, affection, and of interests, which subsists between the great majority of married pairs, and those reciprocal sympathies and endearments which flow from this union, would be altogether unknown

The female sex (as already happens in some nations), with minds uncultivated and unpolished, would be degraded into mere instruments of sensitive enjoyment, into household slaves, or into something analogous to beasts of burden, and would be bought and sold like cattle and horses. The minds of all would be degraded to the level of brutes, and would be incapable of prosecuting either rational or religious pursuits. Their bodies would be wasted and enfeebled with squalid disease: the infirmities of a premature old age would seize upon them; and before they had "lived half their days," they would sink into the grave in hopelessness and sorrow. A universal sottishness and disregard of everything except present sensual enjoyment, would seize upon the whole mass of society, and benumb the human faculties: the God of heaven would be overlooked, and the important realities of an immortal existence completely banished from their thoughts and affections. Thousands, and ten thousands of infants would be strangled at their entrance into life; and the greater part of those who were spared, would be doomed to a wretched and precarious existence. The training up of the youthful mind to knowledge and virtue would be quite neglected; and all that civility and softness of manners, which are now acquired under the eye of parental authority and affection, would be unknown in society. The endearing relations of father and mother, of brothers and sisters, of uncles, aunts, and cousins, and all the other ramifications of kindred, which now produce so many interesting and delightful associations, would fail to be recognized among men; for in such a state of society, the natural relations of mankind would be either disregarded, or blended in undistinguishable confusion.

Children, neglected or abandoned by their mothers, would be left to the full influence of their own wayward and impetuous passions; they would depend for subsistence, either on accident, on pilfering, or on the tender mercies of general society; they would wander about as vagabonds, tattered and forlorn; their hearts shriveled with unkindness, their bodies chilled with the rains and biting frosts, and deformed with filthiness and disease. They would be left to perish in the open fields, without a friend to close their eyes; and their bodies, unnoticed and unknown, would remain as a prey, to be devoured by the fowls of heaven. In every land would be seen multitudes of houseless and shivering females, set adrift by their seducers, wandering with their hungry and half famished offspring, the objects of derision and contempt; and imploring, in vain, the comforts of food, of shelter, and protection. For, among human beings, in such a degraded state, the kindly and benevolent affections would seldom be exercised; cold-blooded selfishness and apathy, in relation to the sufferings of others, would supplant all the finer feelings of humanity; which would dispose them to view the wretched objects around them with perfect indifference, and even with contempt. "However it may be accounted for," says Dr. Puley, "the criminal commerce of the sexes corrupts and depraves the mind, and the moral character, more than any single species of vice whatsoever. That ready perception of guilt, that prompt and decisive resolution against it, which constitutes a virtuous character, is seldom found in persons addicted to these indulgences. They prepare an easy admission for every sin that seeks it; are, in low life, usually the first stage in men's progress to the most desperate villainies; and, in high life, to that lamented dissoluteness of prin-

ciple which manifests itself in a profligacy of public conduct, and a contempt of the obligations of religion and of moral probity. Add to this, that habits of libertinism incapacitate and indispose the mind for all intellectual, moral, and religious pleasures."*

In short, in such a state of society as would inevitably accompany a general violation of the seventh precept of the moral law, all the softness and loveliness of filial piety, of parental affection, of brotherly attachment, and of the intercourse of kindred, would forever cease; science and literature would be neglected; and churches, colleges, schools, and academies would crumble into ruins: a sufficient stimulus would be wanting to the exercise of industry and economy; a lazy apathy would seize upon the mass of society; the earth would cease to be cultivated, and would soon be covered with briars and thorns, or changed into the barren wastes of an African desert. The foundation of all regular government would be undermined; for it is chiefly in those habits of submission and obedience which are acquired under the domestic roof, that the foundations are laid of that subordination which is necessary to secure the peace and order of mankind. Society would, consequently, be thrown into a state of disorder, and would speedily sink into oblivion, in the mire of its own pollution.

The positions now stated could be illustrated, were it expedient, by a variety of melancholy facts, borrowed from the history and the present state, both of savage and of civilized nations. The annals of Turkey, of Persia, of Hindostan, of China, of Japan, of the Society Isles, and even of the civilized nations of Europe and America, would furnish abundance of impressive facts, to demonstrate the demoralizing, and brutalizing, and miserable effects which would flow from a spirit of universal licentiousness.—What revolting scenes would open to view, were we to survey the haunts of licentiousness which abound in Algiers, in Constantinople, in Teheran, in Peking, in Canton, in Jeddo, and other populous cities, where the restraints of Christianity are altogether unknown! In such receptacles of impurity, every moral feeling is blunted, and every moral principle abandoned. Impiety, profanity, falsehood, treachery, perjury, and drunkenness, rear their unblushing fronts; and thefts, robberies, and murders, follow in their train. The unhappy female who enters these antechambers of hell, is, for the most part, cut off from all hopes of retreat. From that moment, the shades of moral darkness begin to close around her; she bids a last adieu to the smiles of tenderness and sympathy, to the kind embraces of father and mother, of sisters and brothers, to the house of God, to the instructions of his word, and to the society of the faithful. Instead of the cheering sounds of the Gospel of peace, her ears become accustomed to oaths, and curses, and horrid imprecations; the voice of conscience is hushed amidst the din of revelry and riot; every generous feeling is shrunk and withered; she stalks abroad like a painted corpse, to fill with horror the virtuous mind, and to allure the unwary to the shades of death; until at length, wasted with consumption and loathsome disease, she is stretched upon the bed of languishing, abandoned by her former associates, deprived of the least drop of consolation, haunted by the ghastly apparitions of departed joys, and the forebodings of futurity, and sinks, "in the midst of

* Principles of Moral and Political Philosophy, Book III, Part III, chap. 2.

ner days," into the chambers of the grave, without the least hope of a glorious resurrection.—And if we consider, that this is a picture of the wretchedness, not only of a few individuals, but of thousands, of tens of thousands, and of millions of human beings, it is impossible to describe the accumulated mass of misery which impurity has created, or to form any adequate conception of the horrible and revolting scenes of wretchedness which would be displayed, were the law under consideration to be set aside by all the inhabitants of our globe.

There is a certain levity and flippancy of speech in relation to this subject, which prevails among many who wish to be considered as respectable characters, which proceeds from a contracted view of the consequences of human actions. They conceive, that no great harm can be done to society, by a few insulated actions of the kind alluded to, especially if they be concealed from general observation; and that the Creator will be disposed to make every allowance for human frailty. But let such remember that, if it were right to violate this, or any other law of the Creator, in one instance, it would be right in a hundred, in a thousand, in a million, and in eight hundred millions of instances: and then all the revolting scenes now described, and thousands of similar effects, of which we cannot at present form a distinct conception, would inevitably take place. And, therefore, every man who, from levity and thoughtlessness, or from a disregard to the laws of heaven, persists in the occasional indulgence of such unhalloved gratifications, indulges in a practice which, were it universally to prevail, would sap the foundations of all moral order, exterminate the most endearing relations of society, prostrate man below the level of the brute, open the flood-gates of all iniquity, diffuse misery over the whole mass of human beings, and, at length, empty the world of its inhabitants.

The precept which we have now been considering, is one which, in all probability, is confined, in its references, to the inhabitants of our globe. At any rate, it would be quite nugatory, and therefore can have no place, in the moral code of a world where the distinction of sexes does not exist. And even in those worlds where a similar distinction may exist, the very different circumstances in which their inhabitants are placed, may render the promulgation of such a law altogether unnecessary. It appears to be a temporary regulation, to remain in force only during the limited period of the present economy of Providence; for, in the future destination of the righteous, we are told, that "they neither marry nor are given in marriage, but are as the angels of God in heaven." And, therefore, it is probable, that the recognition of such a law will not be necessary, in the intercourse which take place among redeemed men in the eternal world; but the principle on which it is founded, and from which it flows, will run through all the other new relations and circumstances in which they may be placed. In the existing circumstances of mankind, however, the operation of this law is essentially necessary to the stability and the happiness of the moral world; and, were its requisitions universally observed, the melancholy scenes to which I have alluded would no longer exist; the present and everlasting ruin of thousands, and of millions, would be prevented; and a scene of happiness and love, such as the world has never yet witnessed, would be displayed among all the families of the earth.

THE EIGHTH COMMANDMENT.

"Thou shalt not steal."

When the Creator had arranged our globe in the form in which we now behold it, he furnished it with everything requisite for the sustenance and accommodation of living beings, and bestowed the whole of its riches and decorations as a free grant to the sons of men. To man he said, "Behold, I have given you every herb bearing seed, which is upon the face of all the earth, and every tree in the which is the fruit of a tree yielding seed; to you it shall be for meat." Ever since the period when this grant was made, God has not left himself without a witness to his benignity, in that he has unceasingly bestowed on mankind "rain from heaven, and fruitful seasons, filling their hearts with food and gladness." The earth has, in every age, brought forth abundance to supply the wants of all the living beings it contains; and there is still ample room on its surface, for the accommodation and support of thousands of millions of the human race, in addition to those which now exist. But mankind have never yet agreed about the division and allotment of this free and ample gift of the Creator; for every one is disposed to think that his share in it is too small, and is continually attempting to make inroads upon the allotment of his neighbors. And to this disposition is to be ascribed more than one half of all the evils which have afflicted the world in every age since the fall of man. To counteract such a propensity in mankind, and to regulate their dispositions and conduct in relation to property, is the great object of this command, "Thou shalt not steal."

To *steal*, is to take the property of others, without their knowledge or consent, and to apply it to our own use. The most flagrant and violent breaches of the law, consist in robbery, house-breaking, pilfering, plunder, and pillage. But it may be violated in a thousand different ways of which human laws seldom take any cognizance. It is violated by every species of fraud by which our neighbor may be injured in his wealth or property. It is violated in the ordinary commerce of mankind, by the use of false weights and measures; by selling deteriorated commodities as if they were sound and good; by depreciating the value of what we wish to buy, and concealing the defects of what we wish to sell; by contracting debts which we have no prospect of discharging, and neglecting to pay them when they are due; by breaches of trust, in the case of servants, guardians, executors, or public officers, embezzling and squandering away the substance of others, or applying it to their own use.—It is also violated by trespassing on the property of others, so as to injure fences, gardens, orchards, plantations or cornfields; and by that disposition to vulgar mischief which delights in breaking lamps, windows, and fences; in injuring and defacing public buildings, walks, and ornamental improvements; in hacking and carving walls, wainscoting, doors, and balustrades; and in cutting down trees and shrubs planted for use or for ornament.—It is violated when we retain borrowed articles beyond a reasonable time, when we suffer them to be injured through negligence, when we circulate them from one person to another, without the knowledge or consent of the proprietors, and when we apply them to purposes for which they were never intended, and which the lender never contemplated. In short, this law is violated by every species of idleness, pride, vanity, gaming, and prodigality, which has a tendency to injure the external pros-

perity, either of our own family, or of the families of others.

Were the law which forbids those actions to be entirely set aside, or universally violated, it is easy to foresee, that, in a very short time, the whole assemblage of human beings would be transformed into a set of lawless banditti. Peace, harmony, and good neighborhood, would be unknown among men; the strong would plunder the possessions of the weak, and deprive them of every enjoyment; children would rob their parents, and parents their children; brothers would plunder brothers, and servants their masters; buying and selling would cease, and all regular trade and commerce would be destroyed: every man's covetous eye would be directed to the wealth and property of his neighbor, with a view of depriving him of his enjoyments; and a thousand schemes, either of treachery or of open violence, would be contrived to effectuate his purpose. Murders would be daily contrived and perpetrated, for the purpose of more easily obtaining possession of the wealth and estates of the powerful and the opulent; and every man's life and happiness would be at the mercy of his covetous neighbor. The inhabitants of one province would rise up against those of another, and, by force of arms, plunder them of all their earthly treasures. One nation would invade the territories of another, for the purpose of ravaging its cities and provinces, and of appropriating its wealth and riches; and, in the midst of such lawless depredations, towns would be demolished, villages consumed to ashes, the fruits of the earth destroyed, men, women, and children, trampled under foot, and crushed to death, and every city and fertile field would present a scene of carnage and desolation. In such a state of society, no man could have confidence in his brother; fear would be on every side; uncertainty would attend every pursuit and possession; of the wealth which any one had acquired, and of the enjoyments which he possessed to-day, he might be deprived before to-morrow; and if, by means of circumspection and vigilance, and the strong arm of power, he were enabled to maintain possession of his property for one year, he could have no rational ground to expect, that he would enjoy it in security for another. And, as no one would think of engaging in regular labor, while he could subsist in plundering his weaker neighbors—the earth would soon be left uncultivated, the useful arts would be abandoned, agricultural industry and improvement would cease, and a universal famine would overspread every land, which would thin the human race, and gradually exterminate them from the face of the earth.

Such scenes of plunder and depredation, have in fact been partially realized in every age and nation of the world, and are still realized, to a certain extent, even in nations which boast of their progress in religion, in civilization, and in science. The annals of the human race contain little more than a number of melancholy records of wholesale robbery, committed by one tribe of human beings upon another. One public robber and desperado has arisen after another, in constant succession, and, at the head of numerous armies, has violated the territories of peaceful industry, demolished the habitations of their unoffending inhabitants, broken down their furniture, and consigned it to the flames; wasted and devoured the fruits of their ground, and plundered them of everything which could render existence desirable. And the inferior ranks of mankind, stimulated by the same principles which actuate their superiors, have supported a system of peculation, of cheat-

ing, of litigation, of injustice, and oppression, which, were it left solely to its own native energies, would soon undermine the foundations of the moral world. That such principles and practices have never yet become universal in their operation, is not owing so much to any deficiency in their malignant tendency, as to the overruling providence of the Moral Governor of the world, who has, by his influence, and his physical arrangements, confined the lawless passions of men within certain bounds, beyond which they cannot pass.

Were a principle of honesty and justice, in regard to property, to pervade the mind of every human being; or in other words, were the law to which I am now adverting universally recognized, a new scene would open upon the moral world, altogether different from what has hitherto been displayed in the transactions of mankind. The iron rod of oppression would be shivered to atoms, and destroying armies would no longer ravage the habitations of men. The crowds of sharpers, cheats, and jockeys, that now stalk through the world, with unblushing fronts, to entrap the unwary, would forever disappear from the world; and impartial justice would reign triumphant over every department of society. No malignant purpose would ever be formed to injure any one in his wealth and property; and all the harassing law-suits and prosecutions, which now distress so many thousands of families, would be swept away. Every loan of money, books, furniture, or utensils, would be returned without injury, and without unnecessary delay; and every debt punctually discharged, according to the nature of the obligation, and at the period at which it was due: Every bargain would be transacted on the principles of immutable justice, and the conditions of every contract faithfully performed: No suspicions of knavery would ever harbor in the breast, nor the least alarm at the possible consequences of any mercantile transaction. Public buildings would be secure from the inroads of the genius of mischief, and gardens and orchards from every wanton depredation. Locks, and bars, and bolts, would no longer be required for securing our substance from the pilferer and the robber; and the iron gratings of a bridewell or a jail, would never again remind us of the dishonesty and the depravity of man. Servants would be universally honest and trustworthy, and the property of their masters would be regarded as a sacred deposit.

And what a happy change would such a state of society introduce among mankind! What a host of cares, anxieties, suspicions, vexations, and perplexities, would be chased away! and what a world of conveniences, and of delightful associations, would thus be created! Every merchant, by marking the price and the quality of each commodity, might leave his goods open to the inspection of the public, and enjoy himself in the bosom of his family, or in active services for the good of the community, without the least risk of loss or of depredations; and every purchaser might depend upon procuring the articles he wanted at their just value. Every traveler would prosecute his journey, either by day or by night, without the least apprehension from sharpers or robbers, and without being harassed by the impositions of inn-keepers, coachmen, carriers, and porters. Every one's mind would be at perfect ease, in regard to his property, whether he were at home or abroad, in health or in sickness; being firmly persuaded that every trust would be faithfully discharged, and every commercial concern fairly and

honorably transacted. Selfishness and rapacity would give place to a spirit of justice, equity, and benevolence; contentions, jockeyings, and altercations would cease; peace and concord would prevail, and righteousness and truth would shed their benign influence over the whole brotherhood of mankind.

THE NINTH COMMANDMENT.

"Thou shalt not bear false witness against thy neighbor."

This command, like most of the others, is expressed in a *negative* form. It is directed against every species of falsehood, and, consequently, must be viewed as inculcating a sacred and universal adherence to truth, in all our thoughts, words, and actions. In the remarks I may throw out in relation to this precept, I shall consider it chiefly in its *positive* form, as commanding an inviolable attachment to *truth*. Truth may be considered in *two* different points of view—*logical* truth, which consists in the *conformity of a proposition or assertion with the actual state of things*; and *moral* truth, which consists in the *agreement of our words and actions with our thoughts*. Logical truth belongs to the *thing* or the fact asserted; moral truth, or what is termed *veracity*, has a reference to the *person* who utters it. In both these respects, truth is of immense importance to all intelligent beings.—The importance of truth and veracity will appear from the following considerations.

In the first place, it is the bond of society, and the foundation of all that confidence and intercourse which subsist among rational beings. By far the greater part of all the knowledge we possess, has been derived from the testimony of others. It is from the communication of others, and from a reliance on their veracity, that those who were never beyond the limits of Great Britain, know that there are such cities as Paris, Vienna, Constantinople, and Cairo; and that there are such countries as Canada, Nova Scotia, Brazil, Peru, Persia, China, and Hindostan. It is from the same source that we have learned the facts of ancient and modern history, and that there once existed such empires as the Greek and Roman, the Persian, Assyrian, and Babylonian. On the same ground, the veracity of others, we confide in all the domestic relations and intercourses of life; and on this ground all the transactions of commercial society, and all the arrangements and operations of government are conducted. On the implied veracity of others, we retire from our employments at certain hours, and sit down to breakfast or dinner; and, on the first day of the week, we assemble in a certain place, at an appointed hour, for religious worship. On this ground, the pupil confides in his teacher, for instruction—the child in his parents, for sustenance, clothing and protection, the master in his servant, for the execution of his orders, and the wife in her husband for provision and support. We confide every moment in the *faithfulness* of the Almighty for the regular return of day and night, of summer and winter, of seed-time and harvest. Could the veracity of God be impeached or rendered liable to suspicion, we should remain in awful suspense, whether another day would again dawn upon the world, or whether the earth would be shattered to pieces, and its fragments dispersed throughout surrounding worlds, before the sun again appeared in the horizon. A Being possessed of boundless knowledge and omnipotence, without

veracity, would be the terror of the whole intelligent universe, and would fill them with universal agitation and alarm.

Again, truth is the foundation of our present comfort and of our future prospects. On the veracity of those illustrious characters that have gone before us, whose declarations were confirmed by signs and miracles, we depend for the hope of forgiveness and acceptance with God, and for those rich sources of consolation which are calculated to support the mind under the afflictions of mortality, and to cheer and animate us in the prospect of a future world. Our hopes of happiness beyond the grave, of the resurrection of our bodies at the termination of the present plan of providence—of the renovation of the physical system of our globe—of a complete restoration to holiness and virtue—of a reunion with departed friends—of associating with virtuous beings of a superior order—of mingling in a happier world with all those illustrious saints who have gone before us—of contemplating the manifestations of Deity on a more extensive scale; and of enjoying unmixed felicity without interruption and without end; depend upon the testimony of the inspired writers, and the light in which we view the truths or declarations which they have recorded. And, therefore, the man who endeavors to undermine the authority of the sacred records, or to distort or misrepresent their meaning by sophistical reasonings, ought to be viewed as a deceiver, and as an enemy to his species, who wishes to deprive his fellow-men of their most substantial enjoyments, and of their most cheering prospects.

Again, truth and veracity are of the utmost importance in relation to the views we ought to take of the character of God. The moral character of the Deity is delineated in the Scriptures, and we are enabled to contemplate this character, in its true light, in so far as we understand and appreciate the delineations of the sacred writers. But his character is also exhibited in the works of creation and providence. Every physical law of nature, every arrangement in the material system, every movement which exists in the boundless universe; every apparent deviation from the general course of nature, as in the case of earthquakes and volcanoes; every event in the history of nations, every fact in relation to the physical and moral condition of the different tribes of the human race, and every arrangement in reference to the lower ranks of animated beings—embodies in it an exhibition of certain aspects of the divine character; and these aspects, if fairly represented, ought to harmonize with the delineations contained in the sacred records. To ascertain such facts as those to which I now allude, requires, in many instances, the exercise of profound reasoning, and of accurate investigation, and that the mind should be free from the influence of prejudice and of every improper bias, and that the facts, when ascertained, be fairly represented, and accurately recorded; otherwise, nothing but a *distorted* view of the divine character will be exhibited to the mind. For example, if the earth be represented as among the largest bodies in nature, and as placed at rest in the center of the universe, and that the sun, moon, and all the other celestial orbs revolve around it every day, and consequently, that the planetary bodies move in orbits which display inextricable confusion—such a representation is not a true exhibition of the God of heaven, but a phantom of our own imagination; and, if carried out to all its legitimate consequences, would involve an impeachment of the wisdom and intelligence of the Deity, and of the sublime

simplicity and order, which characterize his operations in the universe. If the planet Saturn be represented as a globe 900 times larger than the earth, and surrounded with a ring 600,000 miles in circumference, it conveys a very different idea of the majesty of the divine Being who formed it, from what we are led to entertain, when we consider it as only a taper, or a brilliant stud, fixed in the vault of heaven. If the eye of a fly be exhibited as containing ten thousand polished transparent globes, nicely adjusted for the purpose of vision, it displays the character of its Maker in a different light from that in which we might be disposed to view it, when this animal is represented as a nuisance in creation, and designed only to be mangled and tortured by a cruel and unthinking schoolboy.

In some instances the inaccurate statement of a physical fact, or the false coloring put upon it, may have a tendency to endanger the eternal interests of mankind. Mr. Brydone, in his "Tour through Sicily," states, on the authority of a priest, named Recupero, that, in sinking a pit near Jaci, in the neighborhood of Mount Ætna, "they pierced through seven distinct lavas, one under the other, the surfaces of which were parallel, and most of them covered with a bed of thick earth." From suppositions founded on questionable data, he concluded, that "it requires 2000 years or upward to form but a scanty soil on the surface of a lava," and, consequently, that "the eruption which formed the lowest of these lavas, must have flowed from the mountain at least 14000 years ago." This pretended fact was, for a while, triumphantly exhibited by skeptics, as an unanswerable argument against the truth of the Mosaic history; and its publication has, no doubt, tended to stagger weak minds, and to confirm the infidel in his prejudices against the truth of Revelation. But it has been shown by eminent geologists, that the facts alluded to are grossly misstated, and that no vegetable mold exists between these beds of lava; and, consequently, the argument founded upon them goes for nothing. Mr. Brydone himself, in the very same volume in which these pretended facts are stated, before he had advanced twenty pages farther in his account of the regions about Mount Ætna, states a fact which completely overturns all his preceding reasonings and calculations. In describing the country near Hybla, as having been "overwhelmed by the lava of Ætna, and having then become totally barren," he adds, "in a second eruption, by a shower of ashes from the mountain, it soon resumed its ancient beauty and fertility." So that it is here admitted, that, instead of requiring a period of 2000 years, a bed of lava may *speedily* be transformed into a beautiful and fertile region. But even although such facts were fairly represented,—yea, although Mr. Brydone and the Canon Recupero could have proved, to a demonstration, that the strata of the earth is not only fourteen thousand, but fourteen hundred thousand years old, it would not in the least invalidate a single assertion contained in the Mosaic history; for Moses describes only the *arrangement* of the earth into its present form, but nowhere asserts, that the *materials* of which our globe is composed were *created*, or brought out of nothing, at the period at which his history commences. The circumstance, however, to which I have now adverted, shows us of how much importance it is, in many cases, that even a physical fact be fairly stated, as well as the moral facts and the doctrines contained in the Scriptures. For, since every fact in the economy of nature, and in the history of

providence, exhibits a certain portion of the divine character, a very different view of this character will be exhibited, according to the different lights in which we view the divine operations. And, therefore, every one who willfully misrepresents a physical fact or law of nature, is a deceiver, who endeavors to exhibit a distorted view of the character of the Deity. It is nothing less than a man "bearing false witness" against his Maker.

Again, veracity is of infinite importance in reference to our future improvement in the eternal world. In that world, we have every reason to believe our knowledge of the attributes of God will be enlarged, and our views of the range of his operations in creation and providence extended far beyond the limits to which they are now confined. But the Divine Being himself, from the immateriality and immensity of his nature, will remain forever invisible to all finite intelligences; and hence he is described by the Apostle, as "the King Eternal, Immortal, and Invisible, whom no man hath seen or can see." It is, therefore, not only probable, but absolutely certain, that a great portion, perhaps the greatest portion of our knowledge in that state, will be derived from the communications of other intelligences. With intellectual beings of a higher order we shall hold the most intimate converse; for we are informed, that "just men made perfect" will join "the innumerable company of angels." These beings are indued with capacious powers of intellect, and have long been exercising them on the most exalted objects. As messengers from the King of heaven to the inhabitants of the earth, they have frequently winged their way through the celestial regions, and surveyed many of those glorious systems which lie hid from the view of mortals. We have every reason to believe, that they have acquired expansive views of the dispensations of the Almighty, not only in relation to man, but in relation to numerous worlds and intelligences in different provinces of the empire of God. And, therefore, they must be admirably qualified to impart ample stores of information on the sublimest subjects, to the redeemed inhabitants from our world. From the communications of these intelligences we may derive information of the order and arrangements of other systems; of the natural scenery of other worlds; of the different orders of intellectual beings who people them; of the means by which they are carried forward in moral and intellectual improvement; of the most remarkable events which have happened in the course of their history; of the peculiar displays of divine glory that may be made to them, and of the various changes through which they may have passed in the course of the divine dispensations.

But the utility of all such sublime communications, and the delightful transports with which they will be accompanied, will entirely depend upon the immutable *veracity* of those moral intelligences who shall be employed in conveying information respecting the divine plans and operations. No *fictitious* scenes and narrations will be invented, as in our degenerate world, to astonish a gaping crowd; nothing but unvarnished truth will be displayed in that world of light; and the *real scenes* which will be displayed, will infinitely transcend, in beauty, in grandeur, and in interest, all that the most fertile imagination can conceive. Were a single falsehood to be told in heaven, were the tongue of an archangel to misrepresent a single fact in the divine economy, or were the least suspicion to exist that truth might be violated in such communications, the mutual confi-

dence of celestial intelligences would instantly be shaken; and, from that moment, their intercourse and their happiness would be destroyed. Hence, we are repeatedly told, in the book of Revelation, that, "Whosoever loveth, or maketh a lie, shall in no wise enter within the gates of the new Jerusalem." And, therefore, every one who expects to be an inhabitant of that happy world, ought now to cultivate a strict regard to truth and veracity in all its researches, intercourses, and communications; otherwise he cannot be admitted, from the very constitution of things, to the society of saints and angels in the realms of bliss.

Thus it appears, that truth is of the utmost importance to all rational beings, as it forms the source of our knowledge, the foundation of all social intercourse, the ground of our present comfort and future prospects, the basis of all the views we can take of the Divine character and operations, and of all our prospects of future improvement in the eternal world. It is the bond of union among all the inhabitants of heaven; it is the chain which connects the whole moral universe; and it constitutes the immutable basis on which rests the throne of the Eternal.

In the depraved society of our world, truth is violated in ten thousand different ways. It is violated in thoughts, in words, in conversation, in oral discourses, in writings, in printed books, by gestures and by signs, by speaking, and by remaining silent. It is violated in reference to the character of our neighbor, when we invent tales of falsehood respecting him; when we listen with pleasure to such tales when told by others; when we sit mute, and refuse to vindicate his character when it is unjustly aspersed; when we endeavor to aggravate the circumstances which may have accompanied any criminal action; when we make no allowances for the force of temptation, and the peculiar circumstances in which the criminal may have been placed; when we fix upon an insulated act of vice or folly, and apply it to our neighbor as a general character; when we rake up, with a malevolent design, an action which he has long since reprobated and repented of; when his character is made the subject of jest or merriment, and when, by smiles, and noddings, and gestures, we insinuate anything injurious to his reputation. It is violated in *promises*—when we promise, either what we have no intention of performing, or what we had no right to promise, or what is out of our power to perform, or what would be unlawful for us to execute. It is violated in *threatenings*, when we neglect to put them in execution, or we threaten to inflict what would be either cruel or unjust. It is violated in *history*, when the principal facts are blended with doubtful or fictitious circumstances; when the conduct of liars and intriguers, of public robbers and murderers, is varnished over with the false glare of heroism and of glory; and when the actions of upright men are, without sufficient evidence, attributed to knavery, or to the influence of fanaticism; when the writer construes actions and events, and attributes to the actors motives and designs, in accordance with his own prejudices and passions, and interweaves his opinions and deductions, as if they were a portion of the authenticated records of his *official* fact.—It is violated in the invention of *fictitious* narratives, and in the relation of marvelous stories, when the system of nature is distorted, historical facts caricatured, misrepresented, and blended with the vagaries of a romantic imagination; when scenes, events, and circumstances, "which never did nor can take place," are presented to the view, merely

ly to convey a transient gratification to trifling and indolent minds.

It is violated by *men of science*, when they give an inaccurate statement of the results of their observations and experiments; when, either through carelessness or design, they give an unfair representation of the facts and principles in nature, in order to support a favorite system or hypothesis; and when they studiously keep out of view the various circumstances in which every fact should be contemplated.—It is violated in the *literary world*, when the editor of a magazine or a review writes an article, and addresses it to himself, as if it came from the pen of another; when for the sake of "filthy lucre," or to gratify a friend, he bestows encomiums on a work which is unworthy of the attention of the public; or when, to gratify a mean, or revengeful passion, he misrepresents or abuses the literary productions of his opponents, or when an author writes a review of his own work, and imposes it on the public, as if it were the decision of an impartial critic.—It is violated by *controversialists*, when they bring forward arguments in support of any position which they are conscious are either weak or unsound; when they appear more anxious to display their skill and dexterity, and to obtain a victory over their adversaries, than to vindicate the cause of truth; when sneers, and sarcasms, and personal reproaches are substituted in the room of substantial arguments; when they misrepresent the sentiments of their opponents, by stating them in terms which materially alter their meaning; and when they palm upon them the doctrines and opinions which they entirely disavow.

It is violated in *commercial transactions*, when deteriorated goods are varnished over with a fair outside, and puffed off as if they were saleable and sound; when a merchant asks more than he is willing to take for any commodity; when he depreciates the commodities of his neighbor; when he undervalues whatever he is purchasing, and makes an overcharge for the articles of which he is disposing; when he denies the goods he has in his possession, when there is the prospect of an advancing price,—and in a thousand other ways, best known to the nefarious trader.—It is violated by persons in every department of life, not only when they utter what they know to be false, but when they profess to declare the whole truth, and keep back part of it with an intention to deceive; when they make use of a proposition that is literally true, in order to convey a falsehood;* when they flatter the vanity of weak minds; when they ascribe to their friends or to others good qualities which do not belong to them, or refuse to acknowledge those accomplishments of which they are possessed; when they endeavor to cajole children into obedience, by promising what they never intend to perform, and threatening what they never intend to inflict; and when they indulge in a habit of exaggeration, in the account they give of their adventures, and of the things which they have seen or heard.

Truth is violated by *signs*, as well as by words,

* The following fact will illustrate this and similar pieces of falsehood.—A person, when selling a watch, was asked by the purchaser if it kept time correctly? He was told by the owner, that neither the hour nor the minute hand had required to be altered for more than a twelve-month. This was *literally* true; but the watch was, nevertheless, a very bad regulator of time. When hung in a perpendicular position, it went too slow, and, when laid in a horizontal position, it went too fast; but by alternately shifting these positions, and thus modifying the rates of motion, the hands did not require to be altered. Such assertions, however, are to be considered as direct lies, when they are intended to convey a false or erroneous conception, as in the instance now stated.

—as, when we point with our finger in a wrong direction, when a traveler is inquiring about the road he should take; when a British ship hoists Spanish colors; when flags of truce are violated; when spies insinuate themselves into society as upright men, for the purpose of entrapping the unwary; when false intelligence is communicated to an enemy; when fires are lighted, or put out, in order to deceive mariners at sea; and when signals of distress are counterfeited by ships at sea, for the purpose of decoying into their power the ships of an enemy.

Truth is violated in relation to God, when we conceal from those whom we are bound to instruct, the grandeur and immensity of his works, and the displays of divine intelligence and skill which are exhibited in his visible operations; when we exhibit a diminutive view of the extent and glory of his kingdom; when we give an inaccurate and distorted representation of the laws of nature, and of the order and the economy of the universe; when we misrepresent the facts which exist in the system of nature, and which occur in the truth of providence; when we call in question the history of that revelation which he has confirmed by signs and miracles, and by the accomplishment of numerous predictions; when we misrepresent its facts, its doctrines, and its moral requisitions; when we transform its historical narrations into a series of parables and allegories; when we distort its literal meaning by vague and injudicious *spiritualizing* comments; when we fix our attention solely on its doctrines, and neglect to investigate its moral precepts; and when we confine our views to a few points in the system of revelation, and neglect to contemplate its whole range, in all its aspects and bearings.

In the above, and in ten thousand other modes, is the law of truth violated by the degenerate inhabitants of our world. The mischiefs and the miseries which have followed its violation, in reference to the affairs of nations, to the private interests of societies, families, and individuals, and to the everlasting concerns of mankind, are incalculable, and dreadful beyond description. It is one of the principal sources from which have sprung the numerous abominations and cruelties connected with the system of Pagan idolatry, the delusions and the persecuting spirit of the votaries of Mahomet, and the pretended miracles, and “the lying wonders,” of that church which is denominated “the mother of harlots and abominations of the earth.” It has been chiefly owing to the violation of this law, that the thrones of tyrants have been supported, that liberty has been destroyed, that public safety and happiness have been endangered, that empires have been overturned, that nations have been dashed one against another, and that war has produced among the human race so many overwhelming desolations. By the pernicious influence of falsehood, the peace of families has been invaded, their comforts blasted, their good name dishonored, their wealth destroyed, their hopes disappointed, and their bright prospects of happiness involved in a cloud of darkness and despair. By the sophistry of unprincipled men, literature and science have been perverted, and the avenues to substantial knowledge rendered difficult and dangerous; litigations have been multiplied without number; human beings have been agitated, perplexed, and bewildered; and the widow and the fatherless oppressed and robbed of their dearest enjoyments. Could we search the private records of ancient kings, princes, and legislators, and trace the deceitful plans which have been laid in palaces and cabinets—or could we, at

this moment, penetrate into all the intrigues, deceptions, treacheries, plots, and machinations, which are going forward in the cabinets of despots, the mansions of princes, and the courts of law, throughout Europe, Africa, and Asia; such a host of falsehoods, and “lying abominations,” like an army of specters from the infernal regions, would stare us in the face, as would make us shrink back with horror and amazement, and fill us with astonishment that the patience of the God of heaven has been so long exercised toward the inhabitants of such a depraved and polluted world.

Let us now consider, for a little, some of the effects which would inevitably follow were the law of truth *universally* violated. In this case a scene of horror and confusion would ensue, of which it is difficult for the mind to form any distinct conception. It is obvious, in the first place, that rational beings could never improve in knowledge, beyond the range of the sensitive objects that happened to be placed within the sphere of their personal observation. For, by far the greater part of our knowledge is derived from the communications of others, and from the stimulus to intellectual exertion which such communications produce.—Let us suppose a human being trained up, from infancy, in a wilderness, by a bear or a wolf, as history records to have been the case of several individuals in the forests of France, Germany, and Lithuania,—what knowledge could such a being acquire beyond that of a brute? He might distinguish a horse from a cow, and a man from a dog, and know that such objects as trees, shrubs, grass, flowers, and water, existed around him; but knowledge, strictly so called, and the proper exercise of his rational faculties, he could not acquire, so long as he remained detached from other rational beings. Such would be our situation, were falsehood universal among men. We could acquire a knowledge of nothing but what was obvious to our senses in the objects with which we were surrounded. We could not know whether the earth were twenty miles, or twenty thousand miles in extent, and whether oceans, seas, rivers, and ranges of mountains, existed on its surface, unless we had made the tour of it in person, and, with our own eyes, surveyed the various objects it contains. Of course, we should remain in absolute ignorance of the existence and the attributes of God, of the moral relations of intelligent beings to their Creator, and to one another, and of the realities of a future state. For it is only, or chiefly, through the medium of *testimony*, combined with the evidence of our senses, that we acquire a knowledge of such truths and objects.

In the next place, all confidence among intelligent beings, would be completely destroyed.—Disappointment would *invariably* attend every purpose and resolution, and every scheme we wished to execute, if it depended in the least degree upon the direction or assistance of others. We durst not taste an article of food which we received from another, lest it should contain poison; nor could we ever construct a house to shelter us from the storm, unless our own physical powers were adequate to the work. Were we living in Edinburgh, we could never go to Musselburgh or Dalkeith, if we were previously ignorant of the situation of these places; or were we residing in London, it would be impossible for us ever to find our way to Homerton or Hampstead, unless, after a thousand attempts, *chance* should happen to direct us; and when we arrived at either of these villages, we should still be in as much uncertainty as ever whether it was the place to which we intended to direct our steps.

Confidence being destroyed, there could be no friendship, no union of hearts, no affectionate intercourse, no social converse, no consolation or comfort in the hour of distress, no hopes of deliverance in the midst of danger, and no prospect of the least enjoyment from any being around us. In such a case, the mind would feel itself as in a wilderness, even when surrounded by fellow intelligences, and wherever it roamed over the vast expanse of nature, or among the mass of living beings around it, it would meet with no affectionate interchange of feelings and sentiments, and no object on which it could rest for solace and enjoyment. Every one would feel as if he were placed in the midst of an infinite void, and as if he were the only being residing in the universe. In such a case we would flee from the society of men as we would do from a lion or a tiger when rushing on his prey; and hide ourselves in dens, and forests, and caverns of the earth, until death should put a period to a cheerless and miserable existence.

All social intercourses and relations would cease;—families could not possibly exist; nor any affectionate intercourse between the sexes; for truth, and the confidence which is founded upon it, are implied in all the intercourses of husbands and wives, of brothers and sisters, and of parents and children;—and consequently, the human race, dropping into the grave, one after another, like the leaves of autumn, without any successors, would, in a short time, be extirpated from the earth. In such a state, kindness and affection would never be exercised; trade and commerce, buying and selling, social compacts and agreements would be annihilated; science, literature, and the arts, could not exist; and consequently, universities, colleges, churches, academies, schools, and every other seminary of instruction would be unknown. No villages, towns, nor cities would be built; no fields cultivated; no orchards, vineyards, nor gardens planted; no intercourse would exist between different regions of the globe; and nothing but one dreary barren waste would be presented to the eye, throughout the whole expanse of nature. So that were truth completely banished from the earth, it would present a picture of that dark and dismal region where “all liars have their portion!” where all are deceivers and deceived, and where the hopeless mind roams amidst innumerable false intelligences, for one ray of comfort, or one confidential spirit in which it may confide, but roams in vain.

In short, were truth banished not only from this world, but from the universe at large, creation would be transformed into a chaos; the bond which now connects angels and archangels, cherubim and seraphim, in one harmonious union, would be forever dissolved; the inhabitants of all worlds would be thrown into a state of universal anarchy; they would shun each other's society, and remain as so many cheerless and insulated wretches, amidst the gloom and desolations of universal nature; all improvements in knowledge, and all progressive advances toward moral perfection, would be forever interrupted; and happiness would be banished from the whole intelligent system. Every mind would become the seat of terror and suspense, and would be haunted by frightful specters and dreadful expectations. The government of the Eternal would be subverted, the moral order of the intelligent system overturned; all subordination would cease, and misery would reign uncontrolled throughout every region of intellectual existence. For *truth* is implied in the principle of *love*; it is essential to its existence; so

that the one cannot operate except on the basis of the other; and we have already shown, that the destruction of love would be the destruction of all order, and of all happiness among intelligent beings.

Such are some of the dreadful effects which would inevitably follow, were the law under consideration reversed or universally violated. In our world this law has, hitherto, been only *partially* violated; yet what dreadful mischiefs, beyond calculation, and even beyond conception, has its frequent violation created! Ever since that moment when the “father of lies” deceived the first human pair, how many thousands of millions of liars have trodden in his footsteps! and what a host of falsehoods has followed in their train, which have destroyed the harmony of the moral system, and robbed the world of happiness and repose! Yet how little are we affected by the frequent violation of this law? and how seldom do we reflect, that every falsehood we unadvisedly utter, is an infringement of that law on which rest the throne of the Almighty and the eternal happiness of the universe? For if one lie may be palliated or vindicated, on the same principle we might vindicate a thousand and a million, and millions of millions, until falsehood became universal among all ranks of beings, and until the moral order of the intelligent creation was completely subverted. Of how much importance is it then, that an inviolable attachment to truth, in its minutest ramifications, be early impressed upon the minds of the young, by persuasion, by precept, by example, by reasoning, and by a vivid representation of its importance, and of its inestimable benefits? and how careful should we be to preserve them from all incentives to the practice of lying, and especially from the company of those “whose mouth speaketh vanity, and their right hand is a right hand of falsehood.”

Were falsehood universally detested, and the love of truth universally cherished; were a single lie never more to be uttered by any inhabitant of this globe, what a mighty change would be effected in the condition of mankind, and what a glorious radiance would be diffused over all the movements of the intelligent system! The whole host of liars, perjurers, sharpers, seducers, slanderers, tale-bearers, quacks, thieves, swindlers, harpies, fraudulent dealers, false friends, flatterers, corrupt judges, despots, sophists, hypocrites, and religious impostors, with the countless multitude of frauds, treacheries, impositions, falsehoods, and distresses which have followed in their train, would instantly disappear from among men.—The beams of truth, penetrating through the mists of ignorance, error, and perplexity, produced by sophists, skeptics, and deceivers, which have so long enveloped the human mind, would diffuse a luster and a cheerfulness on the face of the moral world, like the mild radiance of the morning after a dark and tempestuous night. Confidence would be restored throughout every department of social life; jealousy, suspicion, and distrust would no longer rankle in the human breast; and unfeigned affection, fidelity, and friendship, would unite the whole brotherhood of mankind. With what a beautiful simplicity, and with what smoothness and harmony would the world of trade move onward in all its transactions! How many cares and anxieties would vanish! how many perplexities would cease! and how many ruinous litigations would be prevented? For the violation of truth may be considered as the chief cause of all those disputes respecting property, which have plunged so many families

into suspense and wretchedness. The tribunals of justice would be purified from every species of sophistry and deceit; and the promises of kings, and the leagues of nations, would be held sacred and inviolate. Science would rapidly advance toward perfection; for, as all its principles and doctrines are founded upon facts, when truth is universally held inviolable, the facts on which it is built will always be fairly represented. Every fact asserted by voyagers and travelers, in relation to the physical or the moral world, and every detail of experiments made by the chemist and the philosopher, would form a sure ground-work for the development of truth, and the detection of error; without the least suspicion arising in the mind respecting the veracity of the persons on whose testimony we rely. For want of this confidence the mind has been perplexed and distracted by the jarring statements of travelers, naturalists, and historians; false theories have been framed; systems have been reared on the baseless fabric of a vision; the foundations of science have been shaken; its utility called in question, and its most sublime discoveries overlooked and disregarded.

In fine, the clouds which now obscure many of the sublime objects of religion, and the realities of a future world, would be dispelled, were falsehood unknown, and truth beheld in its native light; and religion, purified from every mixture of error and delusion, would appear arrayed in its own heavenly radiance, and attract the love and the admiration of men. When exhibited in its native grandeur and simplicity, all doubts respecting its divine origin would soon vanish from the mind—the beauty and sublimity of its doctrines would be recognized as worthy of its Author; and all its moral requisitions would be perceived to be “holy, just, and good,” and calculated to promote the order, and the everlasting happiness of the intelligent universe. Divine truth irradiating every mind, and accompanied with the emanations of heavenly love, would dispel the gloom which now hangs over many sincere and pious minds; would unite man to man, and man to God; and the inhabitants of this world, freed from every doubt, error, and perplexity, would move forward in harmony and peace, to join “the innumerable company of angels, and the general assembly of the spirits of just men made perfect, whose names are written in heaven.”

THE TENTH COMMANDMENT.

“*Thou shalt not covet thy neighbor's house, thou shalt not covet thy neighbor's wife, nor his man-servant, nor his maid-servant, nor his ox, nor his ass, nor anything that is thy neighbor's.*”

Every precept of the law to which I have hitherto adverted, has a reference not only to the *external conduct* of moral agents, but also to the *internal motives or principles* from which that conduct proceeds. This is evident from the considerations already stated, and from the whole tenor of Divine Revelation;—and it is in unison with reason, and with the common sense of mankind, that the merit or demerit of any action is to be estimated, according to the intention of the actor, and the disposition from which it flows.—That no doubt may remain on this point, the Supreme Legislator closes the decalogue with a command, which has a reference solely to the desires and dispositions of the mind: “*Thou shalt not covet.*” Covetousness consists in an *inordinate* desire of earthly objects and enjoyments. This

desire, when uniformly indulged, leads to a breach of almost every other precept of the Divine law; and is the source of more than one half of all the evils which afflict the human race. It leads to a breach of the eighth command, by exciting either to fraudulent dealings, or to direct acts of theft and robbery.—It leads to a breach of the ninth command, by cherishing the principle of falsehood which is implied in every fraudulent transaction.—It leads to a violation of the sixth command, by engendering a spirit of revenge against those who stand in the way of its gratification; and by exciting the covetous man to the commission of murder, in order to accomplish his avaricious desires.—It also leads to a violation of the seventh command; for, when one “*covets his neighbor's wife,*” the next step is to endeavor to withdraw her affection from her husband, and to plunge a family into misery and distress.—It also leads to a violation of the fifth precept of the law, not only as it steals the heart against those kindly filial affections which children ought to exercise toward their parents, but as it excites them to withhold from their parents, when in old age and distress, those external comforts which are requisite to their happiness, and which it is the duty of affectionate children to provide. And, when covetousness has thus led to the breach of every other precept of the second table of the law, it follows, that all the precepts of the first table are also virtually violated. For all the commandments of the first table are briefly summed up in this comprehensive precept, “*Thou shalt love the Lord thy God with all thy heart:*” but it is obviously impossible, nay, it would be a contradiction in terms, to suppose, that supreme love to the Creator can reside in the same breast in which an *inordinate* desire of worldly enjoyments reigns uncontrolled, and in which love to man has no existence. So that covetousness may be considered as the great barrier which separates between man and his Maker, and also, as the polluted fountain from whence flow all the moral abominations and the miseries of mankind.

The more obvious and direct manifestation of this principle is generally distinguished by the name of *Avarice*, or an inordinate desire for riches. And what a countless host of evils has flowed from this unhallowed passion, both in relation to individuals, to families, to nations, and to the world at large! In relation to the avaricious man himself, could we trace all the eager desires, anxieties, perplexities, and cares, which harass his soul; the fraudulent schemes he is obliged to contrive, in order to accomplish his object; the miserable shifts to which he is reduced, in order to keep up the appearance of common honesty; the mass of contradictions, and the medley of falsehoods, to which he is always obliged to have recourse; the numerous disappointments to which his eager pursuit of wealth continually exposes him, and by which his soul is pierced as with so many daggers—we should behold a wretched being, the prey of restless and contending passions, with a mind full of falsehoods, deceitful schemes, and groveling affections, like a cage, full of every unclean and hateful bird,—a mind incapable of any rational enjoyment in this life, and entirely incapacitated for relishing the nobler enjoyments of the life to come. Such a man is not only miserable himself, but becomes a moral nuisance to the neighborhood around him; stinting his own family of its necessary comforts; oppressing the widow and the fatherless; grasping with insatiable fangs every house, tenement, and patch of land within his reach; hurrying poor unfortunate

debtors to jail; setting adrift the poor and needy from their long-accustomed dwellings; and presenting to the young and thoughtless a picture, which is too frequently copied, of an immortal mind immersed in the mire of the most degrading passions, and worshiping and serving the creature more than the Creator, who is blessed forever.

In relation to large communities and nations, this groveling passion has produced, on an extensive scale, the most mischievous and destructive effects. It has plundered palaces, churches, seats of learning, and repositories of art; it has polluted the courts of judicature, and the tribunals of justice; it has corrupted magistrates, judges, and legislators; and has transformed many even of the ministers of religion, into courtly sycophants, and hunters after places and pensions.—It has ground whole nations to poverty, under the load of taxation; it has leveled spacious cities with the dust; turned fruitful fields into a wilderness; spread misery over whole empires; drenched the earth with human gore; and waded through fields of blood in order to satiate its ungovernable desires. What has led to most of the wars which have desolated the earth, in every age, but the insatiable cravings of this restless and groveling passion? It was the cursed love of gold that excited the Spaniards to ravage the territories of Mexico and Peru, to violate every principle of justice and humanity, to massacre, and to perpetrate the most horrid cruelties on their unoffending inhabitants. It is the same principle, blended with the lust of power, which still actuates the infatuated rulers of that unhappy nation, in their vain attempts to overthrow the independence of their former colonies. The same principle commenced, and still carries on, that abominable traffic, the *slave trade*,—a traffic which has entailed misery on millions of the sons of Africa; which has excited wars, and feuds, and massacres, among her numerous tribes; which has forever separated from each other brothers and sisters, parents and children; which has suffocated thousands of human beings in the cells of a floating dungeon, and plunged ten thousands into a watery grave;—a traffic which is a disgrace to the human species; which has transformed civilized men into infernal fiends; which has trampled on every principle of justice; which has defaced the image of God in man, and extinguished every spark of humanity from the minds of the ferocious banditti which avarice has employed for accomplishing her nefarious designs.*

Ambition, or, an inordinate desire of power, superiority, and distinction, is another modification of this malignant principle. This passion is manifested, in a greater or less degree, by men of all ranks and characters, and in every situation in life. It is displayed in the *school-room*, by the boy who is always eager to stand foremost in his class; in the *ball-room*, by the lady who is proud of her beauty, and of her splendid attire; in the

corporation-hall, by the citizen who struts with an air of conscious dignity, and is ever and anon aiming at pompous harangues; on the *bench*, by the haughty and overbearing judge; in the *church*, by those rulers who, like Diotrophes, "Love to have the pre-eminence;" in the *pulpit*, by the preacher whose main object is to excite the admiration and applause of a surrounding audience; in the *streets*, by the pompous airs of the proud dame, the coxcomb, and the dashing squire; in the *village*, by him who has a better house, and a longer purse, than his neighbors; in the *hamlet*, by the peasant who can lift the heaviest stone, or fight and wrestle with the greatest strength or agility; and in the *city*, by the nobleman who endeavors to rival all his compeers in the magnificence of his mansion, and the splendor of his equipage; among the *learned*, by their eager desire to spread their name to the world, and to extend their fame to succeeding generations; and among all classes who assume airs of importance, on account of the antiquity of their families, their wealth, their exploits of heroism, and their patrimonial possessions.

But it is chiefly on the great theater of the world that ambition has displayed its most dreadful energies, and its most overwhelming devastations. In order to gain possession of a throne, it has thrown whole nations into a state of convulsion and alarm. The road to political power and pre-eminence, has been prepared by the overflow of truth and justice, by fomenting feuds and contentions, by bribery, murder, and assassinations, by sanguinary battles, by the plunder of whole provinces, the desolation of cities and villages, and by the sighs, the groans, and lamentations of unnumbered widows and orphans. In order to raise a silly mortal to despotic power on the throne of Spain, how many human victims have been sacrificed at the altar of ambition! how many families have been rent asunder, and plunged into irremediable ruin! and how many illustrious patriots have been immured in dungeons, and have expired under the ax of the executioner! At the present moment, the fertile vales of Mexico, the mountains and plains of South America, the forests of the Burmese, and the shores of Turkey and of Greece, are everywhere covered with the ravages of this fell destroyer, whose path is always marked with desolation and bloodshed. To recount all the evils which ambition has produced over this vast globe, would be to write a history of the struggles and contests of nations, and of the sorrows and sufferings of mankind.—So insatiable is this ungovernable passion, that the whole earth appears a field too small for its malignant operations. Alexander the Great, after having conquered the greater part of the known world, wept, because he had not another world to conquer. Were there no physical impediments to obstruct the course of this detestable passion, it would ravage, not only the globe on which we dwell, but the whole of the planetary worlds; it would range from system to system, carrying ruin and devastation in its train, until the material universe was involved in misery and desolation; and it would attempt to subvert even the foundations of the throne of the Eternal.

Such are some of the dismal and destructive effects of *covetousness*, when prosecuting the paths of avarice and ambition; and when we consider that it is uniformly accompanied in its progress, with pride, envy, discontentment, and restless desires,—it is easy to perceive, that, were it left to reign without control over the human mind, it would soon desolate every region of the earth,

* That this accursed traffic is still carried on, with unabated vigor, by the civilized powers of Europe, appears from the following statement:—"The boats of a British Frigate, the *Maidstone*, boarded, in eleven days of June 1824, no less than ten French vessels, at a single spot upon the coast of Africa; the measurement of which vessels was between 1400 and 1600 tons, while they were destined for the incarceration—we might say, the living burial—of 3000 human beings!" The report to government says—"The schooner *La Louisa*, Capt. Armand, arrived at Guadaloupe, during the first days of April, 1824, with a cargo of 200 negroes, the remainder of a complement of 375, which the vessel had on board. The vessel not being large enough to accommodate so great a number of men, the *overplus* were consigned ALIVE to the waves by the Captain."

and produce all the destructive effects which, as we have already shown, would flow from a universal violation of the other precepts of God's law.

On the other hand, *Contentment*,—the duty implied in this command, would draw along with it an unnumbered train of blessings, and would restore tranquillity and repose to our distracted world. To be contented under the allotments of the providence of God, is one of the first and fundamental duties of every rational creature.—By contentment and resignation to the divine disposal, we recognize God as the supreme Governor of the universe; as directed by infinite wisdom, in the distribution of his bounty among the children of men; as proceeding on the basis of eternal and immutable justice, in all his providential arrangements; and as actuated by a principle of unbounded benevolence, which has a regard to the ultimate happiness of his creatures. Under the government of such a Being, we have abundant reason, not only to be contented and resigned, but to be glad and to rejoice. "The Lord reigneth, let the earth be glad, let the multitude of the isles thereof rejoice." However scanty may be the portion of earthly good measured out to us at present, and however perplexing and mysterious the external circumstances in which we may now be involved, we may rest assured, that, under the government of unerring wisdom, rectitude, and benevolence, all such dispensations shall ultimately be found to have been, not only consistent with justice, but conducive to our present and everlasting interests. Were such sentiments and affections to pervade the minds of all human beings, what a host of malignant passions would be chased away from the hearts and from the habitations of men? Restless cares, and boundless and unsatisfied desires, which constitute the source and the essence of misery, would no longer agitate and torment the human mind.—Voluptuousness would no longer riot at the table of luxury on dainties, wrung from the sweat of thousands;—nor avarice glut its insatiable desires with the spoils of the widow and the orphan;—nor ambition ride in triumph over the miseries of a suffering world. Every one, submissive to the allotments of his Creator, and grateful for that portion of his bounty which he has been pleased to bestow, would view the wealth and enjoyments of his neighbor with a kind and benignant eye, and rejoice in the prosperity of all around him. Benevolence and peace would diffuse their benign influence over the nations, and mankind, delivered from the fear of everything that might "hurt or destroy," would march forward in harmony and affection, to that happier world where every wish will be crowned, and every holy desire satisfied in God "their exceeding great reward."

Thus it appears, that, on the observance of this law, which closes the Decalogue, and which has a reference to a single affection of the mind—the order and happiness of the intelligent system almost entirely depends. Let the floodgates of *Covetousness* be burst open, and let it flow in every direction without control,—in a short period the world is desolated, and overwhelmed with a deluge of miseries. Let the current of every passion and desire be restrained within its legitimate boundary, and let contentment take up its residence in every heart, and this deluge will soon be dried up, and a new world will appear, arrayed in all the loveliness, and verdure, and beauty of Eden. May Jehovah hasten it in his time!

Thus I have endeavored, in the preceding sketches, to illustrate the *reasonableness* of those

laws which God has promulgated for regulating the moral conduct of the intelligent creation. If the propriety of these illustrations be admitted, they may be considered as a commentary on the words of the Apostle Paul: "*The law is holy, and the commandment is holy and just and good.*" In like manner it might have been shown, that all the Apostolic injunctions, and other precepts recorded in the volume of inspiration, are accordant with the dictates of reason, and with the relations of moral agents; for they are all so many subordinate ramifications of the principles and laws, which I have already illustrated.

General Conclusions and Remarks, founded on the preceding illustrations.

I shall now conclude this chapter with the statement of a few remarks in relation to the moral law, founded on the illustrations which have been given in the preceding pages; which may be considered as so many inferences deduced from the general subject which has now occupied our attention.

I. In the *first place*, one obvious conclusion from the preceding illustrations is, That the laws of God are not the commands of an arbitrary Sovereign, but are founded on the nature of things, and on the relations which exist in the intelligent system. Many divines, especially those of the supralapsarian school, have been disposed to ascribe every regulation of the Deity to the Divine Sovereignty. I have been told that, in one of the Latin treatises of Mr. Samuel Rutherford, Professor of Divinity in St. Andrews, there is a sentiment to the following purpose: "That such is the absolute sovereignty of God, that had it so pleased him, he might have made every precept of the moral law given to man exactly the reverse of what we now find it." A sentiment more directly repugnant to the scriptural character of God, and to every view we can take of the divine attributes, it is scarcely possible for the human mind to entertain; and it shows us the dangerous consequences to which we are exposed, when we attempt to push certain theological dogmas to an extreme. If it were possible to suppose the Deity capable of such an act, it would overturn all the grounds on which we are led to contemplate him as glorious, amiable, and adorable. At some future period in the revolutions of eternity, his love, his rectitude, and his faithfulness, might be changed into malevolence, injustice, and falsehood. If the requisitions of the moral law depended solely on the Divine Sovereignty, then there is no inherent excellence in virtue; and theft, falsehood, murder, idolatry, profanity, cruelty, wars, devastations, and the malevolence of infernal demons, might become equally amiable and excellent as truth, justice, benevolence, and the songs and adorations of angels; provided the Deity *willed* the change to take place. But this is impossible; and it is evident, I trust, from the preceding illustrations, that, were moral laws, directly opposite to those contained in the scriptural code, to be prescribed to men, or to any other class of moral agents, not only would misery reign uncontrolled through the universe, but, in a short time, the operation of such laws would annihilate the whole intelligent creation.

It is evident, then, that the moral law is not founded on the *will* of God, but on the relations of intelligent beings, and on its own intrinsic excellence; or, in other words, on its tendency to produce happiness throughout the intelligent sys-

tem. This idea nearly coincides with that of some of our modern moralists, who maintain "that virtue is founded on utility,"—if, by *utility*, is meant a tendency to promote happiness. But it by no means follows, from this position, as some moralists have concluded, that utility is the guide, or the rule by which we are to be directed in our moral conduct. This may be considered as the rule which directs the conduct of the Divine Being, whose eye takes in the whole system of creation, whose knowledge extends from eternity past, to eternity to come, and who perceives, at one glance, the remotest consequences of every action. But it cannot be a rule for subordinate intelligences, and especially for man, who stands near the lowest degree of the scale of intellectual existence. From the limited range of view to which he is confined, he cannot trace the remote consequences of any particular action, the bearings it may have on unnumbered individuals, and the relation in which it may stand to the concerns of the eternal world. An action which, to our limited view, may appear either beneficial or indifferent, may involve a principle which, if traced to its remotest consequences, would lead to the destruction of the moral universe. It might appear, at first view, on the whole, beneficial to society, that an old unfeeling miser should be gently suffocated, and his treasures applied for the purpose of rearing asylums for the aged poor, and seminaries of instruction for the young. But the principle which would sanction such an action, if generally acted upon, would lead to universal plunder, robbery, and bloodshed. To tell a lie to a child, in order to induce it to take a nauseous medicine which is essential to its recovery from disease, may appear, in such a case, to have a benevolent tendency; but we have already shown, that were such a principle universally admitted, it would introduce anarchy and misery through the universe, and would ultimately annihilate the intelligent creation. Man, in his present state, can be directed only by *positive laws* proceeding from the Almighty, whose comprehensive mind alone can trace all their consequences to the remotest corners of the universe, and through all the ages of eternity. These laws are contained in the Scriptures—a comprehensive summary of which has been the subject of the preceding illustrations. And we know, in point of fact, that in every country where these laws are either unknown, or not recognized, there is no fixed standard of morals: and vice, in its various ramifications, almost universally prevails.

From what has been now stated we may infer—that a *full and unreserved obedience to the Divine law is a most reasonable requisition*. Men are too frequently disposed to view the commands of God as the dictates of an arbitrary Sovereign. There is a secret thought that occasionally lodges in the heart of every human being, that the law of God is too extensive and rigorous in its demands, accompanied with a secret wish, that the severity of its requisitions could be a little modified or relaxed. Every man is subject to some "besetting sin," and he is apt to say within himself—"If I were allowed but a little license with regard to *one* precept of the law, I would endeavor to do what I could to comply with the requisitions of the rest." But, it would be inconsistent both with the *benevolence* of the Deity, and with the happiness of his moral creation, either to modify or to relax any one requirement of his law; for it is a *perfect law*, from which nothing can be taken without impairing its excellence and utility. Were he to do so, it would be in effect,

to shut up the path to happiness, and to open the flood-gates of misery upon the universe. Although it is impossible for man in his present degraded condition, to yield a *perfect* obedience to this law, yet nothing short of perfect obedience ought to be his aim. For in as far as we fall short of it, in so far do we fall short of happiness; and consequently, until that period arrives when our obedience shall reach the summit of perfection, our happiness must remain incomplete, and a certain portion of misery must be expected to mingle itself with all our enjoyments.

II. *There is so intimate a connection between all the parts of the Divine law, that the habitual violation of any one precept necessarily includes the violation of the greater part, if not the whole of the other precepts.* This is evident from the general tenor of the preceding illustrations. It has been shown that a breach of the first commandment includes pride, falsehood, blasphemy, ingratitude, and hatred of moral excellence; and that it leads to injustice, cruelty, murder, obscenity, and the most revolting abominations. A breach of the fifth involves a principle which would sap the foundations of all government and moral order, and transform society into a rabble of lawless banditti. The violation of the eighth is connected with falsehood, treachery, and covetousness, and leads to oppression, robbery, plunder, murders, and the devastation of empires; and the violation of the tenth, though consisting only in the indulgence of an irregular desire, is the origin of almost every other species of moral turpitude, in relation either to God or to man. In like manner it might be shown, that the strict and regular observance of any one precept is necessarily connected with a regard for all the other requirements of God's law.

III. It appears, from the preceding illustrations, that a universal violation of any one of the six precepts of the second table of the law, would lead to the entire destruction of the human race. In the case of the sixth commandment being supposed to be reversed, or universally violated, this effect would be most rapidly produced; but the destruction and complete extirpation of human beings from the earth would be as certainly effected, in the course of two or three generations, by the universal violation of any one of the other five precepts. Some of the circumstances which would necessarily produce this effect, are alluded to, in the preceding illustration of these precepts. And as the first principle of the moral law, love to God, is the foundation of the precepts contained in the second table, it is obvious, that the same effect would ultimately follow from a universal violation of the first four precepts of the Decalogue.

IV. It follows from what has hitherto been stated, That the moral law has never yet been universally violated, nor has any one of its precepts been completely reversed in the conduct of the inhabitants of our globe. Every individual, of all the millions of mankind that have existed since the fall of Adam, has, indeed, in one shape or another, broken every one of the commandments of God; but such breaches have not been constant and uniform, and running through every action he performed. Falsehood has always been mingled with a portion of truth, theft with honesty, cruelty with clemency and mercy, anarchy with subordination, and licentiousness with chastity and purity. It is owing to this partial obedience to the dictates of the law of nature, impressed upon every human heart, that the world of mankind has hitherto been preserved in existence.

The partial violation, however, of the divine law, which has characterized the actions of mankind, in all ages, has been the source of all the calamities, miseries, and moral abominations, under which the earth has groaned from generation to generation; and, in proportion to the extent of this violation, will be the extent of wretchedness and misery entailed on the human race.—That a universal violation of God's law has never yet taken place in any region of the earth, is not owing so much to any want of energy, or of malignity in the principle of disobedience which is seated in the hearts of men, as to the restraining influence of the moral Governor of the world, and to the physical impediments which he has placed to prevent the diabolical passions of men from raging without control. Whether it be possible for any class of intelligent organized beings to subsist for any length of time, under a complete violation of the moral law, it is not for us positively to determine; but it is evident to a demonstration, that in the present physical condition of the human race, such a violation would unhinge the whole fabric of society, and in a short time, exterminate the race of Adam from the earth.

V. The greater part of the precepts of the Decalogue is binding upon superior intelligences, and upon the inhabitants of all worlds, as well as upon man. For anything we know to the contrary, there may be worlds in different regions of the universe, and even within the bounds of our planetary system, where their inhabitants are placed in circumstances similar to those in which man was placed in his paradisiacal state; and, consequently, where the precepts which compose their moral code may be exactly the same as ours. But, it is highly probable that, in general, the inhabitants of the various globes, which float in the immensity of space, differ as much in their moral circumstances and relations, as the globes themselves do in their size, their physical constitution, and their natural scenery. I have already shown (p. 61, &c.), that there are seven precepts of our moral law which are common to the inhabitants of all worlds, namely, the *first, second, third, fourth* (see p. 89), the *sixth*, the *ninth*, and the *tenth*. And, if there be no portion of the intelligent system in which *subordination*, in a greater or less degree, does not exist, then, the fifth precept of our code must also be a law common to all intelligences. It was formerly stated (p. 80), that the seventh precept is in all probability, a law peculiar to the inhabitants of the earth, during the present economy of Providence; and, perhaps it is the only one which is not applicable to the other inhabitants of the universe. So that the moral laws given to man may be considered as substantially the same with those which govern all the other parts of the universal system.

VI. From the preceding illustrations, we may infer, the excellency and the divine origin of the Christian Revelation. The Scriptures contain the most impressive evidence of their heavenly original in their own bosom. The wide range of objects they embrace, extending from the commencement of our earthly system, through all the revolutions of time, to the period of its termination; and from the countless ages of eternity past, to the more grand and diversified scenes of eternity to come—the plan of Providence which they unfold, and the views they exhibit of the moral principles of the Divine government, and of the subordination of all events to the accomplishment of a glorious design—the character and attributes of the Creator, which they illustrate by the most impressive delineations, and the most lofty and

sublime descriptions—the views they exhibit of the existence, the powers, the capacities, the virtues, and the employments of superior orders of intellectual beings—the demonstrations they afford of the dignified station, and of the high destination of man—and the sublime and awful scenes they unfold, when the earth “shall melt like wax at the presence of the Lord,” when the throne of judgment shall be set, and the unnumbered millions of the race of Adam shall be assembled before the Judge of all—ininitely surpass everything which the unassisted imaginations of men could have devised, and everything which had ever been attempted by the greatest sages of antiquity, either in prose or in rhyme; and, consequently prove, to a moral demonstration, that a Power and Intelligence, superior to the human mind, must have suggested such sublime conceptions, and such astonishing ideas; since there are no prototypes of such objects to be found within the ordinary range of the human mind.

But the subject to which we have been hitherto adverting, when properly considered, suggests an evidence of the truth and divinity of the Scriptures, as striking, and, perhaps, more convincing than any other. They unfold to us the moral laws of the universe—they present to us a summary of moral principles and precepts, which is applicable to all the tribes and generations of men, to all the orders of angelic beings, and to all the moral intelligences that people the amplitudes of creation—to man, during his temporary abode on earth, and to man, when placed in heaven, so long as eternity endures—precepts, which, if universally observed, would banish misery from the creation, and distribute happiness, without alloy, among all the intellectual beings that exist throughout the empire of God. Can these things be affirmed of any other system of religion or of morals that was ever published to the world? The Greek and Roman moralists, after all their labor-ed investigations, could never arrive at any certain determination with regard to the nature of happiness, and the means of attaining it. We are told by Varro, one of the most learned writers of the Augustan age, that, the heathen philosophers had embraced more than two hundred and eighty different opinions respecting the supreme good. Some of them taught that it consisted in sensual enjoyments, and in freedom from pain; others considered it as placed in study and contemplation, in military glory, in riches, honors, wealth, and fame. Some of their moral maxims, separately considered, were rational and excellent; but they were connected with other maxims, which completely neutralized all their virtue, and their tendency to produce happiness. Pride, falsehood, injustice, impurity, revenge, and an unfeeling apathy to the distresses of their fellow-creatures, were considered as quite consistent with their system of morality; and such malignant principles and practices were blended with their most virtuous actions. But we have already shown, that the uniform operation of such principles would necessarily lead to the destruction of all happiness, and to the overthrow of all order throughout the intelligent creation.

Now, can it be supposed, for a moment, that a Jew, who had spent forty years of his life as a shepherd in a desert country, who lived in a rude age of the world, who had never studied a system of ethics, and whose mind was altogether incapable of tracing the various relations which subsist between intelligent beings and their Creator, could have investigated those moral principles and laws which form the foundation of the moral universe,

and the basis of the divine government in all worlds; unless they had been communicated immediately by Him, who, at one glance, beholds all the physical and moral relations which exist throughout creation, and who can trace the bearings and the eternal consequences of every moral law? Or can we suppose, that, throughout the whole period of the Jewish economy, and during the first ages of the Christian dispensation, a multitude of writers should appear, many of them unknown to each other, all of whom should uniformly recognize those laws in their minutest bearings and ramifications, unless their minds had been enlightened and directed by the same powerful and unerring Intelligence? If these laws are distinguished by their extreme *simplicity*, they are the more characteristic of their divine Author, who, from the general operation of a few simple principles and laws in the system of nature, produces all the variety we perceive in the material world, and all the harmonies, the contrasts, the beauties, and the sublimities of the universe. If it be asked why these laws, which are so extremely simple and comprehensive, were not discovered nor recognized by the ancient sages? It might be answered, by asking why the laws of gravitation, which are also simple and comprehensive, were not discovered, until Newton arose to investigate the agencies of nature, and to pour a flood of light on the system of the universe? But the true reasons are—the unassisted powers of the human mind were inadequate to the task of surveying all the moral relations which subsist throughout the intelligent system, and of tracing those moral principles which would apply to the whole assemblage of moral agents, so as to secure the happiness of each individual, and of the system as one great whole—that the laws of God were almost directly contrary to the leading maxims of morality which prevailed in the world—and that they struck at the root of all those principles of pride, ambition, revenge, and impurity, which almost universally directed the conduct of individuals and of nations.

If, then, we find in a book which professes to be a revelation from heaven, a system of moral laws which can clearly be shown to be the basis of the moral order of the universe, and which are calculated to secure the eternal happiness of all intellectual beings—it forms a strong presumptive proof, if not an unanswerable argument, that the contents of that book are of a celestial origin, and were dictated by Him who gave birth to the whole system of created beings.

VII. From this subject we may learn the absurdity and pernicious tendency of Antinomianism. Of all the absurdities and abominations which have assumed the name of Religion, I know none more pernicious and atheistical in its tendency, than the sentiment which is tenaciously maintained by modern Antinomians, "That Christians are set free from the law of God as a rule of conduct." That in the nineteenth century of the Christian era, amidst the rapid progress of physical and moral science, under the mask of a Christian profession, and with the moral precepts and injunctions of the prophets of Jesus Christ, and of his apostles, lying open before them, a set of men, calling themselves rational beings, should arise to maintain, that there is such a thing as "imputed sanctification," that the moral law is not obligatory upon Christians, and that "whoever talks of progressive sanctification is guilty of high treason against the majesty of heaven!"*—is a moral pheno-

menon truly humbling and astonishing; and affords an additional proof, to the many other evidences which lie before us, of the folly and perversity of the human mind, and of its readiness to embrace the most wild and glaring absurdities! If the leading train of sentiment which has been prosecuted in the preceding illustrations be admitted, there appears nothing else requisite in order to show the gross-absurdity and the deadly malignity of the Antinomian system. If any system of religion be founded on the cancellation of every moral tie which connects man with man, and man with God—if its fundamental and distinguishing principles, when carried out to their legitimate consequences, would lead men to *hate* their Creator and to *hate* one another—if it can be shown, that the operation of such principles constitutes the chief ingredient of the misery which arises from "the worm that never dies, and the fire which is never quenched;" and that, if universally acted upon, they would overthrow all order in the intelligent system, and banish every species of happiness from the universe—it necessarily follows, that such a system cannot be the religion prescribed by the All-wise and benevolent Creator, nor any part of that revelation which proclaims "peace on earth and good-will among men," and which enjoins us to "love the Lord our God with all our hearts, and our neighbor as ourselves."

The Antinomian, in following out his own principles, if no human laws or prudential considerations were to deter him, might run to every excess of profligacy and debauchery—might indulge in impiety, falsehood, and profanity—might commit theft, robbery, adultery, fraud, cruelty, injustice, and even murder, without considering himself as acting contrary to the spirit of his religious system. On his principles, the idea of *heaven*, or a state of perfect happiness, is a physical and moral impossibility; and the idea of *hell* a mere bugbear to frighten children and fools. For, wherever the moral law is generally observed, there can be no great portion of misery experienced under the arrangements of a benevolent Creator; and if this law be set aside, or its observance considered as a matter of indifference, the foundation of all the happiness of saints and angels is necessarily subverted. A heaven without love pervading the breasts of all its inhabitants, would be a contradiction in terms; but love, as we have already seen, is the foundation of every moral precept.

I trust the moral conduct of the deluded mortals who have embraced this system is more respectable than that to which their principles naturally lead;—but the consideration, that such absurd and dangerous opinions have been deduced from the Christian revelation, should act as a powerful stimulus on the Christian world, for directing their attention to a more minute and comprehensive illustration than has hitherto been given, of the *practical bearings* of the Christian system, and of the eternal and immutable obligation of the law of God, which it is the great end of the gospel of Christ to enforce and demonstrate. For it is lamentable to reflect how many thousands of religionists, both in North and in South Britain, even in the present day, have their minds tinctured, in a greater or less degree, with the poison of Antinomianism, in consequence of the general strain of many of the doctrinal sermons they are accustomed to hear, and of the injudicious sentiments they have imbibed from the writings of the supralapsarian divines of the seventeenth century.

* See Cottle's "Strictures on the Plymouth Antinomians."

VIII. Faith and repentance, as required in the Gospel, are absolutely necessary, in the present condition of man, in order to acceptable obedience to the divine law. "Without faith it is impossible to please God; for he that cometh to God must believe that he is, and that he is the rewarder of them that diligently seek him."—Faith, as the term is used in scripture, denotes *confidence* in the moral character of God, founded on the belief we attach to the declarations of his word. It is defined, by the Apostle Paul, in the eleventh chapter of the epistle to the Hebrews, to be the "confident expectation of things hoped for," and "the conviction of things which are not seen."* Faith substantiates and realizes those objects which are invisible to the eye of sense, and which lie beyond the reach of our present comprehension. It recognizes the existence and the omnipresence of an invisible Being, by whose agency the visible operations of nature are conducted; and views him as possessed of infinite wisdom, power, benevolence, faithfulness, rectitude, and eternal duration. It realizes the scenes of an invisible and eternal world—the destruction of the present fabric of our globe, the resurrection of the dead, the solemnities of the last judgment, the new heavens, and the new earth, the innumerable company of angels, and the grandeur and felicity of the heavenly world. These invisible realities it recognizes, on the testimony of God exhibited in his word; and without a recognition of such objects, religion can have no existence in the mind.—In a particular manner, faith recognizes the declarations of God in relation to the character and the condition of men as violators of his law, and as exposed to misery; and the exhibition which is made of the way of reconciliation, through the mediation of Jesus Christ, who is "set forth as a propitiation to declare the righteousness of God in the remission of sins." The man in whose heart the principle of faith operates, convinced that he is guilty before God, and exposed to misery on account of sin, *confides* in the declarations of God respecting "the remission of sins through the redemption that is in Christ Jesus;"—he *confides* in the goodness, mercy, faithfulness, and power of God, which secure the accomplishment of his promises, and the supply of all requisite strength and consolation to support him amidst the dangers and afflictions of life; he *confides* in the wisdom and excellence of those precepts which are prescribed as the rule of his conduct, and which are fitted to guide him to the regions of happiness;—and in the exercise of this confidence, he "adds to his faith, fortitude and resolution, knowledge, temperance, patience, godliness, brotherly kindness, and charity;" and prosecutes with courage this course of obedience, until at length "an entrance is abundantly administered to him into the everlasting kingdom of our Lord and Saviour, Jesus Christ." But, without a recognition of such objects, and an unshaken confidence in the declarations of God respecting them, it is obvious, from the nature of things, that we "cannot please God," nor yield to him an acceptable and "reasonable service."

In like manner it might be shown, that *repentance* is essentially requisite in order to acceptable obedience. Sin is directly opposed to the character of God, and is the great nuisance of the moral universe. While the love of it predominates in any mind, it leads to every species of moral turpitude and depravity; and, consequently, completely unfits such a mind for yielding a

cheerful obedience to the divine law. But repentance, which consists in hatred of sin, and sorrow for having committed it, naturally fits and prepares the mind for the practice of universal holiness. It tends to withdraw the soul from the practice of sin, and warns it of the danger of turning again to folly. It is the commencement of every course of virtuous conduct, and the avenue which ultimately leads to solid peace and tranquillity of mind. It is intimately connected with humility and self-denial, and is directly opposed to pride, vanity, and self-gratulation. It must, therefore, be indispensably requisite to prepare us for conformity to the moral character of God, for universal obedience to his law, and for the enjoyment of substantial and never-ending felicity. Hence the importance which is attached to the exercise of repentance by our Saviour and his Apostles. In connection with faith, it is uniformly represented as the first duty of a sinner, and the commencement of the Christian life. Repentance was the great duty to which the forerunner of the Messiah called the multitudes who flocked to his baptism, and on which the Messiah himself expatiated during the period of his public ministry. "Repent ye, for the kingdom of heaven is at hand." "Except ye repent, ye shall all likewise perish." And the apostles, in their instructions to every nation and to every class of men, laid down the following positions as the foundation of every moral duty. "Repentance toward God, and faith toward our Lord Jesus Christ."

IX. From the preceding illustrations we may learn, that no *merit*, in the sense in which that term is sometimes used, can be attached to human actions in the sight of God; and that the salvation, or ultimate happiness of sinners, is the effect of the grace or benevolence of God.—That the good works of men are *meritorious* in the sight of God, is a notion, as unphilosophical and absurd, as it is impious and unscriptural. They are requisite, and *indispensably* requisite, as *qualifications*, or *preparations* for the enjoyment of felicity, without which the attainment of true happiness, either here or hereafter, is an absolute impossibility; but the actions of no created being, not even the sublimest services and adorations of the angelic hosts, can have the least merit in the eyes of the Creator. "Thy wickedness may hurt a man as thou art, and thy righteousness may profit the son of man;" but "if thou sinnest, what dost thou against God; or, if thou be righteous, what givest thou him? and what receiveth he of thine hand?"* "Thy goodness extendeth not unto him," and "he that sinneth against him wrongeth his own soul."—What merit can there be in the exercise of love, and in the cultivation of benevolent affections, when we consider, that these affections are essentially requisite to our happiness, and that the very exercise of them is a privilege conferred by God, and one of the principal ingredients of bliss? What merit can be attached, in the presence of the Most High, to the noblest services we can perform, when we reflect, that we derived all the corporeal and intellectual faculties by which we perform these services, and all the *means* by which they are excited and directed, from our bountiful Creator? What merit can there be in obedience to his law, when disobedience must infallibly lead to destruction and misery? Is it considered as meritorious in a traveler, when he is properly directed, furnished with strength of body and mind, and provided

* Doddridge's translation of Heb. xi. 1.

* Job xxxv. 6, 8. Psalm xvi. 2, &c.

with every necessary for his journey,—to move forward to the place of his wished-for destination? Our benevolent affections, and the active services to which they lead, may be meritorious in the eyes of our fellow-men, in so far as they are the means of contributing to their enjoyment; but in the presence of Him who sits on the throne of the universe, dispensing blessings to all his offspring, we shall always have to acknowledge, that “we are unprofitable servants.” It is probable, that, if the great object of religion were represented in its native simplicity, if the nature of salvation were clearly understood, and if less were said on the subject of human merit in sermons, and systems of divinity, the idea which I am now combating, would seldom be entertained by any mind possessed of the least share of Christian knowledge, or of common sense.

That the eternal salvation of men, is the effect of the love and the grace of God, is also a necessary consequence from what has been now stated. For every power, capacity, and privilege we possess, was derived from God. “What have we that we have not received?” Even our very existence in the world of life, is *an act of grace*. We exerted no power in ushering ourselves into existence: We had no control over the events which determined that we should be born in Britain, and not in Africa; which determined the particular family with which we should be connected; the education we should receive; the particular objects toward which our minds should be directed, and the privileges we should enjoy.

And, when we arrive at the close of our earthly career, when the spirit is hovering on the verge of life, and about to take its flight from this mortal scene, can it direct its course, by its own energies, through the world unknown? can it wing its way over a region it has never explored, to its kindred spirits in the mansions of bliss? can it furnish these mansions with the scenes and objects from which its happiness is to be derived? can it re-animate the body after it has long moldered in the dust? can it re-unite itself with its long-lost partner? can it transport the resurrection-body, to that distant world where it is destined to spend an endless existence? or can it create those scenes of glory and magnificence, and those ecstatic joys which will fill it with transport while eternity endures? If it cannot be supposed to accomplish such glorious objects by its own inherent powers, then, it must be indebted for every entertainment in the future world to the unbounded and unmerited love and mercy of God. To Him, therefore, who sits upon the throne of the heavens, and to the Lamb who was slain and hath redeemed us to God by his blood, let all praise, honor, dominion, and power, be ascribed now and forever. Amen.

Having now finished what I proposed in the illustration of the principles of love to God and to man, and of the precepts of the Decalogue,—in the following chapter, I shall take a bird's eye view of the moral state of the world; and endeavor to ascertain, to what extent these principles and laws have been recognized and observed by the inhabitants of our globe.

CHAPTER IV.

A BRIEF SURVEY OF THE MORAL STATE OF THE WORLD; OR, AN EXAMINATION OF THE GENERAL TRAIN OF HUMAN ACTIONS, IN REFERENCE TO ITS CONFORMITY WITH THE PRINCIPLES AND LAWS NOW ILLUSTRATED.

THE discoveries of modern astronomy have led us infallibly to conclude, that the universe consists of an immense number of systems and worlds dispersed, at immeasurable distances from each other, throughout the regions of infinite space. When we take into consideration the *Benevolence* of the Deity, and that the happiness of the intelligent creation is the great object which his Wisdom and Omnipotence are employed to accomplish—it appears highly probable, that the inhabitants of the whole, or at least of the greater part, of those worlds whose suns we behold twinkling from afar, are in a state of moral perfection, and consequently, in a state of happiness. At any rate, it is reasonable to conclude, that the exceptions which exist are not numerous. Perhaps this earth is the only material world where physics: evil exists, where misery prevails, and where moral order is subverted; and these dismal effects may have been permitted to happen, under the government of God, in order to exhibit to other intelligences, a specimen of the terrible and destructive consequences of *moral* evil, as a warning of the danger of infringing, in the least degree, on those moral principles which form the bond of union among the intelligent system.

Could we trace the series of events which have occurred, in any one of those happy worlds, where moral perfection prevails, ever since the period when it was replenished with inhabitants, and the objects to which their physical and rational pow-

ers have been directed, we should, doubtless, be highly delighted and enraptured with the moral scenery which the history of such a world would display. Its annals would uniformly record the transactions of *benevolence*. We should hear nothing of the pomp of hostile armies, of the shouts of victory, of the exploits of heroes, of the conflagration of cities, of the storming of fortifications, of the avarice of merchants and courtiers, of the burning of heretics, or of the ambition of princes. The train of events, presented to our view, would be directly opposed to every object of this description, and to everything which forms a *prominent* feature in the history of mankind. To beautify and adorn the scenery of nature around them, to extend their views of the operations of the Almighty, to explore the depths of his wisdom and intelligence, to admire the exuberance of his goodness, to celebrate, in unison, the praises of the “King Eternal,” the Author of all their enjoyments, to make progressive advances in moral and intellectual attainments, to circulate joy from heart to heart, to exert their ingenuity in the invention of instruments by which their physical powers may be improved, and the wonders of creation more minutely explored; to widen the range of delightful contemplation, to expand their views of the Divine perfections, and to increase the sum of happiness among all their fellow-intelligences, will doubtless form a part of the employments of the inha-

bitants of a world where moral purity universally prevails. One circumstance which may probably diversify the annals of such a world, and form so many eras in its history, may be the occasional visits of angelic or other messengers, from distant regions of creation, to announce the will of the Almighty on particular emergencies, to relate the progress of new creations in other parts of the Divine Empire, and to convey intelligence respecting the physical aspects, the moral arrangements, and the history of other worlds, and of other orders of intellectual beings. Such visits and occasional intercourses with celestial beings, would, undoubtedly, have been more frequent in our world, had not man rendered himself unqualified for such associations, by his groveling affections, and by the moral pollutions with which his character is now stained.

When we turn our eyes from the transactions of such a world, to the world in which we live, how very different a scene is presented to the view! The history of all nations embraces little more than

A RECORD OF THE OPERATIONS OF MALEVOLENCE.

Every occurrence has been considered as tame and insipid, and scarcely worthy of being recorded, unless it has been associated with the confused noise of warriors, the shouts of conquerors, the plunder of provinces, the devastation of empires, the groans of mangled victims, the cries of widows and orphans, and with garments rolled in blood. When such malevolent operations cease for a little, in any part of the world, and the tumultuous passions which produced them, subside into a temporary calm, the historian is presented with a *blank* in the annals of the human race, the short interlude of peace and of apparent tranquillity is passed over as unworthy of notice, until the restless passions of avarice and ambition be again roused into fury, and a new set of desperadoes arise, to carry slaughter and desolation through the nations. For, during the short temporary periods of repose from the din of war, which the world has occasionally enjoyed, the malignant passions, which were only smothered, but not extinguished, prevented the operation of the benevolent affections; and, of course, no extensive plans for the counteraction of evil, and the improvement of mankind, worthy of being recorded by the annalist and the historian, were carried into effect.

In order to produce a definite impression of the moral state of the world, I shall endeavor, in this chapter, to give a rapid sketch of the prominent dispositions of mankind, as displayed in the general train of human actions—that we may be enabled to form a rude estimate of the degree in which the law of God has been recognized, and of the extent to which its violation has been carried, on the great theater of the world, and in the ordinary transactions of general society.

I shall, in the first place, take a rapid view of the moral state of the world in ancient times, and then take a more particular survey of the present state of morals, among savage and civilized nations—in the Christian world—and among the various ranks and orders of society.

SECTION I.

STATE OF MORALS IN THE ANCIENT WORLD.

MAN was originally formed after the moral image of his Maker. His understanding was

quick and vigorous in its perceptions; his will subject to the divine law, and to the dictates of his reason; his passions serene and uncontaminated with evil; his affections dignified and pure; his love supremely fixed upon his Creator; and his joy unmingled with those sorrows which have so long been the bitter portion of his degenerate race. But the primogenitor of the human race did not long continue in the holy and dignified station in which he was placed. Though he was placed in “a garden of delights,” surrounded with everything that was delicious to the taste and pleasant to the eye, yet he dared to violate a positive command of his Maker, and to stretch forth his impious hand to pluck and to taste the fruit of the forbidden tree—a picture and a prelude to the conduct of millions of his degraded offspring who despise the lawful enjoyments which lie within their reach, and obstinately rush on forbidden pleasures, which terminate in wretchedness and sorrow. The dismal effects of the depraved dispositions thus introduced among the human species, soon became apparent. Cain, the first-born son of Adam, had no sooner reached to the years of maturity, than he gave vent to his revengeful passions, and imbrued his hands in his brother's blood. And ever since the perpetration of this horrid and unnatural deed, the earth has been drenched with the blood of thousands and of millions of human beings, and the stream of corruption has flowed without intermission, and in every direction around the globe.

Of the state of mankind in the ages before the flood, the sacred history furnishes us with only a few brief and general descriptions. But those descriptions, short and general as they are, present to us a most dreadful and revolting picture of the pitch of depravity and wickedness to which the human race had arrived. We have the testimony of God himself to assure us, that, within 1600 years from the creation of the world, “the wickedness of man had become great upon the earth—that the earth was filled with violence”—yea, that “every imagination of the thoughts of man's heart was only evil continually,” or, as it may more literally be rendered from the Hebrew, “the whole imagination, comprehending all the purposes and desires of the mind, was only evil from day to day.”—“God looked upon the earth; and beheld it was corrupt; for all flesh had corrupted their way upon the earth.” A more comprehensive summary of the greatness and the extent of human wickedness it is scarcely possible to conceive. The mind is left to fill up the outline of this horrid picture with everything that is degrading to the human character, with everything that is profligate and abominable in manners, with everything that is base, false, deceitful, licentious, and profane, and with everything that is horrible and destructive in war, and ruinous to the interests of human happiness.

The description now quoted, contains the following intimations:—1. That, previous to the deluge, wickedness had become universal. It was not merely the majority of mankind that had thus given unbounded scope to their licentious desires, while smaller societies were to be found in which the worship of the true God, and the precepts of his law were observed. For “*all flesh* had corrupted their ways.” And, at this period the world is reckoned to have been much more populous than it has been in any succeeding age, and to have contained at least ten billions of inhabitants, or many thousands of times the amount of its present population. So that universal wickedness must have produced misery

among human beings to an extent of which we can form no adequate conception. 2. The description implies, that every invention, and every purpose and scheme devised both by individuals and by communities, was of a malevolent nature. "The imagination of every man's heart was only evil continually." The dreadful spectacles of misery and horror which the universal prevalence of such principles and practices which then existed, must have produced, are beyond the power of human imagination either to conceive or to delineate. Some faint idea, however, may be formed of some of these spectacles, from the descriptions I have already given of the effects which would inevitably follow, were the principle of *benevolence* to be eradicated from the mind, or were any one of the precepts of the divine law to be universally violated—(see ch. ii. sect. iv., and ch. iii. throughout). 3. The effects produced by this universal depravity are forcibly expressed in the words, "The earth was filled with violence." From this declaration, we are necessarily led to conceive a scene in which universal anarchy and disorder, devastation and wretchedness, everywhere prevailed—the strong and powerful forcibly seizing upon the wealth and possessions of the weak, violating the persons of the female sex, oppressing the poor, the widow, and the fatherless, overturning the established order of families and societies, plundering cities, demolishing temples and palaces, desolating fields, orchards, and vineyards, setting fire to towns and villages, and carrying bloodshed and devastation through every land—a scene in which cruelty, injustice, and outrages of every kind, obscenity, revelry, riot, and debauchery of every description, triumphed over every principle of decency and virtue—a scene in which the earth was strewn with smoking ruins, with fragments of human habitations, with mangled human beings in a state of wretchedness and despair, and with the unburied carcases of the slain.

Such appears to have been the state of general society at the time when Noah was commanded to build an ark of refuge—a state of society which could not have long continued, but must inevitably, in the course of a few generations, have thinned the race of mankind, and ultimately have extirpated the race of Adam from the earth, even although the deluge had never been poured upon the world. Wickedness appears to have come to such a height, that no interposition of Providence could be supposed available to produce a reformation among mankind, without destroying their freedom of will; and, therefore, it was an act of *mercy*, as well as of judgment, to sweep them away at once by the waters of the flood, after having given them warnings of their danger; in order to convince such obstinate and abandoned characters that "there is a God that judgeth in the earth;" and in order to prevent the misery which would otherwise have been entailed on succeeding generations.

Not only the Sacred, but also the Pagan writers, when alluding to the antediluvians, uniformly represent them as abandoned to uncleanness, and all kinds of wickedness. Eutyclus, in his *Annals*, when speaking of the posterity of Cain, says, "that they were guilty of all manner of filthy crimes with one another, and, meeting together in public places for that purpose, two or three men were concerned with the same woman; the ancient women, if possible, being more lustful and brutish than the young. Nay, fathers lived promiscuously with their daughters, and the young men with their mothers, so that neither

the children could distinguish their own parents, nor the parents know their own children." Lucian, a native of Samosata, a town situated on the Euphrates, a spot where memorials of the deluge were carefully preserved, gives the following account of the antediluvians:—"The present race of mankind," says he, "are different from those who first existed; for those of the antediluvian world were all destroyed. The present world is peopled from the sons of Deucalion [or Noah]; having increased to so great a number from one person. In respect of the former brood, they were men of violence, and lawless in their dealings. They were contentious, and did many unrighteous things; they regarded not oaths, nor observed the rights of hospitality, nor showed mercy to those who sued for it. On this account they were doomed to destruction; and for this purpose there was a mighty eruption of waters from the earth, attended with heavy showers from above; so that the rivers swelled, and the sea overflowed, until the whole earth was covered with a flood, and all flesh drowned. Deucalion alone was preserved to re-people the world. This mercy was shown to him on account of his piety and justice. His preservation was effected in this manner:—He put all his family, both his sons and their wives, into a vast ark which he had provided, and he went into it himself. At the same time animals of every species—boars, horses, lions, serpents, whatever kind lived upon the face of the earth—followed him by pairs; all which he received into the ark, and experienced no evil from them; for there prevailed a wonderful harmony throughout, by the immediate influence of the Deity. Thus were they wafted with him as long as the flood endured.

Such is the account which Lucian gives of the antediluvian world, and of the preservation of the human race, as he received it from the traditions of the inhabitants of Hierapolis, in Syria, where the natives pretended to have very particular memorials of the deluge. It corroborates the facts stated in the sacred history, and bears a very near resemblance to the authentic account which has been transmitted to us by Moses.—These facts, respecting the depravity of the antediluvians, present to us a striking example, and a demonstrative evidence of the dreadful effects to which a general violation of the divine law necessarily leads; and of the extensive confusion and misery which are inevitably produced, when the law of love is set aside, and when malevolence exerts, without control, its diabolical energies. All order in society is subverted, every species of rational happiness is destroyed, and the existence of intelligent beings, in such a state, becomes a curse to themselves, and to all around them. Had not this been the case in the primeval world, we cannot suppose that the Deity would have exerted his Omnipotence in shattering the crust of the terraqueous globe, and burying its inhabitants under the waters of the deluge.

After the deluge had subsided, and the race of Noah had begun to multiply on the earth, it was not long before the depravity of man began to show itself by its malignant effects; though human wickedness has never arrived to such a pitch as in the times before the flood; for this reason, among others, that the life of man has been reduced to a narrow span, which prevents him from carrying his malevolent schemes to such an extent as did the inhabitants of the world before the flood, whose lives were prolonged to the period of nearly a thousand years. The lust of *ambition* soon began to exert its baleful influence over the

mind; and an inordinate desire after wealth, distinctions, and aggrandizement, paved the way for the establishment of despotism, and for encroachments on the rights and the enjoyments of mankind. Among the heroes and despots of antiquity, *Nimrod*, the founder of the Babylonish empire, holds a distinguished place. He was the grandson of *Ham*, the son of Noah, and is the first one mentioned in Scripture who appears to have made invasions on the territories of his neighbors. Having distinguished himself, by driving from his country the beasts of prey, and by engaging in other valorous exploits, he appears to have aspired after regal dignity and power, and to have assumed the reins of absolute government. He was the first that subverted the patriarchal government; and is supposed to have introduced, among his subjects, the *Zabian* idolatry, or the worship of the heavenly host. "The beginning of his kingdom," we are told, "was Babylon, and Erech, and Accad, and Calneh, in the land of Shinar." In the footsteps of this proud and ambitious despot, has followed a train of Alexanders, Cæsars, Hannibals, Jenghiz-Khans, Attilas, Alarics, Tamerlanes, Marlboroughs, Fredericks, and Bonapartes, who have driven the plowshare of devastation through the world, erected thrones over the graves of slaughtered nations, decorated their palaces with trophies dyed in blood, and made the earth to resound with the groans and shrieks of dying victims, and the voice of mourning, lamentation, and woe.

To delineate all the scenes of desolation and horror which have been produced by such desperadoes, and the atrocious crimes and immoralities which have followed in their train, would be to transcribe the whole records of ancient and modern history, which contain little else than a register of human folly, avarice, ambition, and cruelty; and of the daring villanies with which they have been accompanied. Even then, we should acquire but a very limited conception of the extent of moral evil, and of the immense variety of shapes which it has assumed; for the one-tenth of the crimes of mankind has never been recorded; and it is to the public transactions of only a small portion of the world that the page of the historian directs our attention. I shall, therefore, content myself with stating a few insulated facts, as specimens of the train of actions which have generally prevailed in the world.

WARLIKE DISPOSITIONS OF MANKIND.

War, as already noticed, has been the delight and the employment of man in every age; and, under this term may be included everything that is base and execrable in moral conduct, everything that is subversive of the principle of benevolence, everything that is destructive of human enjoyment, everything that rouses the passions into diabolical fury, everything that adds to the sum of human wretchedness, everything that is oppressive, cruel, and unjust, and everything that is dreadful and appalling to mankind.—As an exemplification of the destructive effects of war, I shall, in the first place, state a few facts in relation to the Carthaginians.

Carthage was originally a small colony of Phenicians, who, about 800 years before the Christian era, settled on the northern coast of Africa, on a small peninsula, adjacent to the bay of Tunis. Having increased in wealth and power, by means of their extensive commerce, like most other nations, they attempted to make inroads on the territories of neighboring tribes, and to plunder them of their treasures. By degrees they extended their

power over all the islands in the Mediterranean, Sicily only excepted. For the entire conquest of this island, about 480 years before Christ, they made vast preparations, which lasted for three years. Their army consisted of 300,000 men; their fleet was composed of upward of 2000 men of war, and 3000 transports. With such an immense armament, they made no doubt of conquering the whole island in a single campaign. But they found themselves miserably deceived. Hamilcar, the most experienced captain of the age, sailed from Carthage with this formidable army, and invested the city of Hymera. The besieged were much straitened and dismayed by the operations of this powerful armament; but Gelon, the tyrant of Syracuse, flew immediately to their relief, with 50,000 foot and 5000 horse. A dreadful slaughter ensued: an hundred and fifty thousand of the Carthaginians were killed in the battle and pursuit, and all the rest taken prisoners; so that not a single person escaped of this mighty army. Of the 2000 ships of war, and the 3000 transports of which the fleet consisted, *eight* ships only, which then happened to be out at sea, made their escape: these immediately set sail for Carthage, but were all cast away, and every soul perished, except a few who were saved in a small boat, and at last reached Carthage with the dismal tidings of the total loss of the fleet and army.—Here we have presented to our view, in one short struggle, the entire destruction of more than *two hundred thousand* human beings, if we take into account the number which must necessarily have fallen in the Sicilian army. And, if we take into consideration the many thousands of mangled wretches, whose existence, from that moment, would be rendered miserable; the destruction of property in the besieged city; the victims crushed to death amidst the ruins of falling houses; the cries, and shrieks, and lamentations of women and children; the diseases and the misery induced by terror and alarm, and the loss of friends; the terrific and appalling spectacle of 5000 ships all on a blaze, of ten thousands of burning and drowning wretches, supplicating in vain for mercy, and the oaths, execrations, and furious yells which would be mingled with this work of destruction, we shall find it difficult to form an adequate conception of the miseries and horrors of such a scene. And what was the cause of this dreadful slaughter and devastation? That proud and opulent city, whose inhabitants were rioting in every species of luxury, might gratify its ambition, by tyrannizing over neighboring tribes, and by plundering them of that wealth of which it did not stand in need. And this is but one instance out of ten hundred thousand of the miseries of war,—one *faint shade* in the picture of human woe!

One would have thought, that, after such a signal loss and discomfiture, the Carthaginians would have contented themselves with their own territory, and refrained from aggressive war. This, however, was not the case. Where benevolence is banished from the mind, and *revenge* occupies its place in the affections, it will hurry unprincipled men to the most wild and atrocious actions, although they should terminate in destruction to themselves and to all around them. It was not long after this period, when preparations were again made for the invasion of Sicily. Hannibal, the grandson of Hamilcar, landed on the coast of Sicily, and laid siege to Selinus. The besieged made a vigorous defense; but at last the city was taken by storm, and the inhabitants were treated with the utmost cruelty. All were massacred by the savage conquerors, except the

women, who fled to the temples;—and these escaped, not through the merciful dispositions of the Carthaginians, but because they were afraid, that, if driven to despair, they would set fire to the temples, and by that means consume the treasure they expected to find in those places. Sixteen thousand were massacred; the women and children, about 5000 in number, were carried away captive; the temples were plundered of all their treasures, and the city razed to the ground. Hymera was next besieged by Hannibal, and razed to its foundations. He forced three thousand prisoners to undergo all kinds of ignominy and punishments, and at last murdered them, on the very spot where his grandfather had been killed by Gelon's cavalry, to appease and satisfy his *manes*, by the blood of these unhappy victims. Such is the *humanity* and the *justice* of those men, whom we are accustomed to distinguish by the names of *Patriots* and *Heroes*!—Elated with these partial victories, the Carthaginians meditated the reduction of the whole of Sicily. They marched against the city of Agrigentum, and battered its walls with dreadful fury. The besieged defended themselves with incredible resolution. In a sally, they burned all the battering machines raised against their city, and repulsed the enemy with immense slaughter. Again the Carthaginians rallied their forces, beat down the walls of the city, plundered it of an immense booty, and with their usual cruelty, put all its inhabitants to the sword, not excepting even those who had fled to the temples. The Carthaginians were soon after forced to retire from Sicily. Again they renewed their expeditions; again they were repulsed; and again they plunged into the horrors of war; while thousands and ten thousands were slaughtered at every onset; men, women, and children massacred in cold blood; and the pestilence produced by the unburied carcasses of the slain, proved more fatal to myriads, than even the sword of the warrior.

In this manner did these infatuated mortals carry on a series of sanguinary contests for several centuries, with the Sicilians, Greeks, and other nations; until, at length, they dared to encounter the power, and the formidable forces of the Romans, and commenced those dreadful and long-continued conflicts, distinguished in History by the name of *The Punic Wars*. The first Punic war lasted twenty-four years; the second, seventeen years; and the third, four years and some months. In this last contest, the plowshare of destruction was literally driven through their devoted city, by the Romans. It was delivered up to be plundered by their soldiers; its gold, silver, statues, and other treasures amounting to 4,470,000 pounds weight of silver, were carried off to Rome; its towers, ramparts, walls, and all the works which the Carthaginians had raised in the course of many ages, were leveled to the ground. Fire was set to the edifices of this proud metropolis, which consumed them all, not a single house escaping the fury of the flames. And though the fire began in all quarters at the same time, and burned with incredible violence, it continued for *seventeen* days before all the buildings were consumed.—Thus perished Carthage—a city which contained 700,000 inhabitants, and which had waged so many ferocious wars with neighboring nations—a terrible example of the destructive effects produced by malevolent passions, and of the retributive justice of the Governor of the world. The destruction of human life in the numerous wars in which it was engaged, is beyond all specific calculation. During the space

of sixteen years, Hannibal, the Carthaginian general, plundered no less than four hundred towns, and destroyed 300,000 of his enemies; and we may safely reckon, that nearly an equal number of his own men must have been cut off by the opposing armies; so that several millions of human victims must have been sacrificed in these bloody and cruel wars.

The following is a summary statement of the number of human beings that were slain in several of the battles recorded in history.—In the year 101 before Christ, in an engagement between Marius, the Roman Consul, and the Ambrones and the Teutones, in Transalpine Gaul, there were slain of these barbarians, beside what fell in the Roman army, 200,000, some historians say, 290,000. And it is related, that the inhabitants of the neighboring country made fences for vineyards of their bones. In the following year, the Romans, under the command of the same general, slaughtered 140,000 of the Cimbri, and took 60,000 prisoners. In the year 105, B. C., the Romans, in a single engagement with the Cimbri and the Teutones, lost upward of 80,000 men. In the battle of Cannæ, the Romans were surrounded by the forces of Hannibal, and cut to pieces. After an engagement of only *three hours*, the carnage became so dreadful, that even the Carthaginian general cried out, to spare the conquered. Above 40,000 Romans lay dead on the field, and six thousand of the Carthaginian army. What a dreadful display of the rage and fury of diabolical passions must have been exhibited on this occasion! and what a horrible scene must have been presented on the field of battle, when we consider, that, in the mode of ancient warfare, the slain were literally mangled and cut to pieces!—In the battle of Issus, between Alexander and Darius, were slain 110,000; in the battle of Arbela, two years afterward, between the same two despots, 300,000; in the battle between Pyrrhus and the Romans, 25,000; in the battle between Scipio and Asdrubal, 40,000; in the battle between Suetonius and Boadicea, 80,000. In the siege of Jerusalem by Vespasian, according to the account of Josephus, there were destroyed, in the most terrible manner, 1,100,000; and there were slaughtered in Jerusalem, in 170, B. C., by Antiochus, 40,000. At Cyrene, there were slain of Romans and Greeks, by the Jews, 220,000; in Egypt and Cyprus, in the reign of Trajan, 240,000; and in the reign of Adrian, 580,000 Jews. After Julius Caesar had carried his arms into the territories of Usipetes in Germany, he defeated them with such slaughter, that 400,000 are said to have perished in one battle. At the defeat of Attila, King of the Huns, at Chalons, there perished about 300,000. In the year 631, there were slain by the Saracens in Syria, 60,000; in the invasion of Milan by the Goths, no less than 300,000; and in A. D. 734, by the Saracens in Spain, 370,000. In the battle of Fontenay, were slaughtered 100,000; in the battle of Yermouk, 150,000; and in the battle between Charles Martel and the Mahometans, 150,000. In the battle of Muret, in A. D. 1213, between the Catholics and the Albigenses, were slain 32,000; in the battle of Cressy, in 1346, 50,000; in the battle of Halidon-hill, in 1333, 20,000; in the battle of Agincourt, in 1415, 20,000; in the battle of Towton, in 1461, 37,000; in the battle of Lepanto, in 1571, 25,000; at the siege of Vienna, in 1683, 70,000; and in a battle in Persia, in 1734, 60,000.*

* The above statements are collected from facts stated in Rollin's Ancient History, Millot's Elements, Mavor's Uni-

The most numerous army of which we have any account in the annals of history, was that of Xerxes. According to the statement of Rollin, which is founded on the statements of Herodotus, Isocrates, and Plutarch, this army consisted of 1,700,000 foot, 80,000 horse, and 20,000 men for conducting the carriages and camels. On passing the Hellespont, an addition was made to it from other nations, of 300,000, which made his land forces amount to 2,100,000. His fleet consisted of 1207 vessels, each carrying 230 men; in all 277,610 men, which was augmented by the European nations, with 1200 vessels carrying 240,000 men. Beside this fleet, the small galleys, transport ships, &c., amounted to 3000, containing about 240,000 men. Including servants, eunuchs, women, sutlers, and others, who usually follow an army, it is reckoned, that the whole number of souls that followed Xerxes into Greece, amounted to 5,283,220; which is more than the whole of the male population of Great Britain and Ireland, above twenty years of age, and nearly triple the whole population of Scotland. After remaining some time in Greece, nearly the whole of this immense army, along with the fleet, was routed and destroyed. Mardonius, one of his ablest commanders, with an army of 300,000, was finally defeated and slain at the battle of Platea, and only three thousand of this vast army, with difficulty escaped destruction.

The destruction of human life in the wars which accompanied and followed the incursions of the barbarians, who overthrew the Roman empire, is beyond all calculation or conception. It forms an era in history most degrading to the human species. In the war which was waged in Africa, in the days of Justinian, Procopius remarks, "It is no exaggeration to say, that five millions perished by the sword, and famine, and pestilence." The same author states that, during the twenty years' war which Justinian carried on with the Gothic conquerors of Italy, the loss of the Goths amounted to above 15 millions; nor will this appear incredible, when we find, that in one campaign, 50,000 laborers died of hunger. About the beginning of the 13th century arose that cruel and bloody tyrant Jenghiz-Khan. With immense armies, some of them amounting to more than a million in number, he overran and subdued the kingdom of Hya in China, Tangut, Kitay, Turkistan, Karazum, Great Bucharia, Persia, and part of India, committing the most dreadful cruelties and devastations. It is computed, that, during the last 22 years of his reign, no fewer than 14,470,000 persons were butchered by this scourge of the human race. He appeared like an infernal fiend, breathing destruction to the nations of the East, and the principle which he adopted, after conquest, was utter extermination.

Nearly about the same period when this monster was ravaging and slaughtering the eastern world, those mad expeditions, distinguished by the name of the *Crusades*, were going forward in the west. Six millions of infatuated wretches, raging with hatred, and thirsting for blood, assumed the image of the cross, and marched in wild disorder to the confines of the Holy land, in order to recover the city of Jerusalem from the hands of the infidels. In these *holy wars*, as they were impiously termed, more than 850,000 Europeans were sacrificed before they obtained posses-

sion of Nice, Antioch, and Edessa. At the siege of Acre, 300,000 were slain; and at the taking of Jerusalem, in 1099, about seventy thousand. For 196 years, these wild expeditions continued in vogue, and were urged forward by proclamations issued from the throne, and by fanatical sermons thundered from the pulpit, until several millions of deluded mortals perished from the earth; for by far the greater part of those who engaged in the crusades, were either slain or taken prisoners. About this period, and several centuries before it, the whole earth exhibited little else than one great field of battle, in which nations were dashing against each other, conquerors ravaging kingdoms, tyrants exercising the most horrid cruelties; superstition and revenge immolating their millions of victims; and tumults, insurrections, slaughter, and universal alarm, banishing peace and tranquillity from the world, and subverting the moral order of society. "In Europe, Germany and Italy were distracted by incessant contests between the pope and the emperors; the interior of every European kingdom was torn in pieces by the contending ambition of the powerful barons; in the Mahomedan empire, the caliphs, sultans, emirs, &c. waged continual war; new sovereignties were daily arising, and daily destroyed; and amidst this universal slaughter and devastation, the whole earth seemed in danger of being laid waste, and the human race to suffer a total annihilation."*

Such is the bird's eye view of the destruction of the human species, which war has produced in different periods. The instances I have brought forward present only a few detached circumstances in the annals of warfare, and relate only to a few limited periods in the history of man: and yet in the four instances above stated, we are presented with a scene of horror, which includes the destruction of nearly 50 millions of human beings. What a vast and horrid picture, then, would be presented to the eye, could we take in at one view *all the scenes of slaughter*, which have been realized in every period, in every nation, and among every tribe! If we take into consideration not only the number of those who have fallen in the field of battle, but of those who have perished through the natural consequences of war, by the famine and the pestilence, which war has produced; by disease, fatigue, terror, and melancholy; and by the oppression, injustice, and cruelty of savage conquerors,—it will not, perhaps, be overrating the destruction of human life, if we affirm, that *one-tenth* of the human race has been destroyed by the ravages of war. And if this estimate be admitted, it will follow, that more than *fourteen thousand millions* of human beings have been slaughtered in war, since the beginning of the world—which is about *eighteen times* the number of inhabitants which, at the present, exist on the globe; or, in other words, it is equivalent to the destruction of the inhabitants of eighteen worlds of the same population as ours.† That this conclusion is rather within than beyond the bounds of truth, will appear, from what has been stated above respecting the destruction of the Goths, in the time of Justinian. In the course of 20 years, 15 millions of persons perished in the wars. Now, if the population of the countries of Europe, in which these wars took place, did not exceed 60 millions, the proportion of the slaughtered to the

versal History, the historical Articles in the Encyclopedia Britannica, from a list of battles contained in the "Pictures of War," &c.

* Mavor's Universal History, Robertson's Charles V. &c.
† This calculation proceeds on the ground, that 145 thousand millions of men have existed since the Mosaic creation. See Christian Philosopher, Art. *Geography*.

whole population was as *one to four*, and, if 20 years be reckoned as only half the period of a generation, the proportion was as *one to two*; in other words, at the rate of one half of a whole generation in the course of 40 years. What a horrible and tremendous consideration!—to reflect, that 14,000,000,000 of beings, endowed with intellectual faculties, and furnished with bodies curiously organized by divine wisdom—that the inhabitants of eighteen worlds should have been massacred, mangled, and cut to pieces, by those who were partakers of the same common nature, as if they had been created merely for the work of destruction! Language is destitute of words sufficiently strong to express the emotions of the mind, when it seriously contemplates the horrible scene. And how melancholy is it to reflect, that in the present age, which boasts of its improvements in science, in civilization, and in religion, neither reason, nor benevolence, nor humanity, nor Christianity, has yet availed to arrest the progress of destroying armies, and to set a mark of ignominy on “the people who delight in war!”

ATROCITIES CONNECTED WITH WAR.

However numerous may have been the victims that have been sacrificed in war, it is not so much the mere extinction of human life that renders the scene of warfare so horrible, as the cruelties with which it has always been accompanied, and the infernal passions which it has engendered and carried into operation. It extirpates every principle of compassion, humanity, and justice; it blunts the feelings, and hardens the heart; it invents instruments of torture, and perpetrates, without a blush, cruelties revolting to every principle of virtue and benevolence.

When Jerusalem was taken by Antiochus Epiphanes, in the year 168, B. C., he gave orders to one division of his army to cut in pieces all who were found in the temple and synagogues; while another party, going through the streets of the city, massacred all that came in their way. He next ordered the city to be plundered and set on fire; pulled down all their stately buildings, caused the walls to be demolished, and carried away captive ten thousand of those who had escaped the slaughter. He set up the statue of Jupiter Olympus on the altar of burnt-offerings, and all who refused to come and worship this idol were either massacred, or put to some cruel tortures, until they either complied or expired under the hands of the executioners. In the war which the Carthaginians waged with the Mercenaries, Hamilcar, the Carthaginian general, threw all the prisoners that fell into his hands to be devoured by wild beasts. Asdrubal, another Carthaginian general, when engaged in war against the Romans, in revenge for a defeat he had sustained, brought all the Roman prisoners he had taken during two years, upon the walls, in the sight of the whole Roman army. There he put them to the most exquisite tortures, putting out their eyes, cutting off their noses, ears, and fingers, legs and arms, tearing their skin to pieces with iron rakes or harrows; and then threw them headlong from the top of the battlements.* He was of a temper remarkably human, and it is said that he even took pleasure in seeing some of these unhappy men flayed alive. In the year 1201, when Jenghiz-Khan had reduced the rebels who had seized upon his paternal possessions, as a specimen of his lenity, he caused seventy of their

chiefs to be thrown into as many cauldrons of boiling water. The plan on which this tyrant conducted his expeditions, as already stated, was that of total extermination. For some time he utterly extirpated the inhabitants of those places which he conquered, designing to people them anew with his Moguls; and, in consequence of this resolution, he would employ his army in beheading 100,000 prisoners at once.—Tamerlane, one of his successors, who followed in his footsteps, is said to have been more humane than this cruel despot. Historians inform us that “his sportive cruelty seldom went farther than the pounding of three or four thousand people in large mortars, or building them among bricks and mortar into a wall.” If such be the “tender mercies of the wicked,” how dreadful beyond description must their cruelties be!

We are accustomed to hear Alexander the Great eulogized as a virtuous and magnanimous hero; and even the celebrated Montesquieu, in his “*Spirit of Laws*,” has written a panegyric on his character. Yet we find him guilty of the most abominable vices, and perpetrating the most atrocious crimes. At the instigation of the strumpet Thais, during a drunken banquet, he set on fire the beautiful city of Persepolis, and consumed it to ashes;—Clitus, one of his captains, and brother of Helenice, who had nursed Alexander, and saved his life at the battle of the Granicus, at the imminent danger of his own. Yet this man, to whom he was so highly indebted, he thrust through with a javelin, at an entertainment to which he had invited him; on account of his uttering some strong expressions, which were intended to moderate Alexander’s vanity. His treatment of the Branchidæ furnishes an example of the most brutal and frantic cruelty which history records. These people received Alexander, while pursuing his conquests, with the highest demonstrations of joy, and surrendered to him both themselves and their city. The next day, he commanded his phalanx to surround the city, and, a signal being given, they were ordered to plunder it, and to put every one of its inhabitants to the sword; which inhuman order was executed with the same barbarity with which it had been given. All the citizens, at the very time they were going to pay homage to Alexander, were murdered in the streets and in their houses; no manner of regard being had to their cries and tears, nor the least distinction made of age or sex. They even pulled up the very foundations of the walls, in order that not the least traces of that city might remain. And why were these ill-fated citizens punished in so summary and inhuman a manner? Merely because their forefathers, upward of one hundred and fifty years before, had delivered up to Xerxes the treasure of the temple of Didymæon, with which they had been intrusted!—When he entered the city of Tyre, after a siege of seven months, he gave orders to kill all the inhabitants, except those who had fled to the temples, and set fire to every part of the city. Eight thousand men were barbarously slaughtered; and two thousand more remaining, after the soldiers had been glutted with slaughter, he fixed two thousand crosses along the seashore,† and caused them all to be crucified.

War has given rise to the most shocking and unnatural crimes, the idea of which might never otherwise have entered into the human mind. Lathyrus, after an engagement with Alexander,

* Rollin’s Ancient History, Vol. I.

* Rollin’s Ancient Hist.

† Ibid.

king of the Jews, on the banks of the river Jordan—the same evening he gained the battle, in going to take up his quarters in the neighboring villages, found them full of women and children, and caused them all to be put to the sword, and their bodies to be cut to pieces, and put into cauldrons in order to their being dressed, as if he intended to make his army sup upon them. His design was to have it believed that his troops ate human flesh, to spread the greater terror throughout the surrounding country.*

Even under the pretext of religion, and of the *Christian* religion too, the most shocking barbarities have been committed. Under the pretense of vindicating the cause of Him who, in the midst of cruel sufferings from men, prayed, "Father, forgive them, for they know not what they do," the crusaders hurried forward toward Jerusalem, wading through seas of blood. When their banners were hoisted on a principal eminence of Antioch, they commenced their butchery of the sleeping inhabitants. The dignity of age, the helplessness of youth, and the beauty of the weaker sex, were disregarded by these sanctimonious savages. Houses were no sanctuaries; and the sight of a mosque added new virulence to cruelty. The number of Turks massacred, on this night of frantic fury, was at least ten thousand. After every species of habitation, from the marble palace to the meanest hovel, had been converted into a scene of slaughter; when the narrow streets and the spacious squares were all alike disfigured with human gore, and crowded with mangled carcasses, then the assassins turned robbers, and became as mercenary as they had been merciless. When Jerusalem was taken by these furious fanatics, they suffered none to escape the slaughter: "Yet, after they had glutted themselves with blood and carnage, they immediately became devout pilgrims, and in religious transports, ran barefooted to visit the holy sepulcher."† In what light must that religion appear to Eastern Infidels which is supposed to lead to the perpetration of such enormities? And how woefully are the mild precepts and doctrines of Christianity misrepresented, when desperadoes of this description dare assume the Christian name!

Even the finer feelings of the female sex have been blunted, and, in many instances, quite extirpated by the mad schemes of ambition, and the practices connected with war. Toward the beginning of the thirteenth century, a Queen of Hungary took the sign of the cross, and embarked in the mad expeditions of the crusaders, as did likewise fifty thousand children and a crowd of priests; because, according to the Scripture, "God has made children the instruments of his glory."‡ Cleopatra, daughter of Ptolemy Philometer, in order to gratify her restless ambition of reigning alone and uncontrolled in her dominions, killed her son Seleucus, with her own hand, by plunging a dagger into his breast. She had been the wife of three kings of Syria, and the mother of four, and had occasioned the death of two of her husbands. She prepared a poisoned draught to destroy Grypus, another of her sons; but her intention having been suspected, she was compelled to swallow the deadly potion she had prepared, which took immediate effect, and delivered the world from this female monster. The Carthaginians were in the practice of offering human

sacrifices to their god Saturn, when they were defeated in war, in order to propitiate the wrath of this deity. At first, children were inhumanly burned, either in a fiery furnace, like those in the valley of Hiunom, so frequently mentioned in Scripture, or in a flaming statue of Saturn.—The cries of these unhappy victims were drowned by the uninterrupted noise of drums and trumpets. Mothers made it a merit, and a part of their religion, to view the barbarous spectacle with dry eyes, and without so much as a groan; and if a tear or sigh stole from them, the sacrifice was considered as less acceptable to the deity. This savage disposition was carried to such excess, that even mothers would endeavor, with embraces and kisses, to hush the cries of their children, lest they should anger the god.* When Carthage was taken by the Romans, the wife of Asdrubal, the Carthaginian general, who had submitted to the Romans, mounted to the upper part of one of the temples which had been set on fire, and, placing herself, with her two children, in sight of her husband, uttered the most bitter imprecations against him. "Base coward (said she), the mean things thou has done to save thy life shall not avail thee; thou shalt die this instant, at least in thy two children." Having thus spoken, she stabbed both the infants with a dagger, and while they were yet struggling for life, threw them both from the top of the temple, and then leaped down after them into the flames!†

Such are only a few insulated pictures of the atrocities of war, and of the unnatural and infernal passions which uniformly follow in its train, which may be considered as specimens of many thousands of similar instances, which the records of history furnish of the malignity and depravity of mankind. I have selected my examples chiefly from the history of ancient warfare: but were we to search the annals of *modern* warfare, and confine our attention solely to the battles of Alexandria, of the Pyramids, of Borodino, of Smolensko, of Austerlitz, of Leipsic, of Jena, of Eylau, of Waterloo, and other warlike events which have happened within the last thirty years, we should meet with atrocities and scenes of slaughter, no less horrible than those which I have now related. I shall content myself with stating only two or three instances.

After the taking of Alexandria by Bonaparte, "We were under the necessity," says the relater, "of putting the whole of them to death at the breach. But the slaughter did not cease with the resistance. The Turks and inhabitants fled to their mosques, seeking protection from God and their prophet; and then, *men and women, old and young, and infants at the breast, were slaughtered.* This butchery continued for four hours; after which the remaining part of the inhabitants were much astonished at not having their throats cut." Be it remembered that all this bloodshed was premeditated. "We might have spared the men whom we lost," says General Boyer, "by only summoning the town; but it was necessary to begin by confounding our enemy."‡ After the battle of the Pyramids, it is remarked by an eye-witness, that "the whole way through the desert, was tracked with the bones and bodies of men and animals who had perished in these dreadful wastes. In order to warm themselves at night, they gathered together the dry bones and bodies of the dead, which the vultures had spared, and *it was by a fire*

† Ency. Brit., Art. Carthage.

‡ Miot's Memoirs.

*composed of this fuel that Bonaparte lay down to sleep in the desert.** A more revolting and infernal scene it is scarcely possible for the imagination to depict.

Miot gives the following description in relation to a scene at Jaffa:—"The soldier abandons himself to all the fury which an assault authorizes. He strikes, he slays, nothing can impede him. All the horrors which accompany the capture of a town by storm, are repeated in every street, in every house. You hear the cries of violated females calling in vain for help to those relatives whom they are butchering. No asylum is respected. The blood streams on every side; at every step you meet with human beings groaning and expiring," &c.—Sir Robert Wilson, when describing the campaigns in Poland, relates, that "the ground between the woods and the Russian batteries, about a quarter of a mile, was a *sheet of naked human bodies*, which friends and foes had during the night mutually stripped, not leaving the worst rag upon them, although numbers of these bodies still retained consciousness of their situation. It was a sight which the eye loathed, but from which it could not remove." In Labaume's "Narrative of the campaign in Russia," we are presented with the most horrible details of palaces, churches, and streets, enveloped in flames,—houses tumbling into ruins,—hundreds of blackened carcasses of the wretched inhabitants, whom the fire had consumed, blended with the fragments; hospitals containing 20,000 wounded Russians on fire, and consuming the miserable victims,—numbers of half-burned wretches crawling among the smoking ruins,—females violated and massacred, parents and children half naked, shivering with cold, flying in consternation with the wrecks of their half-consumed furniture,—horses falling in thousands, and writhing in the agonies of death,—the fragments of carriages, muskets, helmets, breast-plates, portmanteaus, and garments strewed in every direction,—roads covered for miles with thousands of the dying and the dead heaped one upon another, and swimming in blood,—and these dreadful scenes rendered still more horrific by the shrieks of young females, of mothers and children, and the piercing cries of the wounded and the dying, invoking death to put an end to their agonies.

But I will not dwell longer on such revolting details. It is probable, that the feelings of some of my readers have been harrowed up by the descriptions already given, and that they have turned away their eyes in disgust from such spectacles of depravity and horror. Every mind susceptible of virtuous emotions, and of the common feelings of humanity, must, indeed, feel pained and even agonized, when it reflects on the depravity of mankind, and on the atrocious crimes they are capable of committing, and have actually perpetrated. A serious retrospect of the moral state of the world in past ages, is calculated to excite emotions, similar to those which overpowered the mourning prophet, when he exclaimed, "O that my head were waters, and mine eyes a fountain of tears, that I might weep day and night, for the slain of the daughters of my people!" But, however painful the sight, we ought not to turn away our eyes, with fastidious affectation, from the spectacles of misery and devastation which the authentic records of history present before us. They form traits in the character of man, which ought to be contemplated,—they are *facts* in the history of mankind, and not the mere pictures of fancy which are exhibited in poetry, in novels, and romances,—facts

which forcibly exemplify the operations of the malevolent principle, and from which we ought to deduce important instructions, in reference to the evil of sin, and the malignancy of pride, covetousness, ambition, and revenge. We think nothing, in the common intercourse of life, of indulging a selfish disposition, of feeling proud and indignant at a real or supposed affront, of looking with a covetous eye at the possessions of our neighbors, of viewing the success and prosperity of our rivals with discontentment and jealousy, or of feeling a secret satisfaction at the distress or humiliation of our enemies; and we seldom reflect on the malignant effects which such passions and dispositions would produce, were they suffered to rage without control. But, in the scenes and contentions of warfare which have been realized on the great theater of the world, we contemplate the nature and effects of such malignant dispositions in their true light; we perceive the ultimate tendency of every malevolent affection, when no physical obstruction impedes its progress; we discern that it is only the same dispositions which we daily indulge, operating on a more extensive scale; and we learn the necessity of mortifying such dispositions, and counteracting their influence, if we expect to enjoy substantial felicity either here or hereafter; and if we wish to see the world restored to order, to happiness and repose.

I shall only observe farther on this part of my subject, that, beside the atrocities already noticed, war has been the *nurse of every vicious disposition*, and of every immoral practice. The Carthaginians, who were almost incessantly engaged in war, were knavish, vicious, cruel, and superstitious; distinguished for craft and cunning, lying and hypocrisy, and for the basest frauds and the most perfidious actions. The Goths and Vandals are uniformly characterized, as not only barbarous and cruel, but avaricious, perfidious, and disregarding of the most solemn promises. It was ever a sufficient reason for them to make an attack, that they thought their enemies could not resist them. Their only reason for making peace, or for keeping it, was because their enemies were too strong; and their only reason for committing the most horrible massacres, rapes, and all manner of crimes, was because they had gained a victory. The Greeks and Romans, it is well known, notwithstanding their superior civilization, were distinguished for the most degrading and immoral practices. They gloried in being proud, haughty, and revengeful; and even their amusements were characterized by a spirit of ferocity, and by the barbarisms of war.—It is almost needless to say that war blunts the finer feelings of humanity and engenders a spirit of selfishness, and of indifference even toward friends and companions. Of this many shocking instances could be given.

Miot, in his *Memoirs of the War in Egypt*, relates the case of a soldier who was seized with the plague, and with the delirium which sometimes accompanies the disease. He took up his knapsack, upon which his head was resting, and placing it upon his shoulders, made an effort to rise, and to follow the army. The venom of the dreadful malady deprived him of strength, and after three steps, he fell again upon the sand, headlong. The fall increased his terror of being left by the regiment, and he rose a second time, but with no better fortune. In his third effort, he sunk, and falling near the sea, remained upon that spot which fate had destined for his grave. The sight of this soldier was frightful: the disorder which reigned in his senseless speech—his figure, which represented whatever is mournful—his eyes staring

* Miot's Memoirs.

and fixed—his clothes in rags—presented whatever is most hideous in death. The reader may perhaps believe that his comrades would be concerned for him; that they would stop to help him; that they would hasten to support him, and direct his tottering steps. Far from it: the poor wretch was only an object of horror and *derision*. They ran from him, and they burst into loud laughter at his motions, which resembled those of a drunken man; "He has got his account," cried one; "He will not march far," said another; and, when the wretch fell for the last time, some of them added, "See, he has taken up his quarters!" This terrible truth, says the narrator, which I cannot help repeating, must be acknowledged—*Indifference and selfishness are the predominant feelings of an army.*

Rocca, in his "Memoirs of the War in Spain," remarks, "The habit of danger made us look upon death as one of the most ordinary circumstances of life; when our comrades had once ceased to live, the indifference which was shown them amounted almost to irony. When the soldiers, as they passed by, recognized one of their companions stretched among the dead, they just said, 'He is in want of nothing, he will not have his horse to abuse again, he has got drunk for the last time,' or something similar, which only worked, in the speaker, a stoical contempt of existence. Such were the funeral orations pronounced in honor of those who fell in our battles."—Simpson, in his "Visit to Flanders," in 1815, remarks, "Nothing is more frightful than the want of feeling which characterizes the French soldiery. Their prisoners who were lying wounded in the hospitals of Antwerp, were often seen *mimicking the contortions of countenance which were produced by the agonies of death, in one of their own comrades in the next bed.* There is no curse to be compared with the power of fiends like these."

Thus, it appears, that wars have prevailed in every period, during the ages that are passed, and have almost extirpated the principle of *benevolence* from the world; and, therefore, it is obvious, that, before the prevailing propensity to warfare be counteracted and destroyed, the happiness which flows from the operation of the benevolent affections cannot be enjoyed by mankind at large. To counteract this irrational and most deplorable propensity, by every energetic means which reason, humanity, and Christianity can suggest, must be the duty of every one who is desirous to promote the present and everlasting happiness of his species.*

SECTION II.

STATE OF MORALS IN MODERN TIMES.

Moral state of Savage Nations.

I SHALL now take a very brief survey of the state of morals in modern times, and of the prevailing dispositions which are displayed by the existing inhabitants of our globe. Were I to enter into those minute and circumstantial details which the illustration of this subject would require, several volumes would be filled with the

detail of facts, and with the sketches of moral scenery which might be brought forward. And such a work, if judiciously executed, might be rendered highly interesting, and might produce a variety of benignant effects both on Christian and on general society. But the narrow limits within which the present work must be comprised, compels me to confine my attention to a few prominent features in the characters of mankind, and to a few insulated facts by which they may be illustrated.—I shall consider, in the first place, some of the

Prominent dispositions which appear among Savage and Half Civilized Nations.

It is not to be disputed, that numerous individuals among the uncivilized tribes of mankind, have occasionally displayed the exercise of many of the social virtues,—that they have been brave and magnanimous, faithful to their promises, strong in their attachments, and generous and affectionate to their friends and relatives. But their virtues, for the most part, proceed from a principle of selfishness, and are confined to the clan or tribe to which they belong. Toward their enemies, and toward all who have injured them in the slightest degree, they almost uniformly display cruel, perfidious, and revengeful dispositions. The following facts and descriptions, selected from the authentic records of voyagers and travelers, will tend to corroborate these positions.

The most prominent feature which appears in the character of savage nations, is, their disposition for *war*, and to inflict *revenge* for real or supposed injuries. With respect to the NORTH AMERICAN Indians, it is the uniform description given of them by all travelers, that, if we except hunting, *war is the only employment of the men*, and every other concern is left to the women.—Their most common motive for entering into war, is, either to revenge themselves for the death of some lost friends, or to acquire prisoners, who may assist them in their hunting, and whom they adopt into their society. In these wars, they are cruel and savage, to an incredible degree. They enter unawares, the villages of their foes, and, while the flower of the nation are engaged in hunting, massacre all the children, women, and helpless old men, or make prisoners of as many as they can manage. But when the enemy is apprized of their design, and coming on in arms against them, they throw themselves flat on the ground, among the withered herbs and leaves, which their faces are painted to resemble. They then allow a part to pass unmolested; when, all at once, with a tremendous shout, rising up from their ambush, they pour a storm of musket-balls on their foes. If the force on each side continues nearly equal, the fierce spirits of these savages, inflamed by the loss of friends, can no longer be restrained. They abandon their distant war, they rush upon one another with clubs and hatchets in their hands, magnifying their own courage, and insulting their enemies. A cruel combat ensues; death appears in a thousand hideous forms, which would congeal the blood of civilized nations to behold, but which rouse the fury of these savages. They trample, they insult over the dead bodies, tearing the scalp from the head, wallowing in their blood like wild beasts, and sometimes devouring their flesh. The flame rages on until it meets with no resistance; then the prisoners are secured, whose fate is a thousand times more dreadful than theirs who have died in the field.—The conquerors set up a hideous howling, to

* The Author intended, had his limits permitted, to state some additional considerations to show the folly and wickedness of war. In the meantime, he refers his readers to "Letters addressed to Caleb Strong, Esq.," which contain a series of energetic and impressive reasonings on the subject.—"Pictures of War," by Irenicus, and a duodecimo volume, lately published, entitled, "An Inquiry into the accordancy of War with the principles of Christianity," &c.

lament the friends they have lost. They approach to their own village; the women, with frightful shrieks, come out to mourn their dead brothers, or their husbands. An orator proclaims aloud a circumstantial account of every particular of the expedition; and as he mentions the names of those who have fallen, the shrieks of the women are redoubled. The last ceremony is the proclamation of victory: each individual then forgets his private misfortune, and joins in the triumph of his nation; all tears are wiped from their eyes, and, by an unaccountable transition, they pass in a moment from the bitterness of sorrow, to an extravagance of joy.*

As they feel nothing but revenge for the enemies of their nation, their prisoners are treated with cruelty in the extreme. The cruelties inflicted on those prisoners who are doomed to death, are too shocking and horrible to be exhibited in detail: one plucks out the nails of the prisoner by the roots; another takes a finger into his mouth, and tears off the flesh with his teeth; a third thrusts the finger, mangled as it is, into the bowl of a pipe made red hot, which he smokes like tobacco: they then pound his toes and fingers to pieces between two stones; they apply red hot irons to every part of his mangled body; they pull off his flesh, thus mangled and roasted, and devour it with greediness;—and thus they continue for several hours, and sometimes for a whole day, until they penetrate to the vital parts, and completely exhaust the springs of life. Even the women, forgetting the human, as well as the female nature, and transformed into something worse than furies, frequently outdo the men in this scene of horror; while the principal persons of the country sit round the stake to which the prisoner is fixed, smoking, and looking on without the least emotion. What is most remarkable, the prisoner himself endeavors to brave his torments with a stoical apathy. “I do not fear death (he exclaims in the face of his tormentors), nor any kind of tortures; those that fear them are cowards, they are less than women. May my enemies be confounded with despair and rage! Oh, that I could devour them, and drink their blood to the last drop!”

Such is a faint picture of the ferocious disposition of the Indians of America, which, with a few slight modifications, will apply to almost the whole of the original natives of that vast continent. Instead of the exercise of benevolent affections, and of forgiving dispositions; instead of humane feelings, and compassion for the sufferings of fellow-mortals, we here behold them transported into an *extravagance of joy*, over the sufferings they had produced, the carnage they had created, the children whom they had deprived of their parents, and the widows whose husbands they had mangled and slain; because they had glutted their revenge, and obtained a victory.—Nothing can appear more directly opposed to the precepts of Christ, and to the benevolence of heaven.

If, from America, we cross the Atlantic, and land on the shores of AFRICA, we shall find the existing inhabitants of that continent displaying dispositions no less cruel and ferocious. Bosman relates the following instances of cruelties practiced by the Adomese Negroes, inhabiting the banks of the Praa or Channah river.

“Anqua, the king, having in an engagement taken five of his principal Antese enemies prisoners, wounded them all over; after which,

with a more than brutal fury, he satiated, though not tired himself, by sucking their blood at the gaping wounds; but, bearing a more than ordinary grudge against one of them, he caused him to be laid bound at his feet, and his body to be pierced with hot irons, gathering the blood that issued from him in a vessel, one half of which he drank, and offered up the rest to his god. On another occasion, he put to death one of his wives and a slave, drinking their blood also, as was his usual practice with his enemies.”*—Dispositions and practices no less abominable, are regularly exhibited in the kingdom of *Dahomey*, near the Gulf of Guinea. An immolation of human victims, for the purpose of watering the graves of the king's ancestors, and of supplying them with servants of various descriptions in the other world, takes place every year, at a grand festival which is held generally in April and May, about the period, possibly, when the Bible and Missionary Societies of this country are holding their anniversaries. The victims are generally prisoners of war, reserved for the purpose; but, should there be a lack of these, the number (between sixty and seventy) is made up from the most convenient of his own subjects. The immolation of victims is not confined to this particular period; for at any time, should it be necessary to send an account to his forefathers of any remarkable event, the king dispatches a courier to the shades, by delivering a message to whoever may happen to be near him, and then ordering his head to be chopped off immediately. It is considered an honor where his majesty personally condescends to become the executioner in these cases; an office in which the king prides himself in being expert. The governor was present on one occasion, when a poor fellow, whose fear of death outweighing the sense of the honor conferred upon him, on being desired to carry some message to his father, humbly declared on his knees, that he was unacquainted with the way. On which the tyrant vociferated, “I'll show you the way,” and, with one blow, made his head fly many yards from his body, highly indignant that there should have been the least expression of reluctance.† On the thatched roofs of the guard-houses which surround the palace of this tyrant, are ranged, on wooden stakes, numbers of human skulls; the top of the wall which encloses an area before it, is stuck full of human jaw-bones, and the path leading to the door is paved with skulls.

In the kingdom of ASHANTEE, similar practices uniformly prevail. “When the king of this country (says Dupuis) was about to open the campaign in Gaman, he collected together his priests, to invoke the royal *Fetische*, and perform the necessary orgies to insure success. These ministers of superstition sacrificed thirty-two male, and eighteen female victims as an expiatory offering to the gods; but the answers from the priests being deemed by the council as still devoid of inspiration, the king was induced to *make a custom*, at the sepulchers of his ancestors, where many hundreds bled. This, it is affirmed, propitiated the wrath of the adverse god.” The same king, when he returned, having discovered a conspiracy, decreed, that seventeen of his wives, along with his own sister, should be strangled and beheaded. “His sister's paramour, and all those of his party, were doomed to the most cruel deaths, at the grave of the king's mother.—While these butcheries were transacting, the king

* See Ency. Brit., Art. *America*.

* Dupuis' Journal in Ashantee.
† M'Leod's voyage to Africa.

prepared to enter the palace; and in the act of crossing the threshold of the outer gate, was met by several of his wives, whose anxiety to embrace their sovereign lord impelled them thus to overstep the boundary of female decorum in Ashantee; for it happened that the king was accompanied by a number of his captains, who, accordingly, were compelled to cover their faces with both their hands, and fly from the spot.—This is said to have angered the monarch, although his resentment proceeded no farther than words, and he returned the embraces of his wives. But another cause of anger soon after occurred, and he was inflamed to the highest pitch of indignation, and, in a paroxysm of anger, caused these unhappy beings to be cut in pieces before his face, giving orders, at the same time, to cast the fragments into the forest, to be devoured by birds and beasts of prey. Nor did the atonement rest here; for six more unhappy females were impeached of inconstancy, and they also expiated their faults with their lives. Like another Ulysses, his majesty then devoted himself to the purification of his palace, when, to sum up the full horrors of these bloody deeds, two thousand wretches, selected from the Gaman prisoners of war, were slaughtered over the royal death-stool, in honor of the shades of departed kings and heroes.*

Such are a few specimens of the ferocious dispositions of the petty tyrants of Africa. But we are not to imagine, that such dispositions are confined to kings, and to the higher ranks of society. Wherever such malevolent passions are displayed among barbarous chieftains, they pervade, in a greater or less degree, the whole mass of the people, and almost every one, in proportion to the power with which he is invested, perpetrates similar barbarities. The following instance will corroborate this position, and, at the same time, show, for how many cruelties and acts of injustice the abettors of the infamous traffic in slaves, are accountable. It is extracted from Major Gray's "Travels in Africa, in 1824."

The Kaartan force which the Major accompanied, had made 107 prisoners, chiefly women and children, in a predatory excursion into Bondoo, for the purpose of supplying themselves with slaves. The following is an account of the manner in which they were dragged along. "The men were tied in pairs by the necks, their hands secured behind their backs; the women by the necks only; but their hands were not left free from any sense of feeling for them, but in order to enable them to balance the immense loads of corn or rice which they were obliged to carry on their heads, and their children on their backs."—"I had an opportunity," says Major Gray, "of witnessing, during this short march, the new-made slaves, and the sufferings to which they are subjected in their first state of bondage. They were hurried along (*tied*) at a pace little short of running, to enable them to keep up with the horsemen, who drove them on, as Smithfield drovers do fatigued bullocks. Many of the women were old, and by no means able to endure such treatment. One, in particular, would not have failed to excite the tenderest feelings of compassion in the breast of any, save a savage African. She was at least sixty years old, in the most miserable state of emaciation and debility, nearly doubled together, and with difficulty dragging her tottering limbs along. To crown the heart-rend-

ing picture, she was naked, save from her waist to about half way to the knees. All this did not prevent her inhuman captor from making her carry a heavy load of water, while, with a rope about her neck, he drove her before his horse; and whenever she showed the least inclination to stop, he beat her in the most unmerciful manner with a stick."

Were we to travel through the whole interior of Africa, and round its northern, eastern, and western coasts, we should find, among almost every tribe, numerous displays of the most inhuman and depraved dispositions. The *Algerines* are characterized as the most cruel and dangerous pirates—base, perfidious, and rapacious to the last degree. No oaths, nor ties, human or divine, will avail to bind them, when their interest interferes. Whatever respect they may pretend to pay to their prophet Mahomet, gold is the only true idol which they worship. The emperors of Morocco are well known as a set of rapacious and blood-thirsty tyrants, who have lived in a state of habitual warfare with Christian nations, and in the perpetration of deeds of injustice and cruelty. The *Gallas*, on the borders of Abyssinia, are a barbarous and warlike nation. They are hardy, and of a ferocious disposition; they are trained to the love of desperate achievements, taught to believe that conquest entitles them to the possession of whatever they desire, and to look upon death with the utmost contempt; and therefore, in their wars, they fight with the most desperate resolution, and neither give nor take any quarter. The inhabitants of *Adel*, too, are of a warlike disposition, and most frequently live in enmity and hostility with those around them. The *Feloops* are gloomy and unforgiving in their tempers, thirsting for vengeance even in the hour of dissolution, and leaving their children to avenge their quarrels. The inhabitants of the *Grain Coast*, especially the *Mulattoes*, are said to be a most abandoned set of people. The men are drunkards, lewd, thievish, and treacherous, and the women are the most abandoned prostitutes, sacrificing themselves at all times, and to all sorts of men, without the least degree of restraint.*—The natives of *Ansico*, which borders on Angola, live by plundering all who happen to fall in their way, some of whom they kill, and others they keep as slaves.† "The *Boshemen* are land pirates, who live without laws and without discipline; who lurk in thickets, to watch the passage of travelers, and shoot them with poisoned arrows, in order to seize their cattle."‡ "The negroes of Congo (says M. de la Brosse in his *Travels* along the coast of Angola, in 1738), are extremely treacherous and vindictive. They daily demanded of us some brandy for the use of the king and the chief men of the town. One day this request was denied and we had soon reason to repent it; for all the English and French officers having gone to fish on a small lake near the sea-coast, they erected a tent for the purpose of dressing and eating the fishes they had caught. When amusing themselves after their repast, seven or eight negroes, who were the chiefs of Loango, arrived in sedans, and presented their hands according to the custom of the country. These negroes privately rubbed the hands of the officers with a subtle poison, which acts instantaneously; and, accordingly, five captains and three surgeons died on the spot."

* Dupuis' Mission to Ashantee, in 1823.

* Cooke's Universal Geography, Vol. I, p. 447.

† Ibid.

‡ Vailant's Travels.

The *Moors* are characterized by Mr. Park as having cruelty and low cunning pictured on their countenances. Their treachery and malevolence are manifested in their plundering excursions against the negro villages. Without the smallest provocation, and sometimes under the fairest professions of friendship, they will seize upon the Negroes' cattle, and even on the inhabitants themselves. The *Bedouins* are plunderers of the cultivated lands, and robbers on the high roads; they watch every opportunity of revenging their enemies, and their animosities are transmitted as an inheritance from father to children. Even the *Egyptians*, who are more civilized than the tribes to which I have now alluded, are characterized by excessive pride, vindictive tempers, inordinate passions, and various species of moral turpitude. There is a trait in the character of the women of this country, pointedly adverted to by Sonini, in his "Travels in Egypt," which is particularly odious and horrible. On discovering any partiality in their husbands for other females, they are transported into an unbounded and jealous fury. Such are their deceit and cruelty on these occasions, that they instil into the blood of their faithless husband, a slow and mortal poison. Their revenge is meditated in silence, and they indulge the diabolical satisfaction of taking off an unhappy being by a lingering death. It is said, with confidence, that their own persons supply the horrid means of perpetrating their malicious designs on their husbands, and that they mix with their aliment a certain portion of an ingredient of a poisonous nature, which infallibly induces a slow languor and consumption, and in time brings the wretched victims to the grave. The symptoms are dreadful. The body desiccates, the limbs become excessively weak, the gums rot, the teeth loosen, the hair falls off, and, at length, after having dragged a miserable and tortured existence, for a whole year or more, the unhappy beings die in the most extreme torment.

If we pass from Africa to the regions of Asia, we shall find similar depraved principles and practices pervading its several tribes, and the various ranks of its population. Here, tyranny, in all its degrading and cruel forms, reigns supreme and uncontrolled over a superstitious, a deluded, and an idolatrous race of mankind,—of which the following recent instances, in relation to a petty despot of Persia, may serve as a specimen. "The governor Zulfecar Khun is pronounced to be a cruel and unprincipled tyrant; unfortunately for the people, he has the ear of the sovereign, and they have no resource against his rapacity. He pays to the crown 7000 tomanas a year, but it is asserted that he collects from the district 100,000. His oppression was so grievous, that the inhabitants, wearied out, went in a body to the king to complain; but his majesty only referred them back to their tyrant, who, exasperated at their boldness, wreaked upon them a cruel vengeance. It is said, that he maimed and put to death upward of a thousand of both sexes, cutting off the hands, putting out the eyes, and otherwise mutilating the men, and cutting off the noses, ears, and breasts of the women. The people, desponding and brokenhearted after this, paid, in so far as they were able, the rapacious demands of their oppressor, and the natural consequence, ruin and desolation has ensued."*

Sir John Chardin gives us the following account of the inhabitants of Mingrelia, particular-

ly of the women. "The people are generally handsome, the men strong and well-made, and the women very beautiful; but both sexes are very vicious and debauched. The women, though lively, civil, and affectionate, are very perfidious; for there is no wickedness which they will not perpetrate, in order to procure, to preserve, or to get rid of their gallants. The men likewise possess many bad qualities. All of them are trained to robbery, which they study both as a business, and as an amusement. With great satisfaction they relate the depredations they have committed; and, from this polluted source, they derive their greatest praise and honor. In Mingrelia, falsehood, assassination, and theft, are good actions; and whoredom, bigamy, and incest, are esteemed as virtuous habits. The men marry two or three wives at a time, and keep as many concubines as they choose. They not only make a common practice of selling their children, either for gold, or in exchange for wares and provisions, but even murder them, or bury them alive, when they find it difficult to bring them up."

The *Tartars*, who occupy vast regions of the Asiatic continent, are uniformly described by travelers, as a rude, plundering, and uncultivated race of men. "There is something frightful," says Smellie, "in the countenances of the Calmuck Tartars. All of them are wandering vagabonds, and live in tents made of cloth or of skins. They eat the flesh of horses, either raw, or a little softened by putrefying under their saddles. No marks of religion, or of decency in their manners, are to be found among most of these tribes. They are fierce, warlike, hardy, and brutally gross. They are all robbers; and the Tartars of Daghestan, who border on civilized nations, have a great trade in slaves, whom they carry off by force, and sell to the Persians and Turks."*

The *Arabians*, like the Tartars, live mostly without government, without law, and almost without any social intercourse. They still continue in a state of rudeness and of lawless independency. Their chiefs authorize rape, theft, and robbery. They have no estimation for virtue, and glory in almost every species of vice. They roam about in the deserts, and attack caravans and travelers of every description, whom they frequently murder, and plunder of their property. The *Chinese*, though more highly civilized than the tribes now mentioned, and though they merit great applause for their ingenuity, industry, and perseverance, are as despicable in their moral characters, and as destitute of true benevolence, as almost any nation upon earth. Avarice is their leading passion; and in order to gratify it, they practice every species of duplicity and fraud. They cannot be influenced by motives either of honesty or of humanity; and they surpass every nation on the globe in private cheating. Captain Cook observes, that (the danger of being hanged for any crime being excepted) "there is nothing, however infamous, which the Chinese will refuse to do for gain." In this opinion he concurs with every preceding and subsequent writer, and confirms it by a variety of striking proofs, of which an additional number may be seen in the accounts which have been published of our late embassies to that empire.

The *Birmans* are a lively inquisitive race, active, irascible, and impatient. While in peace, they give proofs of a certain degree of gentleness and civilization; in war, they display the ferocity

* Smellie's Philosophy of Natural History.

of savages.—The *Malays*, though inhabiting a country beautiful and delightful in the extreme, where refreshing gales and cooling streams assuage the heat, where the soil teems with delicious fruits, where the trees are clothed with a continual verdure, and the flowers breathe their fragrant odors, are remarkably ferocious in their manners. They go always armed (except the slaves), and would think themselves disgraced, if they went abroad without their poniards. The inland inhabitants of Malacca, called *Monucaboes*, are a barbarous savage people, delighting in doing continual mischief to their neighbors; on which account, no grain is sown about Malacca, but what is enclosed in gardens, with the thickest hedges, or deep ditches; for when the grain is ripe in the open plains, the *Monucaboes* never fail to set fire to it. The *Persians*, in their dispositions, says Mr. Franklin, are much inclined to sudden anger, are quick, fiery, and very sensible of affronts, which they resent on the spot. Chardin describes them as “wartlike, vain, and ambitious of praise; exceedingly luxurious, prodigal, voluptuous, and addicted to gallantry.” It is well known that the wars and fiend-like cruelties in which the despots of this country have been engaged, have transformed many of its provinces into scenes of sterility and desolation.—The *Hindoos* are effeminate, luxurious, and early initiated into the arts of dissimulation. They can caress those whom they hate, and behave with the utmost affability and kindness to such as they intend to deprive of existence, by the most sanguinary means. Though they seldom scold or wrangle, they often stab each other insidiously, and, without any public quarrel, gratify a private revenge. The destruction of infants, the immolation of widows, the drowning of aged parents, which prevail among them, and the cruel and idolatrous rites which distinguish their religious services, are too well known to require description.—The *Turks*, though grave, sedate, and rather hypochondriac, yet when agitated by passion, are furious, raging, ungovernable, fraught with dissimulation, jealous, suspicious, and vindictive beyond conception. They are superstitious, and obstinately tenacious in matters of religion, and are incapable of exercising benevolence or even humanity toward Christians, or toward Jews. Interest is their supreme good, and when that comes in competition, all ties of religion, consanguinity, or friendship, are with the generality, speedily dissolved. They have deprived of their liberty, and of their wealth, all who have been subjected to their iron scepter, and have plunged them into the depths of moral and of mental debasement. The page of history is filled with details of their devastations and cruelties, and the deeds of injustice and of horror which they have perpetrated, even in our own times, are scarcely equaled by the atrocities of the most savage hordes of mankind.

If we take a survey of the numerous tribes which inhabit the Islands of the Indian and the Pacific Oceans, we shall find similar depraved and malevolent passions, raging without control, and producing all those malignant and desolating effects which have counteracted the benevolence of the Creator, and entailed misery on the human race. The dismal effects of the principle of hatred directed toward human beings, the disposition to engage in continual warfare, and the savage ferocity of the human mind, when unrestrained by moral and prudential considerations, are nowhere so strikingly displayed, as in the isles which are scattered throughout the wide

expanse of the Pacific Ocean. Of the truth of these positions we have abundance of melancholy examples, in the reports of missionaries, and in the journals which have been published by late navigators, from which I shall select only two or three examples.

The first instance I shall produce, has a relation chiefly to the inhabitants of *New Zealand*. With respect to these islanders Captain Cook remarks, “Their public contentions are frequent, or rather perpetual; for, it appears from their number of weapons, and dexterity in using them, that war is their principal profession.”—“The war dance consists of a great variety of violent motions, and hideous contortions of the limbs, during which the countenance also performs a part; the tongue is frequently thrust out to an incredible length, and the eyelid so forcibly drawn up, that the white appears both above and below, as well as on each side of the iris, so as to form a circle around it; nor is anything neglected so as to render the human shape frightful and deformed. To such as have not been accustomed to such a practice, they appear more like demons than men, and would almost chill the boldest with fear; at the same time they brandish their spears, shake their darts, and cleave the air with their *patoo-patoos*. To this succeeds a circumstance almost foretold in their fierce demeanor, horrid and disgraceful to human nature, which is, cutting to pieces, even before being perfectly dead, the bodies of their enemies; and, after dressing them on a fire, devouring the flesh, not only without reluctance, but with peculiar satisfaction.” There is perhaps nothing that can convey a more striking idea of the actions of pure malevolence, and of the horrible rage and fury of infernal fiends, than the picture here presented of these savage islanders.

These people live under perpetual apprehensions of being destroyed by each other; there being few of their tribes that have not, as they think, sustained wrongs from some other tribe, which they are continually on the watch to avenge, and the desire of a good meal is no small incitement. Many years will sometimes elapse before a favorable opportunity happens, yet the son never loses sight of an injury that has been done to his father.—“Their method of executing their horrible designs is by stealing upon the adverse party in the night, and if they find them unguarded (which is very seldom the case) they kill every one indiscriminately, not even sparing the women and children. When the massacre is completed, they either feast and gorge themselves on the spot, or carry off as many of the dead bodies as they can, and devour them at home, with acts of brutality too shocking to be described. If they are discovered before they execute their bloody purpose, they generally steal off again; and sometimes are pursued and attacked by the other party in their turn. To give quarter, or to take prisoners, makes no part of their military law; so that the vanquished can save their lives only by flight. This perpetual state of war, and destructive method of conducting it, operates so strongly in producing habits of circumspection, that one hardly ever finds a *New Zealander* off his guard, either by night or by day.” * While the mind is kept in such a state of incessant anxiety and alarm, it must be impossible for human beings to taste the sweets of rational, or even of sensitive enjoyment. A melancholy gloom must hang over these wretched beings,

* Cook's Voyages.

and the dark suspicions, and the revengeful passions which agitate their minds, can only fit them for those regions of darkness where the radiations of benevolence are completely extinguished.

The implacable *hatred* which these savages entertain toward each other, is illustrated, in the following short narrative from Captain Cook.—“Among our occasional visitors was a chief named Kahoorā, who, as I was informed, headed the party that cut off Captain Furneaux’s people, and himself killed Mr. Rowe, the officer who commanded. To judge of the character of Kahoorā, by what I had heard from many of his countrymen, he seemed to be more feared than beloved among them. Not satisfied with telling me that he was a very bad man, some of them even importuned me to kill him: and, I believe, they were not a little surprised that I did not listen to them; for according to their ideas of equity, this ought to have been done. But if I had followed the advice of all our pretended friends, I might have extirpated the whole race; for the people of each hamlet or village, by turns, applied to me, to destroy the other. One would have almost thought it impossible, that so striking a proof of the divided state in which this people live, could have been assigned.”

Similar dispositions are displayed throughout almost all the other islands of the Southern Ocean. The following description is given by M. de la Perouse, of the inhabitants of *Maouina Oyo-lava*, and the other islands in the *Navigator’s Archipelago*. “Their native ferocity of countenance always expresses either surprise or anger. The least dispute between them is followed by blows of sticks, clubs, or paddles, and often, without doubt, costs the combatants their lives.” With regard to the women, he remarks: “The gross effrontery of their conduct, the indecency of their motions, and the disgusting offers which they made of their favors, rendered them fit mothers and wives for the ferocious beings that surrounded us.” The treachery and ferocity of these savages were strikingly displayed in massacring M. de Langle, the astronomer, and eleven of the crew that belonged to Prouse’s vessel, and such was their fierce barbarity, that, after having killed them, they still continued to wreak their fury upon the inanimate bodies with their clubs. The natives of *New Caledonia* are a race of a similar description. Though Captain Cook describes them as apparently a good natured sort of people, yet subsequent navigators have found them to be almost the very reverse of what he described; as ferocious in the extreme, addicted to cannibalism, and to every barbarity shocking to human nature. The French navigator, Admiral D’Entrecasteaux, in his intercourse with these people, received undoubted proofs of their savage disposition, and of their being accustomed to feed on human flesh. Speaking of one of the natives, who had visited his ship, and had described the various practices connected with cannibalism, he says,—“It is difficult to depict the ferocious avidity with which he expressed to us, that the flesh of their unfortunate victims was devoured by them after they had broiled it on the coals. This cannibal also let us know, that the flesh of the arms and legs was cut into slices, and that they considered the most muscular parts a very agreeable dish. It was then easy for us to explain, why they frequently felt our arms and legs, manifesting a violent longing; they then uttered a faint whistling, which they produced by closing their teeth, and applying to them the tip of the tongue;

afterward opening their mouth, they smacked their lips several times in succession.”

The characters of the islanders now described, may be considered as common to the inhabitants of the New Hebrides, the Friendly Islands, the Marquesas, the Sandwich, New Guinea, New Britain, the Ladrões, and almost all the islands which are dispersed over the vast expanse of the Pacific Ocean. Captain Cook, when describing the natives of New Zealand, remarks, that, “the inhabitants of the other parts of the South Seas have not even the idea of indecency with respect to any object, or to any action.” The inhabitants even of the Society and of the Sandwich Isles, prior to the state of moral and religious improvement to which they have lately advanced, though their dispositions were somewhat milder than those of the other islands, were almost equally low in point of moral debasement. Captain Cook, speaking of the natives of Otaheite, declares, “They are all arrant thieves, and can pick pockets with the dexterity of the most expert London blackguard.”* When describing the societies distinguished by the name of *Arreoy*, he declares, as a characteristic of the female part of the community, “If any of the women happen to be with child, which in this manner of life, happens less frequently than in ordinary cases, the poor infant is smothered the moment it is born, that it may be no incumbrance to the father, nor interrupt the mother in the pleasures of her diabolical prostitution.”† Another circumstance, stated by the same navigator, exhibits their former moral character in a still more shocking point of view. On the approach of war with any of the neighboring islands, or on other interesting occasions, human sacrifices were a universal practice. “When I described,” says this illustrious voyager, “the Natiæ at Tongabato, I mentioned, that, on the approaching sequel of that festival, we had been told that ten men were to be sacrificed. This may give us an idea of the extent of this religious massacre on that island. And though we should suppose, that never more than one person is sacrificed on any single occasion at Otaheite, it is more than probable, that these occasions happened so frequently, as to make a shocking waste of the human race; for I counted no less than forty-nine skulls of former victims, lying before the Morai, where we saw one more added to the number. And, as none of these skulls had, as yet, suffered any considerable change from the weather, it may hence be inferred, that no great length of time had elapsed, since this considerable number of unhappy wretches had been offered on this altar of blood.”‡ He also informs us, that human sacrifices were more frequent in the Sandwich, than in any of the other islands. “These horrid rites,” says he, “are not only had recourse to upon the commencement of war, and preceding great battles, and other signal enterprises; but the death of any considerable chief calls for a sacrifice of one or more *Toutous* (that is, vulgar or low persons), according to his rank; and we were told that ten men were destined to suffer on the death of *Terretoboo*, one of their great chiefs.§

Such are a few specimens of the moral dispositions—the hatred, the horrid warfare, and the abominable practices, which are displayed over the greater portion of the Eastern and Western Continents, and among the thousands of islands which diversify the surface of the Ocean—disposi-

‡ Hawkesworth’s Narrative of Cook’s Voyages, vol. II.

tions and practices, which, if permitted to extend their influence universally, and without control, would soon extirpate the intelligent creation, and banish happiness from the empire of God.

WARLIKE ATTITUDE OF SAVAGE NATIONS.

Were benevolence a characteristic of the inhabitants of our globe, every traveler would be secure from danger from his fellow-men; he might land on every shore without the least suspicion or alarm, and confidently expect that his distresses would be relieved, and his wants supplied, by every tribe of the human race among whom he might occasionally sojourn. No hostile weapons would be lifted up to repel a stranger, when gratifying his curiosity in visiting distant lands, and contemplating foreign scenes; and no instruments of destruction would require to be forged, to preserve a nation from the inroads of destroyers. But when we survey the actual state of mankind, we find almost every nation under heaven, if not actually engaged in war, at least in a warlike attitude, and one of their chief employments consists in devising schemes, either of conquest or revenge, and in furnishing the instruments of death. The following instances may suffice, as illustrations of this position.

The armies of ASHANTEE, says Dupuis, amount to upward of eighty thousand men, armed with tomahawks, lances, knives, javelins, bows, and arrows; and forty thousand, who can occasionally be put in possession of muskets and blunderbusses. —The opposing armies of MOSELEM and DINHERU, amounted at times to 140,000 men. —The king of DAHOMEY, and his auxiliaries, can raise about 50,000 men, armed with bows and arrows, sabers, and iron maces. —The king of BENIN can arm 200,000, upon an emergency, and furnish 10,000 of them with muskets. In those countries of Africa, where fire-arms and gunpowder are unknown, they wield the following kinds of arms with great dexterity and execution. These are, very strong supple lances, which are barbed and poisoned, targets, bows and arrows, tomahawks, and iron maces; the former of which they are in the practice of poisoning with a venom more deadly than that which is used by any other nation, as its operation is said to be sometimes instantaneous, and its wound, though ever so slight, usually produces death within the lapse of a few minutes.*

Such is the warlike disposition displayed by a few comparatively insignificant tribes in Africa, and similar dispositions are manifested, and similar attitudes assumed, by almost all the tribes which inhabit that vast continent. Their time, and their physical and mental exertions, seem to be spent much in war, and in the preparation of warlike instruments, as if these were the great ends for which the Creator had brought them into existence. If the ingenuity and the energies displayed in such preparations and pursuits, were employed in operations calculated to promote the benefit of mankind, what an immense proportion of happiness would be distributed among numerous tribes which are just now sunk into depravity, and into the depths of wretchedness and woe!

Pallas, in his description of the nations inhabiting the *Caucasus*, when speaking of the CIRCASSIANS, says, "Persons of wealth and rank never leave the house without a saber, nor do they venture beyond the limits of the village without being com-

pletely arrayed, and having their breast pockets supplied with ball cartridges." In regard to the lower class, "when they do not carry a saber, with other arms, they provide themselves with a strong staff, two arshines long, on the top of which is fixed a large iron head, and the lower end is furnished with a sharp iron pike, about eighteen inches long, which they are accustomed to throw expertly, like a dart. The princes and knights pursue no other business or recreation than war, pillage, and the amusements of the chase; they live a lordly life, wander about, meet at drinking parties and undertake military excursions." Among these people, "the desire of revenge, for injuries received, is hereditary in the successors, and in the whole tribe. It remains, as it were, rooted with so much rancor, that the hostile princes or nobles of two different tribes, when they meet each other on the road, or accidentally in another place, are compelled to fight for their lives; unless they have given previous notice to each other, and bound themselves to pursue a different route. Unless pardon be purchased, or obtained by intermarriage between the two families, the principle of revenge is propagated to all succeeding generations."†

It is well known, that in almost all the islands in the Indian and the Southern Oceans, when navigators attempt to land, in order to procure water and provisions, they are almost uniformly opposed by crowds of ferocious savages, armed with long spears, clubs, lances, bows and arrows; and, with horrid yells, brandishing them in the most hostile attitudes. In some instances, these warlike attitudes might be accounted for, from a fear of the depredations and murders which might be committed by strangers, with whose dispositions and characters they are unacquainted. But the implacable hatred which they manifest toward even the neighboring tribes, with which they are acquainted, and of which I have already stated several instances, shows, that war, revenge, and the preparation of the instruments of death, are both their employment, and their delight. Yea, not only savage and half-civilized tribes, but almost every civilized nation on the face of the earth, is found in a hostile attitude with respect to surrounding nations—either actually engaged in a deadly warfare with a foreign power, or preparing for an attack, or keeping up fleets and standing armies, and forging cannons, and balls, and swords, in the prospect of a rupture with neighboring states. And in such deadly preparations and employments, a great proportion of those treasures is expended, which, if directed by the hand of benevolence, would be the means of transforming the wilderness into a fruitful field, of distributing intelligence and moral principle among all ranks, and of making the hearts of the poor, the widow, and the orphan, "to leap for joy." What a pitiful picture is here presented of Man, who was originally formed after the image of his Maker, for the purpose of displaying benevolent affections toward his fellows,—now divided into hostile tribes, and brandishing, with infernal fury, at all around, the instruments of destruction! How art thou fallen, O man, from thy original station of dignity and honor! "How is the gold become dim, and the most fine gold changed! The crown is fallen from our heads; woe unto us, for we have sinned!"

* Dupuis' "Mission to Ashantee, in 1823."

† Pallas' "Travels through the Southern Provinces of the Russian Empire," Vol. II, pp. 401-405.

INHUMANITY OF UNCIVILIZED TRIBES TO UNFORTUNATE TRAVELERS.

In passing through the scene of his earthly pilgrimage, Man is exposed to a variety of distresses and dangers. Sometimes he is exposed to "the pestilence that walketh in darkness," and to the fever "that wasteth at noon-day." Sometimes he is exposed to the desolations of the earthquake and the volcano; the blasts of the tempest, the hurricane, and the tornado, and the billows of the stormy ocean; and, at other times, he is exposed to the attacks of the lion, the tiger, and the hyena, in the dark recesses of the forest. It would be well, however, with man, were these the only evils and enemies which he had to encounter. But the greatest enemy which man has to encounter, is *Man* himself—those who are partakers of the same nature, and destined to the same immortal existence; and from these kindred beings, he is exposed to evils and distresses, incomparably greater and more numerous, than all the evils which he suffers from the ravenous beasts of the forest, or from the fury of the raging elements. It is a most melancholy reflection, that, throughout the greater part of the habitable world, no traveler can prosecute his journey, without being in hazard either of being dragged into captivity, or insulted and maltreated, or plundered of his treasures, or deprived of his life, by those who ought to be his friends and protectors. After he has eluded the pursuit of the lion or the wolf, or after he has escaped, with difficulty, from the jaws of the devouring deep, he is frequently exposed to the fury of demons in human shape, who exult over his misfortunes, instead of relieving the wants of his body, and soothing the anguish of his mind. The following relations, among a numerous series which might be presented to the view of the reader, will tend to illustrate these remarks.

My first example shall be taken from the "Narrative of the Loss of the Grosvenor Indianman." This vessel sailed from Trincomalee, June 13th, 1782, on her homeward-bound voyage, and was wrecked on the coast of Caffraria, on the 4th of August following. It is needless to dwell on the circumstances which attended the shipwreck, and on the consternation, distraction, and despair, which seized upon the passengers and the crew, when they became alive to all the terrors of the scene. Shipwreck, even in its mildest form, is a calamity which never fails to fill the mind with horror; but what is instant death, considered as a temporary evil, compared with the situation of those who had hunger, and thirst, and nakedness, to contend with; who only escaped the fury of the waves, to enter into conflicts with the savages of the forest, or the still greater savages of the human race; who were cut off from all civilized society, and felt the prolongation of life to be only the lengthened pains of death?

After losing about twenty men, in their first attempts to land, the remaining part of the crew and the passengers, in number about a hundred, after encountering many difficulties and dangers, reached the shore. Next morning a thousand uneasy sensations were produced, from the natives having come down to the shore, and, without ceremony, carried off whatever suited their fancy. They were at this time about 447 leagues from the Cape of Good Hope, and 226 beyond the limits of any Christian habitation. Their only resource appeared to be, to direct their course by land to the Cape, or to the nearest Dutch settlement. As they moved forward, they were followed by some

of the natives, who, instead of showing compassion to this wretched group, plundered them from time to time, of what they liked, and sometimes pelted them with stones. In this way they pursued their journey for four or five days; during which the natives constantly surrounded them in the day, taking from them whatever they pleased, but invariably retired in the night. As they proceeded, they saw many villages, which they carefully avoided, that they might be less exposed to the insults of the natives. At last, they came to a deep gully, where three of the Caffres met them, armed with lances, which they held several times to the captain's throat. Next day, on coming to a large village, they found these three men, with three or four hundred of their countrymen, all armed with lances and targets, who stopped the English, and began to pilfer and insult them, and at last fell upon them, and beat them. With these inhuman wretches they had to engage in a kind of running fight for upward of two hours: after which, they cut the buttons from their coats, and presented them to the natives, on which, they went away and returned no more. The following night they were terrified with the noise of the wild beasts, and kept constant watch for fear both of them and the natives. How dreadful a situation, especially for those delicate ladies and children, who had so lately been accustomed to all the delicacies of the East! Next day, as they were advancing, a party of natives came down upon them, and plundered them, among other things, of their tinder-box, flint and steel, which proved an irreparable loss. Every man was now obliged to travel, by turns, with a fire-brand in his hand; and before the natives retired, they showed more insolence than ever, robbing the gentlemen of their watches, and the ladies of their jewels, which they had secreted in their hair. Opposition was vain; the attempt only brought fresh insults or blows.

This group of wretched wanderers now separated into different parties, and took different directions; their provisions were nearly exhausted; and the delay occasioned by traveling with the women and children was very great. Their difficulties increased, as they proceeded on their journey; they had numerous rivers, sometimes nearly two miles in breadth, to swim across in the course of their route, while the women and children were conveyed across on floating stages, at the imminent hazard of their lives, and of being carried down by the impetuous current into the sea. Whole days were spent in tracing the rivers toward their source, in order to obtain a ford. They traversed vast plains of sand, and bleak and barren deserts, where nothing could be found to alleviate their hunger, nor the least drop of water to quench their raging thirst. They passed through deep forests, where human feet had never trod, where nothing was heard but the dreadful howlings of wild beasts, which filled them with alarm and despair. Wild sorrel, berries which the birds had picked at, and a few shell-fish which they occasionally picked up on the shore, were the only food which they had to subsist on for several days; and on some occasions the dead body of a seal, or the putrid carcass of a whale, was hailed as a delicious treat to their craving appetites. One person fell after another into the arms of death, through hunger, fatigue, and despair, and were sometimes obliged to be left in the agonies of dissolution, as a prey to ravenous beasts, or to the fowls of heaven. The following circumstance shows the dreadful situation to which they were reduced for want of food. "It appeared that the

captain's steward had been buried in the sand of the last desert they had passed, and that the survivors were reduced to such extremity, that, after he had been interred, they sent back two of their companions to cut off part of his flesh; but while they proceeded in this horrid business, they had the good fortune to discover a young seal, newly driven on shore, which proved a most seasonable relief."

Imagination cannot form a scene of deeper distress than what the tender sex, and the little children must, in such a case, have experienced. It harrows up the very soul to think what pangs those delicate females who had so lately been inured to all the pleasures and luxuries of India, must have endured, when they were fain to appease their craving appetites on the putrid carcass of a whale, and were obliged to repose on the bare ground, amidst the howlings of the tempest, and the more dismal yells of the beasts of prey. But, amidst this heart-rending scene, their fellow-men, who ought to have been their soothers and protectors, and who had it in their power to have alleviated their distresses, were the greatest enemies they had to encounter; and their appearance filled their minds with greater alarm than if they had beheld a roaring lion, or a raging bear. The following are some specimens of the perfidy and inhumanity of the natives. In passing through a village, one of the company observing, "that a traffic would not be unacceptable, offered them the inside of his watch for a calf; but though they assented to the terms, no sooner had they obtained the price, than they withheld the calf, and drove the English from their village." In the same manner were they used on many other occasions. One time, when resting at a village, where the natives offered no particular resistance, "they produced two bowls of milk, which they seemed willing to barter, but as our wretched countrymen had nothing to give in exchange, they denied them this humble boon without an equivalent, and ate it up themselves." At the same place, they implored in the most impressive terms, to partake with the natives of the spoils of a deer, which they had just killed, but they turned a deaf ear to their solicitations, and insisted, moreover, on their quitting the kraal. On another occasion, "on coming to a large village, the inhabitants set upon them with such fury, that several were severely wounded, and one of them died soon after."

In this manner, did the wretched remains of these hapless wanderers traverse the wilds of Africa, during the space of one hundred and seventeen days, until they accidentally met with some Dutch settlers, when within 400 miles of the Cape. Here they were treated with the kindest attention, and their wants relieved. But by this time, only 15 or 20 emaciated beings survived, out of more than 120 persons who were on board the *Grosvener*. What became of the captain and his party is still unknown. Some are supposed to have perished from hunger, some through grief and fatigue, and others to have been killed by the inhospitable natives.—Now, all the accumulated miseries endured by these unfortunate travelers, and the premature death of nearly a hundred persons, are to be attributed to that spirit of selfishness, inhumanity, and hostility, which, in all ages, has prevented enjoyment, and entailed misery on the human race. Had a principle of love to mankind pervaded the hearts of the wretched Caffres, or had even the common feelings of humanity been exercised toward their fellow-creatures in distress, the whole of the unfortunate individuals that pe-

rished in Africa's inhospitable clime, might have been conducted in safety to their friends and their native land.

My next example is taken from M. De Brisson's "Narrative of his shipwreck, and captivity among the Moors."

M. Brisson was shipwrecked on the coast of Barbary, on the 10th July, 1785, and, after much difficulty and danger, he, along with the crew, escaped safe to land. No sooner had they reached the shore, than they were surrounded by a crowd of savages, and seized by the collars. "The Arabs," says M. Brisson, "armed with cutlasses and large clubs, fell upon my companions with incredible ferocity; and I had the mortification of soon seeing some of them wounded, while others, stripped and naked, lay stretched out and expiring on the sand. The news of our shipwreck being spread abroad through the country, we saw the savages running with the greatest eagerness from all quarters. The women, enraged that they could not pillage the ship, threw themselves upon us, and tore from us the few articles of dress which we had left. While they went to the shore to obtain more plunder, a company of Ouadelims discovered and pillaged our retreat, and beat us in the most unmerciful manner, until I was almost at the last gasp. My mind was so much affected that I could not refrain from tears: and some of the women having observed it, instead of being moved with compassion, *threw sand in my eyes, 'to dry up my tears,'* as they expressed it." M. Brisson was forced, by these rude barbarians, into the interior of the country, as a captive. "After passing," says he, "mountains of a prodigious height, which were covered with small sharp flints, I found that the soles of my feet were entirely covered with blood. I was permitted to get up behind my master on his camel; but as I was naked, I could not secure myself from the friction of the animal's hair, so that in a very little time my skin was entirely rubbed off. My blood trickled down over the animal's sides, and this sight, instead of moving the pity of these barbarians, *afforded them a subject of diversion*. They sported with my sufferings; and that their enjoyments might be still higher, they spurred on their camels." After traveling for sixteen days, during which they were exposed to the greatest fatigue, and the most dreadful miseries, they at length reached the place of their destination, in a most wretched and exhausted condition. And what was the manner of their reception? The women having satisfied their curiosity in inquiries about the strangers, immediately began to load them with abuse. "They even spat in our faces," says M. B., "and pelted us with stones. The children, too, copying their example, pinched us, pulled our hair, and scratched us with their nails, while their cruel mothers ordered them to attack sometimes one and sometimes another, and took pleasure in causing them to torment us."

They were compelled to work at the most fatiguing and menial employments, and beaten with severity when they did not exert themselves far beyond their strength, while they were denied a single morsel of wholesome food. "As we were Christians," says the narrator, "the dogs fared better than we, and it was in the basins destined for their use that we received our allowance: our food was raw snails, and herbs and plants trodden under foot by the multitude." In this manner did these unfortunate travelers drag out the period of their captivity; some died of the blows and harsh treatment they received, and others died of hunger and despair. M. Brisson one day found

the captain of the vessel in a neighboring hamlet, stretched out lifeless upon the sand, and scarcely distinguishable but by the color of his body. In his mouth he held one of his hands, which his great weakness had no doubt prevented him from devouring. He was so changed by hunger, that his body exhibited the most disgusting appearance; all his features being absolutely effaced. A few days after, the second captain, having fallen down through weakness below an old gum tree, became a prey to the attacks of a monstrous serpent. Some famished crows, by their cries, frightened away the venomous animal, and, alighting on the body of the dying man, were tearing him to pieces, while four savage monsters, in human shape, still more cruel than the furious reptile, beheld this scene without offering him the least assistance. "I attempted to run toward him," says M. Brisson, "and to save his life, if possible, but the barbarians stopped me, and after insulting me, said, 'This Christian will soon become a prey to the flames.'" The bad state of health of this unfortunate man would not permit him to labor, and his master and mistress would not allow him the milk necessary for his subsistence.—Such were the scenes of inhumanity and cruelty which M. Brisson witnessed, during the whole period he remained in the territories of these barbarous tribes. They present to our view so many pictures of abominable selfishness and even of pure malevolence. And it is a most melancholy reflection, that numerous tribes of a similar description are spread over a very large portion of the habitable world. It makes one feel degraded when he reflects that he is related, by the ties of a common nature, to beings possessing a character so malignant and depraved.

I shall select only another example, illustrative of this topic, extracted from the travels of Mr. Park. This enterprising traveler prosecuted a journey of many hundred miles in the interior of Africa, for the most part on foot, and alone. Sometimes, his way lay over a burning sandy wilderness, where he found little to alleviate either his hunger or his thirst; and sometimes he traveled among woods and thickets, and across rivers and marshes, exposed to the wild beasts, and without any path to guide him. Though the negroes of that country frequently relieved his wants and distresses, yet the Moors used him with great cruelty and inhumanity, so that he hardly escaped with life. The chiefs through whose territories he passed, generally exacted a tribute from him, so long as he had anything to give, and under that plea, they often robbed him of all the articles which he had it not in his power to conceal. When he passed through the town of Deena, the Moors insulted him in every form which malignity could invent. A crowd of them surrounded the hut in which he lodged, and, beside hissing and shouting, uttered much abusive language. Their aim seemed to be to provoke Park to make retaliation, that they might have some pretense to proceed to greater outrages, and to rob him of his property. Suspecting their intentions, he bore all with the greatest patience, and, though they even spat in his face, he showed no marks of resentment. Disappointed in their aim, they had recourse to an argument common among Mahometans, to convince themselves that they had a right to whatever the stranger might have in his possession. He was a *Christian*. They opened his bundles, and took whatever they thought might be of use, and whatever suited their fancy.

Having been kept for some time in captivity

by a Moorish tribe, they not only robbed him of the few articles which were still in his possession, but insulted and oppressed him with the most wanton cruelty. The day was passed in hunger and thirst; to hunger and thirst were added the malignant insults of the Moors, of whom many visited him, whose only business seemed to be to torment him. He always saw the approach of the evening with pleasure; it terminated another day of his miserable existence, and removed from him his troublesome visitants. A scanty allowance of kouskous,* and of salt and water, was brought him generally about midnight. This scanty allowance was all that he and his two attendants were to expect during the whole of the ensuing day. "I was a stranger," says he, "I was unprotected, and I was a Christian; each of these circumstances is sufficient to drive every spark of humanity from the heart of a Moor. Anxious, however, to conciliate favor, and if possible, to afford the Moors no pretense for ill-treating me, I readily complied with every command, and patiently bore every insult. But never did any period of my life pass away so heavily. From sunrise to sunset, was I obliged to bear, with an unruffled countenance, the insults of the rudest savages upon earth." Having, at length, made his escape from these barbarians, he declares, "It is impossible to describe the joy that arose in my mind, when I looked around, and concluded that I was out of danger. I felt like one recovered from sickness. I breathed freer; I found unusual lightness in my limbs; even the desert looked pleasant; and I dreaded nothing so much as falling in with some wandering parties of the Moors, who might convey me back to the land of thieves and murderers from which I had just escaped."—Alas! what a load of sorrow and of misery have the selfishness and inhumanity of man accumulated upon the heads of forlorn and unfortunate sufferers! While our disconsolate traveler, after his escape, was wandering in an unknown desert, fainting with hunger, and parched with thirst, surrounded with pitchy darkness, which was only relieved by the flashes of the lightnings; where no sounds were heard but the howlings of wild beasts, and the rolling thunders:—"About two in the morning," says he, "my horse started at something, and, looking round, I was not a little surprised to see a light, at a short distance among the trees, and supposing it to be a town, I groped along the sand, in hopes of finding corn stalks, cotton, or other appearances of cultivation, but found none. As I approached, I perceived a number of lights in other places, and, leading my horse cautiously toward the light, I heard, by the lowing of the cattle, and the clamorous tongues of the herdsmen, that it was a watering place, and most likely belonged to the Moors. Delightful as the sound of the human voice was to me, I resolved once more to strike into the woods, and rather run the risk of perishing with hunger, than trust myself again into their hands."—It is a most affecting consideration, and shows to what a degree of malignity human beings have arrived, when a hungry, houseless, and benighted traveler prefers to flee for protection to the haunts of the beasts of prey, rather than commit himself to the tender mercies of those who are partakers of the same common nature, and who have it in their power to alleviate his distresses.

Mr. Park, when among the Moors, was forced to pass many days, almost without drink, under a burning climate, where, to a European, the heat

* A species of food somewhat resembling Scotch porridge.

is almost insufferable. His raging thirst induced him to run every risk, and to burst through every restraint. He sent his boy to the wells to fill the skin which he had for holding water; but the Moors were exasperated that a Christian should presume to fill his vessel at wells consecrated to the use of the followers of Mahomet. Instead, therefore, of permitting the boy to carry away water, they gave him many severe blows; and this mode of treatment was repeated as often as an attempt was made.—On another occasion, when awaking from a dream, in which, during his broken slumbers, his fancy had transported him to his native country, and placed him on the verdant brink of a transparent rivulet, and perceiving that his raging thirst had exposed him to a kind of fever, he resolved to expose himself to the insults of the Moors at the wells, in hopes that he might procure a small supply. When he arrived at them he found the Moors drawing water. He desired permission to drink, but was driven from well to well with reiterated outrage. At length he found one well where only an old man and two boys drew for their cattle. He earnestly begged a small quantity. The old man drew the bucket from the well, and held it out. Park was about eagerly to seize it, when the Moor, recollecting that the stranger was a Christian, instantly threw the water into the trough, where the cows were already drinking, and told Park to drink thence. He hesitated not for a moment. His sufferings made even this offer acceptable. He thrust his head between those of two cows, and, with feelings of pleasure which can be experienced only by those who have been reduced to a similar state of wretchedness, he continued to quench his thirst until the water was exhausted, and "until the cows began to contend with each other for the last mouthful."

In this instance, we can partly account for the barbarity of the action, from the inveterate prejudices which all Mahometans entertain against Christians; but it still remains to be accounted for, why any one should refuse to a suffering fellow-creature the common bounties of Providence, which he has in his power to bestow, however different he may be in complexion, in national character, or in the religion he professes. A religion which encourages such prejudices, and which leads to such inhumanity, must be an abomination in the sight of Him who has a special regard to the wants of all his creatures, and who "sendeth rain to refresh the fields of the just and of the unjust." The prevalence of such characters and dispositions over so large a portion of the world, shows that the moral constitution of man has suffered a sad derangement since the period when he proceeded as a pure intelligence from the hands of his Creator.

Such incidents as those to which I have now adverted, when properly considered, are calculated to inspire us with contentment, and to excite to gratitude for the common blessings which we enjoy without the least fear of danger or annoyance. How often do we enjoy the refreshment of a delicious beverage, without thinking of the parched tongues of the African pilgrims; and how often do we spurn at a wholesome dish, which would be hailed with transports of gratitude by the houseless and hungry wanderer of the desert! Yea, how many are there, even in our civilized country, who enjoy, in luxurious abundance, all the blessings which nature and art can furnish, who never once acknowledge, with heartfelt gratitude, the goodness of Him "who daily loads them with his benefits," nor reflect on the

wants and the sufferings of their fellow-men! Mr. Park, when oppressed with hunger and fatigue, applied, at the chief magistrate's house, in a village named Shrilla, for some relief, but was denied admittance. He passed slowly through the village until he came without the walls, where he saw an old motherly-looking woman at the door of a mean hut. She set before him a dish of boiled corn, that had been left the preceding night, on which he made a tolerable meal. "Overcome with joy," says Park, "at so unexpected a deliverance, I lifted up my eyes to heaven, and, while my heart swelled with gratitude, I returned thanks to that gracious and bountiful Being, whose power had supported me under so many dangers, and had now spread for me a table in the wilderness."

When Mr. Park was returning from the interior of Africa, he was encountered by a party of armed negroes, who led him into a dark place of the forest through which he was passing, and stripped him entirely naked, taking from him everything which he possessed, except an old shirt and a pair of trowsers. He begged them to return his pocket compass; but, instead of complying with his request, one of them assured him, that, if he attempted to touch that, or any other article, he would immediately shoot him dead on the spot. He was thus left in the midst of a vast wilderness, in the depth of the rainy season, naked and alone, without food, and without the means of procuring it; surrounded by savage animals, and by men still more savage, and 500 miles from the nearest European settlement. "All these circumstances," says this intrepid traveler, "crowded at once on my recollection, and, I confess, my spirits began to fail me. I considered that I had no other alternative, but to lie down and die. The influence of religion, however, aided and supported me. At this moment, painful as my reflections were, the extraordinary beauty of a small moss irresistibly caught my eye. Can that Being, thought I, who planted, watered, and brought to perfection, in this obscure part of the world, a thing which appears of so small importance, look with unconcern on the situation and sufferings of creatures formed after his own image? Surely not. Reflections like these would not allow me to despair. I started up, and, disregarding both hunger and fatigue, traveled forward, assured that relief was at hand, and I was not disappointed." Thus was this unfortunate adventurer delivered, by the care of Providence, from those accumulated distresses which had been brought upon him by the malignity and inhumanity of man.

Such are a few specimens of the inhumanity displayed by uncivilized tribes toward strangers, and unfortunate voyagers and travelers. They exhibit dispositions and conduct directly repugnant to every principle of benevolence, and present to our view a gloomy prospect of the difficulties and dangers to be surmounted by philanthropic missionaries, before the habitable world can be thoroughly explored, and before the blessings of knowledge, civilization, and religion can be communicated to the benighted and depraved tribes of mankind.

MALEVOLENT DISPOSITIONS, AS DISPLAYED IN DISFIGURING THE HUMAN BODY.

The human frame, when preserved in its original state, is one of the finest pieces of mechanism which the mind can contemplate. In beauty, in symmetry, in the harmony and proportion of all its parts and functions, it is superior to the organical structures of all the other ranks of sensitive

existence. There is no part imperfect or deformed, no part defective, and no part useless or redundant. All its members are so constructed and arranged as to contribute to the beauty and perfection of the whole, and to the happiness of the intelligent mind by which it is governed and directed. In combination with the power of thought and volition, and when unstained by malignant passions, it is a visible representative of the Creator, having been formed after his image; and it displays, in a most striking manner, the wisdom and the goodness of its Almighty Maker. But, notwithstanding the acknowledged excellence of the human frame, it has been the practice of the degraded tribes of mankind, in almost every country, and in every age, to disfigure its structure, and to deface its beauty; as if the Creator, when he formed it, had been deficient in intelligence and in benevolent design. Such practices, I am disposed to think, imply a principle of malevolence directed toward the Creator, and a disposition to find fault with his wise contrivances and arrangements. At any rate, they display a degree of ignorance and folly, a vitiated taste, and a degradation of mind, inconsistent with the dignity of a rational intelligence. The following facts will, perhaps, tend to illustrate these remarks:—

Condamine, when describing the natives of South America, informs us, that the Omaguas, and some other savages, flatten the faces of their children, by lacing their heads between two boards; that others pierce the nostrils, lips, or cheeks, and place in them feathers, the bones of fishes, and similar ornaments;—and that the savages of Brazil pull the hair out of their beards, their eye-brows, and all parts of their bodies, which makes them have an uncommon, and a ferocious appearance. Their under-lip they pierce, and, as an ornament, insert into it a green stone, or a small polished bone. Immediately after birth the mothers flatten the noses of their children. The whole of them go absolutely naked, and paint their bodies of different colors.—Captain Cook informs us, that, in New Zealand, both sexes mark their faces and bodies with black stains, similar to the tattooing in Otaheite. The men, particularly, add new stains every year, so that, in an advanced period of life, they are almost covered from head to foot. Beside this, they have marks impressed, by a method unknown to us, of a very extraordinary kind. They are furrows of about a line deep, and a line broad, such as appear upon the bark of a tree which has been cut through after a year's growth. The edges of these furrows are afterward indented by the same method, and, being perfectly black, they make a most frightful appearance. Both sexes bore their ears: they gradually stretch the holes until they are so large as to admit a finger. Into these holes they put feathers, colored cloth, bones of birds, twigs of wood, and frequently the nails which they received from the ships.—The same voyager, when describing the New Hollanders, tells us,—"Their chief ornament is a bone, which is thrust through a hole bored in the cartilage which divides the nostrils. This bone is as thick as a man's finger, and six inches in length. It reaches quite across the face, and so effectually stops up both nostrils, that they are forced to keep their mouths wide open for breath, and snuffle so when they attempt to speak, that they are scarcely intelligible to each other. Our seamen with some humor, called it their *spirit-sail yard*; and indeed it had so ludicrous an appearance, that, until we were used to it, we found it difficult to restrain

from laughter." He also describes a custom of a peculiar nature which prevails in the Friendly Islands. "The greater part of the inhabitants, both male and female, were observed to have lost one or both of their little fingers. This custom seemed not to be characteristic of rank, of age, or of sex; for, with the exception of some young children, very few people were discovered in whom both hands were perfect. They likewise burn or make incisions in their cheeks."

All the eastern nations are said to have a predilection for long ears. Some draw the lobe of the ear, in order to stretch it to a greater length, and pierce it so as to allow the admission of an ordinary pendant. The natives of Laos so prodigiously widen the holes in their ears, that a man's hand may be thrust through them. Hence, the ears of these people often descend to the tops of their shoulders.* Gentil assures us, that the women, in the northern parts of China, employ every art in order to diminish their eyes. For this purpose, the girls, instructed by their mothers, extend their eye-lids continually, with the view of making their eyes oblong and small. These properties, in the estimation of the Chinese, when joined to a flat nose, and large, open, pendulous ears, constitute the perfection of beauty.—We are informed by Struys, that the women of Siam wear so large and heavy pendants in their ears, that the holes gradually become wide enough to admit a man's thumb. The natives of New Holland pull out the two fore-teeth of the upper jaw. In Calicut, there is a band of nobles called *Naires*, who lengthen their ears to such a degree, that they hang down to their shoulders, and sometimes even lower.† The Arabs paint their lips, arms, and the most conspicuous parts of their bodies, with a deep blue color. This paint, which they lay on in little dots, and make it penetrate the flesh, by puncturing the skin with needles, can never be effaced. Some of the Asiatics paint their eye-brows of a black color, and others eradicate the hairs with *rusma*, and paint artificial eye-brows, in the form of a black crescent, which gives them an uncommon and ugly appearance. The inhabitants of Prince William's Sound, paint their faces and hands, bore their ears and noses, and slit their under lips. In the holes made in their noses, they hang pieces of bone or ivory, which are often two or three inches long; and, in the slit of the lip, they place a bone or ivory instrument with holes in it, from which they suspend beads that reach below the chin. These holes in the lip disfigure them greatly, for some of them are as large as their mouths.‡

Such distortions of the beautiful structure of the human frame, are not peculiar to the savage tribes of the human race, but are practiced by nations which have made considerable advances in science and civilization. It is well known that, in China, a ridiculous custom prevails, of rendering the feet of their females so small that they can with difficulty support their bodies. This is deemed a principal part of their beauty; and no swathing nor compression is omitted, when they are young, to give them this fancied accomplishment. Every woman of fashion, and every woman who wishes to be reckoned handsome, must have her feet so small, that they could easily enter the shoe of a child of six years of age. The great toe is the only one left to act with freedom; the rest are doubled down under the foot, in their tenderest infancy, and restrained by tight band-

* Smellie's Philosophy of Natural History, vol. II.

† Ibid. ‡ Portlock's Voyage round the World.

ages, until they unite with, and are buried in the sole. I have inspected a model of a Chinese lady's foot, exactly of this description, which, I was assured, was taken from life. The length was only two inches and three-fourths; the breadth of the base of the heel, seven-eighths of an inch; the breadth of the broadest part of the foot, one and one-fourth of an inch; and the diameter of the ankle, three inches above the heel, one and seven-eighths of an inch. With feet of this description the Chinese ladies may be said rather to totter than to walk; and, by such practices, they evidently frustrate the benevolent intentions of the Creator, and put themselves to unnecessary inconvenience and pain. Yet such is the powerful influence of fashion, however absurd and ridiculous, that women of the middling and inferior classes frequently suffer their feet to be thus maimed and distorted, in order to ape the unnatural customs of their superiors.

We have every reason to believe that the harsh and ugly features, and the ferocious aspect, by which numerous tribes of mankind are distinguished, are owing to such voluntary distortions of the human frame, and to the filthy and abominable practices in which they indulge. Father Tertre assures us, that the flat noses of the negroes are occasioned by a general practice of mothers, who depress the noses of their new-born infants, and squeeze their lips, in order to thicken them; and that those children who escape these operations have elevated noses, thin lips, and fine features.—It is somewhat unaccountable, and it shows the perversity of the human mind, in its present degraded state, that such practices should be so general, and so obstinately persisted in, when we consider the pain and inconvenience with which they are attended.—To pull the hairs of the chin or eye-brows from the roots; to slit the under lip, until the incision be as large as one's mouth; to pierce the nostrils, until a bone as large as a man's finger can be thrust through them; and to cover the body with black streaks, which make the blood to flow at every stroke of the instrument by which they are produced, must be attended with excruciating pain. Sir Joseph Banks, who accompanied Captain Cook in his first voyage, was present, in the island of Otaheite, at the operation of tattooing, performed on the back of a girl of thirteen years of age. The instrument used had twenty teeth; and at each stroke, which was repeated every moment, issued an ichor or serum, tinged with blood. The girl bore the pain with great resolution, for some minutes, until, at length, it became so intolerable, that she burst out into violent exclamations; but the operator, notwithstanding the most earnest entreaties to desist, was inexorable, while two women, who attended upon the occasion, both chid and beat her for struggling.

I am therefore disposed to view such absurd and barbarous practices, as intimately connected with the operation of a principle of malevolence, as an attempt to frustrate the wise designs of divine benevolence, and as directly repugnant to the spirit of Christianity, and to the benevolent precepts of the gospel of peace. And it becomes some of the ladies, and the dandies of modern Europe to consider, whether some of their awkward attempts to improve the symmetry of the human frame ought not to be viewed in the same light. Not many years ago, it was considered, in the higher circles of society, as an admirable improvement of the female form, to give the lower half of the body the appearance of the frustum of a large tun, as if it had been ten times the ca-

capacity of its natural size, by supporting their robes with enormous hoops;—and, about the same period, the lower ranks of female society considered it as the perfection of proportion and beauty, to have their waists compressed into the smallest possible space, until the vital functions, in many instances, were deranged, and ultimately destroyed. Were the dictates of sound reason universally attended to, and were the influence of Christianity fully felt among all nations, the preposterous and savage practices to which I have now adverted, would not only be discontinued, but held in abhorrence. And were such customs completely abolished, we might soon expect to behold, among all the tribes of mankind, every distortion of the features or the countenance removed, and the human form restored to its original beauty and perfection. Instead of a warlike visage, and a ferocious aspect, and the frightful appearance of naked savages, streaked with colors of black and blue, we should behold, in every land, every countenance beaming with the radiations of benevolence, and reflecting the moral image of the Creator.

MALEVOLENCE AS IT APPEARS IN THE RELIGION OF SAVAGE TRIBES.

There is scarcely a nation on the surface of the globe but what appears to have some impressions of the existence of a Superior Power, and to have formed a system of religious worship. But, it is a striking fact, that, among the greater portion of human beings, their religious notions, and their sacred rites, instead of breathing a spirit of kindness and benevolence toward their fellow-creatures, are blended with a principle of hatred and revenge. This might be illustrated by an induction of a great variety of instances, in reference to almost every uncivilized portion of the human race. I shall content myself, however, with stating only one instance, in reference to the *Nesserie*, a tribe not much known in Europe, and which may serve as an example of many others.

The territory of this people extends from Antioch nearly to Tripoli. They occupy almost all the mountains to the east of Latakia, and a great part of the plain. Among them is perceived a mixture of the religious usages of Paganism, of the Jewish law, of that of Mahomet and Ali, and of some dogmas of the Christian Religion.—The women are considered as a part of the domestic animals of the house, and treated as slaves.—They have no idea of religion, and when they are bold enough to inquire of their masters concerning it, the latter answer them that their religion is, to be charged with the reproduction of the species, and to be subject to the will of their husbands.—The *Nesserie* say their prayers at midnight, and before sunset. They may say them either sitting, standing, or walking; but they are obliged to begin again repeating their ablation, if they speak to a person not of their religion,—if they perceive, either near or at a distance, a camel, a pig, a hare, or a negro. In their prayers, they curse the man who shaves below the chin, him who is impotent, and the two Caliphs, Omar and Abou-Bekr. They detest the Turks, to whom they are sworn enemies. This warlike people of mountaineers would be strong enough to shake off the yoke of the Turks, and live independently, if they were not divided by interested motives, almost all occasioned by implacable family hatreds. They are *vindictive*, and cherish their rancor for a length of time: even the death of the guilty person cannot assuage

their fury; their vengeance is incomplete, if it does not fall beside on one or several members of his family. They are so obstinately superstitious in their attachment to their peculiar system, that no threats nor punishments can extort from them the secrets of their religion.*

Here, then, we are presented with a system of religion which appears to be founded on malevolence,—which directs its devotees to curse their fellow-men—which leads them to keep their women in profound ignorance of everything which they hold sacred—which induces them to conceal its mysteries from all the rest of the world—and which, in so far from producing any beneficial effects on their own conduct, leads to “implacable family hatreds.” A religion, unless it be founded on a principle of benevolence, is unworthy of the name; it must be an abhorrence in the sight of God, and can never communicate happiness to man. And were we to examine the various religious systems which prevail in the numerous islands of the Indian and Pacific Oceans, in Cabul, Thibet, and Hindostan, and among the uncivilized tribes which are scattered over a large portion of Asia and of Africa, we should find them, not only blended with malevolent principles and maxims, but sanctioning the perpetration of deeds of cruelty, obscenity, and horror.

In the preceding pages, I have endeavored to illustrate some of the prominent features in the moral character of the savage and uncivilized tribes of the human race. The examples I have selected have not been taken from the records of missionaries, or of professed religionists, who might be suspected by some to give an exaggerated description of the depravity of the Pagan world—but from the unvarnished statements of respectable voyagers and travelers, who could have no motive for misrepresenting the facts which they have recorded. These illustrations might have been extended to a much greater length, had it been consistent with the limited nature of the present work. Instead of occupying only forty or fifty pages, they might have been extended so as to have filled as many volumes; for every book of travels, as well as every historical document, contains a record of the operations of malignity, and of the diversified modes in which human depravity is displayed. The dispositions which I have illustrated, it will be readily admitted, are all of a *malignant* character, directly repugnant to that benevolent principle which forms the basis of the moral laws of the universe. And when we consider, that such malevolent dispositions are displayed by a mass of human beings, amounting to more than three-fourths of the population of the globe, and that true happiness cannot be experienced where malignant passions reign uncontrolled, a benevolent mind cannot refrain from indulging a thousand melancholy reflections, when it casts its eye over the desolations of the moral world, and from forming an anxious wish, that the period may soon arrive, when the darkness which covers the nations shall be dispelled, and when benevolence and peace shall reign triumphant over all the earth.

I shall now endeavor to present a few facts and sketches which may have a tendency to illustrate the present state, and the moral character and aspect of the *civilized* world.

SECTION III.

MORAL STATE OF CIVILIZED NATIONS.

The present population of the globe may be estimated at about 800 millions. Of these, if we except the empires of China and Hindostan, we cannot reckon above 180 millions as existing in a state of enlightened civilization; a number which is less than the fourth part of the human race. Were even this small portion of mankind uniformly distinguished for intelligence, and for the practice of benevolence, it would form a glorious picture for the philanthropist to contemplate; and would be a sure prelude of the near approach of that happy period, when “*all the ends of the earth shall remember and turn to the Lord, when all the kindreds of the nations shall do homage unto him, and when there shall be nothing to hurt nor destroy*” among all the families of mankind. But alas! when we investigate the moral state even of this portion of human beings, we find the principle of malignity distinctly visible in its operations, and interwoven, in numerous and minute ramifications, through all the ranks and gradations of society. Though its shades are less dark and gloomy, they are no less real than among the hordes of Africa and Tartary, and the other abodes of savage life. To illustrate this position is the object of the following sketches; in which I shall chiefly refer to the state of society among the nations of Europe, and the United States of America, and particularly to the moral character and aspect of the British empire.

I shall, in the first place, consider the operation of the malevolent principle as it appears in the actions and dispositions of the young, and in the modes of tuition by which they are trained.

In many thousands of instances, it may be observed, that, even before a child has been weaned from its mother's breasts, malignant dispositions are not only fostered, but are regularly taught both by precept and example. Does a child happen to hit its head accidentally against the corner of a table—it is taught by its nurse, and even by its mother, to avenge the injury on the inanimate object which caused it, and to exhibit its prowess and its revenge by beating the table with all its might. Does it cry, through peevishness or pain—it is immediately threatened with being thrown into the ditch, tossed out of the window, or committed to the charge of some frightful specter. Is it expedient to repress its murmurings, and to cajole it into obedience—it is then inspired with fallacious hopes, and allured with deceitful promises of objects and of pleasures which are never intended to be realized. Does it require to have its physical powers exercised—a wooden sword or a whip is put into its hands; and it is encouraged to display its energies in inflicting strokes on a dog, a cat, or any of its play-fellows or companions. I have seen a little urchin of this description, three or four years of age, brandishing its wooden sword with all the ardor of a warrior, and repeating its strokes on every person around, while the foolish parents were exulting in the prowess displayed by their little darling, and encouraging it in all its movements. By these and similar practices, revenge, falsehood, superstition, and the elements of war, are fostered in the youthful mind; and is it to be wondered at, that such malignant principles and passions should “grow with their growth, and strengthen with their strength,” until they burst forth in all those hideous forms which they assume amidst the contests of communities and of nations?—The false maxims by which children are frequently trained under the domestic roof,

* See Dupont's “Memoirs of the Manners and Religious Ceremonies of the Nesserie,” a work lately published.

and the foolish indulgence with which they are treated by injudicious parents, in too many instances lay the foundation of those petulant and malignant tempers, which are a pest both to Christian and to general society. Indulgence often leads to an opposite extreme; and produces such a degree of insubordination among the young, that nothing is to be seen and heard but a perpetual round of scolding and beating, and the contest of angry passions. "Among the lower ranks of people," says Dr. Witherspoon, "who are under no restraint from decency, you may sometimes see a father or mother running out into the street, after a child who has fled from them, with looks of fury and words of execration, and they are often stupid enough to imagine that neighbors or passengers will approve them in this conduct." Wherever parental authority is thus undermined, and such conduct uniformly pursued, a sure foundation is laid for an extensive display, in after life, of the malignant passions of the human heart.

If we follow our youth from the nursery to the school-room, we shall find the same malevolent affections developing themselves on a larger scale, and indirectly cherished, by the books they read, the discipline by which they are trained, and the amusements in which they indulge. Here we may behold one little fellow taking a malicious pleasure in pinching his neighbor, another in kicking him, a third in boxing him, a fourth in tearing his book, a fifth in pilfering his property, and a sixth in endeavoring to hold him up to scorn and ridicule; and all of them combined to frustrate, if possible, the exertions of their teacher, and to prevent their own improvement.—If we look into the majority of the books which are read in schools, we shall find them full of encomiums upon war, and upon warriors. The Cæsars, the Alexanders, and the Bonapartes, whose restless ambition has transformed the earth into scenes of desolation and carnage, are represented as patterns of everything that is brave, noble, generous, and heroic. The descriptive powers of the poet are also called in, in order to inflame the youthful mind with warlike dispositions, and to excite an ardent desire for mingling in scenes of contention, and for the acquisition of false glory and of military renown. Hence, there is no part of their school exercises in which the young so much delight, and in which they so much excel, as in that in which they are called upon to recite such speeches as "Sempronius's speech for war," or to ape the revengeful encounter of Norval and Glenalvon. While the spirit of war is thus virtually cherished, the counteraction of vicious propensities, and the cultivation of the moral powers of the young, are considered as a matter of inferior importance, and, in many seminaries of instruction, are altogether overlooked. Many of the school collections to which I allude—instead of exhibiting, in simple language, the beauties and sublimities of the works of nature, the displays of the natural and moral character of the Deity, the facts of Sacred History, the morality of the Gospel, the scenes of rural and domestic life, and the operations of philanthropy—are filled with extracts from metaphysical writers, from parliamentary debates, and from old plays, novels, and farces, which are frequently interlarded with oaths, obscenity, and the slang of Billingsgate, which can have no other tendency than to pollute and demoralize the youthful mind. It needs, therefore, excite no surprise, that the great body of mankind is still so deficient in rational information and substantial knowledge, and that a warlike spirit

is afloat, and exerting its baleful influence among the nations.

If we follow the young from the school-room, to the *play-ground*, or to the streets and the highways, we shall find the spirit of malignity displaying itself in a vast diversity of forms. *Here*, we may behold one mischievous little boy slapping his neighbor in the face, another tearing his neighbor's clothes, another tossing his cap into a dirty ditch, another chalking his back in order to hold him up to ridicule, and another pouring out upon him a torrent of nicknames, and of scurrilous epithets. *There*, we may behold a crowd of boys pelting a poor beggar or an unfortunate maniac with stones and dirt for their diversion; mocking the lame, the deformed, and the aged, and insulting the passing traveler. And, when such objects do not happen to occur, we may see them assailing, with a shower of stones, a cat, a dog, a hare, or a fowl, that happens to cross the path, and enjoying a diabolical pleasure in witnessing the sufferings of these unfortunate animals. *Here*, we may behold an insolent boy insulting a timid girl, overturning her pitcher, and besmearing her with mire;—there we behold another saluting his fellow with a malignant scowl, and a third brandishing his whip, and lashing a horse or a cow, for his amusement. On the one hand, we may sometimes behold a ring of boys, in the center of which two little demons are engaged in mutual combat, with eyes glaring with fury and revenge, exerting their physical powers to the utmost stretch, in order to wound and lacerate, and cover with blood and gore, the faces of each other: on the other hand, we may behold an unfortunate boy, whom a natural temperament, or a virtuous principle, prevents from engaging in similar combats, assailed with opprobrious epithets, and made a laughing-stock, and an object of derision and scorn, because he will not be persuaded to declare war against his neighbor. And, what is still more atrocious and disgusting, we may behold *children* of thirty or forty years of age, encouraging such malevolent dispositions, and stimulating such combatants in their diabolical exertions!* Such infernal practices, among creatures originally formed after the divine image, if they were not so common, would be

* The practice of boxing, among boys, which so generally prevails, especially in England, is a disgrace to the boasted civilization and Christianity of that country, and to the superintendents of its public seminaries. That pugilistic contests between grown-up savages in a civilized shape, should be publicly advertised, and described in our newspapers, and the arena of such contests resorted to by so many thousands of the middling and higher classes of society, is a striking proof that the spirit of folly and of malignity still prevails to a great extent, and that the spirit of Christianity has made little progress, even within the limits of the British empire. —The following late occurrence shows the fatal effects with which such practices are sometimes attended. "On Monday, February 28, 1825, two of the scholars at Eton, the Hon. F. A. Cooper, the son of the Earl of Shaftesbury, and Mr. Wood, the son of Colonel Wood, and nephew to the Marquis of Londonderry, in consequence of a very warm altercation on the play-ground, on the preceding day, met, for the purpose of settling the unhappy quarrel by a pugilistic encounter—a prevalent practice at Eton and all our public schools. Almost the whole school assembled to witness the spectacle. The inexperienced youth commenced fighting at four o'clock, and partly by their own energy, and partly by the criminal excitement of others, continued the fatal contest until within a little of six, when, mournful to relate, the Earl of Shaftesbury's son fell very heavily upon his head, and never spoke afterward. He was carried off to his lodgings, where he expired in a few hours. On the corner's inquest it came out, that brandy had been administered very freely, and that no decisive effort had been made to discontinue a contest prolonged beyond all due limits.—About forty years ago a similar cause led to a similar result at the same establishment. The survivor is a clergyman of great respectability." —See *Public Prints for Feb., and Evan. Mag. for April, 1825.*

viewed by every one in whose breast the least spark of virtue resides, with feelings of indignation and horror.

The great body of our youth, habituated to such dispositions and practices, after having left school at the age of fourteen or fifteen—a period when headstrong passions and vicious propensities begin to operate with still greater violence—have access to no other seminaries, in which their lawless passions may be counteracted and controlled, and in which they may be carried forward in the path of moral and intellectual improvement. Throughout the whole of the civilized world, I am not aware that there exist any regular institutions exclusively appropriated for the instruction of young persons, from the age of fifteen to the age of twenty-five or upward, on moral, religious, and scientific subjects; in order to expand their intellectual capacities, and to direct their moral powers in the path of universal benevolence. Yet, without such institutions, all the knowledge and instructions they may have previously acquired, in the great majority of instances, are rendered almost useless and inefficient for promoting the great end of their existence. From the age of fifteen to the age of twenty-five, is the most important period of human life; and, for want of proper instruction and direction, during this period, and of rational objects to employ the attention at leisure hours, many a hopeful young man has been left to glide insensibly into the mire of vice and corruption, and to become a pest to his friends, and to general society. Our streets and highways are infested, and our jails and bridewells filled with young persons of this age, who, by means of rational and religious training, might have been rendered a comfort to their friends, blessings to society, and ornaments of the Christian Church.

It would be inconsistent with the limited plan of this work, to attempt to trace the principle of malignity through all the scenes of social, commercial, and domestic life. Were I to enter into details of filial impiety, ingratitude, and rebellion—of faithless friendships—of the alienations of affection, and of the unnatural contentions between brothers and sisters—of the abominable *selfishness* which appears in the general conduct and transactions of mankind—of the bitterness, the fraud, and the perjury, with which lawsuits are commenced and prosecuted—of the hatred, malice, and resentment, manifested for injuries real or supposed—of the frauds daily committed in every department of the commercial world—of the shufflings and base deceptions which are practiced in cases of bankruptcy—of the slanders, the caballing, and the falsehood, which attend electioneering contests—of the envy, malice, and resentment displayed between competitors for office and power—of the haughtiness and insolence displayed by petty tyrants both in church and state—of the selfishness and injustice of corporate bodies, and the little regard they show for the interests of those who are oppressed, and deprived of their rewards—of the gluttony, drunkenness, and prodigality, which so generally prevail—of the brawlings, fightings, and contentions, which are daily presented to the view in taverns, ale-houses, and dram-shops, and the low slang and vulgar abuse with which such scenes are intermingled—of the seductions accomplished by insidious artfulness and outrageous perjury—of the multiplied falsehoods of all descriptions which are uttered in courts, in camps, and in private dwellings—of the unblushing lies of public newspapers, and the perjuries of office—of

the systematic frauds and robberies by which a large portion of the community are cheated out of their property and their rights—of the pride, haughtiness, and oppression of the rich, and of the malice, envy, and discontentment of the poor—such pictures of malignity might be presented to the view, as would fill the mind of the reader with astonishment and horror, and which would require a series of volumes to record the revolting details.

There is one very general characteristic of civilized, and even of Christian society, that bears the stamp of malignity, which may particularly be noticed; and that is, the pleasure with which men expatiate on the faults and delinquencies of their neighbors, and the eagerness with which they circulate scandalous reports through every portion of the community. Almost the one half of the conversation of *civilized* men, when strictly analyzed, will be found to consist of malignant insinuations, and of tales of scandal and detraction, the one half of which is destitute of any solid foundation. How comes it to pass, that the slightest deviation from propriety or rectitude, in the case of one of a generally respectable character, is dwelt upon with a fiend-like pleasure, and aggravated beyond measure, while all his good qualities are overlooked and thrown completely into the shade? What is the reason why we are not as anxious to bring forward the good qualities and actions of our fellow-men, and to bestow upon them their due tribute of praise, as we are to blaze abroad their errors and infirmities? How often does it happen, that a single evil action committed by an individual, contrary to the general tenor of his life, will be trumpeted about by the tongue of malice, even to the end of his life, while all his virtuous deeds and praiseworthy actions will be overlooked and forgotten, and attempted to be buried in oblivion! If benevolence were the prevailing characteristic of mankind, such dispositions would seldom be displayed in the intercourses of human beings. If benevolence pervaded every heart, we would rejoice to expatiate on the *excellencies* of others;—these would form the chief topics of conversation in our personal remarks on others; we would endeavor to throw a veil over the infirmities of our brethren, and would be always disposed to exercise that candor and charity “which covers a multitude of sins.”

If we now turn our eyes for a moment, to the *amusements* of civilized society, we shall find many of them distinguished by a malignant character and tendency. What an appropriate exhibition for rational and immortal beings do the scenes of a *cockpit* display! to behold a motley group of *bipeds*, of all sorts and sizes, from the peer to the chimney-sweep, and from the man of hoary hairs to the lisping infant, betting, blustering, swearing, and feasting their eyes with a savage delight on the sufferings of their fellow-bipeds, whom they have taught to wound, to torment, and to destroy each other! There is scarcely anything that appears so congenial to the spirit which pervades the infernal regions, as the attempt to inspire the lower animals with the same malignant dispositions which characterize the most degraded of the human species. That such a cruel and disgusting practice still prevails in England, and that it formed, until lately, a part of the amusements of almost all the schools in Scotland, is a reproach to the civilization, the humanity, and the Christianity of our country. And what a fine spectacle to a humane and civilized mind is the amusement of *bull-baiting*! an

amusement in which the strength and courage of this animal are made the means of torturing him with the most exquisite agonies! Can benevolence, can even the common feelings of humanity, reside in the breast of that man who can find enjoyment in encouraging and in witnessing such barbarous sports? And what a dignified amusement is the *horse-race*! where crowds of the nobility, gentry, and of the most polished classes of society, as well as the ignoble rabble, assemble from all quarters, to behold two noble animals panting, and heaving, and endeavoring to outstrip each other on the course! What a scene of bullying, and jockeying, and betting, and cheating, and cursing, and swearing, and fighting, is generally presented on such occasions! What a wonderful degree of importance is attached, by the most dignified rank of society, to the issue of the race; as if the fate of an empire, or the salvation of an immortal spirit, were depending on the circumstance of one horse getting the start of another! I do not mean to decry, indiscriminately, public amusements; nor to call in question the propriety of improving the locomotive powers of the horse; but, surely, it would require no great stretch of invention, to devise spectacles and entertainments, much more dignified and congenial to the noble powers, and to the high destination of the human mind, and which might be exhibited with as little expense either of time or of money.

And what shall we say of *lion fights*, and *dog fights*, and *boxing matches* between animals in the shape of men, which have been lately advertised in the public prints with so much impudence and effrontery? Are the patrons of such revolting exhibitions, and the crowds which resort to them, to be considered as patterns of taste, of humanity, and of refined benevolence? And what shall we think of the amusements of one half of our gentry, country squires, gentlemen farmers, and the whole tribe of the sporting community, who derive more exquisite enjoyment in maiming a hare, a partridge, or a moorfowl, than in relieving the wants of the friendless poor, in meliorating the condition of their dependents, or in patronizing the diffusion of useful knowledge? If one of our best moral poets declared, that "he would not enter, on his list of friends, though graced with polished manners and fine sense, the man who needlessly sets foot upon a worm," what would be his estimate of the man who derived one of his chief gratifications, day after day, from making havoc among the feathered tribes, and from lacerating and maiming a timid hare, for the sole purpose of indulging a sporting humor, and proving himself an excellent marksman? Can we suppose that the benevolent Creator so curiously organized the beasts of the earth and the fowls of heaven, and endowed them with exquisite feelings and sensibility, merely that tyrannical man might torture and destroy them for his amusement? For the persons to whom I allude cannot plead necessity for such conduct, as if they were dependent for subsistence on their carcasses. Such is still the mania for these cruel arguments, that the butchery of the brutal and the winged tribes, it is likely, will soon be reduced to a regular system, and enroled among the number of the *fine arts*. For, an octavo volume, of 470 pages, which has already passed through three editions, has been lately published, entitled, "Instructions to young Sportsmen in all that relates to Game and Shooting;" by Lieut. Colonel Hawker. The author, after having stated that he has now lost his eyes and nerves for a good shot,

says, "The greatest pleasure that can possibly remain for me, is to resign the little I have learned for the benefit of young sportsmen. The rising generation of shooters might otherwise be left for many years, to find out all these little matters." And a most important loss, doubtless, the rising generation would have sustained, had not the worthy Colonel condescended to communicate his discoveries! I was lately making an excursion in a steamboat, through one of the Scottish lakes. Among the passengers were several of the sporting gentry, furnished with all their requisite accouterments, who seemed to enjoy a higher gratification in disturbing the happiness of the feathered tribes, than in contemplating the natural beauties of the surrounding scene. When any of these hapless animals appeared in view, a hue and cry commenced, a shot was prepared, and a musket leveled at the unoffending creatures, which created among them universal agitation and alarm. Some of them were killed; and others, doubtless, maimed, and rendered miserable for life; while no human being could enjoy the least benefit from such wanton cruelty. To kill, or even to maim any living creature that is doing us no harm, and when there is no possibility, nor even a desire, to procure its carcass for food, cannot, I should think, by any sophistry of reasoning, be construed into an act of benevolence.*

I cannot, here, forbear inserting a passage from "Salt's Travels in Abyssinia," which exhibits a very different spirit in one whom some would be disposed to rank among the class of semi-barbarians. "In the evening, Baharnegash Yasons, a servant of the Ras (of Abyssinia) who had attended me during my whole stay in the country, took his leave. Among all the men with whom I have been intimately acquainted, I consider this old man as one of the most perfect and blameless characters. His mind seemed to be formed upon the purest principles of the Christian religion; his every thought and action appeared to be the result of its dictates. He would often, to ease his mule, walk more than half the day; and as he journeyed by my side, continually recited prayers for our welfare and future prosperity. On all occasions he sought to repress in those around him, every improper feeling of anger; conciliated them by the kindest words, and excited them, by his example, to an active performance of their duties. If a man were weary, he would assist him in carrying his burden; if he perceived any of the mules' backs to be hurt, he would beg me to have them relieved; and, constantly, when he saw me engaged in shooting partridges, or other birds, he would call out to them to fly out of the way, shaking his head, and begging me, in a mournful accent, not to kill them. I have remarked, in my former journal, that, with all this refined feeling of humanity, he was far from being devoid of courage; and, I had an opportunity, subsequently, of witnessing several instances of his bravery, though he appeared on all occasions peculiarly

* In throwing out these reflections, the author by no means wishes to insinuate, that it is improper, in every instance, to kill any of the inferior animals; his remarks being directed solely against the practice of wantonly maiming or destroying them for the sake of mere sport or amusement. Even in those cases where it may appear expedient or necessary, to extirpate a portion of the animal tribes, it appears somewhat strange, that *gentlemen* should be the voluntary agents employed in this work of destruction, and that their minds should be so much absorbed in the satisfaction which it creates. One would have thought that the very lowest class of the community would have been selected for this purpose, as there is something naturally revolting in the employment of destroying the life of any sensitive being.

anxious to avoid a quarrel. We parted, I believe, with mutual regret; at least for my own part, I can truly say, that I have seldom felt more respect for an individual than I did for this worthy man."

As a contrast to the benevolent dispositions displayed by this worthy Abyssinian,—I shall give a short description of a *bull-fight*, in Madrid, extracted from a work, the author of which was a spectator (in 1803) of the scene he describes. "The Spanish bull-fights are certainly the most extraordinary exhibition in Europe: we were present at one of them this morning. The places in the amphitheater were nearly all filled at half past nine, and at ten, the corregidor came into his box; upon which the trumpet sounded, and the people rose and shouted, from the delight that the show was to begin immediately. Four men in black gowns then came forward, and read a proclamation, enjoining all persons to remain in their seats. On their going out of the arena, the six bulls which were to be fought this morning, were driven across, led on by a cow, with a bell round her neck. The two *Picadores* (the men who were appointed to fight the furious animals) now appeared, dressed in leathern gaiters, thick leathern breeches, silk jackets covered with spangles, and caps surmounted by broad brimmed white hats; each rode a miserable hack, and carried in his hand a long pole, with a goad at the end. As soon as they were prepared, a door was opened, and the first bull rushed in. In the course of the contest, I felt first alarmed for the men, and then for the horses. Soon the accidents of the men withdrew my pity from the beasts; and, latterly, by a natural, and dreadful operation of the mind, I began to look without horror on the calamities of both. The manner of the fight is thus:—the bull rushes in, and makes an attack severally upon the picadores, who repulse him; he being always, upon these occasions, wounded in the neck; after a few rencounters, he becomes somewhat shy; but at the same time, when he does rush on, he is doubly dangerous. He follows up the attack, and frequently succeeds in overthrowing both horse and rider. As long as the horse has strength to bear the picadore, he is obliged to ride him. This morning one of these wretched animals was forced to charge, *with his guts hanging in festoons between his legs!* His belly was again ripped open by the bull, and he fell for dead; but the attendants obliged him to rise and crawl out! This seems the cruellest part of the business; for the men almost always escape; but the blood and sufferings of thirteen horses were exhibited in the short space of two hours. Four men were hurt; one who was entirely overturned with his horse upon him, was carried out like a corpse; but the spectators, *totally disregarding this melancholy sight, shouted for his companion to renew the attack.* The bull after his first rage and subsequent fury during many rounds, begins to feel weakness, and declines further attacks on the horsemen. Upon this, a loud shout re-echoes through the theater, and some of the attendants advance and stick his gored neck full of arrows which cause him to *writhe about in great torment.* When the efforts he makes under these sufferings have considerably spent his strength, the corregidor makes a motion with his hand, and the trumpets sound as a signal to the matador to dispatch him. This is a service which requires great skill and bravery; for the madness of the bull, and the torture he endures, prompt him to destroy every one around. The matador advances with a red cloak in one hand, and a sword in the other. He engages the bull with the cloak, until, at length get-

ting opposite to him, he rushes forward, and the sword pierces his spinal marrow, or what is more common, is buried to the hilt in his neck; upon which he turns aside, at first moaning, but a torrent of blood gushes from his mouth; and he staggers round the arena, and falls. The trumpets sound; three mules, ornamented with ribbons and flags, appear, to drag the wretched victim out by the horns, and the horsemen to prepare for the attack of a fresh animal.

"In the evening the show began at half-past four, and ten bulls were brought forward. To tame them before the matador approached, a new expedient was resorted to, most infamously cruel, namely, the covering of the darts with sulphur and fireworks. The torments of these were so dreadful, that the animals whose strength was fresh, raged about terribly, so that the assistants were forced to use great agility to get from them. There were many hair-breadth escapes, one of the animals in pursuit of a man, leaped the barrier of the arena, which is about eight feet high. A second bull was still more furious, and made more tremendous attacks. In one of these he pinned the man and horse against the barriers, got his horns under the horse, and lacerated him dreadfully; in a moment afterward, he lifted him up and threw the man with such force through one of the apertures, as to kill him on the spot. He was borne past the box in which we were with his teeth set, and his side covered with blood; the horse staggered out spouting a stream of gore from his chest. The remaining picador renewed the charge, and *another came in with shouts to take the dead man's place.* One of these had his horse's skin dreadfully ripped off his side, and when he breathed, *the entrails swelled out of the hole;* to prevent which, the rider got off and stuffed in his pocket handkerchief," &c.*—"I have seen," says Bourgoing, "eight or ten horses torn, and their bellies ripped open, fall and expire in the field of battle. Sometimes these horses, affecting models of patience, of courage, of docility—present a spectacle, at which it may be allowable to shudder. You see them tread under their feet, their own bloody entrails, hanging out of their open sides, and still obey, for some time the hand that guides them."

Such are the amusements which, in Spain, fascinate all ranks of the community, from the prince to the peasant. Young ladies, old men, servant girls, and people of all ages and all characters are present. The art of killing a bull, which seems exclusively to be the business of a butcher, is gravely discussed and exalted with transport, not only by the rabble, but by men of sense, and by women of delicacy. The day of a bull-fight is a day of solemnity for the whole canton. "The people come," says Bourgoing, "from ten and twelve leagues distance. The artisan who can with difficulty earn enough for his subsistence, has always sufficient to pay for the bull-fight. Woe be to the chastity of a young girl whose poverty excludes her! The man who pays for her admittance, will be her first seducer. It is indeed a very striking sight, to see all the inhabitants assemble round the circus, waiting the signal for the fight, and *wearing in their exterior every sign of impatience.*" There is not a town in Spain, but what has a large square for the purpose of exhibiting bull-fights; and it is said, that

* Travels through Spain and part of Portugal in 1803, Vol. 2, pp. 35–45. A more circumstantial account of these fights, and in perfect accordance with the above description, may be seen in Bourgoing's "Modern State of Spain," vol. II, pp. 346–360.

even the poorest inhabitants of the smallest villages will often club together, in order to procure a cow or an ox, and fight them riding upon asses for want of horses.* Can a spirit of pure benevolence be general among a people addicted to such cruel and savage amusements! And, need we wonder to find, that troops of lawless banditti are continually prowling among the mountains and forests of that country, committing murders and depredations? One of the authors just now quoted, when alluding to banditti, and detailing the incidents which occurred on his route to Madrid, says, "In this country it is impossible to distinguish friends from foes, as all travelers go well armed. We met just here half a dozen horsemen, many of whom had swords and pistols, and we afterward saw peasants riding on asses, armed in the same way. A few leagues further on, we met a strong detachment of cavalry patrolling the road, in consequence of a daring robbery, which had just been committed on a nobleman who was bringing his bride to court from Barcelona. He had a numerous retinue; the banditti were twelve in number, and completely armed."

If we now take a cursory glance at our POPULAR LITERARY WORKS, and at several of our publications intended for the *nursery*, we shall find that a goodly portion of them is stamped with the character of frivolity and of *malignity*. When the young mind is just beginning to expand, instead of being irradiated with the beams of unadulterated truth, a group of distorted and unsubstantial images, which have no prototypes in nature, is presented to the view of the intellect, as the groundwork of its future progress in wisdom and knowledge. Instead of the simple and sublime precepts of Christian benevolence, the wild and romantic notions connected with chivalry, the superstitions of the dark ages, and the love of false heroism, and of military glory, are attempted to be indelibly riveted on the minds of the young. What else can be expected, when such legends and romances as the following, occupy the principal part of the nursery library?—*Blue Beard*; *Cinderella*; *Tom Thumb*; *Jack the Giant-Killer*; *Valentine and Orson*; *The Seven Champions of Christendom*; *Robin Hood*; *Goody Two-Shoes*; *Puss in Boots*; *Sinbad the Sailor*; *Aladdin, or, the Wonderful Lamp*; *Thalaba, or, the Destroyer*; *The Blood-Red Knight*; *The Maid and the Magpie*; *Fairy Tales*, and a long list of similar tales and romances, equally improving and important! Such works are published, even at the present time, not only in a Lilliputian size, to suit the lower ranks of the community, but in a style of splendor and elegance, calculated to fascinate the highest circles of society. Ten thousands of copies of such publications, are presently in circulation throughout every part of the British empire:—and what is the great object they are calculated to accomplish? To exhibit distorted views of the scenes of nature, and of human society; to foster superstitious notions; to inspire the minds of the young with an inordinate desire after worldly honor and distinction; to set before them, as an ultimate object, the splendor and felicity of "riding in a coach and six;" and to familiarize their minds to chival-

rous exploits, and to scenes of butchery and revenge.

If we glance at the popular literary works of the present day, intended for the amusement of children of a larger growth, we shall find many of them imbued with a similar spirit, and having a similar tendency. What is it that just now fascinates our literary loungers, our polished gentry, our educated females, nay all ranks of the community, from the dignified clergyman to the humble weaver, and which threatens to destroy all relish for plain unvarnished facts, and for substantial knowledge? The novels of *Waverley*, *Guy Mannering*, *Rob Roy*, *Tales of my Landlord*, *The Fortunes of Nigel*, *St. Ronan's Well*, *Marmion*, *The Corsair*, *Childe Harold*, and a shoal of similar publications, which are daily issuing from the press. And what is the general tendency of the great majority of such works?—To distort and caricature the facts of real history; to gratify a romantic imagination; to pamper a depraved mental appetite; to excite a disrelish for the existing scenes of nature, and for the authenticated facts which have occurred in the history of mankind; to hold up venerable characters to derision and contempt; to excite admiration of the exploits and the malignant principles of those rude chieftains and barbarous heroes, whose names ought to descend into everlasting oblivion; to revive the revengeful spirit of the dark ages; to undermine a sacred regard for *truth* and moral principle, which are the basis of the happiness of the intelligent universe; and to throw a false glory over scenes of rapine, of bloodshed, and of devastation.—To such works, and to their admirers, we might apply the words of the ancient Prophet: "He feedeth on *ashes*; a deceived heart hath turned him aside, that he cannot say, Is there not a lie in my right hand?"

"For, sure, to hug a fancied ease,
That never did, nor can take place,
And for the pleasures it can give,
Neglect the 'facts of real life,'
Is madness in its greatest height,
Or I mistake the matter quite."—*Wilkie*.

To affirm, that it is necessary for the entertainment of the human mind, to have recourse to fictitious scenes and narratives, and to the wild vagaries of an unbridled imagination, is, in effect, to throw a reflection upon the plans and the conduct of the Creator. It implies, that, in the scenes of nature which surround us, both in the heavens and on the earth, and in the administration of his moral government among men, God has not produced a sufficient variety of interesting objects for the contemplation, the instruction, and the entertainment of the human race—and that the system of the moral and physical world must be distorted and deranged, and its economy misrepresented and blended with the creations of human folly, before its scenery be rendered fit to gratify the depraved and fastidious tastes of mankind.* And is it indeed true, that there is not a

* It is said that these fights were prohibited in 1805, to the deep regret of the most numerous part of the nation; but another entertainment, called *fiesta de novellas*, which is an image of the bull-fight, is still retained, and it is not improbable, that, by this time, the true bull-fight has been again revived.

* The following sketch of Sir Walter Scott, the supposed author of some of the works alluded to, is given in Hazlitt's "Spirit of the Age, or Contemporaneous Portraits." "His mind receives and treasures up everything brought to it by tradition or custom—it does not project itself beyond this into the world unknown, but mechanically shrinks back as from the edge of a precipice. The land of *pure reason* is to his apprehension like *Van Dieman's Land*, barren, miserable, distant, a place of exile, the dreary abode of savages, convicts, and adventurers. Sir Walter would make a bad hand of a description of the *millennium*, unless he would lay the scene in Scotland 500 years ago; and then he would want facts and worm-eaten parchments to support his drooping style. Our historical novelist firmly thinks, that nothing is

sufficient *variety* to gratify a *rational* mind in the *existing scenes* of creation and providence? If we survey the Alpine scenes of nature; if we explore the wonders of the ocean; if we penetrate into the subterraneous recesses of the globe; if we direct our view to the numerous objects of sublimity and of beauty to be found in every country; if we investigate the structure and economy of the animal and the vegetable tribes; if we raise our eyes to the rolling orbs of heaven; if we look back to the generations of old, and trace the history of ancient nations; if we contemplate the present state of civilized and of savage tribes, and the moral scenery which is everywhere displayed around us—shall we not find a sufficient variety of everything which is calculated to interest, to instruct, and to *entertain* a rational mind? I am bold to affirm, that were a proper selection made of the *facts* connected with the system of nature, and with the history and the present state of human society, and were the sketches of such facts executed by the hand of a master, and interspersed with rational and moral reflections—volumes might be presented to the public, no less entertaining, and certainly far more instructive, than all the novels and romances which the human imagination has ever produced; and that, too, without distorting a single fact in the system of nature or of human society, or exciting a sentiment of admiration or of approbation of the exploits of warriors. If we wish to be amused with entertaining narrations and novel scenes, the narratives of adventurous voyagers and travelers, when written with spirit and animation, will supply us with entertainment scarcely inferior to that of the best written novel; and it is the reader's own fault, if he do not, from such sources, derive moral instruction. Such adventures as those of Mungo Park in Africa, and Captain Cochrane in Siberia, and such narratives as those of Byron, Brissot, Pierre Vaud, Anson, Cook, Bligh, Perouse, and others, abound with so many striking and affecting incidents, that the reader's attention is kept alive, and he feels as lively an interest in the fate of the adventurers, as is usually felt in that of the fictitious hero of a novel, or a romance.

If man were only the creature of a day, whose whole existence was confined within the limits of this sublunary scene, he might amuse himself either with facts or with fictions, or with any toys or gewgaws that happened to strike his fancy while he glided down the stream of time to the gulf of oblivion. But if he is a being destined for eternity, the train of his thoughts ought to be directed to objects corresponding to his high destination, and all his amusements blended with those moral instructions which have an ultimate reference to the scene of his immortal existence. When I read one of our modern novels, I enjoy, for a few hours, a transitory amusement, in contemplating the scenes of fancy it displays, and in following the hero through his numerous adventures; I admire the force and brilliancy of the imagination of the writer (for I am by no means disposed to underrate the intellectual talent which has produced some of the works to which I allude), but when I have finished the perusal, and reflect, that all the scenes which passed before my

mental eye, were only so many unsubstantial images, the fictions of a lively imagination—I cannot indulge in rational or religious reflections on the subject, nor derive a single moral instruction, any more than I can do from a dream or a vision of the night. When I survey the scenes of creation; when I read the history of ancient nations; when I peruse the authentic narratives of the voyager and traveler; when I search the records of revelation; and when I contemplate the present state of society around me,—I learn something of the character, the attributes, and the providence of God, and of the moral and physical state of mankind. From almost every scene, and every incident, I can deduce instructions calculated to promote the exercise of humility, meekness, gratitude, and resignation—to lead the mind to God as the source of felicity, and as the righteous governor of the world—and to impress the heart with a sense of the folly and depravity of man. But it is obvious, that no distinct moral instructions can be fairly deduced from scenes, circumstances, and events “which never did nor can take place.”—Such however is, at present, the tide of public opinion on this subject, that we might as soon attempt to stem a mountain torrent by a breath of wind, or to interrupt the dashings of a mighty cataract by the waving of our hand, as to expect to counteract, by any considerations that can be adduced, the current of popular feeling in favor of novels, and tales of knights, and of tournaments; of warlike chieftains, and military encounters. Such a state of feeling, I presume, never can exist in a world where moral evil has never shed its malign influence.

Again, if we consider the sentiments and the conduct of many of our *Literary and Scientific characters*, we shall find that even philosophy has had very little influence, in counteracting the stream of malignity, and promoting the exercise of benevolence. Do not many of our literary characters in their disputes frequently display as keen resentments, and as malevolent dispositions, as the professed warrior, and the man of the world? and have they not sometimes resorted even to horsewhips and to pistols to decide their contests? In proof of this, need I refer to the gentlemen now or formerly connected with the “*Edinburgh Magazine*,” “*Blackwood's Magazine*,” the “*London Magazine*,” the “*Quarterly Review*,” and other periodical works—and to the mean jealousies and contentions which have been displayed, and the scurrilous paragraphs which have been written by various descriptions of competitors for literary fame? Such a display of temper and conduct in men of professed erudition, is not only inconsistent with moral principle, and the dignity of true science, but has a tendency to hold up philosophy and substantial knowledge to the scorn and contempt both of the Christian and of the political world.

Again, is it an evidence that benevolence forms a prominent character of modern civilized society, when philanthropists, who have devoted their substance and their mental activities to the promotion of the best interests of mankind; and when men of science, who have enlarged the sphere of our knowledge, and improved the useful arts, are suffered to pine away in penury and neglect, and to descend into the grave, without even a “*frail memorial*” to mark the spot where their mortal remains are deposited; while, on the warrior, who has driven the plowshare of destruction through the world, and wounded the peace of a thousand families, enormous pensions are bestowed,

but what has been—that the moral world stands still, as the material one was supposed to do of old—and that we can never get beyond the point where we actually are, without utter destruction, though everything changes and will change, from what it was 300 years ago, and what it is now, from what it is now, to all that the bigoted admirer of the good old times most dreads and hates.⁵

and trophies erected to perpetuate his memory to future generations? And how comes it to pass, if benevolence and justice be distinguishing features of our age and nation, that authors, whose writings afford instruction and entertainment to a numerous public, are frequently suffered to pine away in anxiety and distress, and to remain in hopeless indigence, while publishers and booksellers are fattening on the fruit of their labors? Yet, while we leave them to remain in abject penury, during life,—no sooner have their spirits taken their flight into the world unknown, than subscriptions are set on foot, statues and mausoleums are erected, flattering inscriptions are engraved on their tombs, and anniversary dinners are appointed to celebrate their memories. Such displays of liberality might have been of essential benefit to the individuals, while they sojourned within the limits of this subliminary sphere; but they are altogether futile and superfluous in relation to the separate spirits, which are now placed forever beyond the reach of such vain pageantry and posthumous honors.

If we now attend, for a little, to the *Penal Codes* of civilized nations, we shall find them, not only glaringly deficient in a spirit of benevolence, but deeply imbued with a spirit of cruelty and revenge. The great object of all civil punishments ought to be, not only the prevention of crimes, but also the reformation of the criminal, in order that a conviction of the evil of his conduct may be impressed upon his mind, and that he may be restored to society as a renovated character.—When punishments are inflicted with a degree of severity beyond what is necessary to accomplish these ends, the code which sanctions them, becomes an engine of cruelty and of injustice.—But, the reformation, and the ultimate happiness of the criminal, never seem to have been once taken into consideration, in the construction of the criminal codes of any nation in Europe. The infliction of *pain*, and even of *torture*, and of everything that is degrading and horrible, to a degree far beyond what is necessary for the security of the public, and which has no other tendency than to harden the culprit, seems to have been the great object of the framers of our penal statutes. If a man has committed an offense against society, he is either confined to a jail, thrown into a dungeon, loaded with irons, whipped through the streets, banished to a distant land, hung upon a gallows, or broken on the wheel.—No system of moral regimen, calculated to counteract his criminal habits, to impart instruction to his mind, and to induce habits of industry and temperance (except in a few insulated cases), has yet been arranged by our legislators, so as to render punishment a blessing to the criminal, and to the community which he has injured.

The following circumstances, in relation to punishments, manifest a principle both of folly and of malignity in the arrangements of our criminal jurisprudence. In the first place, the present system of our prison discipline, instead of operating to prevent the increase of crime, has a direct and inevitable tendency to produce vice and wretchedness, and to render our jails the nurseries of every depraved propensity, and of every species of moral turpitude. From the indiscriminate association of the young and the old, and of persons charged with every degree of criminality, the youthful and inexperienced culprit is soon tutored in all the arts of fraud, deception, and robbery, and prepared for acting a more conspicuous and atrocious part on the theater of crime. “I make no scruple to affirm,” says Mr. Howard,

“that if it were the aim and wish of magistrates to effect the destruction, present and future, of young delinquents, they could not desire a more effectual method than to confine them in our prisons.” Of the truth of this position, the reader will find an ample and impressive proof in the Honorable T. F. Buxton’s “Inquiry whether crime and misery are produced or prevented by our present system of Prison Discipline.”

In the second place, the disproportion between crimes and punishments, and the sanguinary character of every civilized code of penal statutes, are directly repugnant to every principle of justice and benevolence. The punishment assigned by the law to the man who steals a sheep, or pilfers a petty article of merchandise, is the same as that which it inflicts on the miscreant who has imbrued his hands in his father’s blood. In France, prior to the revolution, the punishment of robbery, either with or without murder, was the same; and hence it happened, that robbery was seldom or never perpetrated without murder. For, when men see no distinction made in the nature and gradations of punishment, they will be generally led to conclude, that there is no distinction in the guilt. In our own country, it is a melancholy truth, that, among the variety of actions which men are daily liable to commit, no less than *one hundred and sixty* have been declared, by act of parliament, to be felonies, without benefit of clergy; or, in other words, to be worthy of instant death.* It is an indelible disgrace to an age which boasts of its being enlightened with the beams of science, and of religion, that laws, framed in an ignorant and barbarous age, and intended to apply to temporary or fortuitous occurrences, should still be acted upon, and stand unrepealed in the criminal codes of the nations of Europe, in the 19th century of the Christian era, when so many distinguished writers have demonstrated their futility, their injustice, and their inadequacy for the prevention of crime. For, instead of diminishing the number of offenders, experience proves, that crimes are almost uniformly increased by an undue severity of punishment. This was strikingly exemplified in the reign of Henry VIII, remarkable for the abundance of its crimes, which certainly did not arise from the mildness of punishment. In that reign alone, says his historian, *seventy-two thousand executions* took place for robberies alone, exclusive of the religious murders which are known to have been numerous—amounting, on an average, to *six executions a day*, Sundays included, during the whole reign of that monarch.

In the next place, the *shocking and unnecessary cruelties* which are frequently inflicted upon criminals, are inconsistent with every principle of reason and of justice, and revolting to every feeling of humanity. If the forfeiture of life ought, in any case, to be resorted to as the punishment of certain crimes, humanity dictates, that it should be accompanied with as little pain as possible to the unfortunate criminal. But man, even *civilized man*, has glutted his savage disposition by inventing tortures to agonize his fellow man, at which humanity shudders. It is not enough that a poor unfortunate wretch, in the prime of life, whose depravity has hurried to the commission of crime, should be deprived of his mortal existence,—his soul must be harrowed up at the prospect of the prolonged torments which he must endure, before his spirit is permitted to take

* Ency. Brit., Art. Crime.

its flight to the world unknown. Instead of simply strangling or beheading the unhappy criminal, his flesh must be torn with pinchers, his bones dislocated, his hands chopped off, or his body left to pine away in exquisite torments, amidst devouring flames. In Sweden, murder is punished by beheading and quartering, after having previously chopped off the hand. In Germany, Poland, Italy, and other parts of the continent, it was customary, and, I believe, still is, in some places, to put criminals to death, by breaking them alive on the wheel. The following account is given, by a traveler, who was in Berlin, in 1819, of the execution of a man for murder, which shows that the execution of criminals, in Prussia, is frequently distinguished by a species of cruelty worthy of the worst days of the inquisition. Amidst the parade of executioners, officers of police, and other judicial authorities, the beating of drums, and the waving of flags and colors, the criminal mounted the scaffold. No ministers of religion appeared to gild the horrors of eternity, and to soothe the agonies of the criminal; and no repentant prayer closed his quivering lips. "Never," says the narrator, "shall I forget the one bitter look of imploring agony that he threw around him, as immediately on stepping on the scaffold, his coat was rudely torn from off his shoulders. He was then thrown down, the cords fixed round his neck, which were drawn until strangulation almost commenced. Another executioner then approached, bearing in his hands a heavy wheel, bound with iron, with which he violently struck the legs, arms, and chest, and lastly the head of the criminal. I was unfortunately near enough to witness his mangled and bleeding body still convulsed. It was then carried down for interment, and, in less than a quarter of an hour from the beginning of his torture, the corpse was completely covered with earth. Several large stones, which were thrown upon him, hastened his last gasp; he was mangled into eternity!"

In Russia, the severest punishments are frequently inflicted for the most trivial offenses. The *knout* is one of the most common punishments in that country. This instrument is a thong made of the skin of an elk or of a wild ass, so hard that a single stroke is capable of cutting the flesh to the bone. The following description is given by *Olearius* of the manner in which he saw the knout inflicted on eight men, and one woman, only for selling brandy and tobacco without a license. "The executioner's man, after stripping them down to the waist, tied their feet, and took one at a time on his back. The executioner stood at three paces distance, and, springing forward with the knout in his hand,—when ever he struck, the blood gushed out at every blow. The men had each twenty-five or twenty-six lashes; the woman, though only sixteen, fainted away. After their backs were thus dreadfully mangled, they were tied together two and two; and those who sold tobacco having a little of it, and those who sold brandy a little bottle put about their necks; they were then whipped through the city of Petersburg for about a mile and a half, and then brought back to the place of their punishment, and dismissed." That is what is termed the *moderate* knout; for when it is given with the utmost severity, the executioner, striking the flank under the ribs, cuts the flesh to the bowels; and, therefore, it is no wonder that many die of this inhuman punishment.—The punishment of the pirates and robbers who infest the banks of the Wolga, is another act of savage cruelty common to Russia. A float is built, whereon a gallows is

erected, on which is fastened a number of iron hooks, and on these the wretched criminals are hung alive by the ribs. The float is then launched into the stream, and orders are given to all the towns and villages on the borders of the river, that none, upon pain of death, shall afford the least relief to any of these wretches. These malefactors sometimes hang, in this manner, three, four, and even five days alive. The pain produces a raging fever, in which they utter the most horrid imprecations, imploring the relief of water and other liquors.* During the reign of Peter the Great, the robbers who infested various parts of his dominions, particularly the banks of the Wolga, were hung up in this manner by hundreds and thousands, and left to perish in the most dreadful manner. Even yet, the boring of the tongue, and the cutting of it out, are practiced in this country as an inferior species of punishment. Such cruel punishments, publicly inflicted, can have no other tendency than to demoralize the minds of the populace, to blunt their natural feelings, and to render criminal characters still more desperate; and hence we need not wonder at what travelers affirm respecting the Russians, that they are very indifferent as to life or death, and undergo capital punishments with unparalleled apathy and indolence.

Even among European nations more civilized than the Russians, similar tortures have been inflicted upon criminals. The execution of *Damiens*, in 1757, for attempting to assassinate Louis XV, King of France, was accompanied with tortures, the description of which is sufficient to harrow up the feelings of the most callous mind—tortures, which could scarcely have been exceeded in intensity and variety, although they had been devised and executed by the ingenuity of an infernal fiend. And yet, they were beheld with a certain degree of apathy by a surrounding populace; and even counselors and physicians could talk together about the best mode of tearing asunder the limbs of the wretched victim, with as much composure as if they had been dissecting a dead subject, or carving a pullet. Even in Britain, at no distant period, similar cruelties were practiced. Those who are guilty of high treason are condemned, by our law, "to be hanged on a gallows for some minutes; then cut down, *while yet alive*, the heart to be taken out and exposed to view, and the entrails burned." Though the most cruel part of this sentence has never been actually inflicted in our times, yet it is a disgrace to Britons that such a statute should still stand unrepealed in our penal code.—The practice, too, of torturing supposed criminals for the purpose of extorting a confession of guilt, was, until a late period, common over all the countries of Europe; and if I am not mistaken, is still resorted to, in several parts of the continent. Hence, Baron Bielsfeld, in his "Elements of Universal Erudition," published in 1770, lays down as one of the branches of criminal jurisprudence, "*The different kinds of tortures for the discovery of truth.*" Such a practice is not only cruel and unjust, but absurd in the highest degree, and repugnant to every principle of reason. For, as the Marquis Beccaria has well observed, "It is confounding all relations to expect that a man should be both the accuser and the accused, and that pain should be the test of truth; as if truth resided in the muscles and fibers of a wretch in torture. By this method.

* See Hanway's "Travels through Russia and Persia"—Salmon's "Present State of all Nations," vol. 6. Guthrie's Geography, &c.

the robust will escape, and the feeble be condemned.—To discover truth by this method, is a problem which may be better resolved by a mathematician than a judge, and may be thus stated: *The force of the muscles and the sensibility of the nerves of an innocent person being given, it is required to find the degree of pain necessary to make him confess himself guilty of a given crime.*”*

If the confined limits of the present work had admitted, I might have prosecuted these illustrations to a much greater extent. I might have traced the operations of malevolence in the practice of that most shocking and abominable traffic, the *Slave Trade*—the eternal disgrace of individuals and of nations calling themselves *civilized*. This is an abomination which has been encouraged by almost every nation in Europe, and even by the enlightened states of America. And although Great Britain has formally prohibited, by a law, the importation of slaves from Africa; yet, in all her West India colonies, slavery in its most cruel and degrading form still exists; and every proposition, and every plan for restoring the negroes to their natural liberty, and to the rank which they hold in the scale of existence, is pertinaciously resisted by *gentlemen* planters, who would spurn at the idea of being considered as either infidels or barbarians. They even attempt to deprive these degraded beings of the chance of obtaining a happier existence in a future world, by endeavoring to withhold from them the means of instruction, and by persecuting their instructors. “In *Demerara* alone there are 76,000 immortal souls linked to sable bodies, while there are but 3,500 whites; and yet, for the sake of these three thousand whites, the seventy-six thousand, with all their descendants, are to be kept in ignorance of the way of salvation, for no other purpose than to procure a precarious fortune for a very few individuals out of their sweat and blood.” Is such conduct consistent with the spirit of benevolence, or even with the common feelings of humanity? I might have traced the same malignant principle, in the practice of a set of men denominated *wreckers*, who, by setting up false lights, allure mariners to destruction, that they may enrich themselves by plundering the wrecks—in the *warlike dispositions* of all the go-

vernments of Europe, and the enormous sums which have been expended in the work of devastation, and of human destruction, while they have refused to give the least *direct* encouragement to philanthropic institutions, and to the improvement of the community in knowledge and virtue—and in that spirit of tyranny, and thirst for despotic power, which have led them to crush the rising intelligence of the people, and to lend a deaf ear to their most reasonable demands. For, there is no government on this side of the Atlantic, so far as I know, that has ever yet formed an institution for promoting the objects of general benevolence, for counteracting the baleful effects of depravity and ignorance, and for enlightening the minds of the people in useful knowledge; or which has even contributed a single mite to encourage such institutions after they were set on foot by the people themselves. Knowledge is simply *permitted* to be diffused; it is never directly encouraged; its progress is frequently obstructed; and, in some instances, it is positively interdicted, as appears from the following barbarous edict, published in the year 1825.—“A royal Sardinian edict directs, that henceforth no person shall learn to read or write who cannot prove the possession of property above the value of 1500 livres (or about 60*l.* sterling). The qualification for a student is the possession of an income to the same amount.”* Such is the firm determination of many of the kings and princes of Europe to hold their subjects in abject slavery and ignorance; and such is the desperate tendency of proud ambition, that they will rather suffer their thrones to shake and totter beneath them, than give encouragement to liberal opinions, and to the general diffusion of knowledge.—But, instead of illustrating such topics in minute detail, I shall conclude this section by presenting a few miscellaneous facts, tending to corroborate several of the preceding statements, and to illustrate the moral state of the civilized world.

The following statement, extracted from “*Neale's Travels through Germany, Poland, Moldavia, and Turkey*,” exhibits a faint picture of the state of morals in Poland. “If ever there was a country,” says Mr. Neale, “where ‘might constitutes right,’ that country was Poland, prior to its partition.” The most dreadful oppression, the most execrable tyranny, the most wanton cruelties were daily exercised by the nobles upon the unfortunate peasants.—Let us quote a few facts; they will speak volumes. A Polish peasant's life was held of the same value with one of his horned cattle; if his lord slew him, he was fined only 100 Polish florins, or 2*l.* 16*s.* sterling. If, on the other hand, a man of ignoble birth dared to raise his hand against a nobleman, death was the inevitable punishment. If any one presumed to question the nobility of a magnate, he was forced to prove his assertion, or suffer death; nay, if a powerful man chose to take a fancy to the field of his humbler neighbor, and to erect a landmark upon it, and if that landmark remained for three days, the poor man lost his possession. The atrocious cruelties that were habitually exercised, are hardly credible. A Masalki caused his hounds to devour a peasant who happened to frighten his horse. A Radzivil had the belly of one of his subjects ripped open, to thrust his feet into it, hoping thereby to be cured of a malady that had tormented him.

One of the most infallible signs of a degraded state of morals in any country, is the corrupt

* *Hamburg Paper*, August, 1825.

* See Beccaria's “*Essay on Crimes and Punishments*,” pp. 52-56. The following is a brief summary of the principal punishments that have been adopted by men, in different countries, for tormenting and destroying each other. *Capital* punishments—beheading, strangling, crucifixion, drowning, burning, roasting, hanging by the neck, the arm, or the leg; starving, sawing, exposing to wild beasts, rending asunder by horses drawing opposite ways, shooting, burying alive, blowing from the mouth of a cannon, compulsory deprivation of sleep, rolling on a barrel staked with nails, cutting to pieces, hanging by the ribs, poisoning, pressing slowly to death by a weight laid on the breast; casting headlong from a rock, tearing out the bowels, pulling to pieces with red-hot pincers, stretching on the rack, breaking on the wheel, impaling, flaying alive, cutting out the heart, &c., &c., &c. Punishments short of death have been such as the following. Fine, pillory, imprisonment, compulsory labor at the mines, galleys, highways, or correction-house; whipping, bastinading; mutilation by cutting away the ears, the nose, the tongue, the breasts of women, the foot, the hand; squeezing the marrow from the bones with screws or wedges; castration, putting out the eyes; banishment, running the gauntlet, drumming, shaving off the hair, burning on the hand or forehead; and many others of a similar nature. Could the ingenuity of the inhabitants of *Tophet* have invented punishments more cruel and revolting? Has any one of these modes of punishment a tendency to reform the criminal, and promote his happiness? On the contrary, have they not all a direct tendency to irritate, to harden, and to excite feelings of revenge? Nothing shows the malevolent dispositions of a great portion of the human race, in so striking a light, as the punishments they have inflicted on one another; for these are characteristic, not of insulated individuals only, but of *nations*, in their collective capacity.

administration of justice. As specimens of Polish justice, Mr. Neale mentions the case of a merchant of Warsaw, whom it cost 1400 ducats to procure the conviction and execution of two robbers who had plundered him; and another case, still more flagrant, that of a peasant who had apprehended an assassin, and who, on taking him to the Staroste, was coolly dismissed with the prisoner, and the corpse of the murdered person which he had brought in his wagon; because he had not ten ducats—the fee demanded by the magistrate for his interference.—“During the reign of Stanislaus Poniatowsky, a petty noble having refused to resign to Count Thisenhaus his small estate, the Count invited him to dinner, as if desirous of amicably adjusting the affair; and while the knight, in the pride of his heart at such unexpected honor, assiduously plied the bottle, the Count dispatched some hundreds of peasants with axes, plows, and wagons, ordering the village, which consisted only of a few wooden buildings, to be pulled down, the materials carried away, and the plow to be passed over the ground which the village had occupied. This was accordingly done. The nobleman, on his return home in the evening, could find neither road, house, nor village. The master and his servant were alike bewildered, and knew not whether they were dreaming or had lost the power of discrimination; but their surprise and agony were deemed so truly humorous, that the whole court was delighted with the joke!” How depraved must be the state of moral feeling, when the injustice inflicted upon fellow-creatures, and the miseries they endure, become the subjects of merriment and derision!—“The morals of the people of Poland,” says Mr. Neale, “were, and continue to be, nearly at the lowest point of debasement. Female chastity is a phenomenon; while the male sex are proportionally profligate. Drunkenness, gluttony, and sensuality, prevail to a degree unknown in other countries in Europe.”

The following extract from Mr. Howison's “Foreign Scenes and Traveling Recreations,” will convey some idea of the state of morals in the island of Cuba. “Nothing can be worse,” says Mr. H., “than the state of society in Havana. The lower classes are all alike dissolute and unprincipled. Assassinations are so frequent that they excite little attention; and assault and robbery are matters of course, when a man passes alone and at night through a solitary quarter of the town. Several assassinations take place in the streets every week.” This depraved and lawless state of things may be ascribed to three causes: the inefficiency of the police; the love of gaming and dissipation which prevails among the lower orders; and the facility with which absolution of the greatest crimes may be obtained from the priests. In fact, the Catholic religion, as it now exists in Cuba, tends to encourage rather than to check vice. We shall suppose, for example, that a man makes himself master of 100 dollars by robbing or by murdering another; and that the church grants him absolution for half the sum thus lawlessly obtained; it is evident that he will gain 50 dollars by the whole transaction, and think himself as innocent as he was before he committed the crime. No man need mount the Havana scaffold, whatever be his crime, if he has the means of ministering to the rapacity of the church, and of bribing the civil authorities. A poor friendless criminal is executed in a few days after sentence is pronounced upon him; but a person of wealth and influence generally manages to put off capital punishment

for a series of years, and at last get it commuted to fine and imprisonment. Of these depraved practices, Mr. Hewison states several striking examples.—Those statements of Mr. H., in reference to the moral state of Cuba, I find corroborated by a short account of this island in the *Monthly Magazine* for March, 1820, page 120. “They act here very frequently those sacred mysteries which so delighted our good forefathers. I have witnessed (says the writer) the triumph of *Aze Maria*, a tragi-comedy, which closes with the sudden appearance, in the midst of a theater, of a chivalrous worthy, mounted on a real horse, shaking at the end of a lance the bloody head of an infidel. This horrid exhibition excited a titter of enjoyment in all the spectators. The ladies, in particular, seemed to be highly entertained,—no fainting fits, no nervous attacks. How could a mere fiction agonize the blunt feelings of women, hardened by the spectacle of bull-fights, and almost every day meeting with the dead body of some human being who has been assassinated?”

There is no situation in which human beings can be placed, where we should more naturally expect the manifestation of benevolent affections, than in those scenes of danger where all are equally exposed to deep distress, and where the exercise of sympathy and kindness is the only thing that can alleviate the anguish of the mind. When the prospect of immediate death, or of prolonged agonies even more dreadful than the simple pain of dissolution, is full before the mind, one should think that ferocious dispositions would be instantly curbed, and kindly affections begin to appear. Yet, even in such situations, it frequently happens, that feelings of malevolence and revenge, and all the depraved passions, are most powerfully excited to action. The following facts will tend to illustrate this remark. Mr. Byron was shipwrecked, in a violent storm on the coast of South America. A mountainous sea broke over the ship; she was laid on her beam ends; darkness surrounded them; nothing was to be seen but breakers all around; and every soul on board looked upon the present minute as his last. “So terrible was the scene of foaming breakers around us,” says Mr. B., “that one of the bravest men we had could not help expressing his dismay at it, saying it was too shocking a sight to bear.” Even in this dreadful situation, malignant passions began to appear; and, like the dashing waves around, to rage with unbounded violence. No sooner had the morning thrown a ray of light over the dismal gloom, and a faint glimpse of land was perceived, than many of the crew who, but a few minutes before, had shown the strongest signs of despair, and were on their knees praying for mercy, “grew extremely riotous, broke open every chest and box that was at hand, stove in the heads of casks of brandy and wine, and got so drunk that some of them were drowned on board, and lay floating about the decks for some days after.” After the greater part, to the number of 150 persons, had got to shore—“the boatswain and some of the people would not leave the ship so long as there was any liquor to be got at; they fell to beating everything to pieces that came in their way, and carrying their intemperance to the greatest excess, broke open chests and cabins for plunder that could be of no use to them. So earnest were they in this wantonness of theft, that one man had evidently been murdered on account of some division of the spoil, or for the sake of the share that fell to him, having all the marks of a strangled corpse.” The same malignant dispositions were displayed, in numerous

instances, during their abode on the desolate and barren island on which they had been thrown, notwithstanding the hunger, the rains, the cold, and the attacks of wild beasts to which they were all equally exposed.*

There is, perhaps, no occurrence that has happened in modern times, which so strikingly displays the desperate malignity of human beings in the midst of danger, as the conduct of the crew of the *Medusa* Frigate, while tossing on the raft by which they endeavored to save themselves, after that vessel had been shipwrecked. The *Medusa* was stranded, in the month of June, 1816, on the bank of Arguin, near the western coast of Africa. A raft was hastily constructed, which was but scantily supplied with provisions. There were five boats, which contained in all about 240 persons; and upon the raft, there embarked about 150 individuals. The boats pushed off in a line, towing the raft, and assuring the people on board that they would conduct them safely to land. They had not proceeded, however, above two leagues from the wreck, when they, one by one, cast off the tow lines, and abandoned the raft to its fate. By this time the raft had sunk below the surface of the water to the depth of three feet and a half, and the people were so squeezed one against another, that it was found impossible to move; fore and aft they were up to the middle in water. Night at length came on; the wind freshened; the sea began to swell; about midnight the weather became very stormy, and the waves broke over them in every direction. Tossed by the waves from one end to the other, and sometimes precipitated into the sea; floating between life and death; mourning over their own misfortunes; certain of perishing, yet contending for the remains of existence with that cruel element which menaced to swallow them up—such was their situation until break of day, when a dreadful spectacle presented itself. Ten or twelve unhappy men, having their extremities jammed between the spars of the raft, had perished in that situation, and others had been swept away by the violence of the waves.—All this, however, was nothing to the dreadful scene which took place the following night. "Already," says the narrator, "was the moral character of the people greatly changed. A spirit of sedition spread from man to man, and manifested itself by the most furious shouts." Night came on; the heavens were obscured with thick clouds; the wind rose, and with it the sea; the waves broke over them every moment; numbers were swept away, and several poor wretches were smothered by the pressure of their comrades. Both soldiers and sailors resolved to soothe their last moments by drinking to excess; they became deaf to the voice of reason; boldly declared their intention of murdering their officers; and, cutting the ropes which held the rafts together, one of them seizing an axe, actually began the dreadful work. The officers rushed forward to quell the tumult, and the man with the hatchet was the first that fell—the stroke of a saber terminated his existence. One fellow was detected secretly cutting the ropes, and was immediately thrown overboard; others destroyed the shrouds and halyards; and the mast, destitute of support, immediately fell on a captain of infantry, and broke his thigh; he was instantly seized by the soldiers and thrown into the sea, but was saved by the opposite party. About an hour after midnight the insurrection burst forth anew. They

rushed upon the officers like desperate men, each having a knife or a saber in his hand; and such was the fury of the assailants, that they tore their flesh, and even their clothes with their teeth. There was no time for hesitation; a general slaughter took place, and the raft was strewed with dead bodies. On the return of day, it was found that, in the course of the preceding night of horror, *sixty-five* of the mutineers had perished, and two of the small party attached to the officers. A third night of horror approached, distinguished by the piercing cries of those whom hunger and thirst devoured; and the morning's sun showed them a dozen unfortunate creatures stretched lifeless on the raft. The fourth night was marked by another massacre. Some Spaniards and Italians conspired to throw the rest into the sea. A Spaniard was the first to advance with a drawn knife; the sailors seized him and threw him into the sea. The Italian seeing this, jumped overboard; the rest were mastered, and order was restored. But, before the ship *Argus* came to their relief, of the 150 that embarked on the raft, 15 unhappy creatures only remained, covered with wounds and bruises, almost naked, stripped of their skin, shriveled with the rays of the sun, their eyes hollow, and their countenances savage.—Such are the dreadful effects of *malignity*, which produces more sufferings and fatal effects, than the most tremendous elements of nature!

A certain portion of the same spirit was lately displayed by several individuals on board of the *Kent* East Indiaman. In the midst of a most violent gale, in the Bay of Biscay, when the sea was running mountains high, this vessel, containing about 600 persons, took fire, in consequence of the spirits from a stoved cask having communicated with a lamp; and all hopes of safety became extinguished, until the ship *Cambria*, Captain Cooke, hove in sight. But the danger of passing from one ship to the other, in boats, in such a tempestuous sea, rendered the preservation of the passengers and crew in a degree doubtful. Yet, in the midst of the danger, the alarm and the anguish which accompanied this tremendous scene, we are told by the narrator, page 24, that "it is suspected that one or two of those who perished, must have sunk under the weight of their spoils; the same individuals having been seen eagerly plundering the cuddy cabins." And, a little afterward, page 31, he adds: "Some time after the shades of night had enveloped us, I descended to the cuddy in quest of a blanket to shelter me from the increasing cold, and the scene of desolation that there presented itself was melancholy in the extreme. The place, which only a few short hours before had been the seat of kindly intercourse, and of social gayety, was now entirely deserted, save by a few miserable wretches, who were either stretched in irrecoverable intoxication on the floor, or prowling about, like beasts of prey, in search of plunder."*

* See Byron's "Narrative of the Loss of the *Wager* Man of War."

* See a "Narrative of the Loss of the *Kent* East Indiaman, by fire, in the Bay of Biscay, on the 1st of March, 1825, by a Passenger," supposed to be Major Macgregor.—The humanity and intrepidity displayed, amidst the heart-rending scene which this narrative describes—by Captain Cobb of the *Kent*; by Messrs. Thompson, Fearon, Macgregor, and the other officers, and many of the soldiers; by Captain Cooke of the *Cambria*, his crew, and the Cornish miners—is above all praise. Their benevolent and heroic conduct at that alarming crisis, is far more deserving of a public monument being raised for its commemoration, than that of many of our military heroes, in honor of whom so many trophies have been erected. If men, who have been instrumental in destroying the lives and the happiness of hundreds and of thousands, have pensions bestowed on them, and are exalted to posts of honor, surely those who have exerted their

The following is a short description of the moral character of the inhabitants of Carolina, and of one of the *amusements* of a people who boast of their liberty and their civilization,—as it is found in “Morse’s American Geography.” “The citizens of North Carolina who are not better employed, spend their time in drinking, or gaming at cards or dice, in cock-fighting, or horse-racing. Many of the interludes are filled up with a boxing-match; and these matches frequently become memorable by feats of *gouging*. This delicate and *entertaining* diversion is thus performed: When two boxers are worried with fighting and bruising each other, they come, as it is called, to close quarters; and each endeavors to twist his forefingers in the ear-locks of his antagonist. When these are fast clenched, the thumbs are extended each way to the nose, and the *eyes gently twined out of their sockets*. The victor, for his expertness, receives shouts of applause from the sporting throng, while his poor eyeless antagonist is laughed at for his misfortune. In a country that pretends to any degree of civilization, one would hardly expect to find a prevailing custom of putting out the eyes of each other. Yet this more than barbarous custom is prevalent in both the Carolinas, and in Georgia among the lower class of people.”—“Lord, what is man!” In a savage and a civilized state—in infancy and in manhood—in his games and diversions—in the instructions by which he is trained—in the remarks he makes upon his neighbors—in the sports and amusements in which he indulges—in his literary pursuits and lucubrations—in his system of rewards and punishments—in his intercourses and contests with communities and nations—in his commercial transactions—in his judicial administrations—in the height of prosperity—and in scenes of danger, and of the deepest distress,—a principle of malignity is forever operating to destroy his comforts, and to undermine the foundation of his happiness!

The above sketches may suffice, in the meantime, as specimens of some of the prominent dispositions of that portion of the human race who have assumed to themselves the character of *civilized nations*. It will readily be admitted, by most of my readers, that the dispositions displayed in the instances I have selected, are all directly repugnant to the principle of benevolence recognized in the divine law, and tend to undermine the happiness of intelligent beings.—I shall now conclude with a very brief sketch of the conduct of Christians, and of Christian societies toward each other, and of the leading traits of character which appear in the religious world.

SECTION IV.

MORAL STATE OF THE PROFESSING CHRISTIAN WORLD.

I HAVE already endeavored to show, that Christianity is a religion of *love*; that its facts, its doctrines, and its moral precepts, are all calculated to promote “peace on earth,” and to form mankind into one affectionate and harmonious society. This glorious and happy effect, in the first instance, it actually produced. We are told, in the history of the Apostles, that the multitudes who

energies in preserving the lives of hundreds, and in preventing the anguish of thousands, ought not to be suffered to sink into oblivion, or to pass unrewarded. It is, I presume, one reason among others, why virtue is so little practiced, that it is seldom rewarded according to its merit.

were converted to the Christian faith, by the powerful sermons delivered by Peter on the day of Pentecost, had their malignant propensities subdued, and their minds animated with an ardent affection for each other; and, as a practical proof of the operation of this noble principle, “they had all things common, and sold their possessions and goods, and parted them to all, as every man had need.” During the early ages of Christianity, a goodly portion of the same spirit was manifested by the greater part of those who had enrolled themselves as the disciples of Christ. Even in the midst of the reproaches, and the severe persecutions to which they were subjected during the two first centuries of the Christian era, a meek and forgiving disposition, and a spirit of benevolence toward one another, and toward all men, distinguished them from the heathen around, and constrained even their enemies to exclaim, “Behold how these Christians love one another!”—But no sooner was the Christian Church amalgamated with the kingdoms of this world, in the reign of Constantine, than its native purity began to be tainted, and Pagan maxims, and worldly ambition began to be blended with the pure precepts and the sublime doctrines of the Gospel. Many of its professed adherents, overlooking the grand practical bearings of the Christian system, began to indulge in vain speculations on its mysterious doctrines; to substitute a number of unmeaning rites and ceremonies in the room of love to God and to man; and even to prosecute and destroy all those who refused to submit to their opinions and decisions. Pride, and a desire of domination, usurped the place of meekness and humility; and the foolish mummeries of monastic superstition, and the austerities of the *Ascetics*, were substituted in the room of the active duties of justice and benevolence. Saints were deified; the power of the clergy was augmented; celibacy was extolled; religious processions were appointed; pilgrimages were undertaken to the tombs of the martyrs; monasteries and nunneries, without number, were erected; prayers were offered up to departed saints; the Virgin Mary was recognized as a species of inferior deity; the sign of the cross was venerated as capable of securing victory in all kinds of trials and calamities, and as the surest defense against the influence of malignant spirits; the bishops aspired after wealth, magnificence, and splendor; errors in religion were punished with civil penalties and bodily tortures; and the most violent disputes and contentions convulsed every section of the Christian world; while the mild and beneficent virtues of the religion of Jesus were either discarded, or thrown into the shade.

Of these, and similar dispositions and practices, details might be exhibited which would fill many volumes, and which would carry conviction to every impartial mind, that the true glory of Christianity was sadly tarnished and obscured, and its heavenly spirit almost extinguished amidst the mass of superstitious observances, of vain speculations, and of angry feuds and contentions. Milot, when adverting to the state of the Church in the days of Constantine and the succeeding emperors, justly remarks: “The disciples of Christ were inspired with mutual feuds, still more implacable and destructive than the factions which were formed for or against different emperors. The spirit of contention condemned by St. Paul became almost universal. New sects sprung up incessantly, and combated each other. Each boasted its apostles, gave its sophisms for divine oracles, pretended to be the depository of the faith,

and used every effort to draw the multitude to its standard. The church was filled with discord; bishops anathematized bishops; violence was called in to the aid of argument, and the folly of princes fanned the flame which spread with so destructive rage. They played the theologians, attempted to command opinions, and punished those whom they could not convince. The laws against idolaters were soon extended to heretics; but what one emperor proscribed as heretical, was to another sound doctrine. What was the consequence? The clergy, whose influence was already great at court, and still greater among the people, began to withdraw from the sovereign authority that respect which religion inspires. The popular ferments being heightened by the animosity of the clergy, prince, country, law, and duty, were no longer regarded. Men were Arians, Donatists, Priscillianists, Nestorians, Eutychians, Monotholites, &c., but no longer citizens; or, rather, every man became the mortal enemy of those citizens whose opinions he condemned.—This unheard-of madness, for irreconcilable quarrels on subjects that ought to have been referred to the judgment of the Church, *never abated amidst the most dreadful disasters*. Every sect formed a different party in the state, and their mutual animosities conspired to sap its foundations.”*

At the period to which these observations refer, it appears that two erroneous maxims generally prevailed, which tended to undermine the moral system of revelation, and which were productive of almost all the tumults, massacres, and disasters, which distinguished that era of the Christian church. These were, 1. That religion consists chiefly in the belief of certain abstract and incomprehensible dogmas, and in the performance of a multitude of external rites and ceremonies; and, 2. That all heresies or differences of opinion on religious points, ought to be extirpated by the strong arm of the civil power. Than such maxims, nothing can be more repugnant to reason, more subversive of genuine morality, or more inconsistent with the spirit and genius of the Christian religion. And yet, to this very hour, they are recognized and acted upon by more than three fourths of the Christian world, notwithstanding the melancholy examples which history has furnished of their futility, and their pernicious tendency.—The narrow limits to which I am confined will permit me to state only two or three instances in reference to the period to which I allude.

Theodosius, one of the emperors, who commenced his reign in the year 379, and who received baptism during a dangerous distemper, in the second year of it, professed great zeal in favor of religion. By a law addressed to the people of Constantinople, he enacted, “That all subjects shall profess the catholic faith with regard to the articles of the Trinity; and that they who do not conform shall ignominiously be called heretics, until they shall feel the vengeance of God and our own, according as it shall please Divine providence to inspire us.” He declared apostates and Manicheans incapable of making a will, or receiving any legacy; and having pronounced them worthy of death, the people thought they had a right to kill them as proscribed persons. He enacted a law, condemning to the flames *cousins german* who married without a special license from the emperor. He established *inquisitors* for the

discovery of heretics. He drove the Manicheans* from Rome as infamous persons, and, on their death, ordered their goods to be distributed among the people. Yet, with all this religious zeal, he, on one occasion, gave orders for a universal massacre at Thessalonica, because some persons of distinction had been killed in a sedition at the time of the races. The inhabitants were caused to assemble in the circus, under the pretense of an exhibition of games, and slaughtered without distinction of age. Seven thousand, according to some, and fifteen thousand according to others, the greatest part unquestionably innocent, were thus sacrificed to atrocious revenge.† Leo, another emperor, “commanded every person to be baptized, under pain of banishment, and made it capital to relapse into idolatry, after the performance of the ceremony;” just as if Christians could be made by a forced baptism, or by a law of the state. Such edicts clearly showed, that, whatever zeal princes or the clergy might manifest in favor of the Christian religion, they were grossly ignorant of its true spirit, and of the means by which its benevolent objects were to be accomplished.

As a specimen of the manner in which such edicts were sometimes carried into effect, the following instance may be stated. Hypatia, daughter of the celebrated Geometrician, Theon of Alexandria, exceeded her father in learning, and gave public lectures in Philosophy, with the greatest applause; nor was she less admirable for the purity of her virtue, joined to an uncommon beauty, and every accomplishment that could adorn human nature. But this excellent woman, *because she was a Pagan*, trusted by the magistrates and suspected to be active against St. Cyril, the bishop, became an object of detestation to the Christian multitude. A set of monks and desperadoes, headed by a priest, seized her in the open street, hurried her into a church, where they stripped her naked, tore her body with whips, cut her in pieces, and publicly burned her mangled limbs in the market place.‡ St. Cyril, who was suspected of having fomented this tragedy, had previously attacked the synagogues, and driven out the Jews; their goods were pillaged, and several persons perished in the tumult. Such conduct plainly demonstrates the tendency of the human mind, in every situation, to abuse power and authority, for the purposes of persecution and revenge; and shows us what false ideas the Christians of that period must have entertained of the God of Mercy; and how soon they had forgotten the sufferings which their fathers had so lately endured, under the reign of the heathen emperors.

About this period, too, vain speculations about abstruse and incomprehensible subjects, occupied the attention of theologians, and engendered religious quarrels and disputes, which burst asunder the bonds of affection and concord. A play of words and vain subtleties, were substituted in place of clear conceptions and substantial knowledge, which, instead of directing the faculties of the human mind to their proper objects, tended only to darken the light of reason, and to introduce the long night of ignorance which soon succeeded. It was a prevailing madness among the Greek theologians, who were intractable in their opinions,—and it is too much the case with cer-

* The distinguishing characteristic of the Manicheans was, their recognizing the doctrine of two independent and eternal principles, the one the author of all good, and the other the author of all evil.

† Millot's Ancient History, vol. ii.

‡ Ibid.

* Millot's Modern History, vol. I.

tain modern divines,—to dispute about incomprehensible mysteries, to render them more obscure by their attempts to explain them, and perpetually to revive the most dangerous contentions. The Arians rejected the Divinity of the Word, in order to maintain the unity of God;—the Nestorians denied that Mary is the mother of God, and gave two persons to Jesus Christ, to support the opinion of his having two natures;—the Eutychians, to maintain the unity of the person, confounded the two natures into one. This heresy became divided into ten or twelve branches; some of the sections maintaining that Jesus Christ was merely a phantom, or appearance of flesh, but no real flesh. The Monothelites maintained, that there was only one will in Christ, as they could not conceive two free wills to exist in the same person. Another sect maintained, that the body of Christ was *incorruptible*, and that from the moment of his conception, he was incapable of change, and of suffering. This chimera Justinian attempted to establish by an edict. He banished the Patriarch Eutychius, and several other prelates, who opposed his sentiments; and was proceeding to tyrannize over the consciences of men with more violence than ever, when death interposed, and transported him to another scene of existence.—In such vain and preposterous disputes as these, were the minds of professed Christians occupied, notwithstanding the perils with which they were then environed. Councils were held, to determine the orthodox side of a question; anathemas were thundered against those who refused to acquiesce in their decisions; princes interposed their authority, and the civil sword was unsheathed to compel men to believe what they could not understand;—while the substantial truths of religion were overlooked, and its morality disregarded.—“Religion,” says Milot, “inspires us with a contempt of earthly vanities, a detestation of vice, and indulgence for the frailties of our neighbor; invincible patience in misfortunes, and compassion for the unhappy; it inspires us with charity and heroic courage; and tends to sanctify every action in common and social life. How sublime and comforting the idea it gives of the Divinity! What confidence in his justice and infinite mercy! What encouragement for the exercise of every virtue! Wherefore, then, such errors and excesses on religious pretenses? It is because heresy, shooting up under a thousand different forms, incessantly startles the faith by subtleness and sophistry, by which almost the whole energy of men’s minds is absorbed in the contest. Disputes engender hatred; from hatred springs every excess; and virtue, exhausted with words and cabals, loses her whole power.”—How happy would it be, and how glorious for the cause of genuine Christianity, were the present generation of Christians to profit by the sad experience of the past!

As we advance in the history of the Christian church, through the middle ages, the prospect appears still more dark and gloomy. The human mind, at that period, appeared to have lost its usual energy, and its powers of discrimination; the light of reason seemed almost extinguished; sophisms, and absurdities of all kinds, were greedily swallowed; and superstition displayed itself in a thousand diversified forms. Morality was in a manner smothered under a heap of ceremonies and arbitrary observances, which acquired the name of devotion. Relics, pilgrimages, offerings, and pious legacies, were thought capable of opening the gate of heaven to the most wicked of men. The Virgin Mary, and the souls of depart-

ed saints, were invoked; splendid churches were erected to their honor; their assistance was entreated with many fervent prayers; while the mediation of Jesus Christ was thrown into the shade, and almost disregarded. An irresistible efficacy was attributed to the bones of martyrs, and to the figure of the cross, in defeating the attempts of Satan, in removing all sorts of calamities, and in healing the diseases both of the body and of the mind. Works of piety and benevolence were viewed as consisting chiefly in building and embellishing churches and chapels; in endowing monasteries; in hunting after the relics of martyrs; in procuring the intercession of saints, by rich oblations; in worshiping images; in pilgrimages to holy places; in voluntary acts of mortification; in solitary masses; and in a variety of similar services, which could easily be reconciled with the commission of the most abominable crimes. So that the worship of “the God and Father of our Lord Jesus Christ,” was exchanged for the worship of bones, hair, fragments of fingers and toes, tattered rags, images of saints, and bits of rotten wood, supposed to be the relics of the cross. The dubbing of saints became a fruitful source of frauds and abuses throughout the Christian world; lying wonders were invented, and fabulous histories composed, to celebrate exploits that were never performed, and to glorify persons that never had a being, and absolution from the greatest crimes could easily be procured, either by penance, or by money.

The absurd principle, that Religion consists in *acts of austerity*, produced the most extravagant behavior in certain devotees, and reputed saints. They lived among the wild beasts; they ran naked through the lonely deserts, with a furious aspect, and with all the agitations of madness and frenzy; they prolonged their wretched lives, by grass and wild herbs; avoided the sight and conversation of men, and remained almost motionless for several years, exposed to the rigor and inclemency of the seasons;—and all this was considered as an acceptable method of worshiping the Deity, and of attaining a share in his favor.—But of all the instances of superstitious frenzy, which disgraced those times, none was held in higher veneration than that of a certain order of men, who obtained the name of *Pillar saints*. These were persons of a most singular and extravagant turn of mind, who stood motionless on the tops of pillars, expressly raised for this exercise of their patience, and remained there for several years, amidst the admiration and applause of a stupid and wondering populace. This strange superstitious practice began in the fifth century, and continued in the East for more than six hundred years.—To the same principle are to be attributed the revolting practices of the *Flagellants*, a sect of fanatics who chastised themselves with whips in public places. Numbers of persons of this description, of all ages and sexes, made processions, walking two by two, with their shoulders bare, which they whipped until the blood ran down in streamlets; in order to obtain mercy from God, and appease his indignation against the wickedness of the age. They held, among other things, that flagellation was of equal virtue with baptism, and the other sacraments; that the forgiveness of all sins was to be obtained by it, without the merits of Jesus Christ; that the old law of Christ was soon to be abolished, and that a new law, enjoining the baptism of blood, to be administered by whipping, was to be substituted in its place.

The enormous power conferred on the ministers of religion was another source of immorality and

of the greatest excesses. The pope and the clergy reigned over mankind without control, and made themselves masters of almost all the wealth of every country in Europe. They were immersed in crimes of the deepest dye; and the laity, imagining themselves able to purchase the pardon of their sins for money, followed the example of their pastors without remorse. The most violent contentions, animosities, and hatred, reigned among the different orders of monks, and between the clergy of all ranks and degrees. "Instead of consecrating ecclesiastical censures solely to spiritual purposes, they converted them into a weapon for defending their privileges, and supporting their pretensions. The priesthood, which was principally designed to bless, was most frequently employed in *cursing*. Excommunication was made the instrument of *damning*, instead of *saving* souls, and was inflicted according to the dictates of policy or of revenge." The great and the noble, and even kings and emperors, were excommunicated, when it was designed to rob, or to enslave them; and this invisible engine, which they wielded with a powerful and a sovereign hand, was used to foment dissensions between the nearest relatives, and to kindle the most bloody wars. The generality of priests and monks kept wives and concubines, without shame or scruple, and even the papal throne was the seat of debauchery and vice. The possessions of the church were either sold to the highest bidder, or turned into a patrimony for the bastards of the incumbents. Marriages, wills, contracts, the interests of families and of courts, the state of the living and the dead, were all converted into instruments for promoting their credit, and increasing their riches. It was, therefore, a necessary result from such a state of things, that vices of every description abounded, that morals were ruined, and that the benevolence of the divine law was trampled under foot.

The *theological speculations* in which they indulged, corresponded to the degrading practices to which I have adverted, and tended to withdraw the mind from the substantial realities both of science and of religion. Sophisms and falsehoods were held forth as demonstrations. They attempted to argue after they had lost the rules of common sense. The cultivation of letters was neglected; eloquence consisted in futile declamations; and philosophy was lost in the abyss of scholastic and sophistical theology. "They attempted to penetrate into mysteries, and to decide questions which the limited faculties of the human mind are unable to comprehend or to resolve;" and such vain speculations they endeavored to incorporate into the system of religion, and to render theology a subject of metaphysical refinement, and of endless controversy. A false logic was introduced, which subtilized upon words, but gave no idea of things; which employed itself in nice and refined distinctions concerning objects and operations which lie beyond the reach of human understanding, which confounded everything by attempting to analyze everything, and which opened an arena for men of fiery zeal to kindle the flame of controversy, and to give birth to numerous heresies. The following are a few instances, out of many, which might be produced, of the questions and controversies which occupied the attention of bishops and seraphical doctors, and gave rise to furious contentions:—Whether the conception of the Blessed Virgin was immaculate? Whether Mary should be denominated the Mother of God, or the Mother of Christ? Whether the bread and wine used in the eucha-

rist were digested? In what manner the *will* of Christ operated, and whether he had *one will* or *two*? Whether the Holy Ghost proceeded from the Father and Son, or only from the Father? Whether leavened or unleavened bread ought to be used in the eucharist? Whether souls in their intermediate state see God, or only the human nature of Christ? It was disputed between the Dominicans and the Franciscans, *Whether Christ had any property*? The Pope pronounced the negative proposition to be a pestilential and blasphemous doctrine, subversive of catholic faith. Many councils were held at Constantinople, to determine what sort of light it was the disciples saw on Mount Tabor: it was solemnly pronounced to be the eternal light with which God is encircled; and which may be termed his energy or operation, but is distinct from his nature and essence. The disputes respecting the real presence of Christ in the eucharist, led to this absurd conclusion, which came to be universally admitted—"That the substance of the bread and wine used in that ordinance is changed into the real body and blood of Christ;" and consequently, when a man eats what has the appearance of a wafer, he really and truly *eats the body and blood, the soul and divinity of Jesus Christ*; and when he afterward drinks what has the appearance of wine, he drinks the very same body and blood, soul and divinity, which, perhaps, not a minute before, he had *wholly and entirely eaten*!—At the period to which I now allude, the *authenticity of a suspected relic* was proved by bulls—councils assembled and decided upon the authority of forged acts with regard to the *antiquity of a saint*, or the place where his body was deposited; and a bold impostor needed only to open his mouth, to persuade the multitude to believe whatever he pleased. To feed upon animals strangled or unclean, to eat flesh on Tuesday, eggs and cheese on Friday, to fast on Saturday, or to use unleavened bread in the service of the mass—were, by some, considered as indispensable duties, and by others, as vile abominations. In short, the history of this period is a reproach to the human understanding; an insult offered to the majesty of reason and of science, and a libel on the benevolent spirit which breathes through the whole of the Christian system.*

* As a striking instance of the folly and imbecility of the human mind at this period, it may be noticed, that in several churches in France they celebrated a festival in commemoration of the Virgin Mary's flight into Egypt, which was called the *Fest of the Ass*. A young girl richly dressed, with a child in her arms, was set upon an ass richly caparisoned. The ass was led to the altar in solemn procession. High mass was said with great pomp. The ass was taught to kneel at proper places; a hymn, no less childish than impious, was sung in his praise; and when the ceremony was ended, the priest, instead of the usual words with which he dismissed the people, *brayed three times like an ass*, and the people, instead of the usual response, "We bless the Lord," *brayed* in the same manner. This ridiculous ceremony was not a mere farcical entertainment; but an *act of devotion*, performed by the ministers of religion, and by the *authority of the Church*.—Robertson's History of Charles V., vol. I.—In accordance with such ceremonies were the ideas which prevailed of the foolish qualifications requisite to constitute a good Christian. "He is a good Christian," says St. Cloy, a canonized saint of the Romish church; "who comes frequently to church; who presents the oblation offered to God upon the altar; who doth not taste of the fruits of his own industry until he has consecrated a part of them to God; who when the holy festivals approach, lives chastely even with his own wife during several days, that with a safe conscience he may draw near to the altar of God; and who, in the last place, can repeat the Creed and the Lord's prayer. Redeem, then, your souls from destruction, while you have the means in your power; offer presents and tithes to churchmen; come more frequently to church; humbly implore the patronage of the saints; for if you observe these things, you may come with security in the day of retribution to the tribunal of the

Nothing can be conceived more directly repugnant to the benevolence which the religion of Jesus inculcates, than the temper and conduct of those who arrogated to themselves the character of being God's vicegerents on earth, and who assumed the supreme direction and control of the Christian church. In persons who laid claim to functions so sacred and divine, it might have been expected, that the appearance at least, of piety, humility, and benevolence, would have been exhibited before the eyes of the Christian world. But the history of the popes and their satellites, displays almost everything which is directly opposed to such heavenly virtues. Their avarice, extortion, and licentiousness, became intolerable and excessive, almost to a proverb. To extend their power over the kingdoms of this world, to increase their wealth and revenues, to live in opulence and splendor, to humble kings, to alienate the affections of their subjects, and to riot in the lap of luxury and debauchery, seemed to be the great objects of their ambition. Instead of acting as the heralds of mercy, and the ministers of peace, they thundered anathemas against all who called in question their authority, kindled the flames of discord and of civil wars, armed subjects against their sovereigns, led forth hostile armies to the battle, and filled Europe with confusion, devastation, and carnage. Instead of applying the mild precepts of Christianity, and interposing the authority they had acquired for reconciling enemies, and subduing the jealousies of rival monarchs, they delighted to widen the breach of friendship, and to fan the flame of animosity and discord. Dr. Robertson, when adverting to the personal jealousies of Francis I. and Charles V., remarks, "If it had been in the power of the Pope to engage them in hostilities, without rendering Lombardy the theater of war, nothing would have been more agreeable to him than to see them waste each other's strength in endless quarrels."* The Son of man came into the world, not to *destroy* men's lives, but to *save* them; but, in such instances, we behold his pretended vicars, preparing and arranging the elements of discord, laying a train for the destruction of thousands and tens of thousands, and taking a diabolical delight in contemplating the feuds, the massacres, and the miseries which their infernal policy had created. The decrees of the papal throne, instead of breathing the mildness and benevolence of Jesus, became thundering curses, and sanguinary laws, and a set of frantic enthusiasts, or a lawless

banditti, were frequently appointed to carry them into effect.

Not contented with the insurrections and the desolations they had produced among the European nations, they planned an expedition for the purpose of massacring the inhabitants of Asia, and ravaging their country. Urban II., about A. D. 1095, traveled from province to province, levying troops, even without the consent of their princes; preaching up the doctrine of "destruction to the infidels;" and commanding the people, in the name of God, to join in the *holy war*. St. Bernard ran from town to town haranguing the multitude, performing pretended miracles, and inducing all ranks, from the emperor to the peasant, to enroll themselves under the banners of the cross. Peter the Hermit, a man of a hideous figure and aspect, covered with rags, walking barefooted, and speaking as a prophet, inspired the people everywhere with an enthusiasm similar to his own. Thousands of wicked and abandoned debauchees were thus collected; bishops, priests, monks, women and children, were all enrolled in the holy army. A plenary absolution of all their sins was promised: and if they died in the contest, they were assured of a crown of martyrdom in the world to come. With hearts burning with fury and revenge, this army of banditti, without discipline or provisions, marched in wild confusion through the eastern parts of Europe, and, at every step of their progress, committed the most dreadful outrages. So inveterate was their zeal against the Jews, wherever they were found, that many of those unfortunate beings, both men and women, murdered their own children, in the midst of the despair to which they were driven by these infuriated madmen; and when they arrived at Jerusalem, and had taken that city by assault, they suffered none of the infidels to escape the slaughter. Such was the way in which the successors of the Apostle Peter displayed their general benevolence, and their love to the souls and bodies of men.

The establishment of the *Inquisition*, is another mode in which the tyranny and cruelty of the Romish church has been displayed. This court was founded in the 12th century, by Father Dominic, and his followers, who were sent by Pope Innocent III., with orders to excite the Catholic princes and people to extirpate heretics. It is scarcely possible to conceive any institution more directly opposed to the dictates of justice and humanity, to the genius of Christianity, and to the meekness and gentleness of Christ, than this infernal tribunal. The proceedings against the unhappy victims of this court, are conducted with the greatest secrecy. The person granted them as counsel is not permitted to converse with them, except in the presence of the Inquisitors; and, when they communicate the evidence to the accused persons, they *carefully conceal from them the names of the authors*. The prisoners are kept for a long time, until they themselves, through the application of the *torture*, turn their own accusers; for they are neither told their crime, nor confronted with witnesses. When there is no shadow of proof against the pretended criminal, he is discharged, after suffering the most cruel tortures, a tedious and dreadful imprisonment, and the loss of the greatest part of his effects. When he is convicted and condemned, he is led in procession, with other unfortunate beings, on the festival of the *Auto da fé*, to the place of execution. He is clothed with a garment, painted with flames, and with his own figure, surrounded with dogs, serpents, and devils, all open-mouthed, as if ready to

eternal Judge, and say, "Give to us, O Lord, for we have given unto thee."—Here we have an ample description of a good Christian, in which there is not the least mention of the love of God, of resignation to his will, obedience to his laws, or of justice, benevolence, or charity toward men.—*Mosheim's Church History*.

The following are the terms in which Tetzels and his associates describe the benefit of *indulgences*, about the beginning of the 16th century, a little before the era of the reformation. "If any man," said they, "purchase letters of indulgence, his soul may rest secure with respect to its salvation. The souls confined in purgatory, for whose redemption indulgences are purchased, as soon as the money tinkles in the chest, instantly escape from that place of torment, and ascend into heaven. The efficacy of indulgences were so great that the most heinous sins, even if one should violate [which was impossible] the Mother of God, would be remitted and expiated by them, and the person be free both from punishment and guilt. That this was the unspeakable gift of God, in order to reconcile men to himself. That the cross erected by the preachers of indulgences, was as efficacious as the cross of Christ itself. Lo! the heavens are open, if you enter not now, when will you enter? For twelve pence you may redeem the soul of your father out of purgatory: and are you so ungrateful that you will not rescue your parent from torment? If you had but one coat, you ought to strip yourself instantly and sell it, in order to purchase such benefits," &c.—*Robertson's Charles V.*, vol. ii.

* Robertson's Charles V., vol. ii.

devour him. Such of the prisoners as declare that they die in the communion of the church of Rome, are first strangled, and then burned to ashes. Those who die in any other faith, are burned *alive*. The priests tell them, that they leave them to the devil, who is standing at their elbow, to receive their souls, and carry them with him into the flames of hell. Flaming fuzes, fastened to long poles, are then thrust against their faces, until their faces are burned to a coal, which is accompanied with the loudest acclamations of joy, among the thousands of spectators. At last fire is set to the fuzes at the bottom of the stake, over which the criminals are chained so high, that the top of the flame seldom reaches higher than the seat they sit on; so that they seem to be *roasted* rather than burned. There cannot be a more lamentable spectacle; the sufferers continually cry out, while they are able, "Pity, for the love of God;" yet it is beheld by all sexes and ages, with transports of joy and satisfaction; and even the monarch, surrounded by his courtiers, has sometimes graced the scene with his presence, imagining that he was performing an act highly acceptable to the Deity!!*

And what are the heinous crimes for which such dreadful punishments are prepared? Perhaps nothing more than reading a book which has been denounced as heretical by the holy office, such as "Raynal's History of the Indies,"—assuming the title of a freemason—irritating a priest or mendicant friar—uttering the language of free-thinkers—declaiming against the celibacy of the clergy—insinuating hints or suspicions respecting their amours and debaucheries—or throwing out a joke to the dishonor of the Virgin Mary,†—or, at most, holding the sentiments of a Mahometan, of a Jew, or the followers of Calvin or Luther. In the year 1725, the Inquisition discovered a family of Moors at Grenada, peaceably employed in manufacturing silks, and possessing superior skill in the exercise of this profession. The ancient laws, supposed to have fallen into disuse, were enforced in all their rigor, and the *wretched family was burnt alive*.‡ On the entry of the French into Toledo, during the late Peninsular war, General Lasalle visited the palace of the Inquisition. The great number of instruments of torture, especially the instruments to stretch the limbs, and the drop-baths, which cause a lingering death, excited horror, even in the minds of soldiers hardened in the field of battle. One of these instruments, singular in its kind for refined torture, and disgraceful to humanity and religion, deserves particular description. In a subterranean vault adjoining to the audience chamber, stood, in a recess in the wall, a wooden statue made by the hands of monks, representing the Virgin Mary. A gilded glory beamed round her head, and she held a standard in her right hand. Notwithstanding the ample folds of the silk garment which fell from her shoulders on both sides, it appeared that she wore a breastplate; and, upon a closer examination, it was found, that the whole

front of the body was covered with extremely sharp nails, and small daggers, or blades of knives, with the points projecting outward. The arms and hands had joints, and their motions were directed by machinery, placed behind the partition. One of the servants of the Inquisition was ordered to make the machine manœuver. As the statue extended its arms, and gradually drew them back, as if she would affectionately embrace, and press some one to her heart, the well-filled knapsack of a Polish grenadier supplied for this time the place of the poor victim. The statue pressed it closer and closer; and when the director of the machinery made it open its arms and return to its first position, the knapsack was pierced two or three inches deep, and remained hanging upon the nails and daggers of the murderous instrument.

This infamous tribunal is said to have caused, between the years 1481 and 1759, 34,658 persons to be burnt alive; and between 1481 and 1808, to have sentenced 288,214 to the galleys, or to perpetual imprisonment.* In the *Auto* of Toledo, in February, 1501, 67 women were delivered over to the flames for Jewish practices. The same punishment was inflicted on 900 females for being *witches*, in the Duchy of Lorraine, by one Inquisitor alone. Under this accusation, upward of *thirty thousand women* have perished by the hands of the Inquisition.† Torquemada, that infernal inquisitor of Spain, brought into the Inquisition, in the space of 14 years, no fewer than 80,000 persons; of whom 6000 were condemned to the flames, and burned alive with the greatest pomp and exultation; and, of that vast number, there was perhaps not a single person who was not more pure in religion, as well as morals, than their outrageous persecutors.‡—Has the Deity, then, whom the Inquisition professes to serve, such a voracious appetite for the blood of human victims? Has that benevolent Being, who maketh his sun to cheer the habitations of the *wicked* as well as of the righteous, and whose "tender mercies are over all his works"—commissioned such bloodthirsty monsters to act as his ministers of vengeance, and to torment and destroy the rational creatures he has formed? The very thought is absurd and *blasphemous* in the highest degree. All his beneficent operations in creation around us, and all the gracious promises and declarations of his word, stand directly opposed to such hellish practices, and condemn the perpetrators as audacious rebels against the divine government, and as nuisances in the universe of God.

The numerous *Massacres* which, in different ages, have taken place, on account of religious opinions, is another revolting and melancholy trait in the character of the professed votaries of the Christian cause. Of these, the massacre of the Protestants in France on the feast of St. Bartholomew, on the 24th August, 1572, was perhaps, one of the most diabolical acts of perfidy, injustice, and cruelty, which have stained the character of our race. Everything was atrocious and horrible in this unexampled conspiracy and assassination; feelings of the most sacred nature were annihilated; religious zeal was changed into an impious frenzy; and filial piety degenerated into sanguinary fury. Under the direction of the infamous Duke of Guise, the soldiers and the populace *en masse*, at the signal of the tolling of a bell,

* See Ency. Brit., Art. *Act of faith, and Inquisition*, and Bourgoing's "Modern State of Spain," Vol. I. The "Instructions for the office of the holy Inquisition given at Toledo in 1561," may be seen in the *Appendix* to "Peyron's Essays on Spain," which forms the fourth volume of Bourgoing's work.

† The Chevalier de St. Gervais, was imprisoned in the Inquisition on the following occasion.—A mendicant having come to his chamber, with a purse, begged him to contribute something for the lights or tapers to be lighted in honor of the Virgin, he replied, "My good father, the Virgin has no need of lights, she need only go to bed at an earlier hour."

flow to arms, seizing every weapon that presented itself; and then rushing in crowds to every quarter of the city of Paris,—no sound was heard but the horrible cry, *Kill the Huguenots!* Every one suspected of being a Calvinist, without any distinction of rank, age, or sex, was indiscriminately massacred. The air resounded with the horrid cries and blasphemous imprecations of the murderers, the piercing shrieks of the wounded, and the groans of the dying. Headless trunks were every instant precipitated from the windows into the court-yards, or the streets; the gate-ways were choked up with the bodies of the dead and dying, and the streets presented a spectacle of mangled limbs, and of human bodies, dragged by their butchers in order to be thrown into the Seine. Palaces, hotels, and public buildings, were wreacking with blood; the image of death and desolation reigned on every side, and under the most hideous appearances; and in all quarters, carts were seen loaded with dead bodies, destined to be cast into the river, whose waters were for several days sullied by tides of human gore. The infuriated assassins, urged on by the cry, that “It was the king’s will that the very last of this race of vipers should be crushed and killed,” became furious in the slaughter; in proof of which, one Cruce, a jeweler, displaying his naked and bloody arm, vaunted aloud, that he had cut the throats of more than 400 Huguenots in one day. During this horrid period, every species of the most refined cruelty became exhausted; the weakness of infancy proved no impediment to the impulse of ferocity; children of ten years, exercising the first homicidal deed, were seen committing the most barbarous acts, and cutting the throats of infants in their swaddling clothes! The number of victims thus slaughtered in the city of Paris, amounted to above six thousand; and, in the provinces, at the same time, there perished about sixty thousand souls. And, what is still more shocking, the news of this massacre was welcomed at Rome with the most lively transports of joy. The Cardinal of Lorraine gave a large reward to the courier: and interrogated him upon the subject, in a manner that demonstrated he had been previously aware of the intended catastrophe. The cannons were fired, bonfires were kindled, and a solemn mass was celebrated, at which Pope Gregory XIII, assisted, with all the splendor which that court is accustomed to display on events of the most glorious and important consequences!*

The horrid practice of *Dragooning*, which was used by Papists, for converting supposed heretics, was another melancholy example of religious cruelty and frenzy. In the reign of Louis XIV, of France, his troopers, soldiers, and dragoons, entered into the houses of the Protestants, where they marred and defaced their household stuff, broke their looking-glasses, let their wine run about their cellars, threw about and trampled under foot their provisions, turned their dining-rooms into stables for their horses, and treated the owners with the highest indignity and cruelty. They bound to posts mothers that gave suck, and let their sucking infants lie languishing in their sight for several days and nights, crying, mourning, and gasping for life. Some they bound before a great fire, and after they were half roasted, let them go. Some they hung up by the hair, and

some by the feet, in chimneys, and smoked them, with wisps of wet hay until they were suffocated. Women and maids were hung up by their feet, or by their arm-pits, and exposed stark naked to public view. Some they cut and slashed with knives, and after stripping them naked, stuck their bodies with pins and needles from head to foot; and, with red hot pinchers, took hold of them by the nose and other parts of the body, and dragged them about the rooms until they made them promise to be *Catholics*, or until the cries of these miserable wretches, calling upon God for help, induced them to let them go. If any, to escape these barbarities, endeavored to save themselves by flight, they pursued them into the fields and woods, where they shot at them, as if they had been wild beasts; and prohibited them from departing the kingdom, upon pain of the galleys, the lash, and perpetual imprisonment. On such scenes of desolation and horror, the Popish clergy feasted their eyes, and made them only a matter of laughter and of sport.*—What a striking contrast to the benevolence of the Deity, whom they impiously pretended to serve! Could an American savage have devised more barbarous and infernal cruelties?

In the civil wars, on account of religion, which happened in France, in the beginning of the 17th century, above a million of men lost their lives, and nine cities, 400 villages, 2000 churches, 2000 monasteries, and 10,000 houses were burned or destroyed, during their continuance; beside the many thousands of men, women, and children, that were cruelly butchered; and 150,000,000 of livres were spent in carrying forward these slaughters and devastations. It is said of Louis XIII, who carried on these wars, by one of his biographers and panegyrists, Madame de Motteville, that, “what gave him the greatest pleasure, was his thought of driving heretics out of the kingdom, and thereby purging the different religions which corrupt and infect the church of God.”† In the Netherlands alone, from the time that the edict of Charles V, was promulgated against the reformers, more than 100,000 persons were hanged, beheaded, buried alive, or burned on account of religion. The prisons were crowded with supposed heretics; and the gibbet, the scaffold, and the stake, filled every heart with horror. The Duke of Alva, and his bloody tribunal, spread universal consternation through these provinces; and, though the blood of eighteen thousand persons, who, in five years, had been given up to the executioner for heresy, cried for vengeance on this persecutor, and his adherents, yet they gloried in their cruelty. Philip II, in whose reign these atrocities were committed, hearing one day, that thirty persons at least had a little before been burned at an *auto da fé*, requested that a like execution might be performed in his presence; and he beheld with joy forty victims devoted to torments and to death. One of them, a man of distinction, requesting a pardon, “No,” replied he, coldly, “were it my own son. I would give him up to the flames, if he obstinately persisted in heresy.”‡

Even in our own island, the flames of religious persecution have sometimes raged with unrelenting fury. During two or three years of the short reign of Queen Mary, it was computed that 277 persons were committed to the flames, beside

* See a late publication entitled “Memoirs of Henry the Great, and of the Court of France during his reign,” 2 vols. 8vo., in which is contained the fullest description of this massacre which has appeared in our language.

* For a more particular account of such scenes, see Ency. Brit., Article Dragoon.

‡ Milot’s Modern History, vol. ii, p. 190.

those who were punished by fines, confiscations, and imprisonments. Among those who suffered by fires were five bishops, twenty-one clergymen, eight lay gentlemen, and eighty-four tradesmen; one hundred husbandmen, fifty-five women, and four children. And, a century and a half has scarcely elapsed, since the Presbyterians in Scotland were hunted across moors and mosses, like partridges of the wilderness, slaughtered by bands of ruffian dragoons, and forced to seek their spiritual food in dens, and mountains, and forests, at the peril of their lives. Hunter, a young man about nineteen years of age, was one of the unhappy victims to the zeal for Papacy of Mary queen of England. Having been inadvertently betrayed by a priest, to deny the doctrine of transubstantiation, he absconded to keep out of harm's way. Bonner, that arch-hangman of Popery, threatened ruin to the father if he did not deliver up the young man. Hunter, hearing of his father's danger, made his appearance, and was burned alive, instead of being rewarded for his filial piety. A woman of Guernsey was brought to the stake, without regard to her advanced pregnancy, and she was delivered in the midst of the flames. One of the guards snatched the infant from the fire; but the magistrate, who attended the execution, ordered it to be thrown back, being resolved, he said, that nothing should survive which sprung from a parent so obstinately heretical.*

What a dreadful picture would it present of the malignity of persons who have professed the religion of Christ, were we to collect into one point of view, all the persecutions, tortures, burnings, massacres, and horrid cruelties, which, in Europe, and Asia, and even in the West Indies and America, have been inflicted on conscientious men for their firm adherence to what they considered as the truths of religion! When we consider, on the one hand, the purity of morals, and the purity of faith which generally distinguished the victims of persecution; and, on the other, the proud pampered priests, abandoned without shame to every species of wickedness, we can scarcely find words sufficiently strong to express the indignation and horror which arise in the mind, when it views this striking contrast, and contemplates such scenes of impiety and crime. Could a religion, which breathes peace and good-will from heaven toward men, be more basely misrepresented? or can the annals of our race present a more striking display of the perversity and depravity of mankind? To represent religion as consisting in the belief of certain incomprehensible dogmas, and to attempt to convert men to Christianity, and to inspire them with benevolence, by fire, and racks, and tortures, is as absurd as it is impious and profane; and represents the Divine Being as delighting in the torments and the death of sinners, rather than that they should return and live.—But, without dwelling longer on such reflections and details, I shall just present an example or two of the moral state of Roman Catholic countries, as a specimen of the effects to which their system of religion naturally leads.

"By their fruits shall ye know them," says our Saviour. Wherever religion is viewed as consisting chiefly in the observance of a number of absurd and unmeaning ceremonies, it is natural to expect that the pure morality of the Bible will seldom be exemplified in human conduct. This is strikingly the case in those countries, both in Europe and America, where the Catholic religion reigns

triumphant.—Mr. Howison, whose work, entitled "Foreign Scenes," I formerly quoted, when speaking of the priesthood in the island of Cuba, says, "The number of priests in Havana exceeds four hundred. With a few exceptions, they neither deserve nor enjoy the respect of the community. However, no one dares openly to speak against them. In Havana, the church is nearly omnipotent, and every man feels himself under its immediate jurisdiction. Most people, therefore, attend mass regularly, make confession, uncover, when passing a religious establishment of any kind, and stand still in the streets, or stop their voluntos, the moment the vesper-bell begins ringing. But they go no further; and the priests do not seem at all anxious that the practice of such individuals should correspond to their profession. The priests show, by their external appearance, that they do not practice those austerities which are generally believed to be necessary concomitants of a monastic life. The sensual and unmeaning countenances that encircle the altars of the churches, and the levity and indifference with which the most sacred parts of the service are hurried through, would shock and surprise a Protestant, were he to attend mass with the expectation of finding the monks, those solemn and awe-inspiring persons, which people, who have never visited Catholic countries, often imagine them to be.

The following extract, from a late writer, exhibits a specimen of the religion and of the moral feelings of the NEAPOLITANS. "When Vesuvius thunders aloud, or when an earthquake threatens them with destruction—when fiery streams vomited from the roaring mouth of the volcano roll on, carrying desolation over the plains below—when the air is darkened by clouds of smoke, and showers of ashes, the Neapolitans will fall on their knees, fast, do penance, and follow the processions barefooted; but as soon as the roar has ceased, the flame has disappeared, and the atmosphere has recovered its wonted serenity, they return to their usual mode of life, they sink again to their former level, and the tinkling sounds of the tumburella call them again to the lascivious dance of the tarentella."*—As an evidence of the litigious dispositions of the Neapolitans, the same author informs us, "That there is scarcely a landholder but has two or three causes pending before the courts—that a lawyer, and a suit, are indispensable appendages of property;—and that some of the principal families have suits which have been carried on for a century, and for which a certain sum is yearly appropriated, although the business never advances; and, at last, the expenses swallow up the whole capital."—"The infinite number of churches," says a late writer, "is one of the most efficient causes of the decline of the religion of Rome, whose maxims and practice are diametrically opposite to those of the Gospel. The Gospel is the friend of the people, the consoler of the poor. The religion of Rome, on the contrary, considers all nations as great flocks, made to be shorn or eaten according to the good pleasure of the shepherds: for her the golden lever is the lever of Archimedes. The favors of the church are only showered on those who pay: with money we may purchase the right to commit perjury and murder, and be the greatest villains at so much per crime; according to the famous Tariff printed at Rome, entitled, "Taxes of the Apostolic Chancery."†

* Kaim's Sketches, vol. iv.

* Vieusseux's "Italy in the 19th century," 1824.

† "Picture of Modern Rome," by M. Santo Domingo, 1824.

M. Jouy, in his late publication, "The Hermit in Italy," presents the following picture of the religion and the practical morality of the Tuscans. "The greediness after profit is such, among the lower classes of shop-keepers, that they adulterate their merchandise so much as to render it almost intolerable. Milk, cheese, and butter, are always in peril under the hands of a Florentine shop-keeper. It is impossible to meet with good butter, except at the dairies. The grocers are not exempt from the imputation of these illicit mixtures, and adulterations of their goods. I bought, from one of them, some brown sugar, which would not dissolve in the mouth; and, on examination, I found, that nearly one-third part consisted of powdered marble, which had been mixed up with it. Yet they are excessively punctual in the outward ceremonies of religion; and whenever they remove from one place to another, a large cross, or a madonna, is always stuck up at full length in the cart."

In a conversation which Bonaparte had with his friend at St. Helena, on the subject of religion, as related by Las Casas, in his Journal, he said, among many other things, "How is it possible that conviction can find its way to our hearts, when we hear the absurd language, and witness the acts of iniquity of the greatest number of those whose business it is to preach to us? I am surrounded with priests, who preach incessantly that their reign is not of this world, and yet they lay hands upon everything they can get. The Pope is the head of that religion from heaven, and he thinks only of this world," &c. The Emperor ended the conversation, by desiring my son to bring him the New Testament, and taking it from the beginning, he read as far as the conclusion of the speech of Jesus on the mountain. He expressed himself struck with the highest admiration at the purity, the sublimity, the beauty of the morality it contained, and we all experienced the same feeling."

Such facts may suffice as specimens of the benevolence and morality which exist in Roman Catholic countries.

MORAL STATE OF THE PROTESTANT CHURCH, AND OF THE DISPOSITIONS GENERALLY MANIFESTED AMONG CHRISTIANS IN OUR OWN COUNTRY.

This is a topic which would admit of a very extended illustration; but my present limits will permit me to do little more than simply to allude to a few prominent dispositions displayed by the different sections of the Protestant church.—We have already seen some of the pernicious effects which flowed from the divisive and contentious spirit of Christians, under the reign of the Christian emperors, and during the middle ages, when ignorance and intolerance so extensively prevailed.

The present state of the Christian world affords abundant proofs that this spirit is far from being extinguished. Christians are at present distinguished by the peculiarity of their opinions respecting—the person of Christ, and the attributes of which he is possessed—the means by which salvation is to be obtained—the measure and extent of divine benevolence—the Government of the Christian church—and the ceremonies connected with the administration of the ordinances of religion. Hence the religious world appears arranged into such sects and parties as the following:—Arians, Socinians, Unitarians, Sabellians, Necessarians, and Trinitarians; Baxterians, Antinomians, Arminians, Calvinists, Lutherans, Sub-lapsarians, Supra-apsarians, Sandemanians, Swedenbor-

gians, and Moravians;—Roman Catholics, Protestants, Huguenots, Episcopalians, Presbyterians, Independents, Seceders, Brownists, Pædo-Baptists, Anti-Pædo-Baptists, Keilamites, Methodists, Jumpers, Universalists, Sabbatarians, Millenarians, Destructionists, Dunkers, Shakers, Mystics, Hutchinsonians, Muggletonians, the followers of Joanna Southcott, &c., &c.—Most of these sectaries *profess their belief* in the existence of One Eternal, Almighty, Wise, Benevolent, and Righteous Being, the Creator and Preserver of all things;—in the Divine authority of the Holy Scriptures;—that God is the alone object of religious worship;—that Jesus of Nazareth is the true Messiah, and the Son of God;—"that he died for our offenses, and was raised again for our justification;"—that there is a future state of rewards and punishments;—that there will be a resurrection from the dead;—that it is our duty to love God with all our hearts, and our neighbor as ourselves;—that the Divine law is obligatory on the consciences of all men;—that virtue and piety will be rewarded, and vice and immorality punished, in the world to come.

Yet, though agreeing in these important articles of the Christian system, how many boisterous and malignant disputes have taken place between Calvinists and Arminians, Episcopalians, Presbyterians, Independents, and Methodists, respecting the speculative points in which they disagree! While controversies among philosophers have frequently been conducted with a certain degree of candor and politeness, the temper with which religious disputants have encountered the opinions of each other, has generally been opposed to the spirit of Christian love, to the meekness and gentleness of Christ, and even to common civility and decorum. The haughty and magisterial tone which theological controversialists frequently assume,—the indignant sneers, the bitter sarcasms, the malignant insinuations, the personal reproaches they throw out against their opponents,—the harsh and unfair conclusions they charge upon them,—the general asperity of their language,—and the bold and unhallowed spirit with which they apply the denunciations of Scripture to those whom they consider as erroneous, are not only inconsistent with everything that is amiable and Christian, but tend to rivet more powerfully in the minds of their opponents, those very opinions which it was their object to subvert. To gain a victory over his adversary, to hold up his sentiments to ridicule, to wound his feelings, and to bespatter the religious body with which he is connected, is more frequently the object of the disputant, than the promotion of truth, and the manifestation of that "character which is the bond of perfection." And what are some of the important doctrines which frequently rouse such furious zeal? Perhaps nothing more than a metaphysical dogma respecting the sonship of Christ, absolute or conditional election, the mode of baptism, the manner of sitting at a communion-table, an unmeaning ceremony, or a circumstantial punctilio in relation to the government of the church! While the peculiar notions of each party, on such topics, are supported with all the fierceness of unhallowed zeal, the grand moral objects which Christianity was intended to accomplish are overlooked, and the law of meekness, humility, and love, is trampled under foot.

The following are some of the ideas entertained respecting the *rights* of religious disputants, as assumed by the disputants themselves:—"The Controversialist," says Mr. Vaughan, in his "Defense of Calvinism," "is a wrestler; and is at

full liberty to do all he can, in the fair and honest exercise of his art, to supplant his antagonist. He must not only be dexterous to put in his blow forcibly; but must have a readiness to *menace with scorn, and to tease with derision*, if haply he may, by these means, unnerve or unman his competitor. I know not that he is under any obligation to withhold a particle of his skill and strength, whether offensive, or defensive, in this truly Spartan conflict." In perfect accordance with these maxims, he thus addresses his adversary: "Why, Sir, I will *fight you* upon this theme, as the Greeks did for the recovery of their dead Patroclus; as Michael the archangel, when, contending with the Devil, he disputed about the body of Moses; as the famed Athenian, who *grasped his ship with his teeth*, when he had no longer a hand to hold it by. It shall be with a loss not less than life, that I resign this splendid attestation (Rom. viii. 28-30) to the triumphal origin, procession, and coronation, of grace in the redeemed."

Woe to religion, when it meets with such boisterous "wrestlers!" Its true glory will be obscured, its beauty defaced, its interests betrayed, and its benevolent spirit smothered, amidst the smoke and dust raised by the onsets of such angry combatants. Do such controversialists really imagine, that "the wrath of man worketh the righteousness of God?" or, that the religion of Heaven stands in need of such warlike arts, and unhallowed passions, for its vindication and defense? If it did, it would be a religion unworthy of our reception and support. What a contrast to the mild and gentle spirit of Christianity, to behold one zealot dipping his pen in wormwood and gall, when he sits down to defend the Religion of Love! and another, standing up in a Synod or Assembly, with eyes sparkling with indignation, a mouth foaming with rage, and a torrent of anathemas and abusive epithets bursting from his lips, against the supposed abettors of an erroneous opinion! while at the same time, they imagine that they are fired with holy zeal for the honor of the Lord God of Sabaoth. Such disputants seem not to be aware, that they are grossly misrepresenting the genius of the Christian system, and bidding defiance to its most distinguishing principles and laws.—There are heresies in *conduct*, as well as heresies in doctrine; and of all heresies, the former are the most pestilential and pernicious. And why do not Controversialists and Religious Societies manifest as much zeal against heresies in temper and morality, which are nursed among the members of every church, as they do against heresies in theology? If these heresies were more particularly investigated and subverted, and a greater latitude allowed for the exercise of private judgment, the church of Christ would present a very different moral aspect from what she has hitherto done.

Again, there is nothing which so strikingly marks the character of the Christian world in general, as the want of candor, the spirit of jealousy, and the evil surmisings which the different denominations of religionists manifest toward each other. There is a prevailing disposition in one religious party to speak evil of another; and it appears, in many instances, to afford a high degree of satisfaction, when one party can lay hold of the inadvertencies of another denomination, or even of the imprudence of a single individual, in order to asperse the character of the whole body, and to hold it up to general derision and contempt. Episcopalians look down with feelings of scorn and contempt on Methodists and Dissenters; Independents sneer at Methodists, and Methodists at

Independents; Presbyterians are disposed to revile Independents, as self-conceited, sanctimonious pretenders, and Independents, to treat with unbecoming levity, and even with ridicule, the opinions and practices of Presbyterians; while the different classes of Baptists, distinguishable only by the slightest shades of opinion, stand aloof from each other, in a warlike attitude, and refuse to join with cordiality in the ordinances of Divine worship. I have seldom been in company with individuals of any particular party, in which I have not found, when allusions were made to another denomination, innuendoes thrown out to their prejudice; and that the detail of any error or imperfection which attached to them, was generally relished, and even received with a high degree of satisfaction. Hence it happens, that the rules of common civility are every day violated by the different sectaries. If a person belonging to a particular denomination be accidentally introduced into a company composed of persons belonging to another religious party, he is frequently treated with reserve, and with a spirit of jealousy and suspicion, even although he may be viewed, on the whole, as a Christian at bottom. I have known individuals of respectable character and attainments, who, from conscientious motives, had forsaken the denomination to which they formerly belonged, have, merely on this account, been treated with scorn and neglect, been banished from the intimacies of social and friendly intercourse, and been regarded nearly in the same light as a Turk or an infidel; and that, too, by men who pretended to liberality, and to literary accomplishments.

There is certainly neither heresy nor orthodoxy inherent in stone or lime, in a church-pew, or a pulpit cushion:—yet one denomination will rudely refuse to another, the liberty of preaching in their place of worship, when it can conveniently be spared, although nothing but the fundamental doctrines acknowledged by both are intended to be proclaimed; just as if the walls, the pews, and the pulpit of a church, would receive a stain of pollution from the presence of another sectary. Even in those cases where the common interests of Christianity are to be supported,—as in vindicating the cause of Missionary, and other Philanthropic institutions,—if the preacher belongs to a dissenting body, he is shut out from the spacious churches of the Establishment, where he might address a numerous audience, and obtain a large collection; and is obliged to confine his exertions within the narrow walls of any public hall, or meeting-house, that he can procure. We account it no more than a piece of common civility, to accommodate a neighbor with a barn, a parlor, or even a dining-room, for the entertainment of his friends at a wedding or a funeral; but such is the little progress that professed Christians have made in the exercise of a noble and generous liberality, that, when we ask the use of a church, or meeting-house, only for a couple of hours, we are spurned away with rudeness and indignation.—The Christian world is unhappily divided into sects and parties; and these divisions must still continue for a time; but what should hinder Christian ministers of different parties from occasionally at least, officiating for each other, in order to show to the world, that they entertain no malignant jealousies, and that they are united in the bonds of a common Religion? Yet, do we ever behold an Episcopalian officiating for a Methodist, an Independent preaching in an Established church, or a Baptist leading the devotional exercises of a society of Presbyterians? If such a

case occasionally occur, it is so far from being a matter of course, that it is considered a phenomenon in the religious world. Yet all these different parties recognize the leading doctrines and duties exhibited in the Christian Revelation; and the points in which they differ are "trifles light as air," when compared with those important truths in which they all agree.*

Even among Christians belonging to the same religious society, how often do we behold a display of "bitter envyings," contentious dispositions, and malignant passions! Perhaps a mere punctilio respecting a certain mode of worship, or a difference in opinion about the choice of a pastor, will throw the whole society into a flame. Evil passions will be engendered; backbitings, whisperings, tumults, and dissensions, will arise; harsh and unfounded conclusions, respecting the motives and characters of individuals, will be drawn; alienations of affection will be induced; friendly intercourse interrupted; an attitude of hostility assumed; and even the rules of common civility violated;—so that a calm and impartial spectator will plainly discern, that the spirit of Christianity has never been thoroughly imbibed, and that they have never learned the apostolic precept, "to forbear one another in love," however high pretensions they may have previously made to spirituality of affection and deportment. Among Christians of every name, we find dispositions and practices daily prevailing, which are altogether inconsistent with the genius of the religion of Christ, and directly repugnant to its precepts. Slander, dishonesty, falsehood, cheating, swindling, and vexatious litigations, are far from being uncommon among those who profess to be united in the bonds of a common Christianity. How little dependence can we have, in social and commercial transactions, on the promise or the declaration of a man, merely on the ground of his being a Christian in profession! If written engagements, and civil laws, did not secure our property, and the performance of promises and contracts, our reliance on Christian principle, abstractly considered, in the present state of the religious world, would prove like that of a person who leans upon a broken reed. How few would fulfill their promises and engagements, when they interfered with their ambitious schemes, and their pecuniary interests! How many instances of fraudulent bankruptcy happen among the professors of religion! And in cases of common bankruptcy, where a legal settlement has been obtained, is there one out of a hundred that ever thinks of performing an act of natural justice, in restoring to his creditors the loss they had sustained, when he afterward has it in his power?

* The following recent facts will illustrate some of the positions contained in this paragraph.—It appears that the minister of the parish of Annan has been in the habit of allowing Dissenters occasionally to preach in the parish church. His Assistant brought this heavy offence before a late meeting of the Presbytery; and, by that body, it was declared, that no Dissenter should, in future, pollute the said pulpit. They, at the same time, voted thanks to the Assistant for his manly and liberal conduct in making the complaint.—*Public Prints, April, 1824.*

† Lately, the minister of a parish, a few miles to the westward of Cupar, a sermon was to be preached to them, by a parishioner, a sermon was to be preached to them, by a Dissenting clergyman from Cupar, and knowing that the school-room was the only place where that could be conveniently done, he called upon to the teacher and commanded him not to allow the school-room to be used for such a purpose. In a few days, a company of strolling players visited the parish; whereupon the worthy pastor, calling on the schoolmaster, ordered the school-room to be at their service, to perform in.—*Dundee Courier, April, 1823.*

Finally, the degree in which the spirit of intolerance and persecution still prevails, shows a lamentable deficiency of benevolence and of Christian spirit in the religious world. Notwithstanding the unjust and cruel sufferings which English Protestants endured from Popish priests and rulers, a short period only elapsed, after they had risen to power, before they began in their turn, to harass their Dissenting brethren, with vexations and cruel prosecutions, and fines and imprisonments, until they were forced to seek for shelter in a distant land. And no sooner had the English Independents settled in America, than they set on foot a persecution against the Quakers, no less furious than that which they themselves had suffered in the country from which they had fled. A number of these worthy persons they threw into prison, and seized upon the books they had brought from England, and committed them to the flames. In virtue of a law which had been made against heretics in general, sentence of banishment was passed upon them all; and another law punished with death, "all Quakers who should return into the jurisdiction after banishment;" and it is a fact, that four persons actually suffered death, under this impolitic and unjust law.* Nor did the Reformed clergy in Scotland lose sight of that magisterial authority which had been assumed by the Romish church. Upon a representation, in 1646, from the commission of the Kirk of Scotland, James Bell, and Colin Campbell, bailiffs of Glasgow, were committed to prison by the Parliament, merely for having said, that "Kirkmen meddled too much in civil matters."† Even so late as the middle of the eighteenth century, when Whitefield, Wesley, and other pious men, began to address the ignorant villagers of England on the most important subjects, "a multitude has rushed together, shouting and howling, raving and cursing, and accompanying their ferocious cries and yells with loathsome or dangerous missiles, dragging or driving the preacher from his humble stand, forcing him, and the few who wished to hear him, to flee for their lives, sometimes not without serious injury before they could escape. And these savage tumults have, in many cases, been well understood to be instigated by persons, whose advantage of superior condition in life, or even express vocation to instruct the people better, has been infamously lent in defense of the perpetrators, against shame or remorse, or legal punishment for the outrage. And there would be no hazard in affirming, that, since Wesley and Whitefield began to conflict with the heathenism of the country, there have been in it hundreds of instances answering in substance to this description.—Yet the good and zealous men who were thus set upon by a furious rabble of many hundreds, the foremost of whom active in direct violence, and the rest venting their ferocious delight, in a hideous blending of ribaldry and execration, of joking and cursing,—were taxed with a canting hypocrisy, or a fanatical madness, for speaking of the prevailing ignorance, in terms equivalent to those of the prophet, 'The people are destroyed for lack of knowledge.'‡

But we need not go back even to the distance

* Morse's American Geography.—The following severe laws, among others, were enacted against the Quakers. "Any Quaker, after the first conviction, if a man, was to lose one ear,—and for the second offense, the other—a woman, to be each time severely whipped;—and the third time, whether man or woman, to have their tongues bored through with a red hot iron."

† Kaim's Sketches.

‡ Foster's "Essay on Popular Ignorance."

of half a century in order to find instances of religious intolerance among Protestant communities and churches; our own times unhappily furnish too many examples of a bigoted, intolerant, and persecuting spirit. Little more than two years have elapsed since the Methodist chapel in Barbadoes was thrown down and demolished by the *mob-gentry*, and with the connivance of the public authorities of that slave-trafficking island, and Mr. Shrewsbury, a worthy and respected pastor and missionary, obliged to flee for his life. Previous to this outrage, he suffered every species of insult, contumely, and reproach. He was abused as a villain, and hissed at in the streets, not by mere rabble, but by the *great vulgar*; by merchants from their stores, and individuals in the garb of gentlemen. By such characters his chapel was surrounded, and partly filled, on Sunday the 5th October, 1823. Thin glass bottles had been previously prepared and filled with a mixture of oil and asafetida; and all of a sudden, they were thrown with great violence in the midst of the people, and one was aimed at the head of the preacher; and during the whole service, stones were rattling against the chapel from every quarter. On the next Sabbath an immense concourse of people assembled, "breathing out threatenings and slaughter;" and from 20 to 30 of the *gentlemen-mob* planted themselves around the pulpit apparently ready for any mischief. Men wearing masks, and having swords and pistols, came galloping down the street and presenting their pistols, fired them at the door; and it was originally designed to have fire crackers among the females, to set their clothes on fire. At length, on Sabbath, the 19th, this execrable mob, consisting of nearly 200 *gentlemen*, and others, again assembled, with hammers, saws, hatchets, crows, and every other necessary implement; and in the course of a few hours, the lamps, benches, pews, pulpit, and even the walls, were completely demolished. They entered the dwelling-house, broke the windows and doors, threw out the crockery-ware, chopped up tables, chairs, and every article of furniture; tore the manuscripts of the preacher, and destroyed a library of more than 300 volumes. All this was done under the light of the full moon, in the presence of an immense crowd of spectators, without the least attempt being made to check them either by the civil or military authorities—while the unfortunate preacher, with his wife in an advanced state of pregnancy, had to flee to a neighboring island to save his life! Such is the tolerant and humane conduct of *gentlemen* Protestants of the nineteenth century! *gentlemen* who would, no doubt, consider it very unhand-some were they to be compared to Goths and Vandals, or to the rude and barbarous savages of Papua or New Holland.*

About the same period, the authorities of Demerara set on foot a persecution against Mr. Smith, Missionary from the London Society, under various pretenses: but his real crime in the eyes of his persecutors, was, his unwearied zeal in instructing the negroes in the knowledge of religion. He was condemned to death by a court-martial, in the face of every principle of justice: he died in prison, was refused the privilege of a Christian burial, and his friends were prohibited from erecting a stone to mark the spot where his body was laid. The whole details of this transaction present a scene of savage bar-

barity, created by the lust of gain, scarcely to be paralleled in the history of Europe.

In Switzerland, which was formerly the headquarters of Protestantism, the demon of religious persecution has again reared its head. The council of state of the Pays de Vaud, at the instigation of the clergy, on January 15, 1825, published a decree, "prohibiting, under the penalty of severe fines and imprisonments, all meetings for religious worship or instruction, other than those of the Established Church;" and in the following May, another decree was issued, which denounces "fines, imprisonment, or banishment, upon the most private kind of religious assembly, or even the admission of a single visitor to family worship." In pursuance of these disgraceful laws, several ministers and private Christians of high character for piety and acquirements, have been banished from the Canton, some for one and some for two years—cut off from all means of subsistence, unless possessed of independent fortunes, and left perhaps to starve and perish in foreign lands. If they returned before the expiration of their sentence, it is said that *death* is the punishment to be inflicted. One poor man, a school-master, in the principality of Neuchâtel, has been condemned to *ten years'* banishment. He was brought out from prison, tied with cords, and compelled to kneel in the snow in the public square to hear his sentence read. His crime was, gathering together a few fellow Christians in his own house, and there having the Lord's supper administered by a regularly ordained minister!*

And is England pure from the spirit of persecution and intolerance? Let us see.—At Kenneridge in Dorsetshire, a worthy and excellent individual, belonging to the Wesleyan denomination, had attended on a green, where 20 or 30 persons usually congregated, on a Sunday afternoon, to listen to the truths he thought it important to declare. The clergyman of the parish approached with a retinue of servants, and *commanded* him to desist. The preacher took no notice of the command, and proceeded to read his text. The clergyman then commanded the tithing-man to seize him. He was directed to be conveyed to Wareham jail; and to every question the preacher put, as to the ground of his being seized upon, the *reverend* and *worthy* clergyman only replied by the brandishing of his stick.—Instances have occurred in which clergymen of the establishment have refused to *bury the dead*. At Chidds Ercal, in Shropshire, the child of a poor man was refused interment, and the father was obliged to carry it six miles, before it could be laid at rest in its mother earth.—At Catsfield, in Sussex, a similar act of infamy was committed.—At the moment when the bell had tolled, when the earth was to fall heavily upon the coffin, containing the only remains of the being that affection had endeared, and when those who stood by needed all the consolations that religion can supply—at this moment the clergyman appeared, but advanced only to give pain to the mourners, and to agonize a parent's heart, by saying, "Now that you have waited an hour until it suited me to come, I will not inter your child! I did not know that you were Dissenters—take your child somewhere else—take it where you please—but here it shall not lie in consecrated ground." And, in fact, they were compelled to carry the child away, eleven miles from the abode of its parents, and from the place

* For a more particular detail of these execrable transactions, see "Report of the Wesleyan Missionary Society for 1824," and the debates in Parliament in 1825.

* See a pamphlet on this subject by Dr. Pye Smith. See also, Cong. Mag. for June, 1825, and other periodical works of that date.

that gave it birth; before it could find repose in its kindred dust.—At Mevagissey, in the county of Cornwall, the vicar refused to allow the corpse of a Dissenter to be brought within the church, and, therefore, read the burial service in the open air; but, in consequence of which, he read only a part of that service, and omitted the most beautiful portion.—Such a power appears to be conceded to the clergy by the laws of the church; but the spirit which gave it existence is deeply to be deplored, as the spirit of bigotry and intolerance. At Wellingborough, a clergyman, in opposition to a custom which had been established for sixty years, issued orders, that no bell should toll when a Dissenter expired. He boldly avowed, “that he never would permit the passing-bell to be rung for a Dissenter, even in the event of an interment in the church-yard; that while he held the curacy, no bell of his church should ever toll for a Dissenter; and that he would not even permit the bells to ring for a marriage where the parties were Dissenters.” In reference to this case, an appeal was made to the Bishop of Peterborough, who wrote a long letter on the subject, and defended the conduct of this Wellingborough curate.—At Newport Pagnel, two persons of decent appearance, teachers of Baptist Societies, were collecting subscriptions for the erection of a new place of worship.—After arriving at the residence of the parish clergyman, they were taken before a clerical magistrate, who upon the oath of the other clergyman, that they were rogues and vagrants, committed them to Aylesbury jail; where they were confined for three weeks in common with the basest felons; among convicted thieves of the most abandoned character;—nay, more, they were sentenced to the tread-mill, and kept at hard labor there, though, during the whole time, one of them was afflicted with spitting of blood. Their papers were seized upon; their money was taken from them; and by means of it the expense of sending them to prison was defrayed.*

All the above-stated instances, and many others of a similar description, occurred within the limits of the year 1824; and every year since the “Society for the Protection of Religious Liberty” was formed, similar instances, some of them of a more barbarous nature, have been brought forth to public view. And, were it not for the protection which this Society affords to the victims of intolerance, it is highly probable, that vexatious persecutions, insults, fines, and imprisonments, on account of differences in religious opinions, would be much more common than they now are. Were such individuals as those to whom we have now alluded, permitted, by the laws of our country, to carry their intolerant spirit to its utmost extent, Dissenters would have no security either for their property or their lives; and the fires of Smithfield would again be kindled, to torture the souls, and to consume the bodies, of all who refused to conform to the dogmas of a national church.

After what has been stated in the preceding part of this work, it is almost needless to say, that such an intolerant and persecuting spirit is diametrically opposite to every principle that pervades the Christian system; and there cannot be a grosser misrepresentation of its spirit and tendency, than to ascribe such dispositions and

conduct to the genius of that religion which INTOLERANCE has thought proper to assume. Can a single instance be produced of a persecuting spirit in the conduct of Jesus Christ, or in that of any one of his apostles! When he “was reviled, he reviled not again; and when he suffered, he threatened not;” and he solemnly rebuked his followers when the least symptom of intolerance or revenge was displayed. Can a religion, which commands us to “love our neighbors as ourselves—to be kindly affectionate one toward another—to love our enemies—to do good to them that hate us—to bless them that curse us—and to pray for them that despitefully use us,”—can such a religion be supposed to give the least countenance to actions that are both intolerant and inhuman? If the religion of Christ have any one prominent object which distinguishes it from all others, it is this—to unite mankind in one harmonious and affectionate society; and such an object is altogether incompatible with resentment, intolerance, or persecution in any shape. “By this shall all men know,” says Jesus; “that you are my disciples, if ye love one another.”

Here I must close the illustrations of the moral state of mankind, though they might have been carried to a much greater extent. They present to every benevolent mind a *gloomy* picture of the moral aspect of the human race, and of the depravity which the principle of malevolence carries in its train. It is a picture which shows us that those moral principles and laws which the Creator intended to promote, the felicity of all worlds, have never yet been brought into full effect in the world in which we live. It is a picture, however, from which we ought not to turn away our eyes. It sets before us the evils which require to be counteracted, and the obstacles which must be surmounted, before the principles of malignity be extirpated, and the moral principles of the Christian system take root in the world. But such views of the existing state of the moral world, so far from operating as sedatives, ought to stimulate us to exert every energy, and to use every judicious and powerful mean, which has a tendency to promote the accomplishment of this important object.

It would have given me pleasure to have presented before the eye of the reader a more cheerful and alluring picture; but “facts are stubborn things,” and there is no resisting the force of the evidence which they adduce.—I intend to relieve some of the dark shades of this picture, by exhibiting some faint radiations of truth and benevolence which are still visible amidst the surrounding gloom. For, amidst the moral darkness which has so long covered the earth, some streaks of celestial light have always been visible; and the dawning of a brighter day now begins to gild our horizon. Substantial knowledge is now beginning to diffuse its benign influence on all ranks; the shackles of despotism are bursting asunder; the darkness of superstition is gradually dispelling; the spirit of persecution is borne down and powerfully opposed by the force of truth and of common sense, and the rights of conscience are beginning to be generally recognized. Philanthropic institutions of various descriptions have been established, education is extending its beneficial effects; the instruction of the young is becoming an object of more general attention; philosophical institutions, village libraries, and associations for intellectual improvement, are ra-

* The reader will find a more particular detail of these cases, in the “Address of John Wilks, Esq., at the Fourteenth Anniversary of the Protestant Society for the Protection of Religious Liberty,” in May, 1825.

pidly organizing; Bible and missionary societies are extending their influence through every portion of the religious world, and Christianity is now beginning to display its beneficent energies on distant continents, and the islands of the ocean. —But, instead of entering into details in the illustration of these and similar effects which have always, in a greater or less degree, accompanied the progress of the Christian religion, I shall, in the meantime, refer the reader to the excellent work of Dr. Ryan, “On the History of the effects of Religion on Mankind.”

Here a question may be proposed by some of my readers,—Is it possible to bring the inhabitants of this world, in their present depraved state, to a general observance of the laws of benevolence which have been illustrated in the preceding part of this work? To such a question I would reply,—*Whatever man has done, man may do.* Amidst the depravity and the darkness with which the earth has been generally enveloped, individuals have occasionally arisen who have shone as lights in the moral world, and exhibited bright patterns of Christian temper and of active beneficence. The Apostle Paul had his mind imbued with a large portion of the spirit of love. He voluntarily embarked in a tour of benevolence through the nations; and in spite of reproaches, persecutions, stripes and imprisonments; in the midst of “perils in the waters, perils of robbers, perils by his own countrymen, perils in the city, and perils in the wilderness;” and in the face of every danger, and of death itself, he prosecuted, with a noble heroism, his labor of love, purely for the sake of promoting the best interests of mankind. All the Apostles engaged in the same benevolent undertaking; they sacrificed every private interest, every selfish consideration; “neither counted they their lives dear unto themselves, so that they might finish their course with joy,” and be the means of accomplishing the salvation of their fellow-men.

Even in our own times, many distinguished individuals have arisen, who have reflected honor on our species. The name of *Howard* is familiar to every one who is in the least acquainted with the annals of philanthropy (see p. 14). This excellent man, and truly philanthropic character, devoted his time, his strength, his genius, his literary acquisitions, and his fortune, and finally sacrificed his life, in the pursuits of humanity, and in the unwearied prosecution of active benevolence. He traveled over every country in Europe and in the adjacent regions of Asia, impelled by the spirit of Christian love, in order to survey the mansions of sorrow and of pain, and to devise schemes for the relief of human wretchedness wherever it existed; and, in the execution of this scheme of benevolence, the energies of his mind were so completely absorbed, that “he never suffered himself, for a moment, to be diverted from carrying it into effect, even by the most attractive of those objects which formerly possessed all their most powerful influence upon his curiosity and his taste.”*

The late Walter Venning, Esq., who has been denominated, by Prince Galitzin, the *second Howard*, walked in the steps of his illustrious predecessor, and with the most fervent Christian zeal, devoted his short, but useful life, to the alleviation of human misery, and to the promotion of the best interests of thousands of wretched individuals

who “were ready to perish.” He withdrew himself from the ordinary round of genteel society and declined all commercial business, that he might devote the whole energies of his soul to benevolent occupations. He commenced his philanthropic career, by co-operating in the formation of the “Society for improvement of Prison discipline,” which was formed in London in 1816; and afterward visited the prisons in Petersburg, Novogorod, Tver, Moscow, and other cities in the Russian empire. The prisons, hospitals, work-houses, mad-houses, houses of correction, and the abodes of misery of every description in Petersburg, were visited by him, day after day: “and many a prisoner, bowed down with affliction and iron, was cheered, instructed, and saved by his ministrations; for his philanthropy extended both to the bodies and to the souls of men.”*

Many other examples might be produced from the annals of our times, and of illustrious characters, presently existing, to demonstrate, that a noble and disinterested benevolence is a principle, capable of being exercised even in the present degenerated state of the inhabitants of our world. We find parents sometimes displaying a high degree of benevolent feeling toward their offspring, and sacrificing their ease, and their personal interests, in order to secure their health, their happiness, and enjoyments. We find bosom friends like David and Jonathan, and like Damon and Pythias, rejoicing in the welfare of each other, and encountering difficulties and dangers in promoting the interests of the objects of their friendship. What, then, should hinder such dispositions from becoming universal? What should hinder them from being transferred to all the sensitive and intellectual beings, with whom we may have occasion to correspond, or to associate? Would not the universal exercise of such dispositions be *highly desirable*? would it not tend to banish war and discord from the world, and promote peace on the earth, and good-will among men? Why, then, are such dispositions so seldom displayed? Not because the universal exercise of them is a thing impossible; but because men, actuated by selfishness, are *unwilling* to give full scope to the benevolent affections; because they have never yet employed all the requisite means for bringing them into full operation. If all the energies of the intellect, and all the treasures which have been expended in fostering malignant passions, and in promoting contentions and warfare, had been devoted to the great object of cultivating the principle of benevolence, and distributing happiness among men; the moral and physical aspect of our world would long ago have assumed a very different appearance from what it now wears.

The philanthropic individuals, to whom I have alluded, were men, whose actions were sometimes blended with the failings and imperfections incident to degenerated humanity; but the principle of benevolence ruled supreme over all the subordinate affections; and if the world were peopled with such men, notwithstanding the imperfections which attached to them, society, in every land, would present the appearance of a moral paradise, and form an image of the harmony and felicity of “the saints in light.” Every one who believes in the existence of a future state, fondly imagines that he shall enjoy happiness in that state. But, whence is his happiness to arise in the future world, but from the exercise of those dispositions

* For a particular account of the labors of this eminent philanthropist, see Brown’s “Memoirs of the public and private life of John Howard.”

* Mr. Venning died in Petersburg, in 1821, in the fortieth year of his age.

which the law of God requires? And if the exercise of benevolent dispositions be essentially requisite for securing supreme felicity in the eternal state, their cultivation, even in the present world, must be an *indispensable* duty, in order to our *preparation* for the employments of the celestial world. For it is a law of the Creator, which is eternal and immutable, that "without holiness, no man can see the Lord." And whenever the requisite means are employed for the cultivation of holy and beneficent dispositions, we may rest assured, that our labor will be crowned with success. For the energy of the divine Spirit, from whom proceedeth every good and perfect gift, is promised to accompany the use of every proper mean, so as to render it effectual for counteracting the effects of moral evil, and for promoting the renovation of the world.

We have examples before us, not only of a few insulated individuals, but of societies, where the principle of benevolence, in a greater or less degree, pervades the whole mass. The people who have been denominated *Quakers*, have always been distinguished by their humane and peaceable dispositions, their probity and hospitality to each other, the cheerfulness of their manners, their opposition to war, and the active zeal which they have displayed in contributing to the good of mankind. The *Moravians* are also distinguished for their affectionate intercourse with each other, the liberality of their dispositions, the peaceableness of their tempers, the purity and simplicity of their lives, and their missionary efforts for evangelizing the heathen world.* Would to God that the whole world were Quakers and Moravians, notwithstanding their peculiarities of opinion! With all their foibles and imperfections, society would then wear a more beautiful and alluring aspect than it has ever yet done; peace and industry would be promoted: the fires of persecution would be quenched; philanthropy would go forth among the nations, distributing a thousand blessings, and the people would learn war, no more.

I intend, in this place, to inquire into the MEANS

* The following anecdote, is illustrative of the character of many of the Moravians, or Hernhutters as they are sometimes called.—In a late war in Germany, a captain of cavalry was ordered out on a foraging party. He put himself at the head of his troop, and marched to the quarter assigned him. It was a solitary valley, in which hardly anything but woods was to be seen. In the midst stood a little cottage; on perceiving it he rode up, and knocked at the door; out comes an ancient Hernhutter with a beard silvered by age. "Father," says the officer, "show me a field where I can set my troopers a-foraging." "Presently," replied the Hernhutter. The good old man walked before, and conducted them out of the valley. After a quarter of an hour's march, they found a field of barley. "There is the very thing we want," says the captain.—"Have patience for a very few minutes," replied the guide, "and you shall be satisfied." They went on, and about the distance of a quarter of a league farther, they arrived at another field of barley. The troop immediately dismounted, cut down the grain, trussed it up, and remounted. The officer, upon this, said to his conductor, "Father, you have given yourself and us unnecessary trouble; the first field was much better than this." "Very true, Sir," replied the good old man, "But it was *not mine*."—Here we have a beautiful *practical* exhibition of *love to our neighbor*, and of calm resignation to the providential dispensations of God. How few professed Christians have been found acting in this manner! And yet I doubt not, that this good man would experience more true satisfaction in the temper and conduct he displayed, than if he had offered resistance, practiced dissimulation, or set them to plunder his neighbor's field. A number of disinterested actions such as this, would contribute more powerfully to the support of the Christian cause than a thousand theological disputes, imbued with the spirit and temper with which they have been most frequently conducted.

BY WHICH THE PRACTICE OF CHRISTIAN MORALITY MIGHT BE PROMOTED. But I find that this is a subject which would require a distinct volume for its illustration. At present, I can suggest only two or three hints.

In the first place, the *intellectual* instruction of the young, should be an object of universal attention, both in public and private. For true knowledge is the spring of all religious emotions, and of all virtuous actions. By intellectual instruction, I do not mean merely a series of exercises in spelling, pronouncing, parsing, construing, writing, and figuring; but a communication of the elements of thought, and of clear and extensive conceptions of the physical and moral relations of the universe.—2. The moral instruction of the young should be an object of particular and incessant attention. Moral instruction should be inculcated, not merely by a reiteration of dry precepts, maxims, and abstract doctrines, or by a reference to the details and flimsy sentiments contained in fictitious narratives; but by a pointed and pacific reference to real facts; as exhibited in the Sacred History, the annals of nations, and in the scenes of the family, and of general society. I would expect no greater assistance in the work of moral instruction from the religious novels with which the Christian world is now deluged, than I would do from a circulation of the Pious Frauds which were so common in the first ages of the church. In schools and in families, everything which has a tendency, either directly or indirectly to foster pride, envy, contention, revenge, and other malignant affections, should be firmly and sedulously discouraged and counteracted; and higher rewards (if rewards be expedient) should in every instance, be bestowed on the individual who cultivates and displays benevolent affections, than on him who is distinguished merely for intellectual acquirements. Hitherto, a more decided preference seems to have been given to what is termed *genius*, than to moral accomplishments.—3. Institutions should be formed for communicating literary and scientific knowledge, blended with moral and religious instructions, to persons of both sexes, and of every rank and age, from fifteen years and upward, particularly to apprentices, journeymen, clerks, shopkeepers, and others, for the purpose of calling forth into action the energies of their minds, and for preventing the growth of habits of dissipation. In such institutions, the manifestation of benevolent affections, and propriety of moral conduct, should be made the conditions of enjoying the instructions and privileges of the association.—4. In connection with these and other means, the cause of practical morality would be powerfully promoted, were the ministers of religion, among all parties, to direct their energies to the discussion of moral subjects, on Christian principles, instead of confining their attention almost exclusively to doctrinal discussions. Religion is not a system merely of speculative and metaphysical truths, nor does it consist in the contemplation of mysterious facts, or incomprehensible dogmas; but it is a rational and tangible subject, addressed to the reason, the hopes, and fears, and the common sense of mankind; and therefore, its illustrations should be chiefly derived from the facts of Sacred History, the system of nature, and from the existing objects, scenes, and associations with which we are connected.—A much greater degree of animation, and of energy, than is now displayed in instructions from the pulpit, is also requisite for arresting the attention, and riveting impressions of moral and religious truths

upon the mind. If fewer sermons were delivered, and a greater portion of intellectual energy concentrated in each discourse, and if preachers, particularly among Dissenters, had fewer discourses to compose, and more time for taking an ample intellectual range through the system of nature, of Providence, and of revelation, a more powerful effect would undoubtedly be produced on the Christian world, and upon all who occasionally attend on the ministrations of religion.

I need scarcely add, that all such means ought to be accompanied with fervent prayer to the "Father of lights," and dependence on the promised aid of the Spirit of holiness. But without the application of all the energetic means which reason and revelation suggest, we have no reason to conclude, and it would be presumption to expect, that the influences of heaven will descend upon the moral world. For it appears, in point of fact, to be one part of the plan of the divine procedure, that human agents shall be the means of enlightening each other, and of promoting the renovation of the world, as "workers together with God."

CONCLUSIONS FROM THE GENERAL PRINCIPLES ILLUSTRATED IN THIS VOLUME.

If the general train of sentiment which runs through the preceding discussions and illustrations be admitted, the following conclusions may be deduced respecting,

I. The subject of preaching, and the grand aim which the ministers of religion, in their discourses, ought always to have in view.* We have already seen, that it is the great object of revelation to bring into practical operation the principles of love to God and to man; and, it is obvious, that, what is the main object of Christianity to accomplish, ought to be the ultimate aim of every Christian preacher. It is not merely to convert men to the belief of certain *opinions*, or to induce them to embrace the peculiarities of a party. It is, that they may "be renewed in the spirit of their minds," and, "made meet for the inheritance of the saints in light"—it is, that they may "deny ungodliness and worldly lusts, and live soberly, righteously, and godly, in the present evil world;" and be "united together in love, which is the bond of perfection."—Metaphysical disquisitions, respecting dogmas in religion, have very little tendency to meliorate the heart, and to promote benevolent dispositions and affections. On the contrary, they have frequently produced a temper of mind directly opposite to the spirit of Christianity. They have led multitudes to pique themselves on the supposed purity of their profession, and the orthodoxy of their creed, and to point at others as heretics, and subverters of the gospel, on account of some slight differences in sentiment about a particular doctrine; while they themselves have never attempted to cultivate heavenly dispositions, and to display that charity which "suffereth long, and is kind, which is not easily provoked, and thinketh no evil." There are certain doctrines and facts, which we ought always to recognize, and to keep in view as fundamental axioms in the Christian system;—such as, that "there is one God, and one Mediator be-

tween God and man, the man Christ Jesus;" that "he died for our offenses, and rose again for our justification;" that "all have sinned and come short of the glory of God;" and that "we are justified freely by his grace, through the redemption that is in Christ Jesus." But, there is no necessity for expatiating almost exclusively on these and similar doctrines, as is frequently done, to the exclusion of practical morality; since they ought to be regarded in the light rather of first principles in religion, than as topics which require to be proved by labored and diffused arguments. Yet, it is a fact, that such doctrines, which are only the means of religion, have been expatiated upon without intermission, as if the simple belief of them were the end of religion; while the great moral object of Christianity has been either entirely overlooked, or thrown into the shade. What should we think of the instructor of youth, who confined the attention of his pupil solely to the characters of the alphabet, and to the pronunciation of a few elementary sounds, and then dismissed him with a general exhortation, to apply them to all the combinations of letters and syllables he might find in every book? Could we ever expect, that, in ordinary cases, such a pupil would either make progress in the art of reading, or use it as the medium of acquiring knowledge? And what shall we think of those who do little more than attempt to explain the axioms of the Christian system, but never show their bearings on the scenery of real life, nor endeavor to extend our views of the providential operations of God, and of the glory of his kingdom? If Christianity consisted merely in abstract disquisitions, and metaphysical dogmas, such a practice might be, in some measure, defensible; but since it is, in every sense of the word, a *practical* system, it is next to trifling with its prominent objects, to confine the range of religious discussions within so narrow bounds as is generally done by many of those who are designated by the term *evangelical*; and argues a complete forgetfulness of the apostle's exhortation, "Therefore, leaving the first principles of the doctrine of Christ, let us go on to perfection," tracing first principles through all their diversified bearings on mortal action, and on Christian contemplation.

One of the great objects of preaching ought, undoubtedly, to be, to investigate the numerous and minute ramifications of human conduct; to explore every avenue of corruption; to endeavor to draw forth from its hiding-place every immoral principle and action, which exerts its pernicious influence in Christian or in general society; and with all the powers of graphical description we can command, to portray them before the eyes of men, in all their repulsive features, and in all their abominations. At the same time, we ought to apply the touch-stone of the divine law to every unchristian propensity and practice; to exhibit its contrariety to the spirit of our holy religion; to show how the principle of love ought to operate in every given case and circumstance, and in the minutest actions of human life; and how very different effects would be produced, were the principles laid down by our Saviour and his apostles, to operate with full effect throughout every department of the moral world. Unless such objects be generally aimed at, and steadily kept in view, in the course of public instruction, religion will be apt to degenerate into a mere figment, or, at most, into a subject of wrangling, or a matter of curious speculation.

Let no class of religionists presume to tell us, that, if the fundamental doctrines of religion be

* The Author originally intended to illustrate this, and the following conclusions, at considerable length, and to enter into a variety of circumstantial details; but, as the intended illustrations would occupy more than a hundred pages, and as the work has already swelled to a considerable size, he is under the necessity of postponing them for the present.

simply declared, Christian morality will follow as a matter of course; and that, to expatiate on any particular branch of social conduct, is to degenerate into *legal preaching*. If this principle were to be admitted, then all the expostulations and denunciations of the prophets, all the reproofs and exhortations of the apostles, all the moral sermons of our Saviour, and all the minute directions in reference to moral conduct, detailed in every epistle to the Christian churches, may be regarded as egregious trifling. If it be one grand design of revelation to restore mankind from the ruins of the fall, and to reinstate them in that integrity which they at first possessed;—if it was the chief design of “the law and the prophets” to bring forth into action, on the theater of the world, the two fundamental principles of the moral law, as the Lawgiver himself has expressly stated (Matt. xxii. 37-40);—if the sweet singer of Israel devoted a large portion of his inspired strains to the celebration of the divine precepts (Psalm cxix. &c.);—if most of the sermons and parables of our Saviour have a direct bearing on the same important subject;—if the apostle Paul, in his instructions to a Christian minister, enlarged particularly on the duties which should be inculcated on the various ranks and relations of men (Titus ii. iii.);—if all the apostolic letters to the Christian churches are full of minute directions, in relation to every branch of moral duty;—if heaven be the scene of perfect moral rectitude, where ardent affection toward God, and toward fellow-intelligences, ever reigns—where love, peace, and harmony, eternally prevail;—if the happiness of that world depend upon the absence of moral evil, and the attainment of moral perfection;—if the present world be a state of preparation for the enjoyments of that happier region;—if this preparation consist in having the principles of love to God and to man interwoven through the whole constitution of the mind, and brought forth into action in the diversified scenes of civil and religious intercourse;—if such important effects cannot be produced, unless by laying open to view the latent abominations of the heart, by impelling the moral principles of the gospel through all the avenues and windings of the human passions and affections; and by illustrating, with minute particularity, every subordinate branch of Christian duty;—if these positions be admitted, it will follow, that the duties of Christian morality, so far from being thrown into an obscure corner, ought to occupy a *prominent place* in the range of the ministration of every Christian minister, who is desirous to promote the improvement of society, and the renovation of the world.

In short, we expect no grand moral reformation to be achieved—no commencement of the millennial era of the church, until “the watchmen upon Mount Zion,” with more energy than they have yet displayed, “shall lift up their voice like a trumpet, and show to the house of Jacob their transgressions”—until they “lift it up with strength, and not be afraid” of any suspicions that may be thrown out against their orthodoxy, when they show unto men the path of duty in all its bearings on the relations of time, and on the employments of eternity—until they make the moral principles of Revelation bear, in all their force, not only on the prominent features of social life, but upon every minute ramification of human conduct until every lurking principle of jealousy, envy, avarice, and revenge be made to feel their energy—until even the very *amusements* of public and domestic life be made to bend to the eternal laws of rectitude, and to carry on their

fronts that noble inscription, “*HOLINESS TO THE LORD.*”

II. If the preceding train of sentiments be admitted, we may be directed in our views of the *nature and ends* of church discipline, and the persons on whom it ought to be exercised.

In a great majority of Christian churches, censures are inflicted chiefly, or solely, on persons guilty of an *external* breach of one or two precepts of the decalogue—only one or two species of violation of the moral law are considered as worthy of cognizance; while the systematic operations of slander, revenge, envy, and avarice—the indications of harsh, sour, and ungovernable tempers, and the absence of Christian candor and affection—circumstances which display the real characters of men far more distinctly than any *insulated* acts of immorality can do—are either wholly overlooked, or considered as characteristics of very trivial import. The censures to which I allude, are likewise accompanied, in many instances, with a degree of magisterial haughtiness, severity, and unchristian feeling, which is directly repugnant to every amiable, candid, and generous principle. A person guilty, in a single instance, of a breach of the seventh or eighth commandments, will lie under the frown of a religious society for years, and even to the close of his life, notwithstanding every evidence he can give of the sincerity of his repentance, and even be deprived of the means of earning his subsistence; while another may habitually violate almost all the other precepts of the decalogue, and be screened from the discipline of the church. He may be avaricious, cunning, and deceitful; harsh and unfeeling in his conduct; uncandid and uncharitable in his dispositions toward others; proud, selfish, and obstinate in his temper; addicted to slander and to incessant litigations; impatient of control; and boisterous and contentious in his general deportment—and yet be considered as no proper object of censure; and, though never manifesting the least symptom of penitence, will be viewed as a tolerably fair character in religious society, especially if he has acquired a considerable share of wealth and of influence in general society.—Of such cases and practices, the author had selected a number of striking examples, which the narrow limits to which he is confined in the present work, constrain him, in the meantime, to postpone.

Now, if the general sentiments already thrown out be founded on truth, and on the nature of things, such a practice as that to which we allude, must be absurd, unchristian, and inconsistent with the preservation of the moral purity of religious society. It has this pernicious tendency, among others, that it leads multitudes to imagine, that, if they can keep clear of two or three acts of moral delinquency, they may trample on every divine principle and law with impunity. A poor wretch, under the pressure of poverty, steals a hen or a pocket handkerchief, and, notwithstanding his subsequent repentance, is banished from social intercourse, and held up to execration; while a sanctimonious hypocrite will swindle his neighbor out of a hundred pounds, if no criminal law can take hold of him, and will retain his station in the church, and hold up his face without a blush in the presence of general society. It is obvious, if there be any truth in what we have hitherto stated, that the general tenor of the conduct, and the uniform manifestation of benevolent affections, ought, in every case, to form the grand criterion of a man's being entitled to the character of a Christian; and, that dispositions of an opposite nature habitually displayed, however much

overlooked in the general intercourse of life, ought to form a ground of exclusion from the society of the faithful.

III. This subject has a particular bearing upon the *divisions* which subsist in the religious world, and the grand principles which ought to form a *bond of union* among all who acknowledge the truth of the Christian Revelation.—If the train of thought illustrated in the preceding pages be correct, it will follow, that a cordial union of the various sections of the Christian church is to be expected from the cultivation of the Spirit of Love, more than from any attempt to produce an exact coincidence of opinion on these theological points in which they now differ. Wherever this spirit is found expanding the soul, and governing the affections, it will lead its possessors to view the peculiar opinions of others with candor; to respect their persons; to allow them liberty of thought on all the subordinate ramifications of theological sentiment; and to set a higher value on moral qualifications, and the manifestation of benevolent affections, than on those circumstantial opinions which do not enter into the essence of the Christian scheme. If the professing Christian world were thoroughly investigated, it would be found, that it is owing more to the absence of this spirit, that Christians stand so much aloof from each other, than to the speculative opinions which they respectively maintain. The prevalent disposition for sneering at other denominations, and the pleasure that seems to be felt in laying open their sores, will generally be found to proceed from a principle of pride, and of self-conceit in regard to our own favorite opinions, some of which, when probed to the bottom, will be found as rotten as our neighbor's. Why are men not as much disposed to pass encomiums on what is sound in the opinions, and laudable in the conduct of other parties, as they are to censure them for minor peculiarities of sentiment? Why? Because it appears, that many professed Christians take more delight in the exercise of malevolent feelings than of benevolent affections; and are like flies, that pass over the sound parts of a man's body, and fix upon his sores. Until such unchristian dispositions be undermined, and tempers of an opposite description pervade the ranks of Christian society, we can expect no cordial nor lasting union in the visible church, however many ingenious schemes may be formed, to bring about this desirable event. For every effect must have an adequate cause: this cause will be found to consist more in the affection than in opinion; and a union formed on an apparent coincidence of sentiment, unmingled with ardent love and affection, would be unworthy of the name, and would soon be dissolved.

It can form no decisive mark of a man's Christianity, that he recognizes the *peculiar opinions* of the Baptists or Pædo-Baptists, of Presbyterians, Episcopalians, or Independents; it is a matter, comparatively of little importance, whether a man believes that Christ was an actual or a virtual Mediator under the Old Testament; whether he be designated the *Son of God* in virtue of his office, or of his nature; whether or not we be guilty of Adam's first sin; whether the transaction which passed between him and his Creator, should be viewed as a law, or as a covenant; whether the ordinance of baptism should be administered by dipping, or by sprinkling, &c., &c.—But it is, unquestionably, a matter of the highest moment, both to the person himself, and to Christian society, that his temper, affections, and conduct, should be in unison with the holy law

of God, and that he should display the love which it requires, in all his social, commercial, domestic, and Christian intercourses;—and if such dispositions and conduct were universally to prevail among the various denominations of the religious world, union* would soon follow, as a matter of course.—If, therefore, we wish to behold the unhappy divisions of the church cemented, let us cultivate, with ardor, those amiable and affectionate dispositions which our benevolent religion inculcates, and be more anxious to correct our own mental and moral aberrations, than to magnify the errors and the faults of others. Let us make every allowance for the effects which education, habit, temper, local circumstances, and particular associations, may have produced on the opinions of our supposed erring brethren; and let us consider, that we ourselves, had we been placed in the same circumstances, might have imbibed the same sentiments. Let us endeavor to acquire clear and well-defined ideas on every subject connected with religion; that we may not contend about trifles, about mere abstract ideas, or the application of particular terms or phrases. Let us keep our eyes fixed on the great and prominent objects of revelation, and on all the subordinate active means by which they may be promoted. Let us consider religion as consisting more in action, than in speculation. Let our love to Christian brethren be founded, not so much on a general coincidence of opinion, as on the resemblance they bear to the Divine image; and then we may confidently expect, that that period will soon approach, when the saints of God "shall see eye to eye," in reference to all the grand bearings of the Gospel scheme, and when the name of Jehovah shall be one throughout all the earth.

IV. We may learn from the subject we have been illustrating, what notions we ought to form of the *NATURE of a future state of happiness, and of the PREPARATION requisite to enable us to engage in its employments.*—The felicity of the future world will not consist simply in a *change of place*; nor will it consist chiefly in change of sentiment or opinion. Its foundation must be laid in the principle of *Love*, and in the complete renovation of the moral powers of the human mind, without which no celestial scene could produce permanent enjoyment. Although all the theologians who now exist were united in opinion about every article of the system of Divinity; and although they were transported to the most splendid world that revolves around the star *Arcturus*; after the first transports, arising from the novelty and the grandeur of the scene had subsided, they would enjoy little more happiness in that orb, than they do in this terrestrial sphere, unless they were actuated with moral dispositions and affections very different from those which many of them now display. For, not only rancor and malice, but even coldness and indifference to the welfare of others, would prevent happiness from being enjoyed in any region of the material universe. All who believe in the reality of a future world, indulge in anxious wishes to be made happy when they pass from this mortal scene to the world of spirits. Even wicked men, whose consciences frequently forbode evil to them in the other world, indulge the hope that God will ultimately be merciful to them, and admit them to the joys of heaven. But this is impossible, in the very nature of things, unless they be "renewed in the spirit of their minds," and endowed with those holy dispositions which alone can qualify them for relishing substantial happiness, and for participating in

"the inheritance of the saints of light." How could Malignity associate with Benevolence, Contention with Friendship, or War with Peace? How could the sons of discord dwell in unity, in an assembly where all is harmony and love? How could the malicious and revengeful spirit find delight in the employments of kindness and pure benignity? How could the man who now finds his chief pleasure in hounding and horseracing, in brawling and fighting, have any relish for the sublime adorations, the enraptured praises, and the lofty and refined contemplations, of the celestial inhabitants? The thing is impossible, unless the moral order of all worlds were completely subverted. Such characters will be banished from the abodes of bliss; not by any arbitrary decree of the Almighty, but in virtue of the moral constitution of the intelligent universe.

It is, therefore, evident, that the happiness of heaven must be founded upon the exercise of love, affection, harmony, perfect good-will to fellow-intelligences, and the infinite variety of ramifications into which such principles may diverge; combined with profound, enlightened, and venerable views and affections, in relation to the God and Father of our Lord Jesus Christ. When these and similar dispositions are uniformly exercised, without the least mixture of any one ingredient of moral evil, it is easy to conceive, with what transports of delight the inhabitants of heaven will contemplate the displays of Divine Power, Wisdom, and Goodness, and investigate the history of his dispensations in the moral government of our world, and in the arrangements of all the other worlds whose physical and moral economy may be laid open to their view.*

Such views are in perfect accordance with the representations of Scripture.—"Without holiness, no man shall see the Lord." "The pure in heart (and they alone) shall see God." "Nothing that worketh abomination, can enter within the gates of the heavenly city." "As we have borne the image of the earthly (says the Apostle), so shall we bear the image of the heavenly." "Christ Jesus gave himself for the church, that he might sanctify and cleanse it, and that he might present it to himself a glorious church, holy, and without blemish." The crown of glory, reserved in heaven for the faithful, is designated "a crown of righteousness." "The spirits of just men," in the future world, "are made perfect," freed from

every taint of moral pollution, and unrestrained in the exercise of their moral powers. The inheritance to which they are destined, is "undefiled" with the least stain of corruption, or with the example of impure and malignant spirits. "When Christ, who is our life, shall appear, we shall be like him;" transformed into his moral image, and animated with those Divine principles and virtues, which he displayed in his conduct, when he tabernacled among men. The saints "shall walk with him in white," an emblem of their perfect moral purity; "They shall receive an inheritance among them that are sanctified," and "there shall be no more death, neither sorrow, nor crying; for the former things shall have passed away."

V. From the preceding illustrations we may learn something of the *nature and essence of future punishment*. If the exercise of love, in all its diversified modifications, constitutes the foundation and the essence of happiness, the unrestrained operations of malevolence must be the source and the sum of misery. We cannot form a more dreadful picture of future punishment, than by conceiving the principles of falsehood, deceit, and malignity, and the passions of pride, hatred, malice, and revenge, raging with uncontrolled and perpetual violence. We need represent to ourselves nothing more horrible in the place of punishment, than by supposing the Almighty simply to permit wicked men to give full scope to their malevolent dispositions; leaving them "to eat of the fruit of their own ways, and to be filled with their own devices." The effects produced by the uncontrolled operation of such principles and passions would be such, as may be fitly represented by the emblems of "the worm that never dies," of "devouring fire," and of their necessary concomitants, "weeping, and wailing, and gnashing of teeth." (See Chap. II, Sect. iv, pp. 42-44.) What other ingredients of misery, arising either from local circumstances, from the recollection of the past, or the anticipation of the future, may be mingled with the cup of future woe, it becomes not us particularly to determine. And, whether this scene of misery will ever come to a termination, must be determined by the consideration, whether the effects produced by such a punishment will have a tendency to produce repentance and reformation on the minds of the sufferers. If, after a lapse of ages, the principles of hatred to God, and to surrounding intelligences, continue to operate with increasing violence, without producing the least desire of returning to their allegiance to God, or the least symptom of reformation,—then, we may conclude, that the misery of wicked intelligences will continue so long as they remain in existence.

* The author will have an opportunity of illustrating this topic in more minute detail, in a work entitled, "*The Philosophy of a Future State*;" or, an Illustration of the Connection of Science with the Eternal World,—and of the Aids which its discoveries afford, for enabling us to form a conception of the *perpetual improvement* of the celestial inhabitants in knowledge and felicity."

THE UNIVERSITY OF CHICAGO

P R E F A C E.

THE train of thought which runs through the following Work has been familiar to the Author's mind for upward of twenty-six years. Nearly twenty years ago, he intended to address the public on this subject: but he is now convinced that, at that period, the attempt would have been premature, and consequently unsuccessful. He took several opportunities, however, of suggesting a variety of hints on the necessity of new-modeling and improving the system of education—particularly in the London "Monthly Magazine," the "Edinburgh Christian Instructor," the "Christian Recorder," the "Perth Courier," and several other publications, as well as in several parts of his former volumes.—Of late years the attention of the public has been directed to this subject more than at any former period, and even the British Legislature has been constrained to take into consideration the means by which the benefits of education may be more extensively enjoyed. It is therefore to be hoped, that the subject will now undergo a deliberate and unbiased consideration, corresponding to its interest and importance.

In endeavoring to establish a new system of education—although every requisite improvement could not, in the first instance, be effected,—yet nothing short of a comprehensive and efficient system should be the model after which we ought to copy, and to which all our arrangements should gradually approximate. To attempt *merely to extend* the present, in many respects inefficient and limited system, without adopting those improvements which experience and the progress of society have rendered necessary, would be only to postpone to an indefinite period what *must* ultimately be established, if society is expected to go on in its progress toward perfection.

In the following volume the Author has exhibited a brief outline of the whole series of instructions requisite for man, considered as an intelligent and moral agent destined to immortality—from the earliest dawn of reason to the period of manhood. But it is merely an *outline*; for the subject, considered in all its bearings, is the most *extensive* and interesting that can occupy the attention of mankind. Should the present volume, however, meet with general approbation, some more specific details in reference to the subjects here discussed, and to other topics connected with the improvement of society, may afterward be presented to the public.

Several excellent works have lately been published on the subject of education, some of them recognizing the leading principles which are here illustrated. But the Author has, in every instance, prosecuted his own train of thought, without interfering with the sentiments or language of others, unless where it is acknowledged. Some of the works alluded to he has not had it in his power to peruse; and the same current of thought will sometimes occur to different writers on the same subject.—The greater part of this work was composed before the Author had an opportunity of perusing

the excellent treatise of Mr. Simpson, entitled, "Necessity of Popular Education"—a work which abounds with liberal and enlightened views, and which recognizes the same general principles which are here illustrated. But the two works do not materially interfere; and the one may be regarded as a supplement or sequel to the other, both having a bearing on the same grand object.

It was originally intended to offer a few remarks on classical learning, and on the system of education which prevails in our colleges and universities; but the size to which the volume has swelled has rendered it expedient to postpone them to a future opportunity. For the same reason, the "Miscellaneous Hints in reference to the Improvement of Society," and the remarks on "Mechanics' Institutions," have been much abridged, and various topics omitted which were intended to be particularly illustrated.

The Author intends proceeding with his promised work "On the Scenery of the Heavens," as soon as his present engagements will permit.

BROUGHTY FERRY, NEAR DUNDEE.

the feet—directions in regard to shoes, illustrated by figures. *Sleep and exercise* of children. Attention requisite to direct their pronunciation. 2. *Moral* instruction of infants. Means of acquiring an absolute *authority* over them. Plan recommended by Dr. Witherspoon. Anecdote of Mr. Cecil—rule for securing authority—obstacles which prevent mothers from acquiring it—general violation of parental authority illustrated—Abbot's "Mother at Home" recommended—anecdote extracted from that work. Importance of attending to truth in the education of children,—truth and falsehood in pictorial exhibitions. Illustrative anecdote from Mr. Abbot. General rules on this subject. Habit of incessantly finding fault with children. Children should feel the consequences of their conduct, and be guarded against *vanity* and self-conceit. Danger of *frightening* children, illustrated by an appalling fact. Necessity of *harmony* in the conduct of parents toward their children. 3. *Intellectual* instruction of infants. Objects, natural and artificial, which should be presented to their view—mode of conveying a knowledge of the *qualities* of objects—communication of ideas by *engravings*. Experiments on this subject, with a boy about two years old. Importance of imparting *correct* ideas to the infant mind. Maternal associations..... 31

CHAPTER IV.

ON INFANT SCHOOLS.

Objects of infant schools. Proper situation for such institutions, and the apparatus requisite for conducting them. Method of teaching vocal music, the alphabet, arithmetic, and the facts of sacred history—figure of the *Arithmeticon*. *Advantages* which would flow from the universal establishment of infant schools—increase of useful information—formation of intellectual *habits*—foundation laid of moral conduct—certainty of success when judicious moral training is attended to. Moral effects of infant teaching, illustrated by examples. Infant schools, beneficial to general society and counteractive of juvenile delinquency. Social habits cultivated with safety. Influence of infant schools on *Missionary* operations—infant schools in Africa—such institutions ought to be universally established for all ranks. *Qualifications* of teachers in order to render them efficient. Origin and progress of infant schools..... 45

CHAPTER V.

ON SCHOOLS FOR YOUNG PERSONS FROM THE AGE OF FIVE OR SIX TO THE AGE OF FOURTEEN YEARS.

Introductory remarks—plan, situation, and arrangement of school-room, illustrated with cuts. Idea of a seminary on a large scale. School furniture—Apparatus and Museum—systematic sets of engravings. Description of a new *Optical Diagonal Machine*, with figures,—suggestions to engravers on this subject. Beneficial effects of such schools. *School-books*, and the principles on which they ought to be constructed. Specimens of subjects for elementary books,—objections obviated. Outline of a school-book for the advanced classes, drawn up twenty-six years ago,—capacity of children for understanding judicious selections,—*third series* of school-books, comprising popular systems of the sciences, &c. Historical class-books, with remarks on the manner in which history should be taught,—propriety of embellishing school-books with engravings—Dictionaries and portable Cyclopedias..... 52

CHAPTER VI.

METHOD OF TEACHING, AND THE DEPARTMENTS OF KNOWLEDGE WHICH SHOULD BE TAUGHT IN EVERY SEMINARY.

SECTION I.

ENGLISH READING.

Specimen of lessons for children, and the mode in which they should be taught. Lesson on the *Peacock*, with an engraving. Lesson on the philosophical toy termed the *Sagacious Swan*, with remarks. Lesson for the advanced classes—description of volcanoes, with engravings. Questions on the lesson. Manner in which such questions should be formed and arranged. Sets of miscellaneous questions. Lessons on objects..... 61

SECTION II.

WRITING AND COMPOSITION.

- Mr. Buchanan's plan for teaching writing on slates (with ■ cut). Professor Jacotot's plan. Specimens of sentiments and statements of facts for copy lines. Mode of training the young in the art of composition..... 66

SECTION III.

DRAWING.

- Mode of procedure in learning this art. Fancy landscapes, &c., should be discarded—drawing from the objects of nature and art. Utility of this accomplishment..... 68

SECTION IV.

ARITHMETIC.

- Mode of conveying ideas of numbers—the relative value of *money*—the measures of *length* and *capacity*, of time, and the divisions of the *circle* (with figures). Sensible illustration of arithmetical operations (with cuts). Illustration of the value of fractions. Miscellaneous hints..... 69

SECTION V.

GRAMMAR.

- Absurdities in relation to this subject—Lord Kaimes' opinion on our mode of teaching grammar. Simple mode of communicating the elements of grammar. Origin of language, suggests the proper method of teaching it. Fundamental rules of *syntax*—complexity of some of our "English Grammars." General remarks..... 73

SECTION VI.

GEOGRAPHY.

- Utility of this science. Deficiencies in the mode of teaching it. Mode of proving the *globular form* of the earth, illustrated with figures. Mode of conveying an impressive idea of its *magnitude*. Quantity of solid matter it contains—how many mountains, such as *Etna*, would be required to form a mass equal to the earth. Diversified scenery on the earth's surface, quantity of water in the rivers and seas, &c. *Projections and delineations* requisite for illustrating Geography. Maps exhibiting the *ranges of mountains*—the proportional length and breadth of *rivers*—comparative size of countries, lakes, and seas—*Isothermal charts*—charts of geographical *Zoology*—chart of moral and religious geography, &c.—views of the cities, grottoes, &c.—*slate globes*—delineations of the comparative heights of mountains—wax models of particular countries, &c. Mode of describing countries. Geographical class-books—what they should contain. Directions for commencing this study. Characteristics of certain geographical class-books lately published in America..... 77

SECTION VII.

GEOLOGY.

- Its practical utility. Classification of the rocks and strata of the globe, illustrated with a plate. Specimens for illustrating geological facts—books on Geology..... 82

SECTION VIII.

ASTRONOMY.

- Object and utility of this science. Mode of communicating to the young a knowledge of celestial phenomena. Observations on the *motion* of the sun, and the *phases* of the moon—the principal *stars* and *constellations*—apparent motion of the celestial vault—apparent annual motion of the sun—*measures* of the celestial sphere. Apparent motion of the planets—experiment which solves the apparent irregularities. Proofs of the Earth's *diurnal* rotation—

of its annual revolution. Mode of explaining the variety of *seasons*. Manner of exhibiting the phenomena of the planets, and the magnifying powers best adapted to this purpose. Circumstances to be attended to in exhibiting the moon through a telescope. Mode of exhibiting the solar spots. Imperfect conceptions conveyed by orreries and planetariums. Manner of representing the *proportional magnitudes and distances* of the planets. Mode of explaining a *parallax*, illustrated by figures. Books on Astronomy—Burritt's "Geography of the Heavens," &c..... 84

SECTION IX.

EXPERIMENTAL PHILOSOPHY AND CHEMISTRY.

Departments of Experimental Philosophy. *Mechanical Powers*. Experiments illustrative of *Hydrostatical* principles (with figures). Simple experiments illustrative of *Pneumatical* subjects—*pressure, elasticity and compressibility of air*—principle of the *diving-bell*—siphons—effects of the *expansion of air*, &c. Methods of cutting glass tubes and bending them for siphons. *Optical* experiments, for explaining the principles of telescopes and microscopes. Description of a *diagonal eye-piece*. *Camera obscura*, on a large scale. *Phantasmagoria*, solar microscope—manner of procuring animalcula. How a compound microscope may be formed from a common telescopic eye-piece. Experiments with *concave mirrors*. Chemical subjects and apparatus—Books on Natural Philosophy and Chemistry..... 91

SECTION X.

MATHEMATICS.

General Remarks on the plan and order in which a knowledge of this subject should be communicated to young persons..... 98

SECTION XI.

PHYSIOLOGY.

Inconsistency of omitting this department in a general course of education. Evils which arise from ignorance of this subject. Distortions of the human frame caused by absurd practices. Means by which a general knowledge of the human system might be communicated. Figure exhibiting the thorax and abdomen. Evidences of *design* in the human fabric. Practical purposes to which a knowledge of Physiology might be applied..... 98

SECTION XII.

LOGIC, OR THE ART OF REASONING.

Utility of this subject. Outline of a comprehensive system of Logic. Popular Logic—examples of reasoning, with remarks. Subjects for exercising the reasoning powers. Anecdotes of *Gassendi*, when a boy, and his mode of reasoning with his companions. Analysis of *Gassendi's* reasoning. Reasoning to prove that, "*air exists*"—that "all should enjoy a moral and intellectual education." *Sources of error* illustrated. *Sophisms* illustrated. Particular species of false reasoning. Importance of an early exercise of the rational faculty—evils which have arisen from false reasoning. Diabolical reasoning—reasoning by physical force—by torture—by fines and imprisonments—reasoning of persecutors, of mobs, &c. Powerful influence of *Gold* in producing conviction..... 101

SECTION XIII.

NATURAL THEOLOGY.

An appropriate study for the young. Summary of subjects and facts connected with this study. *Other departments of knowledge briefly noticed*—Natural History, Botany, Political economy. Vocal music, Domestic economy. Bodily exercises—amusements—and excursions. *Female* education—illustrious females—energy of the female mind, and its influence in society. Prevailing misconceptions. Reasons for universal instruction..... 107

CHAPTER VII.

MORAL AND RELIGIOUS INSTRUCTION.

Instruction in the knowledge of the Deity. Mode of illustrating the Divine perfections, exemplified in reference to the *Wisdom* and the *Immensity* of God. Instruction in the history of the Divine dispensations—religion to be taught chiefly from the Scriptures—doctrines and precepts of Christianity—propriety of a specific application of Scriptural precepts to the conduct of the young. *Moral training* particularly exemplified. Manner in which the young should be directed in the study of the Scriptures. *Scripture class-book*..... 111

CHAPTER VIII.

SABBATH SCHOOLS.

Defects which adhere to the present system of Sabbath-Schools. Qualifications of Sabbath-School Teachers. Necessity of their being trained to their office. Departments of knowledge they should study—Sacred History, Ancient Geography, Biblical Criticism, &c. General remarks on Sabbath-Schools—practices to be avoided, &c. Books on this subject..... 117

CHAPTER IX.

SCHOOLS FOR YOUNG PERSONS FROM THE AGE OF FOURTEEN TO THE AGE OF TWENTY OR UPWARD.

Necessity of such institutions. Subjects to which this class of young persons should be directed. Prerequisites to their establishment..... 121

CHAPTER X.

ON THE QUALIFICATIONS OF TEACHERS AND SEMINARIES FOR THEIR INSTRUCTION.

Deficiency in the qualifications of Teachers—honorable nature of the office—necessity of training. *Preceptoral Colleges*, and the subjects to be studied. Examination of candidates. Importance of training candidates for teachers. Infant School Teachers. Prussian Normal Schools..... 122

CHAPTER XI.

ON THE PRACTICABILITY OF ESTABLISHING SEMINARIES FOR INTELLECTUAL EDUCATION.

Number of schools requisite to be established in Scotland and England. Importance of such institutions, and the necessity for philanthropic exertions. Liberality under the Jewish economy. Enormous sums expended in war. Pension list. Contested elections. Savings which might be made in personal expenditure. Sums spent on spirituous liquors. Appeal to Christians. Contributions of the Jews, and predictions in relation to the Christian Church. Means requisite for exciting attention to this subject. Limited views of education taken by statesmen. Voluntary and compulsory education..... 125

CHAPTER XII.

ON THE UTILITY OF ESTABLISHING SEMINARIES FOR UNIVERSAL EDUCATION.

1. They would tend to the *prevention of Crime*. Number of thieves in London—trials at the Old Bailey—erroneous views of legislation—inefficiency of severe punishments—juvenile delinquency—deficiency of Education in England and Scotland. Beneficial results of education—Schools, publications, &c., in Boston and New York. Expense of punishing crime. 2. Universal education would elevate the general character of man. Contrast between the majority of mankind, and celestial intelligences. Native dignity of man—security of property dependent on education. 3. Universal education introductory to the Millennium. Manner in which this era will be introduced—when it will commence. Exertions preceding the Millennium. Christian generosity and heroism. Story of St. Pierre. Contributions for the tabernacle and temple. The Pilgrims of New England..... 131

CONTENTS.

CHAPTER XIII.

PRINCIPLES ON WHICH A NATIONAL SYSTEM OF EDUCATION SHOULD BE ESTABLISHED.

Difficulties—Brougham's "Education Bill" of 1821. Liberal views in the establishment of Education. Superintendence of education. Mode of religious instruction. Efficiency of Scriptural instruction. Harmony of Sectaries in America. Proposed plan of establishing education.	139
--	-----

CHAPTER XIV.

MAXIMS, OR FIRST PRINCIPLES IN EDUCATION.

<i>Ideas</i> should precede <i>words</i> — <i>tasks</i> —exhilarating associations—principle of emulation—corporeal punishments—confinement—fixing the attention, &c.	142

APPENDIX.

Insanity from excessive study.	165
-------------------------------------	-----

ON THE MENTAL ILLUMINATION AND MORAL IMPROVEMENT OF MANKIND.

INTRODUCTION.

BEFORE we attempt to accomplish any great and extensive enterprise, it is requisite to ascertain, in the first place, whether the object we propose be attainable, and, in the next place, whether, if attained, it would be productive of beneficial effects. If these points are not ascertained, previous to our engaging in any undertaking, we may exert our intellectual faculties, and active powers, and spend our time, our wealth, and our labor to no purpose, and in the end meet with nothing but disappointed expectations. The history of the world, and even the annals of science, would furnish hundreds of facts to corroborate this position. The object of the Alchemists was to transmute earthy substances and the baser metals into gold, and, by the fortunate labor of some happy day, when the stars were propitious, to realize vast treasures of wealth, to enable them to live in splendor and opulence during the remaining period of their lives. In this visionary pursuit, which, for several centuries, occupied the attention of princes, statesmen, ecclesiastics, physicians, and experimenters of various descriptions, thousands of fortunes were irretrievably wasted, and the dupes of this fallacious science kept in perpetual anxiety, and amused with vain and unfounded expectations. Even although such schemes had been practicable—which experience proves they are not—it would not be difficult to show, that, had they been successful, they would have produced more misery than happiness among mankind. The study of the heavens, with the view of foretelling future events, and the destinies of men, from the different aspects of the planets and the signs of the Zodiac, was another scheme which, for many ages, absorbed the attention of kings, legislators, popes, cardinals, and even men of science, as well as that of the illiterate vulgar,—and, in numerous instances, no public affair of any importance was undertaken, without first consulting the stars. This fallacious art has likewise been proved impracticable, and inconsistent with the peace and happiness of mankind. The researches which were long made after the *panacea*, or universal remedy for all disorders—the search for an universal menstruum and ferment—the search for a medicine which will confer immortality even in this world—the attempts to discover mines by means of dowsing-rods—and to cure palsies, inflammations, obstructions, and other disorders, by animal magnetism and metallic tractors—and, above all, the attempt to conduct mankind to happiness by discarding the idea of a Divine Being and every species of religion from the plans proposed—with hundreds of similar schemes,—may be regarded nearly in the same light as the foolish arts of astrologers and alche-

mists, and could easily be shown to be equally unprofitable and vain.

In endeavoring to promote a general diffusion of knowledge among the various ranks of society, it becomes us likewise to inquire, whether the attempt would be accompanied with such beneficial effects as to warrant the labor and expense which must necessarily attend such an enterprise—and, whether any insurmountable difficulties stand in the way of its accomplishment. There are not wanting, even amidst the light of science which is now shining around us, many individuals in the higher classes of society who are bold enough to insinuate, that an increase of knowledge would be injurious to the lower ranks of the community—that its accomplishment is both undesirable and impracticable—that the moral world will proceed onward as it has hitherto done—that there is no possibility of meliorating the condition of the great mass of mankind—and that it is altogether Utopian to attempt to direct the moral and intellectual energies of the human race into any other channel than that in which they have hitherto been accustomed to flow. Such insinuations evidently flow from a spirit of misanthropy, and are intended, if possible, to fix the moral world in a quiescent state, as the material world was supposed to be in former times, and to damp every exertion that is now making to promote the improvement and the happiness of our species. They are likewise inconsistent with the dictates of Divine Revelation, which plainly declare that “the knowledge of Jehovah shall cover the earth, as the waters cover the channels of the seas,” and that “all shall know him, from the least to the greatest.”

In a work lately published, I have endeavored to illustrate, at considerable length, some of the *advantages which would result from a general diffusion of knowledge*, which, I presume, will tend to substantiate the position, that an increase of knowledge among all ranks would be productive of an increase of enjoyment. If a more extensive diffusion of knowledge would have a tendency to dissipate those superstitious notions and false alarms which have so long enslaved the minds of men—to prevent numerous diseases and fatal accidents—to accelerate the improvement of the physical sciences—to increase the pleasures and enjoyments of mankind—to promote the progress of the liberal and mechanical arts—to administer to the comforts of general society—to prepare the way for new inventions and discoveries—to expand our views of the attributes and moral government of the Deity—to advance the interests of morality—to prepare the mind for the pleasures

and employments of the future world—to promote a more extensive acquaintance with the evidences, facts, and doctrines of Revelation—to prepare the way for the establishment of peace and harmony among the nations, and to promote the union and the extension of the Christian church;—if such positions can be fairly proved, every philanthropist and every rational and well-directed mind will readily admit, that a more general cultivation of the human intellect, and a more extensive diffusion of rational information, are highly desirable, and would be productive of the most auspicious and beneficial results, in reference both to the present interests and the future prospects of mankind.

With regard to the *practicability* of this object, no rational doubt can be entertained, if the moral machinery requisite for its accomplishment were once thoroughly set in motion. *Whatever Man has hitherto achieved, Man may still accomplish.* If minds, once feeble and benighted, and ignorant as the wild ass's colt, have, by proper training, been raised near the highest pitch of moral and intellectual attainments, other minds, by similar training, may be elevated to the same degree of perfection. If nations, once rude and ignorant, as the Britons formerly were, have been raised to a state of civilization and refinement, and excited to cultivate the arts and sciences, the same means by which this object was accomplished, may still be employed in other cases to produce the same effect. If several portions, however small, of any civilized community, have been brought to a high state of intellectual improvement, it is evident, that the greater part, if not the whole, may be advanced into a similar state. It only requires that the means of instruction be simplified and *extended*, and brought within the reach of every one whose faculties are capable of cultivation. That this object has never yet been effected, is not owing to its impracticability, or to any insuperable obstacles which lie in the way of its accomplishment; but because the attention of mankind has never yet been thoroughly directed to it: and because the means requisite for promoting it have never been employed on a scale proportionate to the extent and magnitude of the enterprise. The influential classes of society, in every country, have been more absorbed in the pursuits of avarice, ambition, war, devastation, and sensual gratifications, than in meliorating the physical and moral condition of their species. The tenth part of the treasures which have been wasted in the prosecution of such mad and immoral pursuits, had it been properly directed, would have been more than sufficient to have brought the means of instruction within the reach of every individual of the human race, and to have transformed the barren wastes of every country into the appearance of a terrestrial para-

dise. There is no government under heaven, so far as we are acquainted (if Prussia and the United States of America be not excepted), where the instruction of the great mass of the people forms a prominent and specific object in its administration. On the contrary, in several instances, even within the limits of Europe, it is well known, that the intellectual instruction of the lower orders is prohibited by a law.* Even in Great Britain, where the light of science shines with peculiar effulgence, the exertions of philanthropists have been damped in their attempts to diffuse knowledge among the people; heavy *taxes* have been imposed on the means of its diffusion; men of knowledge have been persecuted and neglected, while men devoted to war and bloodshed have been loaded with wealth, and exalted to the highest stations of dignity and honor; no national scheme, supported by the state, has ever yet been devised for its universal propagation among all ranks, and no sums set apart for this purpose, while the treasures of the nation have been wasted in extravagance, and, in too many instances, devoted to the support of vice, tyranny, and intolerance.

But we trust that the breath of a new spirit is now beginning to animate the councils of the nation and the great body of the people;—and when the means within our power of extending the blessings of knowledge shall be employed with energy and judgment, we may expect, ere long, to behold a generation rising up, in intelligence and moral action, superior to all the generations that have gone before it—improving the soil, adorning the landscape, promoting the progress of the useful arts, enlarging the boundaries of science, diffusing the blessings of Christianity over the globe, giving an impulse to every philanthropic movement, counteracting the spirit of war, ambition, and licentiousness, cultivating peace and friendly correspondence with surrounding nations, and forming an impregnable bulwark around every government where the throne is established in truth and in righteousness.

To state and illustrate the various means by which a more extensive diffusion of knowledge may be effected, and the general improvement of society promoted, is the main object of the following pages, in which the state of education in our country, and the principles on which it ought to be conducted, shall occupy our first, and our chief attention.

* For example,—A Royal Sardinian edict, published in 1825, enjoins, “that henceforth no person shall learn to read or write who cannot prove the possession of property above the value of 1500 livres,” or about £62 10s. sterling. And it is well known, that the greater part of the lower classes in Russia, Austria, and Poland, are, from their situation, debarred from the benefits of instruction.

PART I.

ON EDUCATION.

PRELIMINARY REMARKS.

THERE is, perhaps, nothing of more importance to the human race, and which has a more direct bearing on the happiness of all ranks, than the cultivation of the mental faculties, and the acquisition of substantial knowledge. Whether we consider man as a transitory inhabitant of this lower world, or as in a state of progression to another region of existence—it is of the utmost importance, that he be thoroughly acquainted with the Great Author of his existence, with the general structure of the universe in which he is placed, with the relations in which he stands to his fellow-men, and the other beings which surround him, with the duties he ought to discharge to his Creator, and to his own species, with the nature of that eternal world to which he is destined, and with that train of action and of contemplation which will prepare him for the enjoyments of a future and eternal state. All the other objects which can employ the attention of the human mind must evidently be viewed as in some degree subordinate to these. For, on the acquisition of the knowledge to which we allude, and the corresponding course of conduct to which it leads, depends the happiness of man, considered both as an individual, and as a member of the great family to which he belongs—his happiness both in the present life, and in the life to come.

Nothing, however, appears to have been more overlooked, in the general arrangements of society, than the selection of the most proper means by which such important ends are to be accomplished. In those nations and societies which, in their progress from barbarity, have arrived at only a half-civilized state, the acquisition of the means of subsistence, and of those comforts which promote their sensitive enjoyment, forms almost the exclusive object of pursuit; and it is not before they have arrived at a certain stage of civilization, that moral and intellectual improvement becomes an object of general attention. And, even in those nations which have advanced farthest in the path of science and of social refinement, the cultivation of the human mind, and the details of education, are not considered in that serious light which their importance demands. Almost everything else is attempted to be accurately adjusted, while the moral and intellectual improvement of the mass of the community is left either to the direction of chance, or to the injudicious schemes of weak and ignorant minds. Every one who has acquired a smattering of English grammar and arithmetic, and who can write his own name, conceives that he is qualified to conduct the intellectual improvement of the young; the most illiterate and superficial pedants have intruded themselves into the office of teachers; those who have never had the least experience in the art of teaching, nor have studied its principles, have assumed the prerogative of dictating the arrangements and discipline of a school; and hence, the office of a teacher of youth, which is one of the most important and respectable in the social system, has frequently

been considered as connected with the meanest talents, and with the lowest gradations in society.

Great Britain has long held a distinguished rank among the nations of Europe in the scale of science and of civilization, and on account of the numerous seminaries of instruction which have been established in every quarter of the island. Excepting Prussia, the United States of America, and the mountains and vales of Switzerland, there are few countries in which education is more generally appreciated and more widely diffused than in the northern district of Great Britain; and the effects produced by our literary and scholastic establishments are apparent in the desire for knowledge, and the superior intelligence which characterize the different ranks of our population. When we compare ourselves in this respect with the Russian boors, the Laplanders, the Calmucks, the Cossacks, or the Tartars, or even with the inhabitants of Naples, of Spain, or of Portugal, we seem to stand on an eminence to which they can scarcely hope to approach for a lapse of ages. On the other hand, when we compare ourselves with what we ought to be, as beings possessed of rational natures, and destined to immortality, and as surrounded with the light of science and of revelation,—we shall find that we are, as yet, but little more than just emerging from the gloom of moral depravity and mental darkness. When we consider the mass of depravity which is still hovering around us, the deplorable ignorance, the superstitious notions, the false conceptions in regard to many important truths, the evil passions, and the groveling affections, which so generally prevail, we must acknowledge that much, *much indeed*, remains to be accomplished, before the great body of the people be thoroughly enlightened in the knowledge of all those subjects in which they are interested, as rational, accountable, and immortal beings, and before they can be induced to give a decided preference to moral pursuits and intellectual pleasures. And, if this is the case in a nation designated civilized and enlightened, how thick must be the darkness which broods over the inhabitants of other regions of the globe, how deep the moral debasement into which they are sunk, and how many vigorous efforts must be requisite, ere they can be raised to the true dignity of moral and intellectual agents? If ever this important object is to be accomplished—which the predictions of ancient prophecy leave us little room to doubt—it is now high time that we arouse ourselves from our slumbers, and engage with increased activity and zeal in the work of reformation and of rational instruction. Let us not imagine that the preaching of the gospel, in the dull and formal manner by which it is at present characterized, will effectuate this great object, without the use of all the efficient means of juvenile instruction we can devise. While we boast of the privileges of our favored land, of the blessings of Divine Revelation, and of the enlightened era in which we live; and

while we are endeavoring to impart to distant nations the blessings of science and of the Christian religion;—let us not forget, that there are thousands of the young generation around us, under the show of having obtained a good education, rising up in life, in a state of ignorance and vice, in consequence of the superficial and injudicious modes by which they have been tutored, and which prevent them from profiting by the instructions of the ministers of religion.

While the great body of mankind must necessarily be engaged in manual employments, and while it is essential to their happiness, as well as to their bodily subsistence, that a portion of their time be thus employed,—it would be a highly desirable object to induce upon their minds a taste for intellectual pursuits, and for those pure enjoyments which flow from a contemplation of the works and providence of the Creator, and of those moral laws and arrangements which he has ordained for promoting the social order and the eternal happiness of mankind, in which those hours not devoted to worldly business might be occasionally employed. As man is a being compounded of a corporeal organized structure, and a system of intellectual powers, it evidently appears to have been the intention of the Creator that he should be frequently employed both in *action* and in *contemplation*. But when his physical powers only are set in motion, and the principal object of his activity is to supply the wants of his animal frame, he can be considered as little superior to the lower orders of animated existence, and must, in a great measure, frustrate the end of the Creator in bestowing upon him the faculties of his rational nature.

In order to raise mankind from the state of mental darkness and moral degradation into which they have fallen, it is essentially requisite, that the utmost care be bestowed on the proper direction of the youthful mind, in its *first* excursions in the physical and moral world; for when it has proceeded a certain length, amidst the mists of ignorance and the devious ways of vice, it is extremely difficult, if not impossible, to recall it from its wanderings to the path of wisdom and felicity. Instructions, not merely in reference to sounds and

accents, and accurate pronunciation, but also in relation to important facts, and the various properties and relations of objects around them, must be communicated at an early age; and not merely the *names*, but the *ideas*, of the most interesting objects in the physical and intellectual world, must be conveyed by a succession of well defined mental imagery, and sensible illustrations, so as to arrest and impress the juvenile mind, and excite its energies and affections in the pursuit of knowledge and virtue. Without an attention to this important object, the business of elementary instruction appears to regard man rather as a mere machine than as a rational and immortal being, and seems to be little short of an insult offered to the human understanding. The ultimate object of all scholastic instruction ought undoubtedly to be, to convey to youthful minds substantial knowledge, to lead them gradually into a view of the nature and qualities of the objects with which they are surrounded, of the general appearances, motions, and machinery of external nature, of the moral relations in which they stand to the Great Author of their existence, and to one another, and of the various duties which flow from these relations,—to direct their affections, tempers, and passions, in such a channel as will tend to promote their own comfort, and the harmony of general society, and to prepare them for the nobler employments of an immortal existence. Such moral and intellectual instructions ought to go hand in hand with the acquisition of the various combinations of sounds and syllables, and with the mechanical exercises of writing and ciphering; otherwise the beneficial consequences, which should result from instruction in the common branches of education, will be few and unimportant. Whether the prevailing modes of education in this country be calculated to promote the ends now stated, will appear, when we come to investigate the range of our elementary instruction, and the circumstances connected with the manner of its communication. Before proceeding to this investigation, I shall take a rapid view of the present state of education in different civilized nations.

CHAPTER I.

PRESENT STATE OF EDUCATION IN DIFFERENT COUNTRIES.

For a long period, even after the introduction of Christianity among the nations of Europe, the education of the young seems to have been in a great measure neglected. The records of history afford us no details of any particular arrangements that were made either by the church or the state for promoting this important object. During the long reign of Papal superstition and tyranny, which lasted for nearly a thousand years, the instruction of the young appears to have been entirely set aside, or, at least, to have formed no prominent object of attention. The common people grew up, from infancy to manhood, ignorant of the most important subjects, having their understandings darkened by superstition, their moral powers perverted, and their rational faculties bewildered and degraded, by an implicit submission to the foolish ceremonies and absurdities inculcated by their ecclesiastical dictators; and

even many in the higher ranks of life, distinguished for their wealth and influence in society, were so untutored in the first elements of learning, that they could neither read nor write. Ignorance was one of the foundations on which the splendor and tyranny of the Romish hierarchy were built, and therefore it would have been contrary to its policy, and the schemes it had formed of universal domination, to have concerted any measures for the diffusion of knowledge and the enlightening of mankind. We read of no nation or community, during the dark ages, that devised plans for the rational and religious instruction of youth, excepting a poor, oppressed, and despised people, “of whom the world was not worthy”—the pious and intelligent, but *persecuted Waldenses*. It appears that a system of instruction prevailed among these inhabitants of the valleys of Piedmont, seven hundred years ago, more rational and effi-

cient than has yet been established in the British Isles.

It was not until the era of the Reformation that seminaries for the instruction of the young began to be organized and permanently established. Prior to this period, indeed, colleges and universities had been founded in most of the countries of Christendom; but the instructions communicated in those seats of learning were chiefly confined to the priestly order, and to the sons of the nobility, who aspired after the highest and most lucrative offices under the hierarchy of Rome. Their influence was scarcely felt by the mass of the people; and the origin of the earliest of these seminaries cannot be traced much beyond the beginning of the thirteenth century. These new establishments, however, with the academical honors they conferred on proficients in knowledge, gave a powerful impulse to the study of science, and greatly increased the number of those who devoted themselves to the pursuits of learning. It is said, that, in the year 1262, there were no less than ten thousand students in the university of Bologna, although law was the only science taught in it at that time; and that in the year 1340, there were thirty thousand students in the university of Oxford. But the education of the middling and lower classes of society was still miserably neglected. Even in those countries which have since been distinguished for scholastic establishments, a universal apathy seems to have prevailed, in regard to the acquisition of knowledge, and of the first elements of education. In the year 1494, a few years before Luther began to assail the Romish Church, it was enacted by the Parliament of Scotland, "that all barons and substantial freeholders throughout the realm should send their children to school, from the age of six to nine years, and then to other seminaries, to be instructed in the laws, that the country might be possessed of persons properly qualified to discharge the duties of sheriffs, and other civil offices." Those who neglected to comply with the provisions of this statute, were subjected to a penalty of twenty pounds Scots. This enactment evidently implies, that even the influential classes of society, at that period, paid little attention to the education even of the male branches of their families, and, of course, that those in the lowest ranks must have been generally, if not altogether deprived of this inestimable privilege. It was only after the passing of this act, as Dr. Henry remarks, that several individuals began to be distinguished for their classical acquirements, and that learning was much more generally diffused throughout the country.

At the time of the revival of learning, soon after the Reformation, a new impulse was given to the human mind, a bold spirit of inquiry was excited in the laity, when the vices of the Romish clergy were exposed, and their impositions detected; the absurdity of many tenets and practices authorized by the church was discovered; the futility of the arguments by which illiterate monks attempted to defend them was perceived; the mystic theology of the schools was set aside, as a system equally unedifying and obscure; the study of ancient literature was revived; the attention was directed to the sacred Scriptures, as the only standard of religious truth, the legendary tales of monkish superstition were discarded, a taste for useful knowledge was induced,—and from that period, seminaries for the instruction and improvement of the juvenile mind, began to be gradually established in many of the countries of Europe;—although they are still miserably deficient both in point of number, and in the

range of instruction which they profess to communicate.—The following is a brief view of the present state of education in various countries:—

United States of America.—Although the system of education has never yet arrived nearly at perfection, in any nation, yet the inhabitants of the United States may be considered, on the whole, as the best educated people in the world. With a degree of liberality and intelligence which reflects the highest honor on their character, they have made the most ample provision for the elementary instruction of all classes; and most of their arrangements, in reference to this object, appear to be dictated by disinterested benevolence, and by liberal and enlarged views of what is requisite to promote the moral improvement of society. In the New States, *one square mile in every township, or one thirty-sixth part of all the lands*, has been devoted to the support of common schools, beside seven entire townships for the endowment of larger seminaries. In the older States, grants of land have frequently been made for the same purposes; but in New England all sorts of property are assessed for the support of the primary schools, which are established in every township.—The following extract from a speech of Mr. Webster, a distinguished member of Congress, in a convention held at Massachusetts in 1821, displays the principles and practical operation of this system, and the grand design it is intended to accomplish:—"For the purpose of public instruction," said this illustrious senator, "we hold every man subject to taxation in proportion to his property; and we look not to the question, whether he himself have or have not children to be benefited by the education for which he pays; we regard it as a wise and liberal system of police, by which property and life, and the peace of society, are secured. We hope to excite a feeling of respectability, and a sense of character, by enlarging the capacities and increasing the sphere of intellectual enjoyment. By general instruction, we seek so far as possible, to purify the moral atmosphere; to keep good sentiments uppermost, and to turn the strong current of feeling and opinion, as well as the censures of law, and the denunciations of religion, against immorality and crime. We hope for a security beyond the law and above the law, in the prevalence of enlightened and well-principled moral sentiment. We hope to continue and to prolong the time, when, in the villages and farm-houses of New England, there may be undisturbed sleep within unbarred doors. We do not indeed expect all men to be philosophers or statesmen; but we confidently trust, that by the diffusion of general knowledge and good and virtuous sentiments, the political fabric may be secure, as well against open violence and overthrow, as against the slow but sure undermining of licentiousness. We rejoice that every man in this community may call all property his own, so far as he has occasion for it to furnish for himself and his children the blessings of religious instruction, and the elements of knowledge. This celestial and this earthly light he is entitled to by the fundamental laws. It is every poor man's undoubted birth-right—it is the great blessing which this constitution has secured to him—it is his solace in life—and it may well be his consolation in death, that his country stands pledged, by the faith which it has plighted to all its citizens, to protect his children from ignorance, barbarity, and vice."

These are noble sentiments and views, worthy of being adopted and reduced to practice by every government under heaven; and we trust the

period is not far distant when the British senate, and every other legislative assembly in Europe, shall have their attention directed to the arrangement of a *system of universal education*, on an expansive and liberal scale, and with such generous and disinterested objects in view.

There are no states in the Union, nor perhaps in any country in the world, so amply provided with the means of instruction, as the States of New York and New England. In New York, in 1829, there were no less than 8609 common schools, affording education to 468,205 young persons, which was rather more than a *fourth* part of the entire population! and it is probable, that, since that period, the number has considerably increased. In Scotland, which is reckoned one of the best educated countries in Europe, it is found that only one in eleven, out of the entire population, has the benefit of education.—In New England, free schools have been endowed by benefactions from different individuals,—and the funds thus bequeathed by charity, or public spirit, have not been devoured by the cormorants of a grasping oligarchy, but prudently and carefully administered.—The education given at these schools, too, is vastly superior to what is obtained at our parish schools. “The general plan of education at the public free schools here,” says Mr. Stuart,* “is not confined to mere reading, writing, arithmetic and book-keeping, and the ancient and modern languages, but comprehends grammar, mathematics, navigation, geography, history, logic, political economy, rhetoric, moral and natural philosophy. These schools being, as stated in the printed regulations, intended to occupy the young people from the age of four to seventeen, and to form a system of education, advancing from the lowest to the highest degree of improvement which can be derived from any literary seminaries inferior to colleges and universities, and to afford a practical and theoretical acquaintance with the various branches of useful education. There are at present in Boston, 68 free schools, beside 23 Sabbath schools, in all of which the poorest inhabitant of Boston may have his children educated, according to the system of education now specified, from the age of four to seventeen, without any expense whatever. The children of both sexes are freely admitted. The funds of those schools are derived from funds and bequests from individuals, and grants from the legislature and corporations; and enable the trustees, consisting of twelve citizens elected by the inhabitants of each of the twelve wards of the city, with the mayor and eight aldermen, to give the teachers salaries, varying from 2500 to 800 dollars a-year. The assistant teachers have 600 dollars. The trustees elect their teachers, and vote their salaries yearly, and *no preference is given on any principles but those of merit or skill.* No expense whatever is incurred in these schools for the children, except in books. The richer classes in Boston formerly very generally patronized teachers of private schools, who were paid in the usual way; but they now find that the best teachers are at the head of the public schools, and in most cases prefer them—the children of the highest and lowest rank enjoying the privilege, altogether invaluable in a free state, of being educated together.

“In the adjoining State of Connecticut, it has been ascertained by actual reports, that *one-third* of the population of about 275,000, attend the free schools. The result of the recent inquiry

into the state of education in the State of New York, which adjoins New England, and is almost equal to it in population, is very much, though not entirely the same.—It proved by actual reports, that 499,434 children, out of a population of 1,900,000, were at the same time attending the schools, that is, a *fourth* part of the whole population. Although the public funds of New York State are great, these schools are not entirely free; but free to all who apply for immunity from payment. The amount of the money paid to the teachers, by private persons, does not, however, amount to one-third of the whole annual expense, which is somewhat less than a million of dollars.”

Beside the seminaries appropriated to the instruction of the mass of the population, the United States contain no less than *seventy* colleges, in which the ancient and modern languages, the mathematical sciences, Natural Philosophy, Chemistry, Logic, Christian Theology, and other branches, are regularly taught, as in the European universities; but with more attention to the *moral and religious* conduct of the students. About the time of the American Revolution, in 1775, there were 10 colleges; from 1775 to 1800, 13 were established; from 1800 to 1814, 11 were added; and from 1814 to 1834, no less than 36 colleges have been established. In these colleges, 5500 students are prosecuting their education, in the different departments of Literature and Science.—The *American Education Society* is just now educating 912 young men for the ministry; the *Presbyterian Education Society* has 612 students under its charge; the *Northern Baptist Society* has 250. The whole number at present educated by these Societies, including the Episcopalians, German, Lutheran, &c., is 2000. These are exclusive of a very large number who are paying the expenses of their own education, and who are equally pious and promising.

It is to the numerous establishments of education—the extensive range of instruction they embrace—the opportunities of instruction afforded to the lowest classes of the community—the superior degree of comfort they enjoy—and to the elevation of character promoted by their free institutions, that we are to attribute the non-existence, in most parts of the United States, of what is usually termed a mob or rabble, and that depredations are less frequent, and property more secure, than in other countries. In the Southern States, indeed, the means of education are not so extensive, nor has society advanced to such a state of moral and mental improvement, as in the Northern. The reason is obvious. These States, with a *most glaring inconsistency*, still continue the abettors of *slavery*, in its most disgusting forms. More than one-half of their population consists of slaves, who are deemed unworthy of enjoying the blessings even of a common education. A spirit of haughtiness and domination prevails among the influential classes, barbarous amusements among the lower; and Christian morals, the finer feelings of humanity, and intellectual acquisitions, are too frequently disregarded.

Silesia.—This country, in consequence of the exertions of Frederick the Great, is now richly furnished with scholastic establishments. Prior to 1765, Silesia, like the rest of Europe, was but wretchedly provided either with schools or with teachers. In the small towns and villages, the schoolmasters were so poorly paid, that they could not subsist without practicing some other trade beside their occupation as instructors; and they usually united the character of the village fiddler

* “Three Years’ Residence in North America.”

with that of the village schoolmaster. Frederick issued an ordinance, that a school should be kept in every village, and that a competent subsistence should be provided for the schoolmaster by the joint contribution of the lord of the village and the tenants. Felbiger, an Augustine monk, belonging to a convent at Sagan, traveled to different countries to obtain an acquaintance with the best modes of teaching. After spending some years at Berlin, to obtain a perfect knowledge of the best method of instruction in the schools of that city, he returned to Sagan, and made the convent to which he belonged a seminary for candidates as schoolmasters. Pattern schools were established at Breslaw, Glatz, and other places, on the principles he had adopted, and all candidates for the office of teachers, were obliged to attend these seminaries, and to practice the method in which they were there instructed. The clergy, no less than the teachers, were required to go through this process, because the superintendence of the teachers was to be committed to them. After these preparatory matters had been carried into effect, an ordinance was published in the year 1765, prescribing the mode of teaching, and the manner in which the clergy should superintend the system. The teachers were directed to give plain instruction, and upon subjects applicable to the ordinary concerns of life; not merely to load the memory of their scholars with words, but to make things intelligible to their understanding, to habituate them to the use of their own reason, by explaining every object of their lesson, so that the children themselves may be able to explain it, upon examination. The school tax must be paid by the lord and tenants, without distinction of religions. The boys must all be sent to school from their sixth to their thirteenth year, whether the parents are able to pay the school tax or not. For the poor the school money must be raised by collections. Every parent or guardian who neglects to send his child or pupil to school, without sufficient cause, is obliged to pay a double tax, for which the guardian shall have no allowance. Every curate must examine, weekly, the children of the school of his parish. A general examination must be held annually, by the deans of the districts, of the schools within their respective precincts; and a report of the condition of the schools, the talents and attention of the schoolmasters, the state of the buildings, and the attendance of the children, made to the office of the vicar-general, who is bound to transmit all these reports to the royal domain offices, from which orders are issued to supply the deficiencies of the schools, and to correct any abuses that may be found to prevail. If one school suffice for more than one village, neither of them must be more than half a German mile, or two and one-fourth British miles, distant from it in the flat country, nor more than half that distance in the mountainous parts.

This system had at first many difficulties to struggle with, from the indolence of the Catholic clergy, and their consequent aversion to the new and troublesome duty imposed upon them. Their zeal was alarmed at the danger arising from this diffusion of light to the stability of their church. They considered the spirit of innovation, and the spirit of inquiry, as equally their natural enemies; and the system still finds a certain degree of resistance from the penurious economy, and the stubborn love of darkness, which still prevail in some parts of this province. But in so far as it has been acted upon, its operation has proved a blessing to multitudes. As a proof of its exten-

sive effects, the number of schools, in 1752, amounted only to 1552; but in 1798, their number was more than 3500; and many other facts, equally clear, attest the progressive increase of knowledge, and a desire for improvement. Before the seven years' war, there had scarcely ever been more than one periodical journal or gazette published in Silesia at one time; but in 1801, there were no less than seventeen newspapers and magazines, which appeared by the day, the week, the month, or the quarter; many of them upon subjects generally useful, and containing valuable information and instruction for the people. At the former period, there were but three booksellers, and all these at Breslaw; but in 1801, there were six in that capital, and seven dispersed in the other cities. The number of printing presses, and of bookbinders, had increased in a similar proportion. Agriculture and manufactures, too, have been vastly improved and extended; so that Silesia is, at this moment, one of the most flourishing districts of the Continent. The habits of the people have been signally improved; and they have become among the most intelligent, orderly, and industrious, in Europe.*

Wurtemberg, Baden, Bavaria, &c.—In Wurtemberg, during the last thirty years, the system of education has been very greatly extended and improved. A public school is established in every parish, and, in some instances, in every hamlet. The master receives, as in Scotland, a fixed salary from the parish, exclusive of a small fee from the pupils, varying according to their age, and the subjects in which they are instructed. The fees are fixed by government, and are everywhere the same. Exclusive of the salaries and fees, the masters are furnished with a house, a garden, and, in most instances, a few acres of ground, corresponding to the *glebes* of the Scottish clergy. The law requires that the children should be instructed in reading, writing, and arithmetic; and it is specially enacted, that they shall be instructed in the principles of German grammar and composition. The books used in the schools of Wurtemberg and Baden, are very superior to those used in similar establishments in this country. They consist of geographical, biographical, and historical works, and elementary treatises on moral science, natural history, and the principles and practice of the most important and useful arts. In all the large schools, the boys and girls are kept separate. The girls, in addition to reading, writing, and arithmetic, are taught all sorts of needlework, the knitting of stockings, the making of clothes, &c.; receiving at the same time lessons in the art of cookery, the management of children, and other departments of domestic employment. The supervision of the schools is intrusted, in every parish or *commune*, to a committee, consisting of a few of the principal inhabitants; the clergy of the parish, whether Protestants or Catholics, being always *ex officio* members of the committee. This body is intrusted with the duty of inspecting the school, and is bound to see that the master performs his duty, and that the children attend. No particular system of religion is allowed to be taught in any of the schools of Wurtemberg, and most of the other Germanic States. The tuition of this important branch is left entirely to the clergy and the parents of the children, so that the sons and daughters of Catholics, Lutherans, Calvinists, Quakers, &c., frequent the schools, and live in the utmost harmony.

* See President Adams' *Letters on Silesia*, *Quarterly Journal of Education*, and *Glasgow Geography*, vol. iii.

The greatest desire prevails among the lower classes that their children should enjoy the advantages of the excellent education provided for them; but the government, not trusting entirely to this feeling, has enacted regulations, by which *every individual is compelled to send his children to school from the age of six to fourteen years*. The public functionaries transmit regularly to government, once every six months, a list of the children in their respective districts, who have attained their sixth year; and they are bound to see that they are sent to school. In the event of the parents being unable to pay the school fees, a statement to that effect is prepared by the parochial authorities, and the fees are paid by the public.

In *Bavaria*, the beneficial consequences resulting from the establishment of a system of national education, have been more apparent than in any other European country. Half a century ago, the Bavarians were the most ignorant, debauched, and slovenly people, between the Gulf of Genoa and the Baltic; but, during the last thirty years, no people has ever made a more rapid advancement than they have done, in the career of knowledge and of civilization. The late and present kings of *Bavaria*, have not only swept away myriads of abuses, and established a representative system of government, but they have laid the only sure foundations of permanent and real improvement, in the organization of an admirable system of national education. A school has been established in every parish, to which every one is obliged to send his children, from the age of six to fourteen; Lyceums, Colleges, and Universities have also been instituted, for the use of those who are desirous of prosecuting their studies; and every facility is afforded for the acquisition of the best instruction, at the lowest price. The following is a summary view of the principal seminaries in this country:—Three universities, seven lyceums, eighteen gymnasia, twenty-one colleges, thirty-five preparatory schools, sixteen houses of education, seven for higher branches, two boarding-schools for girls, seven normal schools, one school for foreigners, two schools of law, two veterinary schools, two schools of midwifery, and two royal schools. The public, or national schools, amount to 5394; the inspectors to 286; the teachers to 7114; and the pupils of all classes, to about 498,000;—and, since the population of *Bavaria* is about four millions, it follows, that not less than *one-eighth* of the entire population is at school, which is a higher proportion than what attends the schools in *Scotland*.

Mr. Loudon, the talented editor of the "Gardener's Magazine," who traveled over most parts of *Wurtemberg*, *Bavaria*, and *Baden*, in 1828, bears the most unqualified testimony to the excellence and efficiency of the system of public instruction adopted in these countries, and the beneficial effects which have resulted from its operation. "From what I have seen," says he, "of *Wurtemberg*, I am inclined to regard it as one of the most civilized countries in Europe. I am convinced that the great object of government is more perfectly attained here, than even in Great Britain; because, with an almost equal degree of individual liberty, there are incomparably fewer crimes, as well as far less poverty and misery. Every individual in *Wurtemberg* reads and thinks; and to satisfy one's self that this is the case, he has only to enter into conversation with the first peasant he meets; to observe the number and style of the journals that are everywhere circulated, and the multitude of libraries in the towns and villages. I did not meet with a single beggar in *Wurtemberg*,

and with only one or two in *Bavaria* and *Baden*. The dress of the inhabitants of *Wurtemberg*, as well as those of a great part of *Bavaria* and *Baden*, appeared to me to indicate a greater degree of comfort, than I had ever observed in any other country, with the exception, perhaps, of *Sweden*, and the Lowlands of *Scotland*."

The above sketches were written two or three years ago. Since that time, M. Victor Cousin's "Report of the State of Public Instruction," has been published, and translated into English by Mrs. Austin. This report, which fills nearly 340 pages, contains a very full, but rather dry detail, of the whole machinery of education in *Prussia*. From this document it appears, that, in 1831, there were 22,612 schools, and 27,749 schoolmasters and mistresses—that the total number of children under fourteen years of age was 4,767,072; the number between seven and fourteen years, 2,043,030, out of which, the number of children attending school was 2,021,424, or nearly a sixth part of the whole population, which is estimated at about twelve and a half millions. It does not appear, from this report, that infant schools are established in *Prussia*, or any institution for the instruction of young persons from the age of fourteen to twenty, or upward; nor can we learn, from anything stated in it, that an *intellectual* principle is uniformly acted upon in the details of education. The system presents too much of a military spirit and character, throughout all its departments, corresponding to the nature of a despotic government; and it would require a very considerable modification, before it could, with propriety, be adopted in a republic or a limited monarchy. Many deficiencies in the system likewise require to be supplied. Yet, notwithstanding all its defects, it has already produced a benign influence on the knowledge and moral conduct of the inhabitants of that country; and, in a short time, if Britain does not immediately bestir herself in the cause of education, the *Prussian* population will be among the most enlightened inhabitants of Europe.

France.—Notwithstanding the numerous scientific characters which have appeared in this country, and the discoveries and improvements they have made in the physical and mathematical sciences—the provision for public instruction, particularly in the southern departments, is very defective. The Revolution of 1789 annihilated almost every existing institution, and those for public instruction among the rest. For a period of nearly five years, a whole nation of thirty millions of people remained without any regular education. It was, indeed, enacted by a law of the 13th September, 1791, "That a system of public instruction should be organized; that the public schools should be open to every one; and that no fees should be charged for the elementary branches. But, amidst the commotions and demoralizing scenes of that period, this law, like many others, was never carried into effect; and, at this moment, *France*, with the exception of *Spain* and *Portugal*, is worse provided with the means of elementary instruction, than any other countries in Europe. In the "*Bulletin des Sciences Geographiques*," vol. xiv, for 1828, it is stated, that "in *France*, the number of children of an age to frequent primary schools is nearly 6,000,000. Of this number scarcely a million and a half receive instruction." Thus, without adverting to the circumstance of ten millions of adults who can neither read nor write, according to a recent calculation—there are four millions and a half of young Frenchmen, who do not receive even the first rudiments of educa-

tion. The children at school, in the thirty-two departments of the north, are reckoned at 740,846; and in the fifty-four departments of the south, only 375,931, which is little more than *one-thirtieth* of the population. In Paris there are to be distinguished two populations,—the population already enlightened, which comprehends, at most, about 100,000, souls; and the population which still remains to be enlightened, which amounts to nearly 800,000. Societies and individuals at Paris and other populous towns, exerted themselves to supply so great a want; but their efforts being openly opposed by the clergy, and secretly by the late government, were not so successful as they might otherwise have been. Schools, upon the Lancasterian plan, were introduced by the government at Paris, and other large towns; but the benefits of the system were extended only to professed Catholics;—none but Catholic teachers were employed, and the Protestants were left to educate their children the best way they could. In consequence of this deficiency of instruction, ignorance and superstition, irreligion and immorality prevail over a large portion of the kingdom, even amidst the light of literature and science with which they are surrounded; and a considerable period must elapse before the mental darkness can be dispelled, and the moral mischief it has produced be completely eradicated. It is to be hoped, now that the influence of the Catholic priests has been diminished, and liberal measures of policy introduced, that a more extensive system of elementary instruction will be established; and we are happy to understand that the attention of the Government of Louis Philip, has been directed to this object, and that measures have been brought forward in order to its accomplishment. In the year 1831, M. V. Cousin was sent as a deputation to Prussia from the government of France to acquire a knowledge of the details and regulations connected with the Prussian system of education. Since his return, numerous schools have been established on the principles of the Prussian system, and there is now a prospect, that, in the course of a few years, an efficient system of education will be established in that country.—According to the latest statistical accounts, the number of children who are learning to read, now amounts to 2,000,000: the number of primary elementary schools is 35,007; of superior primary schools, 370; of private schools, 9092; total, 44,269. The number of boys attending these schools is, 1,175,248; and of girls, 731,773. The total expense of primary instruction is 10,162,706 francs, or about £423,446. Of this expense there is paid by the Communes, 7,693,793 fr.; by the Departments, 2,063,072 fr.; and by the State, 405,841 fr.; or about £16,910—a very paltry sum when compared with the magnitude and importance of the object.

Spain.—"In this country there are few establishments for the diffusion of the first rudiments of knowledge. The lower classes seldom learn to read or write; those above them are as seldom instructed in anything but those two accomplishments, and the elements of arithmetic. Such as are intended for the learned professions attend a Latin school for three or four years; and since the expulsion of the Jesuits, these schools are not numerous. Some private establishments, for the instruction of the boys in Latin, were rising at the time of the French invasion, and a desire of improvement in the method of teaching was showing itself among the teachers."* When we consider that the education of youth in this country is com-

mitted chiefly to monks, we may rest satisfied, that, in general, its plans and objects are very limited and defective. Nor is the system much improved, when the student proceeds to the university. He is there taught little else but the logic and natural Philosophy of Aristotle, and the theology of Thomas Aquinas. If a Spaniard, therefore, attain to anything like true knowledge, he must either leave his country in the search, or teach himself in the best way his fancy may devise.—The same remarks, with a slight modification, will apply to the neighboring kingdom of *Portugal*, where Papal superstition and tyranny exist in all their fullness and rigor. As the numerous swarms of priests, monks, and friars, that infest this country, are almost universally ignorant, and not unfrequently vicious,—as they are bigoted in the extreme to the established religion and its childish ceremonies, and as the general diffusion of knowledge would strike at the foundation of their ecclesiastical system,—it cannot be supposed that they will show much zeal either in making their scholars liberal and intelligent, or in enlarging and improving the general system of instruction. Several generations must elapse, and numerous and important changes be effected, before we can expect that the great body of the Spaniards and Portuguese can become enlightened and moralized.

Russia.—It is only of late years that the attention of the Russian government has been directed to the promotion of education throughout that extensive empire; and several ages will be requisite, before its half-civilized inhabitants be raised from the state of mental debasement in which they have been so long immersed. During the reign of the late emperor Alexander, Lancasterian schools and other seminaries were established in different parts of European Russia, and Bible societies, for distributing the Scriptures among the lower orders, were patronized by the Emperor, Prince Gallitzin, the archbishops, and other distinguished characters. It appears that in the beginning of 1830, the emperor Nicholas gave his sanction to certain regulations, providing for the establishment of primary schools in the several villages appertaining to the crown. The object of these seminaries is to diffuse useful knowledge among the peasantry, and to furnish the villages with individuals who may act as writers. Gratuitous instruction is to be afforded in these schools to youths of not less than eight years of age, in the catechism, reading books and written documents, writing, and the first four operations of arithmetic. The lessons are to open after their return from labor, and to continue until it be resumed; with the exception of Sundays and festivals, they are to occupy four hours a-day. Permission is, however, given to the teacher to assemble his pupils for the purpose of repeating their lessons, even while they are working in the fields; but this cannot take place without the consent of the villagers. The expenses of these schools are to be defrayed out of the territorial income of the villages, and the first essays are intended to be made in the governments of St. Petersburg and Pscov.

Switzerland.—This country, remarkable for the sublimity of its mountain scenery, the fertility of its vales, and the beauty of its expansive lakes,—is no less remarkable for the means of education it possesses, and the consequent intelligence and moral order of its inhabitants. In this respect, it is scarcely inferior to the best educated countries in Europe. The proportion of the inhabitants undergoing the process of instruction is greater than that of either France, England or

* Quarterly Journal of Education, vol. i.

Scotland. In the *Pays de Vaud*, this proportion amounts to *one-eighth* of the population, which is more than the average of the other countries of Europe, where systems of instruction have been established; so that the inhabitants of this district of Switzerland, have generally been considered by travelers as the most intelligent and the best educated among the European nations.

The celebrated school of *Pestalozzi* at Yverdon, in the *Pays de Vaud*, has been visited and celebrated by every traveler. This was among the first seminaries in which the intellectual system was introduced, in which the *rationale* of every subject taught is explained and illustrated, and the intellectual faculties stimulated and brought into exercise. It embraces, also, the plan of mutual instruction, as exemplified in the schools of Bell and Lancaster. The establishment of the School of Industry of M. Fellenberg at Hofwyl, in the Canton of Berne, has also been deservedly cele-

brated. The object of this seminary is to combine scholastic education with industrious habits, and a knowledge of the best manner of performing mechanical and agricultural operations. Although, at Hofwyl, the principles and practice of *Agriculture* are the chief objects of attention, yet the general principles of the institution and the mode of instruction might, in towns, be successfully applied to mechanical operations and manufacturing processes of every description. It has given a great impulse to education throughout the country, and has produced some very eminent scholars. Not only the lower classes, but pupils of the highest rank come to this seminary, from Germany, France, England, and other parts of Europe. In most of the cantons, education is a matter of state, persons of the greatest respectability are engaged in the business of instruction, and the arrangements of the system of tuition are under the immediate direction and protection of the government.

CHAPTER II.

STRICTURES ON THE MODE IN WHICH EDUCATION HAS GENERALLY BEEN CONDUCTED.

THERE are few subjects which have so frequently engaged the attention of the literary public as the instruction of the young; and yet there is no subject about which so many vague and erroneous notions generally prevail. No term in our language has been more abused and misapplied than that of *education*. By the great majority of our countrymen it is considered as consisting merely in the acquisition of pronunciation, spelling, and grammar—of writing, casting accounts, and the knowledge of languages; and these acquisitions are considered of value chiefly as they prepare the individual for engaging in certain *secular* employments, and are instrumental in procuring his subsistence. By others it has been confined to the communication of the elements of thought, and the improvement of the intellect; and, by a comparatively small number, it has been regarded chiefly as the formation of character, and the cultivation of moral habits. But, to neither of these objects is education to be *exclusively* confined. It consists of a comprehensive and harmonious combination of them all, including every mean and every mode of improvement by which intelligent beings may be trained to knowledge and virtue—qualified for acting an honorable and respectable part on the theater of this world, and prepared for that immortal existence to which they are destined. It is deeply to be regretted, that, up to the present hour, with a very few exceptions—in an age deemed liberal and *enlightened*—the system on which education has generally been conducted is repugnant to the dictates of reason, inefficient for enlightening and meliorating the human mind, and is little short of an insult offered to the understandings of the young. While almost every initiatory book has for its motto, and every teacher can readily repeat the following lines of Thomson,—

“Delightful task! to rear the tender thought,
To teach the young idea how to shoot,
And pour the fresh instruction o’er the mind,”

the great objects which education ought to promote have been miserably neglected. A farrago of *words* has been substituted in the place of *things*; the elements of *language* have been preferred to the elements of *thought*; the *key* of knowledge has been exhibited instead of *knowledge* itself; and the youthful mind, at the termination of the common process of instruction, is almost as destitute of *ideas* as at its commencement. At that period of life when the minds of the young are beginning to expand—when they ardently thirst after novelty and variety—when they are alive to the beauties and sublimities of nature, and listen with delight to the descriptions of other countries, and the tales of other times—instead of being gratified with the exhibition of all that is interesting in the scenes of creation and the history of man—they are set down in a corner to plod over unknown characters and strange sounds—no pleasing objects are exhibited to inspire them with delight—their memories are burdened, and even *tortured*, while their understandings are neglected; and, after many painful efforts, intermingled with cries and tears, while the detested lash is hanging over their heads, they are enabled to repeat, like a number of puppets, their medley of grammar rules, their psalms, their hymns, their catechisms, and their speeches from the English and Roman classics, pouring out their words with a velocity like water bursting from a spout, *without a single correct idea connected with their exercises*, “understanding neither what they say, nor whereof they affirm.”—Hence it has too frequently happened, that the school-room has been viewed as a prison, their teachers as a species of tyrants, and the scholastic exercises in which they are engaged, as repugnant to their natural vivacity, and subversive of their youthful pleasures. Hence they have frequently been driven to the village school, like sheep to the slaughter, and like criminals to a jail, or carried on the shoulders of their companions, amidst

cries, and lamentations, and forebodings of punishment.

In seminaries of a higher order than those to which I now allude, five or six years are generally spent in learning the declension of nouns, the conjugation of verbs, and the rules of syntax, and in acquiring a smattering of the Roman classics; while, at the close of this tedious, and to the pupil, *revolting* process, he retires from the seminary to the shop, the counting-house, or the university, nearly as ignorant of the common phenomena of nature, of the sublime discoveries of modern times, of the principles of the arts and sciences, and the laws of moral action, as if he had been born in Patagonia, or in the center of New Holland. If he has acquired anything at all, which may be denominated *knowledge*, it consists chiefly in a jumble of notions about the squabbles of heathen gods and goddesses, detached fragments of Roman history, the *Metamorphoses* of Ovid, the fictions of Pagan mythology, and the revengeful encounters of destroying armies and ambitious despots. While his mind is familiar with the absurdities and impieties of ancient superstition and idolatry, he not unfrequently quits the scene of instruction as ignorant of the character and attributes of the true God, of the doctrines of the Christian religion, and of the tempers which it inculcates, as if he had been tutored in a Pagan land.

Even in those seminaries which are devoted to the *religious* instruction of the young, the same absurd and inefficient system to which I have alluded is too frequently acted upon. Instead of exhibiting to the understandings of the young the character and perfections of the Deity, and the truths of Christianity, by familiar and popular illustrations deduced from the economy of nature and the *facts* of revelation, a great proportion of their Sabbath-school exercises consists in repeating, with a disgusting flippancy and vociferation, their catechisms, psalms, paraphrases, hymns, and scripture passages, assigned them as *tasks*, and in listening to the crude expositions of certain abstract theological dogmas, to which they can attach no precise or well-defined notions, and which do not enter into the essence of the Christian system. In certain schools of this description, I have witnessed the attention of the children almost exclusively directed to the *mere repetition* of the Shorter Catechism, and other compends of divinity, and that, too, in a most inaccurate, irreverent, and vociferous manner, without a single attempt being made to convey any *idea* to the understanding of the nature of the truths repeated—while the catechumens seemed to be much gratified and relieved in having got their memories disburdened of the ungracious tasks imposed upon them. In other schools, where the teachers had acquired a smattering of systematic theology—after the memorial tasks were dispatched—I have listened to a series of crude dissertations addressed to the young respecting the covenant of works and of grace, predestination, absolute and conditional decrees, faith, the Trinity, and similar topics, together with long-winded exhortations, occasionally intermingled with boisterous and unhalloved threats and denunciations, because the young did not yield a profound attention to such abstract speculations. Yet all this goes by the name of *religious* instruction; and, when it is found to produce little influence on the moral conduct of the young, the effect is attributed solely to the corruption of human nature, and to the withholding of the influences of divine grace,—a sentiment which goes far to attribute to the “Only Wise God”

those effects which are produced by the folly and the injudicious schemes of men.—As it is painful to exercise the memory to any extent on words unconnected with ideas, so it frequently happens, that a disrelish for religion and its services is induced, in consequence of the labor and drudgery with which they are thus associated. In these seminaries, too, the duties of Christian morality are too frequently thrown into the shade. Christianity is not a mere theory, but a *practical system*; for all its historical details, its doctrines and precepts, its promises and threatenings, have an ultimate reference to the regulation of the temper and affections, the direction of the conduct, and to the general renovation of the moral powers of man, in order to his preparation for a higher state of moral and intellectual excellence. And, therefore, it ought to be one of the grand objects of religious instruction to cultivate the moral powers, to direct the temper and affections, and to show, by familiar illustrations taken from the scenes of active life, how the principles of Christianity ought to operate in all the diversified circumstances and relations of society.—But, leaving this topic, in the meantime, let us attend a little more particularly to the range of instruction in our common introductory schools.

After a knowledge of the characters of the alphabet and of the principal elementary sounds is acquired, the scholar is led through a series of dry and uninteresting lessons and spelling exercises in which his memory and his faculty of pronunciation are solely exercised. The New Testament is next put into his hand, and, after reading a portion of it with great difficulty and awkwardness, and before he is capable of reading one sentence with ease and accuracy, he is introduced to such books as “Barrie’s Collection,” and “Tyro’s Guide,” and “Scott’s Beauties of Eminent Writers,” in which there is scarcely one selection interesting to a youthful mind, or level to its comprehension. But this circumstance seems to be considered by many as a matter of no importance; for it is seldom or never that an attempt is made to convey to the minds of youth the *ideas* contained in the lessons they read and commit to memory. During these reading exercises, the Shorter Catechism is put into their hands, in order that its vocables may be committed to memory; and that, too, at so early a period, that they find the greatest difficulty in mastering the pronunciation of the long and technical terms with which it abounds. Through this ungracious task they struggle with the greatest reluctance, and generally, too, without annexing a single idea to any of the answers they repeat. They are soon after, perhaps before they are seven years of age, introduced to the study of English grammar; and, after feeling much apathy and not a little disgust at this abstract science, and experiencing many days and hours of ungrateful labor, they are able to repeat a few of its rules, definitions, and declensions. Like so many parrots, they can tell us by rote, what is a verb, an adverb, or a preposition, or that “conjunctions which imply contingency require the subjunctive mood,” without understanding what they say, or annexing a clear idea to any of the rules or definitions they repeat. By turning over Scott’s or Fulton’s Dictionary, they learn that *virtue* is a *noun*, because *n* is annexed to it—that, *to write* is a *verb*, because *v* is annexed to it—and that *from* is a *preposition*, because *pre* is annexed to it; but, beyond such reasons they seldom attempt to aspire; and after two or three years’ training in such exercises, they know little more of the subject, or of the application of its rules to composition, than when

they first commenced. The principal acquisition made, is a facility in finding out words in a dictionary, without any attention being paid to their meaning—an object which may easily be accomplished in a few days. The useful art of *writing* is next attempted to be taught; and, in most instances, a far greater degree of importance is attached to the acquirement of an “elegant text,” or a “fine running hand,” than to the cultivation of the moral and intellectual powers, and the acquisition of substantial knowledge.—*Arithmetic* follows in the rear, and the scholar, after hurrying through its four fundamental rules, without any *sensible illustrations* of the different operations, is exercised in calculations respecting Tare and Tret, Interest and Annuities, the Square and Cube Root, Exchange, Discount and Equation of Payments, before he has the least knowledge of the nature of these transactions; and, consequently, like one walking in the dark, is unable to perceive the drift and tendency of most of his operations, or the foundation of the rules by which he calculates; and hence it happens that, when he actually engages in the business of real life, he has almost the whole of his arithmetical processes to study over again, and to re-investigate the foundations, objects, and principles of his operations, in their applications to the transactions in which he is engaged.

In fine, during the whole of the process now described, the moral powers of the young are in a great measure overlooked, and the business of *moral tuition* shamefully neglected. To improve their tempers and affections, and to bend them into that direction which will tend to promote their own happiness and that of others, is considered as a matter of inferior moment, in which teachers are very little, if at all, interested. It forms, at least, no *prominent* object, in our schools, to meliorate the tempers of the young, to counteract the principles of malice, envy, and revenge—to inspire them with kindness and benevolence—and to train them to moral excellence. On the contrary, the mode in which they are treated has frequently a tendency to produce *obstinacy*, *dissimulation*, superstition, pride, *hatred*, and *disaffection*. The spirit of unchristian emulation, contention, and revenge is indirectly fostered by the books they read, the discipline by which they are trained, the amusements in which they indulge, the false maxims and pagan sentiments which are interwoven through the whole course of their education, and by the admiration which is attempted to be excited in their breasts for barbarous heroes and the butchers of mankind. The active powers of the young being thus allowed to take the natural bent of their depraved inclinations, selfishness, pride, malice, and other malignant passions, are allowed to spring up and flourish, without feeling the force of those salutary checks which might impede their progress, or destroy them in the bud; and thus perverse habits and dispositions are induced, which “grow with their growth, and strengthen with their strength,” until at length they display themselves with diabolical energy in the scenes of domestic life, and on the theater of the political world, amidst the contentions of communities and “the tumults of the people.”

Such is the amount of the education which the great mass of our population receive prior to their entrance on the scene of active life. To affirm that it is attended by no beneficial effects, would be to fly in the face of all observation and experience. It prepares the mind, in some measure, for certain avocations in civil society, and for the reception of knowledge in after life, should it ever be exhibited in a more judicious and intelligent

manner; and, in some instances, when combined with judicious domestic instruction, it will assist and direct the pupil, in the pursuit of knowledge and of mental enjoyments. But, considered by itself, as a system of culture for rational and immortal beings, in order to the development of their moral and intellectual powers, and as a preparation for a higher state of existence, it is *miserrably deficient*, both in the means which are employed, in the range of instruction, and in the objects which it is calculated to accomplish.—To illustrate this position is the object of the following remarks.

1. In the first place, one glaring defect which runs through the whole system of initiatory instruction (except in very rare instances) is that *no attempt is made to convey ideas to the youthful mind, along with the elementary sounds of language and the art of pronunciation*. Provided children can *mouth* the words, and vociferate with alacrity the different sentences contained in their lessons, it appears to be a matter of little importance in the eyes either of teachers or of parents, whether or not they appreciate the meaning of any one portion of the sentiments they read. Although the great object of education is “to teach the young idea how to shoot,” it is almost the only object which is thrown into the shade; and those scholastic exercises which are only the *means* of education, are almost exclusively attended to as if they were the *end*. The young are thus treated as if they were only so many puppets, placed on a stage to exhibit a series of mechanical movements, and as if they were not possessed of the smallest portion of intellect, and were entirely destitute of affections and passions. Yet, it is undeniable, from fact, that children, at a very early age, are capable of receiving a variety of ideas into their minds, and of exercising their reasoning powers respecting them. Present an engraved landscape to a boy of four or five years of age, especially as exhibited through the *Optical Diagonal Machine*, where he will see every object in its true perspective as it appears in nature—he will at once recognize and describe, in his own way, the houses, the streets, the men, the women, the roads and carriages, and the land and water of which it is composed, and express his opinion respecting them. Present well-executed engravings of a horse, a cow, a lion, an elephant, or a monkey, and he will soon learn to distinguish the one from the other, and will feel delighted with every new exhibition that is made to him of the objects of nature or of art. And, therefore, if sensible objects, level to his capacity, and range of thought, and with which he is in some measure acquainted, were uniformly exhibited in his first excursions in the path of learning, his progress in knowledge would nearly correspond to his advancement in the art of spelling and pronunciation. The absurdity of neglecting the cultivation of the understanding, in the dawn of life, and during the progress of scholastic instruction, however common it may be, is so obvious and glaring, that it scarcely requires a process of reasoning to show its irrationality, if we admit that the acquisition of knowledge ought to be one of the great ends of education. What important purpose can be gained by a number of boys and girls spending a series of years, in pronouncing, like so many parrots, a number of articulate sounds, to which they annex no corresponding ideas or impressions, and which cost them so much pain and anxiety to acquire? What is the use of the art of reading, if it be not made the medium by which knowledge and moral improve-

ment may be communicated? And, if we neglect to teach youth to apply this mean to its proper end, while they are under regular tuition, how can we reasonably expect, that they will afterward apply it, of their own accord, when a sufficient stimulus is wanting? By neglecting to connect the acquisition of useful information with the business of elementary instruction, we place the young nearly in the same predicament as we ourselves should be placed, were we obliged from day to day, to read and repeat long passages from the writings of Confucius, the Alcoran of Mahomet, or the Shasters of Bramah, in the Chinese, the Turkish and the Hindoo languages, while we understood not the meaning of a single term. And how painful and disgusting should we feel such a revolting exercise!—The consequence of this absurd practice is, that, instead of exciting desires for further acquisitions in learning,—in a majority of instances, we produce a disgust to every species of mental exertion and improvement; instruction becomes unpleasant and irksome, both to the teacher and the scholar; the child leaves school without having acquired any real knowledge, and destitute of any *relish* for it, and seldom afterward makes any use of the instructions he received for the further cultivation of his mind in wisdom and virtue. To this cause, perhaps, more than to any other, is to be attributed the deplorable ignorance which still pervades the mass of our population, notwithstanding the formal process of instruction they undergo,—and the little relish they feel for devoting their leisure hours to the improvement of their minds, and to those pursuits which are congenial to rational and immortal natures.

II. Another defect which pervades the whole system of scholastic instruction in our country, and of which the former is a native consequence, is, *that there is scarcely one of our elementary books adapted to the capacities of youth, and calculated to excite their attention and affections, by its interesting and instructive details.*

Not to mention the dry and uninteresting lists and details contained in most of our spelling-books, and the vague and somber moral instructions they exhibit—let us fix our attention, for a moment, on the general train of subjects contained in “Barrie’s Collection,” and “Tyro’s Guide,” and in “Scott’s Beauties of eminent writers,”—the books most commonly used in the parochial and other schools in this country,—and we shall soon perceive that they are everything but calculated for the purpose intended. These works (which, like some others of the same fry, seem to have been constructed by means of the scissors) chiefly contain extracts illustrative of the beauties of sentiment and composition:—Speeches on political subjects formerly delivered in the Roman, Grecian, and British Senates—characters of Pope, Dryden, Milton, or Shakespeare—descriptions of the battles of Poitiers, Hastings, Agincourt, and Bannockburn—abstract eulogiums on virtue, oratory, and the art of criticism—prosing dissertations on the cultivation of taste—on happiness, retirement, and meditation—Speeches and Epilogues of stage-players, political disquisitions, foolish tales, parables and allegories—Falstaff’s encomiums on sack—Hamlet’s advice to players—Epilogue of Garrick for the benefit of decayed actors—the Drunken Knight and his brawling lady appeared—Speeches of Quintus Capitolinus, of Romulus to his citizens, of Hannibal to Scipio, and of Gaius to his army—East India Company’s address on the junction of Spain and France—Mr. Walpole and Mr. Pitt’s Parliamen-

tary debates—Extracts from the Poems of Aken-side, Thompson, Milton and Young—Speech of Sin to Satan—Speech of Satan in his infernal palace of Pandemonium—Moloch’s speech to Satan—Belial’s Speech in reply—Satan’s soliloquy—the combat of the Horatii and the Curiatii—Captain Bobadil’s method of defeating an army—Clarence’s dream—Norval and Glenalvon’s revengeful encounter—Lord and Lady Randolph, Sir Charles and Lady Racket—Sempronius’ speech for war—Description of Queen Mab—Ossian’s address to the sun—Soliloquy of Dick the Apothecary’s apprentice—Alexander’s feast—Blair’s Grave—Young’s Life, Death, and Immortality—Queen of the Fairies—the Wolf and the Crane—the Town Mouse and the Country Mouse—the Tailor and the Conjuror—the Old Man and his Ass—with a multifarious medley of pieces of a similar description.

These comprehend a fair specimen of the prominent subjects selected, in our common school-books, *for the purpose of training the youthful mind in knowledge and virtue.* I have no hesitation in asserting, that more unsuitable subjects, consistent with common decency, could scarcely have been selected, and that they are little short of a direct insult offered to the youthful understanding. The compilers of such collections, either suppose, that the juvenile mind, at the age of eight or nine years, when such selections are put into their hands, has embraced a range of thought and contemplation far beyond what it is capable of in ordinary cases, or they wish to insult their imbecile minds, by offering them stones instead of bread, or they rake together their extracts at random, without considering whether they are at all suited to the class of persons to whom they are addressed. For there is not one lesson out of twenty which is level to the range of thought, and to the capacity of the youthful mind, in its first outset in the path of science, even although parents and teachers were to attempt an explanation of the passages which are read; as they embody descriptions and allusions respecting objects, events, and circumstances, which cannot be duly appreciated without a previous course of study; and they abound with a multitude of abstract speculations which can never convey well-defined ideas to the understandings of the young. What ideas can a boy of seven or eight years old form of the Parliamentary debates of Mr. Pulteney, Mr. Pitt, or Sir Robert Walpole; of the speech of Marcus Valerius on a dispute between the Patricians and the Plebeians concerning the form of government; of dissertations on the art of criticism; of Belial’s speech to Moloch; or even of Blair’s Grave, or Young’s Life, Death, and Immortality;—or what interest can he be supposed to feel in such themes and discussions? I appeal to every one of my readers, if, at the age now specified, they ever understood such selections, or felt gratified and improved by perusing them. It is an absurdity, at once perceptible, that the beauties of sentiment and composition which are appreciated and relished by persons of refined taste, at the age of twenty or thirty, will be equally relished and admired by children of eight or ten years of age; and yet, from an examination of our introductory school-books, it is undeniable, that on a false principle of this kind, almost all our elementary works have been constructed.

But, it is farther to be regretted, that this is not the only fault that can be charged upon these productions. They exhibit scenes and sentiments which ought not to be familiarized to the minds of children, and which are repugnant to the spirit

and practice of genuine Christianity. In almost every page, both of the prosaic and poetic-extracts, the *war gong* is ever and anon resounding in our ears, and "the confused noise of the warrior, with garments rolled in blood." The Cæsars, the Alexanders, and the Buonapartes, of ancient and modern times, instead of being held up to execration as the ravagers and destroyers of mankind, are set forth to view as glorious conquerors and illustrious heroes, whose characters and exploits demand our admiration and applause. And if, at any time, the minds of the young imbibe the sentiments which pervade their lessons, it is generally when they breathe a *warlike spirit*, and exhibit those desolations and ravages which ambition and revenge have produced in the world,—and when they themselves are trained to *spout* at an examination, and, arrayed in warlike habiliments, with guns, or spears, or darts, to *ape* the revengeful exploits of a Norval and a Glengalvon. I have beheld the young, when engaged in such exhibitions, eulogized and applauded by their examiners, and surrounding spectators, more than on account of all the other scholastic improvements they had acquired. To this cause, doubtless, as well as to others, is to be attributed the spirit of warfare and contention which still reigns on the theater of the political world, and which has desolated, and disgraced, and demoralized, every nation under heaven. I have known a teacher who has turned over page after page, in some of the works now referred to, in search of a passage worthy of being committed to memory by his pupils, and who could not in conscience fix upon any one, in a long series of extracts, on account of its being imbued with this anti-christian spirit. In addition to this striking characteristic of our school-collections, and in perfect accordance with it—it may also be stated, that Pride, Ambition, Revenge, and other Pagan virtues, are sometimes held up to view as the characteristics of a noble and heroic mind; and swearing, lying, brawling, and deceit, are frequently exhibited in so ludicrous a manner, as almost to win the affections, and to excite approbation.

But, in fine, although the selections to which I allude were level to the comprehensions of the young, and untinted with anti-christian sentiments—what is the amount of all the knowledge and instruction they contain? They embrace no perspicuous system of interesting and useful information,—scarcely anything that bears on the cultivation of Christian dispositions,—no exhibitions of the scenes of Nature and Art in which the young may afterward be placed,—little information respecting the works of God, the revelations of his word, or the useful inventions of men. The beauties which adorn the scenery of nature, the wonders of Creating Power, as displayed in the earth, the air, the ocean, and the heavens; the displays of Divine Wisdom and Goodness, which everywhere surrounds us; the mild and pacific virtues of Christianity, which ought equally to adorn the prince and the peasant; the avocations and amusements of domestic life; the scenery of the country, the city, and the village, or the important facts contained in the Sacred history,—are seldom or never detailed, with interesting simplicity, in this class of publications. And, are a few extracts from old plays and novels, romances and fables, Pagan mythology and Parliamentary debates—from the speeches of Roman orators and the epilogues of stage-players, to be considered as the most agreeable and substantial food for the youthful intellect, and as the most judicious process for inbuing it with useful know-

ledge, and preparing it for the employments of an immortal existence? Are the absurd opinions of a Roman and Grecian poets and warriors, respecting their gods, their heroes, and their religion, and the polluted streams of heathen morality, to be substituted in the room of the simple and sublime delineations of revelation, the pure principles of the gospel, and the noble discoveries of modern science? If so,—then let us not boast of imparting to our children a rational and a *Christian* education.

I have alluded more particularly to the works above-mentioned, because they are most frequently used in our borough and parochial schools; but I know no works of this kind, published in this country, with the exception of two or three volumes, to which the above strictures will not, in a greater or less degree, apply. I do not, however, condemn such books, in so far as they contain sentimental extracts, for the use of advanced students of elocution,—or considered as miscellanies for the amusement of persons advanced in life (though even in this last point of view they cannot be held in high estimation),—my main objection rests on the ground of their being unfitted to interest the minds of the young, and to convey to them the outlines of knowledge and virtue, unmingled with the rubbish of false maxims and anti-christian sentiments.*

III. Another error which runs through our scholastic instruction is, that, while the cultivation of the judgment is neglected, the *memory is injudiciously, and often too severely exercised*. The efforts of memory, in most cases, especially when exercised in the retention of mere sounds and terms, are generally attended with painful sensations; and, when these sensations are long continued, they frequently produce a disgust at the objects and employments of education. Long passages from Homer, Shakespeare, Milton, or Pope, are given out for recitation to the young, while they are still incapable of appreciating the

* The above remarks were written in the year 1821, and published in the "Christian Instructor." Since that period several school-books have appeared, compiled on more rational and Christian principles than most of their predecessors,—particularly, McCulloch's "Course of Elementary Reading in Science and Literature," "The National School Collection," "The American Reader," by Merriam, and several others; but they are chiefly adapted for the higher classes in schools; and for young people who have nearly finished their course of instruction in reading, and they have been introduced into comparatively few of our schools, and in many parts of the country are altogether unknown. Several useful compilations have likewise of late been published in England and America, but they are more adapted to the use of families and domestic instruction than to public seminaries. I am acquainted with no book for the Juvenile classes, comprising useful information, and compiled in such a manner as to render knowledge and morality perspicuous, fascinating, and interesting to the young, and calculated to give full scope to their rational and active powers. About a year after the publication of these remarks in the "Christian Instructor," its Editor, the late Rev. Dr. A. Thomson, compiled a school collection, and sent me a copy of it, for my inspection. My opinion of this compilation having been requested, at the next personal interview I had with the Doctor, I told him that I considered the book free of any anti-christian sentiments, calculated to make a good impression on the minds of the young, and that it contained a considerable number of instructive and entertaining selections; but that a number of the selections, however good in themselves, were too didactic and *somber* to engage the attention of the juvenile mind. The Doctor admitted the justice of the last remark, and said, that, in another edition, he intended to throw out the pieces alluded to, and substitute, in their place, more entertaining selections. Dr. Thomson's collection is, on the whole, a good one; but, like the others mentioned above, is chiefly adapted to the higher classes. The plan of all the school collections hitherto published is susceptible of much improvement; and I shall afterward take an opportunity of adverting to this subject in a subsequent part of this volume.

meaning of a single sentiment in the task prescribed; and the facility with which they can recollect and vociferate a number of jingling sounds is considered by many as the best evidence of their progress in the paths of instruction. The period has not long gone by (if it have yet passed) when the repetition of the first chapter of the first book of Chronicles, of the tenth chapter of Nehemiah, of the hundred-and-nineteenth Psalm, or of half a dozen chapters in the New Testament, by a school-boy,—with a disgusting vociferation, and a uniform velocity, like water dashing over a precipice, was regarded, both by parents and teachers, as an evidence of extraordinary genius and as an achievement in education of far greater importance than if he had drawn an outline of universal history, or sketched the geography of the globe.—Of all the exercises of memory to which the young tyro is accustomed, there is none more injudicious and more painful to the pupil, than that by which he is constrained to get by rote the Shorter Catechism, at the early age at which it is generally prescribed. At the age of five or six, before he is capable of understanding a single sentiment of the system of Divinity, and even before he can read with ease any one of its questions and answers—he is set to the ungracious task of committing its vocables to memory, as if he were a mere machine, formed solely for mechanical movements and the emission of sounds. The reluctance with which this task is generally engaged in; the painful sensations which accompany it; the correction which follows its neglect; the ludicrous blundering; and the complete destitution of ideas with which it is generally attended—all conspire to show the absurdity of the practice. I am fully persuaded, that the unpleasant associations connected with this task, have, in many instances, produced a lasting disgust, both at the pursuits of learning, and the instructions of religion. Yet, there are few school-exercises to which parents in general attach a greater degree of importance. To omit the teaching of this catechism by rote, even although other and more perspicuous instructions were given on divine subjects, would be considered as arguing a certain degree of *irreligion* on the part of the teacher; and even respectable clergymen and others consider this exercise as a *sine qua non* in religious instruction—just as if the mere terms and definitions of this excellent summary were to produce a *magical* effect on the moral and intellectual faculties. The common argument in favor of this practice, “that it is laying in a store of religious vocables for after reflection, and that the answers will be perfectly understood in riper years,”—when considered in connection with what has been now said, is extremely futile and inconclusive. The blundering manner in which persons advanced in life frequently repeat this catechism—mistaking, for example, the answer to “What is Justification?” for that which relates to “sanctification,” or what is *forbidden* for what is *required* in any of the commandments, and without being at all conscious of their error—plainly indicates, that correct ideas are seldom attached to whatever has been learned by mere rote, and that the rational faculty is seldom exerted in such exercises. In short, I have little hesitation in laying it down as a maxim that will generally hold true, that “whenever the words of a proposition are committed to memory without being understood, their meaning will afterward be seldom inquired after or perceived.” I am convinced, that a careful perusal of this catechism, or any other similar system, accompanied with

proper explanations, at the age of fourteen, or sixteen, will convey more real information than can be acquired by all the painful labor and drudgery endured by committing it to memory at the usual age at which it is prescribed.

Let it not, however, be imagined, that I wish to throw the least reflection on the Shorter Catechism, as a summary of Christian doctrine and duty. On the contrary—without admitting every sentiment it contains as perfectly correct, or necessary to be embodied in such a synopsis of theology—I consider it on the whole, as one of the most comprehensive compends of divinity ever published—which, with a few retrenchments and modifications, might form a *basis of union* to almost all the religious bodies in this country. But the very thing in which its chief excellence consists, constitutes an argument against its being used as a first catechism. It is so *comprehensive*, that almost every word includes an important meaning, and has an allusion to those profound views of the Christian system, and to those controverted points in divinity, which are chiefly recognized by professed divines. It is not by endeavoring to convey *general* and *abstract* views of Christian doctrine, or by cramming the memories of young persons with a multiplicity of theological terms and doctrinal opinions, that instructions in religion will be successful in arresting their attention, and impressing their minds; but by particular explications, and familiar illustrations borrowed from sensible objects, of a few of the most prominent truths of the Christian system, that impressive and well-defined ideas will be communicated to the youthful mind. And perhaps too little care is exercised in communicating, in a vivid and impressive manner, the fundamental truths of *natural religion*, which form the groundwork of the different parts of the Christian superstructure. I conceive, that it is time enough to commence the regular study of the Shorter Catechism, at the age of twelve or thirteen, when its answers should be minutely analyzed, and its terms, doctrines, and moral injunctions, familiarly explained and elucidated by instructors, who have accurate and enlarged views of the truths it conveys; and, when employed in this way, it will be found a useful synopsis of Christian faith and practice. Prior to the period to which I now refer, some of Dr. Watts’ first catechisms might be used; or, perhaps, it might be possible to construct a catechism more simple and interesting, and containing more striking illustrations of natural and revealed religion, than any that have yet appeared; or, perhaps, without adopting the form of a catechism, we might directly refer to the positive declarations of Scripture, in reference to its facts, doctrines, and precepts, accompanying the passages we extract with short comments and familiar elucidations. The truths contained in such catechisms might be learned with ease, and even with pleasure, by the young, if they were accompanied with a few hints from the parent or teacher, to elucidate the facts and doctrines exhibited to their view; and especially, were they compiled on such a plan, as to give occasional exercise to the curiosity and the judgment in finding out the proper answers.

In throwing out such remarks as the above, I am aware that I am treading on delicate ground. But far more convincing arguments than any I have yet heard must be brought forward, before I can see reason to alter the opinion now stated. If it be once admitted, that the communication of *ideas* ought to form the great object of all in-

struction—that the young, at an early age, are capable of being the recipients of knowledge—and that education should be rendered as pleasant and agreeable as the nature of the exercise will admit—I will not fear to face any argument that may be presented on this subject. I am far from wishing to insinuate, that the memory ought not to be exercised in the process of education; for it is one of the powers or instruments conferred on us, for the purpose of making intellectual acquisitions; but I contend, that its exertions, in the first instance, ought to be gentle, easy, and rational, and employed chiefly in relation to those objects about which the young are capable of forming some distinct and agreeable conceptions, and not merely on sounds and terms, and abstract propositions, to which no precise meaning is attached.

IV. In our schools and seminaries, as presently conducted, *grammar is attempted to be taught at too early an age*. Grammar is an abstract branch of the philosophy of mind; and, therefore, to enter with intelligence and interest into its spirit, the foundation of its rules and their application—requires some degree of knowledge, observation, and maturity of judgment, not generally possessed by juvenile minds; and, consequently, to attempt to teach it to infants, *in a systematic form*, seems almost as preposterous as it would be to instruct them in the Newtonian philosophy, or in the Hutchinsonian system of metaphysics. The little urchin of six or seven years of age, may, indeed, be taught to repeat the definitions of all the parts of speech, and of all the moods and tenses of verbs—the inflections of nouns and verbs, and even the whole of the rules of syntax; but such exercises are always accompanied with a certain degree of labor and disgust, which tend to sour the mind in its progress through such scholastic instruction. And after all the mental anxiety and toil endured in such mechanical exercises, they acquire not, perhaps, a single correct idea on the subject, especially in the abstract and superficial manner in which it is taught in our common schools, and are unable to appreciate any one useful purpose to which such exercises are subservient. To distinguish a *noun*, or the *quality* of a noun, or the nature of a *verb*, and to correct a simple sentence in which a verb disagrees with its nominative, are exercises which children may be taught at an early period, by familiar examples, and which might be rendered both amusing and instructive, without the formality of technical terms, complex rules, or abstract systems; but to proceed much farther than such easy exercises, before the intellectual powers are somewhat matured, appears to be wasting time and money, and mental anxiety, to no purpose. Even the elements, or the more popular parts of natural history, geography, astronomy and experimental philosophy, could be taught with much better effect, at such an early period, than the abstract study of verbs and adverbs, conjunctions and declensions, and metaphysical rules, the foundation of which no child can comprehend; because, in those departments of knowledge, sensible objects and pictorial representations can be presented to the view of the juvenile mind as elucidations of the facts and principles inculcated.

That the opinions now stated may not appear altogether singular, I shall quote a sentence or two from the writings of the learned *Mr. Smellie*—the well-known translator of “*Buffon’s Natural History*.” In his work on “*The Philosophy of Natural History*,” vol. ii, p. 453, he remarks—“*Premature studies are uniformly painful, because young minds are incapable of comprehending the principles, and far less the application of them to arts or*

sciences. *Grammar*, the first science obtruded upon, I may say, *infantile* intellects, is one of the most abstract and intricate. To attain even a tolerable knowledge of grammar, whatever be the language (for the general principles are, and must be, the same), presupposes a considerable range of intuitive facts, as well as of acquired ideas.” Again, speaking of the absurdity of “*journeymen shoemakers, tailors, weavers, bakers, carpenters*,” &c., sending their children for years to Latin and Grammar schools, he remarks—“*During the hours of recess from scholastic discipline, nature resumes her empire, and, by her irresistible power, obliges the children to frisk and romp about, and to enjoy those various and pure pleasures which result from activity and amusement. But these enjoyments are no sooner over, than the abhorred ideas of unnatural confinement, and of a constrained attention to jargon, which to them is completely unintelligible, instantly recur, and harass, and terrify their imaginations. The fruitless and painful labors which such preposterous conduct in managing the early education of youth produces, are immense, and truly ridiculous.*” P. 448.

V. In regard to the art of *writing*, which is chiefly a mechanical exercise, the quality of which depends somewhat on the taste of the pupil—a great degree of fastidiousness exists, and *by far too much importance is attached to the acquisition of an “elegant hand.”* To so disgusting a degree has this predilection been carried, on certain occasions, that all the qualities of a good teacher have been considered as concentrated in this one acquirement; and persons have been selected to superintend the instruction of youth, who were destitute of almost every other qualification, merely because they could write “a fine text,” or “an elegant running hand.” The art of communicating our thoughts by writing, is one of the most useful accomplishments, which every person from the highest to the lowest ranks of society ought to possess. To attain a certain degree of neatness and regularity in writing is highly desirable; and where a taste for elegance in this art exists, it should be encouraged, though not at the expense of more substantial acquirements. To write *straight*, to attend to the proper use of capital letters, and to arrange the subject of writing into distinct sentences and paragraphs, so as to render the writing easily legible, and the sentiments perspicuous to others, should be considered as the great object of this art; and such qualities of writing are undoubtedly of more importance, in the practical purposes to which it may be applied, than the acquirement of the most elegant “*dashes*” and “*flourishes*” of penmanship. I have, indeed, known but few individuals who have prided themselves in such showy accomplishments, who were not extremely superficial in their other attainments. It is a very odd circumstance, and shows to what a ridiculous length a fastidious taste for elegant writing may be carried—that most of the higher ranks, who have been taught by the first writing-masters, now consider it as *fashionable* to write an illegible scrawl, which is nothing else than a *caricature* of good plain writing—which is the pest of merchants, printers, editors, and every other class of correspondents—which costs them a world of trouble before it can be read; and, in many cases, the very names of the writers can scarcely be deciphered. This is *elegance* with a witness; it is carrying it to its highest pitch of perfection, by rendering the art of writing almost useless for the purpose for which it was intended. I do not mean, by these remarks, to

insinuate that care and attention should not be bestowed, in order to acquire a neat and accurate mode of writing; but merely to modify that undue degree of importance which is attached to the accomplishment of "fine writing," and to impress upon the mind this sentiment, that a man may be possessed of very slender attainments in this art, in respect to elegance, and yet prove a good general teacher; while another may excel in all the ornamental flourishes of penmanship, and, at the same time, be altogether unqualified for directing the young mind in knowledge and virtue. I have known parents and guardians who seemed to consider the most useful and substantial accomplishments of youth as of little value, while their children remained in the smallest degree deficient in the flimsy ornaments of writing, and the higher elegancies of penmanship. In a word, to arrest and record the useful ideas which pass through our minds, to communicate them to others, in such well defined characters, and with such external neatness and order as may be most perspicuous and easily legible—to acquire a certain degree of facility and rapidity in forming characters and words—and to state mercantile accounts with taste, accuracy, and precision—should be considered as the great objects of the art of writing, beyond which it is of little importance to aspire; though, at the same time, no individual should be discouraged from indulging a taste for elegance in this department, when it does not absorb the attention from more important pursuits.

VI. With regard to our mode of teaching *Arithmetic*, a variety of strictures might be made. This department of scholastic instruction, like all the rest, is generally conducted in too abstract a manner—too much detached from the objects of sense, and from the pursuits of science and the business of human life, to which it has a reference. As all our notions on any branch of human knowledge are originally derived from *sensible* objects, so our ideas of numbers and their various relations and combinations, must be derived from the same source; and consequently, without a reference to the original objects and ideas whence the notion of numbers is derived, no accurate impression of their signification and use can be made on the juvenile mind. A boy may be taught to distinguish the character 9 from the rest of the digits, and yet may remain devoid of a distinct conception of the *idea* for which it stands; and in the same manner, he may be taught by rote, that $9+8=17$; that $16-9=7$; that 7 times 8 are 56; and that the quotient of 84, divided by 14, is equal to 6, without attaching any definite conception to such arithmetical processes.—By neglecting to illustrate the fundamental rules of arithmetical computation, in a familiar and amusing manner, by presenting to the eye the precise objects or ideas which numbers represent, we leave the young arithmetician to grope in the dark, and to a vagueness and confusion of conception in all the subsequent operations of this useful study.

In most of our elementary arithmetical works, the questions for exercise in the different rules are not so simple and interesting to young minds as they might be rendered. The practical use of the various operations—the commercial transactions to which they refer, and the extent and capacity of the weights and measures about which their calculations are employed, are seldom appreciated with any degree of precision, for want of the original ideas denoted by the terms employed, and for want of those models and representations of money, weights, and measures, by which they

might be illustrated. In many instances, too, there is a studied brevity and obscurity, and a tendency to puzzle and perplex, instead of rendering the operations of Arithmetic simple and perspicuous. While a young person may easily be made to perceive the object and meaning of such questions as the following—"What is the price of 30 lemons at twopence a-piece?" or, "If one pair of shoes cost 5s. 6d., what will 7 pair of shoes cost?"—he is quite puzzled to conceive what is the precise meaning of scores of questions arranged in columns in the following manner— $497865 \text{ a } 1\frac{1}{4}d.$ — $7643984 \text{ a } 3\frac{3}{4}d.$ — $46794 \text{ a } 4s.$ $7\frac{1}{2}d.$ — $444766 \text{ a } 15s.$ $\text{a } 11\frac{3}{4}d.$, &c. &c. Even although he may happen to perform mechanically the operations intended, he frequently knows nothing at all of the principle and object of his calculations. It is true, indeed, the teacher is expected to explain the nature and design of such questions; but in a crowded promiscuous school he cannot afford time to give the necessary explanations to every individual. And why should it be requisite? Why should not every book on arithmetic be so conspicuous and explicit as to render the meaning and object of every question clear and well defined even to the youthful understanding? And why should not questions, circumstances, and objects, be selected as arithmetical exercises, which are familiar to the young, and calculated to awaken their curiosity and attention? In short, the greater part of our arithmetical treatises, like our "School Collections," "English Readers," and "Beauties of Eminent Writers," are calculated for men of advanced years, instead of being adapted to the capacities and the range of thought possessed by boys and girls of from eight to twelve years of age. I might have enlarged to an indefinite extent on this topic; but several additional remarks may be introduced more appropriately in the sequel, when I shall take an opportunity of throwing out a few hints for the improvement of the present system of education.

In addition to the above remarks, I shall now briefly state a few *miscellaneous circumstances* which have a tendency either to impede the education of the young, or to render it disagreeable and irksome.

1. In the first place, in most of our schools both in town and country—there is a *deplorable want of ample accommodation, and of convenient school furniture*. In many cases, a hundred children are compressed into a space scarcely sufficient for the easy accommodation of one-third of that number, and appear huddled together like a flock of sheep pent up in a narrow pen. Scarcely a passage can be obtained for moving from one place to another; and when one class is about to retire, and another is called up, a noise, and jostling, and hubbub ensue, which throws the whole school into confusion. The narrow and unsteady forms on which the scholars are obliged to sit—the awkward tables—the confined air—and the press and general disorder which frequently occur, all conspire to render the hours devoted to instruction tedious and unpleasant, and to make the school partake something of the nature of a jail.* Beside, in most of our cities and towns, the school-rooms are generally situated in dark closes or narrow lanes, where there is a sufficiency neither of light nor of pure

* It may be proper to state, that in these, and the preceding and subsequent remarks, there is no particular allusion to Grammar-schools and other public seminaries for instruction in the higher branches of education; but chiefly to those schools both in town and country where the mass of the community is attempted to be instructed in the common branches of education.

air, nor of space for the occasional amusement of the children; so that learning, instead of being connected with cheerful and enlivening objects, becomes associated with everything that is gloomy, dirty, and disagreeable. A school has generally been considered as a "noisy mansion;" and, as presently conducted, it is next to impossible it should be otherwise. There is nothing which produces greater annoyance to a teacher, than the hum and the frequent clamors of a hundred tongues assailing him on every side; and wherever such noisy turbulence daily prevails, it is impossible that a train of rational instructions can be successfully carried forward. Of the many causes of noise and confusion in schools, I am persuaded this is none of the least—the want of space and proper accommodation for the various movements, classifications and arrangements, which the business of instruction requires— and the want of separate apartments, or of an ample inclosed area around the school, into which a portion of the children, even during school hours, might occasionally be sent, either for amusement, or for the preparation of their lessons, so as to prevent the general annoyance of the teacher.

2. Another circumstance which tends to make learning disagreeable to the young, is, that *they are in general confined too long in school*. When a boy is first sent to school, he is kept in a confined posture for two or three hours at a time, and generally for five or six hours in a day. His direct attention to his lesson, during all this time, does not perhaps exceed fifteen or twenty minutes. During the whole of the remaining hours he receives no instruction, and either sits as stiff as a poker, or becomes restless and noisy, or sinks into sleep. He dares not speak to his companions for fear of punishment, he cannot, without assistance, apply his attention to the unknown characters and sounds he is set to learn, he cannot amuse himself with his windmills and whistles, and, consequently, he feels himself in a state destitute of enjoyment. Can it then be wondered at that young people, should so frequently feel an aversion to school, and required to be driven to it as slaves to their task-work, or as culprits to a jail? In such a case as I have now supposed, there is no reason why a child should be confined to school beyond half an hour at any one time; and it is a piece of absurdity, and even of cruelty, to prolong their confinement a moment beyond the limits which are essentially requisite for their instruction; and yet many parents are so foolish as to think, that the progress of their children ought to keep pace with the number of hours they are immersed within the walls of the school-room. Children are not mere machines, whose movements may be regulated by weights and springs; they must give scope to their natural vivacity and desire for activity, and must feel, like all other animals, when they are confined to unnatural attitudes, and cramped in their movements. The tongue—that "unruly member" among all ranks and ages—cannot be restrained; the space of twelve inches square, allotted them for their seat, they will not be confined to; their feet and limbs will not remain in that precise mathematical position which order is supposed to require; neither will their hands remain in the same unvaried posture as those of a marble statue, but will occasionally be pushing, first toward one side, and then toward another for the benefit of their companions. Hence arise noise, dissension, altercation, and disorder—the chief circumstances which render corporeal punishment at all expedient in public schools

To confine a little boy in school, contrary to his inclination, when no useful purposes can be served by it, and when it is productive of so many inconveniences to the teacher, to the general interests of the school, and to the boy himself—appears to be the height of folly, and imprudence, and must present to the juvenile mind a forbidding prospect of the path which leads to the temple of knowledge. Even when children have advanced to that stage in their education where they are capable of preparing their lessons by themselves, it appears improper to confine them longer than their attention can be fixed to their scholastic exercises. Fifteen or twenty minutes of unremitting application to their lessons before and after having been heard by their teacher in their respective classes, would be of more importance, in promoting their progress in learning, than two or three hours spent in yawning over their books, or devoted, as is usually the case, to noisy prattle and impertinence. Those scholars who are farther advanced, or are engaged in arithmetical or other processes, may remain during all the hours usually allotted to scholastic instruction. — In throwing out these remarks, I do not mean to insinuate, that teachers should have much less confinement in public schools than they now have; I only propose it as a principle, which should generally be acted upon, that children should never be confined to school a minute longer than is absolutely necessary for their instruction, and, if this principle were generally recognized, promiscuous schools would no longer present a scene of idleness and impertinence, of noisy bustle and confusion. But, whatever may be the opinion of teachers on this head, the majority of parents in the present age are generally in opposition to all such arrangements.

3. *The exercise of undue severity toward the young, and the want of a disposition to bestow commendation where it is due*—is another circumstance which retards the beneficial effects of education. In every rank and department of human life, mankind are too much disposed to find fault with the opinions and conduct of others, and to pass a harsh sentence on the minor delinquencies of their neighbors; while they are slow in bestowing their commendation on those actions and qualities which are laudable and excellent. This disposition, we have reason to believe, is too frequently displayed in public seminaries of instruction. In many instances, trivial faults are magnified into great offenses; corporeal punishment is inflicted for slight inadvertencies; the terms, blockhead, scoundrel, villain, ass, dunce, numskull, and other degrading epithets, are liberally applied to the youthful group, because they occasionally give way to their playful humors, or because they do not thoroughly comprehend what has never been clearly explained to them. When their conduct is unimpeachable, they are simply screened from punishment; but the meed of praise for diligence and improvement—which has so obvious a tendency to cheer and animate the youthful mind; is slowly and reluctantly bestowed. Those endearing appellations to which they are accustomed under the domestic roof are seldom heard in the village school; and scolding, threatening, and the detested lash, are too frequently "the order of the day." While they are sometimes exercised in writing the following sentiment on their copy-books, "*Commendation animates the mind*," the voice of praise and commendation is seldom heard resounding from the desk, because, forsooth, they have not yet attained to perfection in their behavior, or in any of their scholastic exercises. Imperfections attach them-

selves to the performances of every human being; but where should we find a person grown up to manhood, who would not feel indignant at being perpetually found fault with in all his operations, and who would not be discouraged in the prosecution of his plans, when that portion of praise to which he is justly entitled is studiously withheld? An assemblage of children in a school is a republic in miniature, animated materially by the same principles, passions and interests, as those which appear in action on the theater of the great world, only directed to inferior objects and pursuits. They must, therefore, feel indignant at the epithets, the threatenings, and the blustering, with which they are so frequently assailed, and must also feel that injustice is done them, when every trivial fault and oversight is magnified into a crime. And, on the other hand, we know by experience, that nothing contributes more to cheer and stimulate the juvenile mind than to receive the merited approbation of guardians and instructors.

4. Another circumstance prejudicial to an accurate and enlightened education, is *the practice of hurrying children too rapidly from one book to another*. In the "Statistical View of Education in Scotland," published in the Christian Instructor during the year 1819, it is stated by most of the teachers, that the children at their several schools can read the New Testament by the time they have been *one year* at school. Nay, some of them assert, that they can read it in six months, and even during the second and third quarters.* That the New Testament is put into the hands of children at the periods now stated, and that they are allowed to stammer through it in the best manner they can, is doubtless a fact, and a fact which is much to be regretted; but that a child that goes to school at the age of four or five, is able, in ordinary cases, to read the New Testament with any tolerable degree of accuracy and ease, in six, nine, or even in twelve months, is altogether incredible. There are many passages in this book as difficult to be read as the writings of the generality of English authors, and, if a boy or girl can once read it with propriety and ease, a very little additional practice will suffice to enable him to read any other English work. The statements to which I refer, however, show that the practice of hurrying children from one book to another, is too prevalent in many of the parochial schools of this country, and must, consequently, be attended with a train of pernicious effects. I have seen children sent to school with a Testament in their hand, as a class-book, who could not read a single verse, and could scarcely pronounce two or three of the easiest vocables without pausing to spell almost every word that occurred, and who, at the same time, appeared deficient in their knowledge of the characters of the alphabet. Before children can read such a book as the New Testament, with any degree of ease and fluency, they must be trained to the exercise of spelling, and of reading a variety of appropriate lessons accommodated to their capacities, until they can read a sentence or a paragraph without blundering or hesitation. But how is this proficiency to be acquired?—how can a child, with propriety, be transferred from one spelling book to another, and from one series of reading lessons to another, in the space of six or eight months? The practice to which I refer, seems almost to imply, that they are conducted at once from a twopenny Primer to the Evangelical History or the Acts of the Apostles. A pupil should

be able to read with ease every initiatory book that is put into his hands before he is transferred to another. For, by passing with a rapid transition from one book to another, and to lessons which are too difficult for his articulation and comprehension, he will be apt to acquire a hesitating and a blundering habit of reading; he will be discouraged in his progress; he will seldom attempt to aim at accuracy and perfection; he will appreciate few of the ideas contained in his lessons; he will seldom acquire even the elements of accurate spelling and pronunciation, and will be apt to continue through life, an awkward, an incorrect, and an injudicious reader.

5. The last circumstance I shall mention, in the meantime, as prejudicial to an accurate and enlightened education, is—*the attempt to teach three or four branches of education at the same time*. The principle of the division of labor, and its utility when applied to the various departments of art, science, and commerce, are now fully appreciated and realized; and to this circumstance is to be attributed many of the improvements of modern times. In cities and large towns this principle has also been applied successfully to the art of teaching. But it is well known that in the majority of schools, especially in the country, an attempt is made to teach reading, grammar, writing, arithmetic, book-keeping, mathematics, Latin, French, and other branches, in the same school, by the same teacher, and at the same time. The consequence is, that none of them is taught with efficiency and accuracy—which can only be obtained by allotting separate hours for each distinct department of knowledge, and, if possible, having separate teachers for each branch of scholastic instruction. Before this principle, however, can be followed out to its full extent in country schools, a variety of arrangements require to be made, a variety of difficulties and obstructions removed, and a variety of new scholastic institutions established—the details of which I shall postpone to a subsequent section of this work.

Such is a brief sketch of some of the evils and defects connected with the system of instruction which has so long prevailed in this country. It treats rational beings as if they were mere machines; it presents the *form* of education without the *substance*—it expends its energies on *words* instead of *things*—it rests in the *means* of knowledge, without prosecuting the *end*—it stimulates the *memory*, and even *tortures* it, by cramming its compartments with sounds instead of sense, but permits the *understanding* to remain in darkness and desolation—it indirectly fosters *malignant* passions, but leaves the *benevolent* affections waste and uncultivated—it throws a gloom over the enjoyments of the young, instead of inspiring them with delight at the prospect of being introduced to the sublime and interesting scenes presented in the temple of knowledge—it conveys a jumble of confused notions into their minds, but leaves them ignorant of all that is grand and ennobling, and interesting to man as a rational and immortal intelligence. In proof of these positions, we need only look around us on the various ranks of society. Where is there one individual out of twenty to be found, who has his mind enlightened in the knowledge of those subjects with which every human being, considered as a rational, social, and immortal being, ought to be acquainted? Where is there even to be found a *relish* for useful information and intellectual improvement, among the majority of those who have gone the round of the usual course of education? And where are to be seen the

* See Christian Instructor for August and November, 1819, pp. 561 and 763.

moral effects of our scholastic training on the stage of social and active life? Is not ignorance still a prominent trait in the great mass of our population? Do not vice and immorality very generally prevail? And are not selfishness and avarice, envy and revenge, sensuality and other groveling affections, still the distinguishing characteristics of the majority of the lower orders, and even of the higher ranks of society, notwithstanding the scholastic process through which they have passed? If any individuals in our times have been excited to the prosecution of rational and scientific pursuits, the stimulus has been derived from other quarters, from other circumstances, and from other institutions. The greater part of the benefit derived from the existing system, consists in a considerable portion of our population having acquired, to a certain degree, the art of reading, and, consequently, the capacity of rendering it subservient to the acquisition of knowledge, *when certain peculiar and favorable circumstances in after life conspire to stimulate their mental activity, and to produce a relish for rational enjoyments.* But, it may be affirmed, without the least hesitation, that there is not one out of twenty of the population who is stimulated, in this way, to rise superior to his groveling associates in the scale of intelligence.—Such considerations evidently show, that the system of instruction hitherto adopted is glaringly defective and inefficient for the improvement of society in knowledge and virtue;—and must be subverted and new-modeled, if ever we expect to see mankind raised to that rank which they ought to hold in the scale of moral and intellectual excellence. Until this object be accomplished, I verily believe, that, notwithstanding the instructions delivered from a thousand pulpits, very little change to the better will appear on the face of general society; for the public instructions of religion are neither understood nor appreciated by the one-half of our church-going population, owing to the deficiency of their moral culture in the early periods of life. That such a futile and inefficient system of tuition should have so long prevailed in this enlightened age, as it is generally termed, and that no powerful and general exertions should have been made for its improvement is little short of a libel on the common sense and the Christianity of our country.

In throwing out the preceding hints on the errors and deficiencies of the present system of education, let it be carefully remembered, that I am far from attaching blame indiscriminately to that respectable body of men who superintend the parochial and other seminaries in this country. It is indeed to be regretted, that there are too many persons employed as teachers who consider themselves as sufficiently qualified for the office, if they can write a tolerably good hand and cast accounts. But, on the other hand, it is one of the pleasing signs of our times, that the characters and qualifications of teachers are rapidly advancing in respectability, and our public schools are in general filled with men of learning and talent. It is to the *system of teaching*,—and not to the respectable individuals who act under it,—that these strictures more particularly refer. I am fully aware of the difficulties and the opposition which teachers have to encounter when they deviate from the common mode—arising from prejudices in favor of established practices, the ignorance of parents, and the foolish and unchristian modes by which many children are trained under the domestic roof. Many of our intelligent teachers perceive the evils of the present system, but they are *obliged*, in the meantime, to act

under it. In their individual and insulated capacity, unsupported by public patronage, they cannot remove its essential defects, nor attempt any material or important improvement, in consequence of the current of popular opinion; and their deviation from established practices would, in certain cases, tend to injure their pecuniary interests. I have known instructors of youth who have attempted improvements similar to some of those above hinted at, who were afterward constrained to throw them aside, owing to the causes now specified. I knew one in particular, who selected the most simple and interesting reading-lessons, and caused his pupils to give an account of every leading idea contained in them—who likewise attempted to explain the meaning of every question, Psalm and passage, which was to be committed to memory, and consequently, a very small portion only was prescribed, that it might be clearly understood and accurately repeated. But this plan could not be endured by those who estimate the quantity of instruction by the number of unmeaning lines and vocables which their children can vociferate. Such persons consider the repetition of three or four pages of mere words without ideas, as of far more importance than the communication of a hundred well-defined notions. He also caused the children, after their lessons were prepared and rehearsed, to write upon slates—letters, triangles, parallelograms, and other mathematical figures and diagrams, in order to keep them fully employed while in school; and occasionally permission was granted to scratch whatever they pleased on their slates—men, horses, houses, windmills, or any other fancy, as a reward for the attention they had previously bestowed. But he was obliged to desist from the prosecution of these and other plans, in consequence of “the hue and cry” which was raised about such “trifling modes of tuition.”

It is, therefore, pretty obvious, that no general or extensive improvement in the system of education can be expected, until a *strong conviction* be produced in the minds of the intelligent public of the *necessity* of a more rational and efficient system being adopted, and until a powerful and simultaneous movement take place among all classes, in order to the erection and endowment of seminaries calculated to produce a *moral* and an *intellectual* education. For many of the principles which pervade the present mode of tuition require to be *completely reversed*, and a system organized which shall form the foundation of the future progress of the human race—which will bear the test of succeeding and enlightened ages—which will render the acquisition of knowledge pleasant and desirable to the young—and which will embrace everything that is interesting to man as an intellectual being, as a member of society, and as a candidate for a blessed immortality.

In the meantime, I am fully convinced (however extravagant and paradoxical the sentiment may appear), that the great majority of our youth acquire more real and *substantial knowledge*, during their play hours, and in their various amusements and intercourses with each other, than they acquire during the formal process of teaching while in school. At these times they acquire a rude knowledge of the appearances and qualities of various objects; of some of the laws of Nature and its general scenery; of the forms, economy, and varieties of vegetables,—of the habits and instincts of animals; of the application of several mechanical powers; and of the various modifications of human temper and ac-

tion. Their games at shuttle-cock, nine-pins, marbles, balls and tops—their exercises in swimming, running, climbing, swinging and jumping—their visits to museums, menageries, and other exhibitions of natural and artificial curiosities—their views of the shipping, and the operations connected with it in seaport towns—their occasional excursions to the delightful and romantic scenes of the country, and the daily spectacle of the ebbing and flowing of the sea, of the sun shining in his glory, and of the moon walking in brightness among the hosts of stars—convey to their minds fragments of useful knowledge, more diversified and practical, than anything they acquire from their catechisms, spelling-books, grammars, and “English Readers,” in the manner in which they are generally taught. In school they acquire, indeed, the *means* of knowledge, in being taught the arts of reading, writing, and arithmetic; but as they are seldom taught to apply these means to their proper ends, little knowledge is thereby acquired; and, in the majority of instances, they depart from school, and pass the remainder of their lives, without ever thinking of making the further cultivation of their minds even a subordinate object of pursuit—glad that they are at length released from the confinement and drudgery connected with scholastic discipline. As a proof of this I need only appeal to the ignorance, and prejudices, the foolish opinions and the wayward passions, which still pervade the greater portion of the inferior ranks of our population, and even of the middling and higher classes—and the disinclination which so generally exists to rational investigations, and to prosecuting the path of mental improvement.

Much has of late been said on the subject of *abolishing corporeal punishment* in schools; and it is certainly a highly desirable object, which we should endeavor to promote by every means in our power. But we can have little hope that this will ever be fully attained while the present plan of education continues in operation, and while the majority of children are so injudiciously trained, as at present, by their parents and guardians. If, however, the evils complained of in this chapter were removed; if the books which are put into the hands of children were interesting and level to their comprehension; if they were taught to understand the lessons they read and commit to memory; if the understanding and the affections were as frequently exercised as the memory; if the mechanical drudgery of grammar were postponed to a period when they could enter into its spirit and applications; if the processes of arithmetic were more frequently illustrated by sensible objects and representations; if

interesting experiments and representations, calculated to illustrate the operations of nature and art, were frequently exhibited; if ample and agreeable accommodation were furnished, both within and without doors; if they were not too long confined in school; if a spirit of conciliation on the part of teachers, and a disposition to bestow merited commendation, were generally exercised; if every branch of education were taught at separate hours, and the attention of the pupil completely engaged while in school; and if a system of moral training were to form a *prominent* object in the business of education—we have good reason to believe that corporeal punishment might be almost, if not altogether superseded; and the employment of teaching in crowded promiscuous schools, instead of resembling Paul’s “fighting with beasts at Ephesus,” might become a rational, interesting, and delightful employment, both to the teacher and to the scholars.*

* The preceding strictures, chiefly written in 1821, were published in the Edinburgh Christian Instructor, for March 1822, and February 1823. The Author has good grounds for stating, that they proved a stimulus to the active mind of its learned Editor, the late Dr. A. Thomson, in exciting to those arrangements which were afterward made in St. George’s Parish, over which he presided, for establishing schools on a more enlightened system, both for the children of the higher and the lower ranks within that district. In the autumn of 1823, the author had several conversations with the Doctor, by special request, in reference to this subject, in which he unfolded his leading ideas on what he considered the true principles of education and the improvements that required to be introduced, which in general met the Doctor’s approbation, and appeared to coincide with the views he had lately adopted on the subject. He showed the author, at the same time, a variety of natural and artificial objects, which he had partly purchased, and partly received as donations from certain benevolent ladies, with the view of introducing them as part of an improved system of tuition which he intended soon to establish; and urgently requested him to continue his disquisitions on education, in the Christian Instructor, at certain moderate intervals between the appearance of the different essays, in order that the subject might be kept for some time before the view of the public. The intended communications, owing to certain circumstances, were never published; but the substance of what was then intended to be communicated will be found in the following pages. The schools established by Dr. Thomson, alluded to above, along with the Edinburgh Sessional School, under the superintendence of Mr. Wood, are material improvements on the usual mode of scholastic instruction, and though deficient in many important particulars, approximate, in a considerable degree, to the true intellectual mode of tuition.

The strictures thrown out in the preceding pages, more particularly apply to the parochial and other schools in Scotland, for the instruction of the middle and lower classes; but most of them are likewise applicable to the general modes of tuition in England. Since the period stated above, when they were first written, a few schools on more improved plans, have been established; but their number does not, perhaps, exceed twenty or thirty throughout the whole of North Britain; so that the preceding remarks will still apply to the modes of instruction generally practiced in our country.

CHAPTER III.

HINTS IN REFERENCE TO A COMPREHENSIVE AND IMPROVED SYSTEM OF EDUCATION.

THE *education* of human beings, considered in its most extensive sense, comprehends everything which is requisite to the cultivation and improvement of the faculties bestowed upon them by the Creator. It ought to embrace everything that has a tendency to strengthen and invigorate the animal system—to enlighten and expand the understanding—to regulate the feelings and dispositions of the heart—and, in general, to direct the *moral* powers in such a manner as to render those who are the subjects of instruction happy in themselves, useful members of society, and qualified for entering on the scenes and employments of a future and more glorious existence. The series of instructions by which these ends are to be attained, ought to be continued, not merely for five or six years, or less than the tenth part of the period of human existence—but *during the whole of that interval which lies between the cradle and the grave.*

It is a very common but absurd notion, and has been too long acted upon—that the education of our youth terminates, or should terminate, about the age of thirteen or fourteen years. Hence, in an article on this subject, in one of our encyclopedias, education is defined to be “that series of means by which the human understanding is gradually enlightened, between infancy and the period when we consider ourselves as qualified to take a part in active life, and *ceasing to direct our views to the acquisition of new knowledge or the formation of new habits*, are content to act upon the principles we have already acquired.” This definition, though accordant with general opinion and practice, is certainly a very limited and defective view of the subject. In the ordinary mode of our scholastic instruction, education, so far from being *finished* at the age above stated, can scarcely be said to have *commenced*. The *key* of knowledge has indeed been put into the hands of the young; but they have never been taught to unlock the gates of the Temple of Science, to enter within its portals, to contemplate its treasures, and to feast their minds on the entertainments there provided. Several moral rules and maxims have been impressed on their memories; but they have seldom been taught to appreciate them in all their bearings, or to reduce them to practice in the various and minute ramifications of their conduct. Beside, although every rational means were employed for training the youthful mind until near the age of puberty, no valid reason can be assigned why regular instruction should cease at this early period. Man is a progressive being; his faculties are capable of an indefinite expansion; the objects to which these faculties may be directed are boundless and infinitely diversified; he is moving onward to an eternal world, and, in the present state, can never expect to grasp the universal system of created objects, or to rise to the highest point of moral excellence. His tuition, therefore, cannot be supposed to terminate at any period of his terrestrial existence;

and the course of his life ought to be considered as nothing more than the course of his education. When he closes his eyes in death, and bids a last adieu to everything here below, he passes into a more permanent and expansive sphere of existence, where his education will likewise be progressive, and where intelligences of a higher order may be his instructors; and the education he received in this transitory scene, *if it was properly conducted*, will form the groundwork of all his future progressions in knowledge and virtue throughout the succeeding periods of eternity.

There are two very glaring defects which appear in most of our treatises on education. In the first place, the *moral* tuition of youthful minds, and the grand principles of religion which ought to direct their views and conduct, are either entirely overlooked, or treated of in so vague and general a manner, as to induce a belief that they are considered as matters of very inferior moment; and, in the business of teaching, and the superintendence of the young, the moral precepts of Christianity are seldom made to bear, with particularity, upon every malignant affection that manifests itself, and every minor delinquency that appears in their conduct—or to direct the benevolent affections how to operate in every given circumstance, and in all their intercourses and associations. In the next place, the idea that man is a being destined to an immortal existence, is almost, if not altogether overlooked. Volumes have been written on the best modes of training men for the profession of a soldier, of a naval officer, of a merchant, of a physician, of a lawyer, of a clergyman, and of a statesman; but I know of no treatise on this subject which, in connection with other subordinate aims, has for its grand object to develop that train of instruction which is most appropriate for man considered as a candidate for immortality. This is the more unaccountable, since, in the works alluded to, the eternal destiny of human beings is not called in question, and is sometimes referred to as a general position which cannot be denied—yet the means of instruction requisite to guide them in safety to their final destination, and to prepare them for the employments of their everlasting abode, are either overlooked, or referred to in general terms, as if they were unworthy of particular consideration. To admit the doctrine of the immortality of the human soul, and yet leave out the consideration of it, in a system of mental instruction, is both impious and preposterous, and inconsistent with the principle on which we generally act in other cases, which requires, that affairs of the greatest moment should occupy our chief attention. If man is only a transitory inhabitant of this lower world, if he is journeying to another and more important scene of action and enjoyment, if his abode in this higher scene is to be permanent and eternal, and if the course of instruction through which he now passes has an important bearing on his happiness in that state, and his preparations

for its employments—every system of education must be glaringly defective which either overlooks, or throws into the shade, the immortal destination of human beings.

If these sentiments be admitted as just, the education of the young must be a subject of the highest importance—and there cannot be an object more interesting to Science, to Religion, and to general Christian society, than the forming of those arrangements, and the establishing of those institutions, which are calculated to train the minds of all ranks to knowledge and moral rectitude, and to guide their steps in the path which leads to a blessed immortality. In this process there is no period of human life that ought to be overlooked—we must begin the work of instruction when the first dawning of reason begins to appear, and continue the process through all the succeeding periods of mortal existence, until the spirit takes its flight to the world unknown.

In the following cursory observations, I shall, in the first place, offer a few general remarks on the proper training of the young during the earlier stages of life, and afterward illustrate some of the modes of instruction which may be proper to be adopted in the more advanced stages of human existence. It may be proper, however, to premise, that I have no intention of presenting to the reader a detailed system of education, but only a few general hints in reference to the outlines of this important subject, and to the principles on which a system of rational tuition ought to be conducted.

SECTION I.

ON THE EDUCATION OF THE YOUNG DURING THE PERIOD OF INFANCY.

At the moment a child is ushered into the world, and first draws into its lungs the atmospheric air, it may be said to commence its education. What its sensations are, when it has emerged from the watery fluid with which it was surrounded, and inhales this new element, it is impossible to determine; but from the sounds which it utters, we may reasonably conjecture that they are attended with pain. It struggles and cries—hunger produces an uneasy sensation—it feels a want—that feeling opens its lips, and makes it seize and greedily suck the nourishing breast of its mother. At this period its eyes are generally dull and languid; it seems to keep them fixed and idle; they want that luster which they afterward acquire; and if they happen to move, it is rather an accidental gaze, than an exertion of the faculty of seeing. But, after some months have elapsed, its vision becomes distinct, its organs are fortified, and it becomes susceptible of various impressions from surrounding objects. Then the senses of seeing, hearing, tasting, touching, and smelling, begin to act with a certain degree of vigor; all the avenues to the mind are thrown open; the objects of nature and art rush in crowds to their respective organs of sensation, and engrave an indefinite assemblage of ideas upon the mind, though perhaps with a certain degree of irregularity and confusion. In this first stage of existence, the various sensations it feels, and the multifarious external objects it perceives, may be considered as so many instructors conveying the rudiments of knowledge to the infant mind.

As the infant advances in its new career, multitudes of objects of various descriptions begin to solicit its attention. A thousand sounds, of different degrees of intensity, and variously modified, strike its ears, producing various indescribable emotions; a thousand visible objects of diversified forms and colors present themselves to his visual organs, producing pleasure or pain, desire or aversion. By insensible degrees it learns to see and to hear—to mark the difference between one sound and another, and between one object of vision and another—to distinguish the form and countenance of its mother from those of other individuals, and to take an interest in some of the objects which compose the surrounding scene. Being uniformly struck with the same sensations and emotions in the presence of the same objects, its memory begins to be exercised, and it acquires a more accurate idea, and a more distinct remembrance of them, in proportion to the frequency with which these objects are presented to view. Its body, in the meantime, gradually expands, and becomes more firm, vigorous, and alert. It crawls along the nursery or parlor, below tables and chairs, examining every object that falls in its way, and appears delighted in exerting its muscular powers. It tries to stand erect, and at length to walk; it tumbles and rolls on the floor, uttering screams of pain and disappointment. Numberless and repeated falls lead to more caution, and teach it to endeavor to preserve the equilibrium of its body, and to stand firmly upon its legs; and the more frequent and painful the falls, the more instructive they prove, to teach it to balance its body, and to walk with adroitness and ease. Having acquired, after repeated exertions, a certain firmness of step, it runs from one place to another, eagerly intent upon new objects and pursuits, and feeling a delight in proportion as the range of its perceptions is increased. It tries to climb a stair, and, after repeated efforts, and exertions of hands and feet, succeeds in the attempt; but, when arrived at the top, and wishing to descend, it looks down to the bottom, and, remembering the falls it formerly experienced, feels a sense of danger, and screams for assistance.

The child (whom we shall now distinguish by the masculine pronoun) now runs about through the garden or in the fields, and perceives a variety of objects and operations. He sees a stone thrown into the water, and sink to the bottom; he sees a piece of wood or the leaf of a tree fall into the same water, and yet float on the surface; he amuses himself with numberless experiments of this kind, and from these he gradually acquires his first ideas of the specific gravity of bodies. If he take the stone and the wood out of the water, and by chance they fall upon his feet, he learns that the heavier body falls with more force than the lighter, from the unequal degree of pain occasioned by the fall, and has his mind impressed with the idea of their unequal hardness and weight. He strikes a table with a stick, and soon after, a pane of window-glass with the same weapon; he perceives the glass broken to shivers, while the table remains as before, and thus learns the difference between substances that are hard, and those that are brittle, and that some bodies are broken with a blow which others can resist. He views with pleasure a brilliant light, and ventures to put his fingers to the blazing hearth, or to the flame of a candle, but feels a sudden sensation of acute pain, which warns him of the danger of using too much familiarity with fire, notwithstanding its alluring aspect. He sees a cow, a dog, or a cat,

and is told its name, and, after frequent repetitions, he learns to connect the sound with the object which it is intended to represent. He sees a horse walking along a road, and afterward its figure as represented in an engraving, and soon learns to recognize the resemblance of the one to the other. In short, every person with whom he is acquainted, every individual object of which he becomes fond—his rattles and his bells, his drums and his whistles, his little coaches and his jumping Jacks, may all be considered as so many instructors conveying lessons to his opening mind.—In acquiring the information such objects are calculated to afford, *repeated exertions of the understanding* must necessarily be made. The knowledge of any particular object, as to its powers and qualities, cannot be supposed to be attained without an effort similar to that which an adult person must exert, when investigating the laws of Nature, and the general economy of the universe. For, everything a child sees or hears, in the first instance, all the marks and characters of Nature, and the qualities and operations of surrounding objects, are as much unknown to him as the sciences of Philology, Mathematics and Astronomy, to the untutored savage; and, consequently, require a certain degree of attention and reasoning before the knowledge of them can be acquired.

The little student, however, prosecutes his observations and studies with apparent pleasure, and with evident marks of industry, and soon acquires pretty correct notions of the nature and relations both of the inanimate and of the living world. He learns to correct the illusions to which he was at first exposed—to distinguish one object from another, and to exert his memory so as to know them again, and to recognize their general forms and qualities. It is amazing what a degree of knowledge a child has thus acquired before he arrives at the age of two years, or even twenty months. By this time he has made a thousand experiments on an indefinite variety of objects, all which he has arranged in his mind, and distinctly remembers. Light and heat, the properties of fire and flame, of water and air, the laws of projectiles and moving bodies, things sweet and bitter, soft and hard, rough and smooth, articulate sounds and the objects they denote, sounds soft or loud, agreeable or terrible; horses, cattle, dogs, asses, sheep, ducks, birds, butterflies, beetles, worms, the clouds, the sun, moon, stars, and numerous other objects—are all distinguished, and many of their properties and relations indelibly imprinted on the mind. He has acquired more real knowledge during this short period, than he generally does, on the present plan of instruction, throughout the eight or ten succeeding years of his life; and it is a striking instance of the Benevolence of the Creator, and a prelude of the vast extent of knowledge he is afterward capable of acquiring, that all these acquisitions are not only made without pain, but, in the greater number of instances, are accompanied with the highest pleasure and enjoyment.

In the process of instruction, now described, during the first two years of human existence, although Nature is the principal instructress, yet she frequently requires to be guided by the hand of Art; and much is left to the judicious attentions of parents and guardians, that her benevolent designs may not be thwarted, and that her efforts may be conducted to their proper ends. In throwing out a few hints on this point, our remarks may be arranged under the following heads—Physical, Moral, and intellectual Education.

I. THE PHYSICAL EDUCATION OF INFANTS.

The influence of physical education during infancy, on the future happiness of the individual, is much greater, and more extensive in its consequences, than is generally imagined. A proper attention to food, climate, cleanliness, air and exercise, may have an important effect, not only in developing the different parts of the body, and strengthening the animal system, but also in invigorating, and calling forth into exercise, the powers of the mind. We find, in advanced life, that the state of the body as to health or sickness, has a powerful influence on the vigor of the intellectual faculties; and we have reason to believe that the same connection between the physical system and the development of mind exists in the most early period of life. A certain writer has observed that, “as the manifestations of mind depend on organization, it is conceivable why even talents and moral feelings depend on the influence of climate and nourishment.”—In throwing out a few cursory remarks on this subject, I shall attend, in the first place, to

The food of Infants.—As soon as an infant is ushered into the world, Providence has provided for it food exactly adapted to its situation. The milk of the mother is at first of a thin, watery consistence, fitted to evacuate the meconium, and no other substance is found to be so efficacious for this purpose. Syrups, wines, oils, honey, or rhubarb, which have been so frequently administered to new-born infants, by midwives and nurses, are repugnant to nature, and are condemned, except in extraordinary cases, by every medical practitioner. Children require very little food for some time after birth; and what they receive should be thin, weak, light, and of a cooling quality. After a few days the mother's milk becomes thicker and more nutritious, and should form the principal nourishment of the child during the first three months. It appears to be the dictate of nature, that every mother ought to suckle her own child, since she is furnished with the proper nutriment for this purpose; and nothing but downright necessity should prevent her from undertaking the task, or induce her to have recourse to a substitute. We might tell the mother who, without necessity, throws the care of her issue upon a stranger, that the admirable liquor which the God of Nature has provided for her child, may become mortal to her for want of a discharge, diffuse itself within, gather and stagnate, or, at least, bring on a dangerous fever—that there is a natural proportion between the blood that runs in the veins of a child, and the milk it receives from its mother—that to receive the caresses, to enjoy the smiles, and to mark the gradual progress of her child toward maturity, would be more than a compensation for all the fatigue she would undergo in watching over its infant years—that the mutual affection of a mother and her child depends, in no inconsiderable degree, on the child's spending the period of its infancy in its mother's arms—and that, when she substitutes another in her place, the child naturally transfers its affection to the person who performs the duties of a mother. But, before such considerations can have much weight with the higher classes of society, who chiefly indulge in this practice, their general system of education must be altered and reformed. The daughters of the nobility and of opulent citizens, must be more accustomed to the open air and rural employments, and their bodies trained to the bearing of burdens, the endurance of severe heat or intense cold, and

to the resisting of danger and fatigue;—in short, they must be educated like the daughters of *Bethuel* and of *Laban*—the nobles of ancient times—who did not disdain to “keep their father’s sheep,” and to go “to the well of water, with their pitchers on their shoulders.”

As the child advances, he may be gradually accustomed to other food beside the milk of his mother—beginning with liquids, such as milk and sugar, broth, boiled biscuits, thin milk potage, and similar aliments, and then going on to more solid nutriment, according to the strength of his digestive powers. The younger the child, the less nourishment should be given at one time, and the oftener repeated; older children may take more food at once, and at longer intervals. All high-seasoned, salted, and smoke-dried provisions, tough, heavy, and fat meats, unripe fruits, sweetmeats, wines and spirituous liquors, are injurious to children. Few things are more so than the common practice of *sweetening* their food, which entices them to take a greater quantity than is necessary, and makes them grow fat and bloated. All cramming of their stomachs, pampering them with delicate meats, and guzzling of ale and other fermented liquors, ought to be carefully avoided. Pure water for drink, plain and simple food—which will never induce them to take more than enough—and abstinence from physic, except in very critical cases, will be found the most judicious means for preserving and confirming the health of children, and invigorating their mental powers.

No less attention ought to be paid to the *air* they breathe, than to the food with which they are nourished. Pure atmospheric air is indispensable to the existence of every sensitive being, for where it is greatly corrupted or exhausted, animals languish or die. It may be regarded as a universal medicine and restorative, and as the principal pabulum of life. Wherever it is confined for want of circulation, and impregnated with the deleterious fumes of sulphur, putrid substances, smoke, dunghills, excrements, and other noxious exhalations, it acts as a slow poison, induces diseases, and gradually undermines the human constitution. Hence the propriety of rearing children in apartments where the air is clear and dry, uncontaminated with the steam arising from cooking victuals, and from ironing linen, and from the breath and perspiration of persons crowded into a narrow room—and the necessity of frequently leading them abroad into the open air, to enjoy the light of heaven and the refreshing breeze. Hence the impropriety of crowding two or three children’s beds into one small apartment,—of covering a child’s face when asleep, and wrapping him up too close in a cradle, by which means he is forced to breathe the same air over and over again, all the time he sleeps. In great towns, where the poorer class of inhabitants live in low, dirty, confined houses, and narrow lanes, where pure air has seldom access, the want of wholesome air often proves destructive to their offspring; and those of them who arrive at maturity are most frequently weak and deformed. In the improvements now going forward in society, it would be of vast importance to the health and comfort of the laboring classes, that such dwellings were completely demolished, and forever prevented from again becoming the habitations of men.

In connection with air, the influence of *light* ought not to be overlooked. Almost all organized bodies require the influence of light for their health, and the full development of their parts

and functions. It changes the color of plants and animals, and the complexion of man. As plants when deprived of light grow pale, and insects confined to dark places remain white, so those who spend their lives in their closets, or in gloomy apartments, acquire a pale and yellowish complexion, and many sickly persons become worse about sunset, and during the continuance of night. Hence the propriety of nursing children in light and cheerful apartments, and of carrying them frequently into the fields, to enjoy the full influence of the radiant sun. And hence it follows, that dark habitations, close and narrow lanes, houses sunk beneath the level of a street, small windows, somber walls, trees immediately in the front of dwellings, and whatever intercepts the light of heaven from the habitations of men, must damp the animal spirits, and prove noxious to the vigor of the human frame. Whereas, a full and uninterrupted view of the beauty, the variety, and the lively colors, of the scenes of nature, has the happiest effects on the temper, and a tendency to exercise and invigorate the powers of the mind;—for there can be little doubt, that the faculties of the understanding, and the dispositions of the heart, which characterize the individual in the future part of his life, acquire their particular bias and distinguishing features from the circumstances in which he is placed, and the objects with which he is surrounded, in early life.—It may not be improper to add, that, as the eyes of very young children are delicate, they should not at once be exposed to a strong light; and, when they advance, as they are eager to stare at everything, particularly at a brilliant light, their eyes should be turned so as to have the object in a straight line before them, or their backs turned directly to it. To allow them to look at it sideways, or with one eye, would teach them a habit of *squinting*.

Few things are of more importance to the health and comfort of children than *cleanliness*. The functions of the skin are of peculiar importance in the animal system, and have a great influence in preserving the health and vigor of the corporeal frame. Through its millions of pores, the insensible perspiration is incessantly flowing, and more than the one-half of what we eat and drink is in this way discharged. Hence the danger which must arise from frequent obstruction of this essential function, from wet, excrements, dirty linens, and every kind of uncleanness. From want of attention to this circumstance, various diseases of the skin, eruptions, catarrhs, coughs, the itch, obstructions of the first passages, and even many fatal disorders, derive their origin. It is injurious both to the health and the virtue of man; it stupefies the mind, sinks it into a lethargic state, deprives him of animal enjoyment, and of the esteem and regard of others. Whereas cleanliness promotes both health and virtue, clears the understanding, encourages to cheerfulness and activity, prevents many loathsome maladies, and procures the attachment and esteem of associates. Hence the incessant and minute attention which ought to be paid to this circumstance, by parents and nurses, in the rearing of the young. Cleanliness in domestic life, may be considered as one of the cardinal virtues, as an essential requisite in the physical education of children, and, perhaps, the only province of parental care in which they can never do *too much*. The pores of the skin should be kept open by washing the body, and changing the clothes and linen whenever they are unclean. In the first instance, children may be bathed in lukewarm

water, and afterward with water of a colder temperature, as they are able to bear it. Some parts of the body, such as the interior of the legs, the folds of the neck, the arm-pits, and the parts behind the ears, which are liable to be inflamed, demand particular attention. The nose, likewise, should be occasionally washed and thoroughly cleaned; it having been found, that the unpleasant smell peculiar to some infants, is owing to the habitual neglect of cleaning that organ. Great attention ought to be paid to children in regard to their evacuations; and everything that may occasion dampness, and every kind of offensive matter that might adhere to the skin, should be speedily removed. As children are liable to perspire more than adults, frequent change of their linen is a matter of some consequence; and all parents who can afford it, should give them clean dry linen *every day*. It is as much the duty of parents to wash and clean their children, as it is to feed and clothe them; and children that are frequently washed and kept clean, gradually improve in health and vivacity; cleanliness becomes familiar to them, their spirits are enlivened, and they grow up virtuous, polite, and happy.

The Russians, with all their ignorance and rusticity of manners, are said to be superior to the more refined English, French, and Germans, both in a delicate sensibility of cleanliness, and in the practical use of the bath. A foreign gentleman, traveling in Russia, had hired one of the natives as his groom or postillion. After having traveled several days together in very sultry weather, the semi-barbarian, upon his knees, requested his employer to grant him leave of absence for two or three hours, to refresh himself with the luxury of a bath, which to him was indispensable, and the want of which he had long felt.—In Russia almost every house has its bath; and the peasants in that country possess a refinement of sense, with respect to the surface of the body, with which the most elegant ladies in other countries seem totally unacquainted. Even the American Indians, who cannot change their furs so frequently as we can our clothes, put under their children the dust of rotten wood, and renew it as often as it becomes damp.

The *clothing* of children likewise requires some degree of skill and attention. This, indeed, is so simple a matter, that it is surprising that persons living in civilized countries should ever have erred so egregiously in regard to it; and yet it is a fact, that many children have been rendered deformed, and others have lost their lives, by the pride and folly of their parents in respect to this circumstance. The time has not long gone by (if it have yet passed), since a poor child, as soon as it breathed the vital air, had as many rollers and wrappers—sometimes ten feet in length—applied to its body, as if every bone had been fractured in the birth; and these were often drawn so tight, as to gall its tender frame, and even obstruct its vital organs—a piece of folly so repugnant to the dictates of nature, that even the most savage nations never commit it; and hence, deformed children are seldom or never found among them. By the weight and pressure of stays, bandages, heavy and tight clothes, children, who were well-proportioned at their birth, have afterward appeared with flat breasts, high shoulders, crooked spines, and other deformities. For when a child is cramped in its clothes, it naturally shrinks from the part that is hurt, and puts its body into unnatural postures: and every part of it, even the bones themselves, being soft and flexible, deformity, of some kind or other, is the natural result.

To this cause physicians have ascribed the numerous instances of children dying of convulsions soon after their birth.

The general rule which reason suggests, in regard to the clothing of children is—"That a child have no more clothes than are necessary to keep it warm, and that they be quite easy for its body." In conformity to this rule, the dress of children should be simple, clean, light, and cheap—free, wide, and open, so as neither to impede the vital functions, nor the free and easy motions of the body, nor prevent the access of fresh air, and be easily put on or taken off. The following cut exhibits the simple dress of a little

girl.—Pins should be used as little as possible, and the clothes chiefly fastened with strings, which would prevent the occasional scratching of their tender skins, and those alarming cries which so frequently proceed from this cause. Such a light and simple dress would induce children to live with less restraint in the society of each other; and check that silly pride, which leads them to ape the fashions of their superiors, and to value themselves on account of the finery of their clothes. During the first months, the head and breast may be slightly covered; but as soon as the hair is sufficiently long to afford protection, there appears little necessity for either hats or caps, unless in seasons of rain or cold. By keeping the breast and neck uncovered, they acquire more firmness, are rendered hardier, and less susceptible of being affected with cold. Beside, a child has really a more interesting aspect, when arrayed in the beautiful simplicity of nature, than when adorned with all the trappings which art can devise. The following anecdote, related by Herodotus, illustrates the advantage connected with a cool regimen of the head. "After the battle fought between the Persians, under *Cambyses*, and the Egyptians, the slain of both nations were separated; and upon examining the heads of the Persians, their skulls were found to be so thin and tender, that a small stone would immediately perforate them; while, on the other hand, the heads of the Egyptians were so firm, that they could scarcely be fractured by the largest stones." The cause of this remarkable difference was attributed to the custom of the Egyptians shaving their heads from earliest infancy, and going uncovered in all states of the weather; while the Persians always kept their heads warm by wearing heavy turbans.

Attention ought likewise to be paid to the proper covering of the *feet*. It is scarcely necessary for children to use shoes before they are a year old; or if they do, the soles should be thin and soft. The form of the human foot is such, that, at the

toes it is broad, at the heel narrow, and the inside of the foot is longer than the outside—a form which is evidently intended by Nature to enable us to stand and walk with firmness and ease. It is therefore a dictate of nature, that shoes should be made in the same form as the feet, and be sufficiently roomy for the toes to move with ease; and in order to this, they must be formed upon two separate lasts, corresponding to the right and the left foot. How shoes came at first to be made tapering to a point at the toes, almost like a bodkin—how high heels became the darling fashion of the ladies—and how a small foot came to be reckoned *genteel*—I pretend not to determine; but certainly nothing can be more absurd and preposterous. Such opinions and practices, along with many others which abound, particularly in the fashionable world, have a direct tendency to counteract the benevolent intentions of Nature, and are nothing short of an attempt to arraign the wisdom of the Creator, in his arranging and proportionating the different parts of the human frame—as if puny man, by his foolish whims, were capable of improving the workmanship of Infinite Intelligence.—The following figures (taken from Dr. Faust) plainly show the absurdity of the shapes which have been given to shoes. Fig. 1, shows the original shape of the sole of the left foot. Fig. 3, shows how the sole of the left shoe ought to be formed,—and Fig. 2, shows clearly that the shoes usually worn, and made on one last, cannot correspond to the natural shape of the foot. If they taper toward a point, the large toe, and some of the small ones, must be crushed and pressed against each other, causing pain to the wearer, and producing corns. The simplest and most accurate mode of taking the true measure and form of shoes, is, to place each foot upon a sheet of paper, and then draw its shape with a pencil, to which two separate lasts should nearly correspond, after having ascertained the curve of the upper part of the foot.

With regard to the clothing of children, in general, it is the opinion of Dr. Faust, that, from the beginning of the third, to the end of the seventh or eighth year, "their heads and necks must be free and bare, the body clothed with a white shirt, and frock with short sleeves, the collar of the shirt to fall back over that of the frock, with the addition of a woollen frock, to be worn between the shirt and the linen frock, *during winter*, and that the feet be covered only with a pair of socks, to be worn in the shoes." Such a cheap and simple dress, if generally adopted, would undoubtedly be beneficial to mankind in general, and tend to promote the strength, beauty, and graceful attitudes of children,—and, at the same time, check the foolish propensity of parents to indulge their children in flimsy ornaments and finery, beyond what their means can afford. At present, children are frequently muffled up with caps, hats,

bonnets, cravats, pelisses, frills, muffles, gloves, ribbons, and other paraphernalia, as if they were to be reared like plants in hotbeds,—so that the shape and beautiful proportions which Nature has given them can scarcely be distinguished. I shall only add, that the dress of children ought to be kept thoroughly *clean*; as dirty clothes not only gall and fret their tender skins, but tend to produce disagreeable smells, vermin, and cutaneous diseases; and no mother or nurse, however poor, can have any valid excuse for allowing her children to wallow in dirtiness.

We may next offer a remark or two on the *sleep* and *exercise* of children. The exercise of the corporeal faculties is essentially necessary to the health, the growth, and the vigor of the young. The desire of exercise is indeed coeval with our existence, which is plainly indicated in the delight which children take in beating with a stick, crawling along a floor, or climbing a stair, as soon as they are able to make use of their hands and feet. It is, therefore, the duty of parents to regulate this natural propensity, and direct it to its proper end. When children are very young, they may be exercised by carrying them about, giving them a gentle swing, encouraging them to move their hands and feet, talking to them, alluring them to smile, and pointing out everything that may please and delight their fancy. When they first begin to walk, the safest method of leading them about, is by taking hold of both their hands; and when they fall, they should never be lifted up by one part only, such as by one hand or one arm, as luxations, or loosening of the joints, may be occasioned by this practice. The practice of swinging them in leading-strings, is sometimes attended with hurtful consequences. It induces them to throw their bodies forward, and press their whole weight upon their stomach and breast, by which their breathing is obstructed, and their stomach compressed. When they are able to walk with ease, they should be encouraged to run about in places where they are not exposed to danger, to exert their hands and limbs, and to amuse themselves in the company of their associates. When they cannot go abroad, they may be exercised in running along a room or passage, or in leaping and dancing. A certain eminent physician used to say, "that he made his children dance, instead of giving them physic." When children fall, or get into any difficulty in the course of their movements, if they are in no danger, we should never be forward to express our condolence, or to run to their assistance; but leave them to exert their powers, and to scramble the best way they can, in order to extricate themselves from any painful situations in which they may have been involved. By being too attentive to them, and appearing too anxious, in such cases, we teach them to be careless of themselves,—by seeming to regard every trifling accident which befalls them as a dreadful calamity, we inspire them with timidity, and prevent them from acquiring manly fortitude.

With regard to the *sleep* of children, it is universally admitted, that they require far more than persons of adult age; and the younger the child, the more sleep he requires. An adult requires only about seven hours in the twenty-four; but very young children require double that number. However long they may happen to sleep, they should never be suddenly awakened. It is dangerous in the extreme to lull them to sleep by doses of laudanum, or other soporific medicines, as is frequently done by mercenary and indolent nurses. In order to induce children to repose, they are generally rocked in cradles; but there is no absolute

necessity for resorting to this expedient. If they are constantly kept dry and clean, and accustomed to fresh air, and not frequently disturbed, they will sleep comfortably and soundly without any violent agitation. Some of my own children were never in a cradle, and yet they were far more easily managed, in respect to sleeping, and watching, and other circumstances, than those of them who were accustomed to it; and many similar instances, were it expedient, could be brought forward. But if they are to be *rocked* in cradles, it ought to be with the greatest gentleness. The violence with which children are sometimes rocked, jumbles their brain, and makes them uneasy, giddy, and stupid, and is consequently injurious, both to body and mind. If the practice of rocking, however, were altogether laid aside, it would be a great relief to mothers and nurses, and afford them more uninterrupted leisure for the performance of other domestic employments.—As it is viewed by some to be hurtful and dangerous for mothers to take their infants with them to bed,—in Italy, mothers who do so, use a machine which protects them from all injury and danger. It is called *arcuccio*, and is 3 feet 2 inches long, and the head-board, 14 inches broad and 13 inches high.

I shall only observe further, on the subject of physical education,—that, when children begin to lisped out a few words, or syllables, *great care ought to be taken to give them an accurate and distinct pronunciation.* Every sound we wish them to pronounce, should be *slowly and distinctly* uttered before them, beginning with single sounds, and proceeding to easy words; and they should never be taught any pronunciation which they will afterward be under the necessity of unlearning. The pleasure we feel at first hearing them aim at the use of language, is apt to dispose us to listen with such attention, as to relieve them from the necessity of acquiring a distinct and open articulation. The consequence is, that they get into a rapid, indistinct, and hesitating mode of speaking, which is afterward very difficult, and sometimes impossible to correct. Would we teach them a plain and distinct articulation, we should uniformly speak with distinctness and accuracy in their presence; and refuse to answer their requests, unless they are expressed with the greatest precision and accuracy which their organs of articulation will permit. Attention to this circumstance would smooth the way to accurate and early reading, and prevent much trouble both to teacher and scholar, when the child commences a regular train of instruction.

I have been induced to offer these few hints on this subject, from a strong conviction, that the physical education of children is intimately connected with the development of mind—and that whatever tends to promote health, and to strengthen the animal frame, will also tend to invigorate the soul, and call forth into exercise its energies and powers.

II. ON THE MORAL INSTRUCTION OF INFANTS.

This is a subject of peculiar importance, to which the attention of every parent ought to be early and thoroughly directed. No duties are generally more trifled with than those which relate to the moral tuition of infants; and even sensible and pious parents too frequently err on this point, and lay the foundation of many bitter regrets and perplexities in after life, both to themselves and to their offspring. On the mode in which a child is trained, during the two or three first years of its existence, will, in a great measure, depend

the comfort of its parents, and its own happiness during the succeeding periods of its existence.

The first and most important rule on this subject, and which may be considered as the foundation of all the rest, is—that *an absolute and entire authority over the child, should, as early as possible be established.* By authority I mean, a certain air and ascendant, or such a mode of conducting ourselves toward children, as shall infallibly secure obedience. This authority is to be obtained neither by age nor stature—by the tone of the voice, nor by threatening language; but by an even, firm, moderate disposition of mind—which is always master of itself—which is guided only by reason—and never acts under the impulse of mere fancy or angry passions. If we wish such authority to be absolute and complete—and nothing short of this ought to be our aim—we must endeavor to acquire this ascendancy over the young *at a very early period of their lives.* Children at a very early age are capable of reasoning, of comparing different objects with each other, and of drawing conclusions from them. I have seen a child of eight months turn round and point at a portrait, when the name of the individual whom it represented was announced; and another, not much older, point first to the original and then to the painting, indicating its perception of the resemblance of the one to the other. And as the rational and perceptive powers soon begin to operate, so we find that stubbornness, obstinacy, anger, and a spirit of independence, display themselves at a very early period, even when the child is sucking its mother's breast. "What mean those cries," (says Augustine), those tears, the threatening gesture of the eyes, sparkling with rage, in an infant, when resolved to gain his point, with all his force, or inflamed with jealousy against one another? Though its infantine members are weak and imbecile, its passions are sometimes strong and furious. I have seen a child burning with jealousy. He could not yet utter a word, but, with a pale countenance, could cast a furious look at another child who was sucking with him at the same breast."

These circumstances clearly point out the period for subduing the bad inclinations of children, and training them to submission and obedience. From the age of ten or twelve months, and earlier if possible, every parent ought to commence the establishment of authority over his children; for the longer it is delayed after this period, the more difficult it will be to bring them under complete control. This authority is to be acquired—not by passionately chiding and beating children at an early age—but by accustoming them to perceive that *our will must always prevail over theirs*, and in no instance allowing them to gain an ascendancy, or to counteract a command when it has once been given. Dr. Witherspoon recommends the following plan to accustom children to obedience:—"As soon as they begin to show their inclination by desire or aversion, let single instances be chosen, now and then (not too frequently), to contradict them. For example, if a child shows a desire to have anything in his hand that he sees, or has anything in his hand with which he is delighted, let the parent take it from him; and when he does so, let no consideration whatever make him restore it at that time. Then, at a considerable interval, perhaps a whole day is little enough, let the same thing be repeated. In the meantime, it must be carefully observed, that no attempt should be made to contradict the child in the intervals. Not the least appearance of

opposition, if possible, should be found between the will of the parent and that of the child, except in those chosen cases when the parent must always prevail. Neither mother nor nurse should ever presume to condole with the child, or show any signs of displeasure at his being crossed; but, on the contrary, give every mark of approbation. This experiment, frequently repeated, will in a little time so perfectly habituate the child to yield to the parent whenever he interferes, that he will make no opposition. I can assure you from experience, having literally practiced this method myself, that I never had a child of twelve months old but would suffer me to take anything from him or her, without the least mark of anger or dissatisfaction, while they would not suffer any other to do so without the bitterest complaints."

Such experiments, if properly conducted, would gradually produce in children habits of obedience; but they require to be managed with judgment and prudence, and gradually extended from one thing to another, until absolute submission is produced; care, however, being taken that the child be not *unnecessarily* contradicted or irritated. The Rev. Mr. Cecil, in some of his writings, relates an experiment of this kind which he tried on his own daughter, a little girl of about three or four years old. She was standing one day before the fire, amusing herself with a string of beads, with which she appeared to be highly delighted. Her father approached her, and said, "What is this you are playing with, my little dear?" "My beads, papa." "Show me these beads, my dear." She at once handed them to her father, who immediately threw them into the fire. "Now," said he, "let them remain there." She immediately began to cry. "You must not cry, my dear, but be quite contented." She then sat down on the floor, and amused herself with some other toys. About two or three days after this, he purchased another string of beads much more valuable and brilliant, which he immediately presented to her. She was much delighted with the appearance of the new set of beads. "Now," said her father "I make a present of these to you, because you was a good girl, and gave me your beads when I asked them." She felt, in this case, that obedience and submission to her parent were attended with happy effects, and would be disposed, in her future conduct, to rely on his wisdom and affection.* Children trained in this way, with firmness and affection, soon become happy in themselves, and a comfort to their parents; and those scoldings, contentions, and sounds of discord, so frequently heard in the family mansion, entirely prevented.

In order to establish complete authority, and secure obedience, the following rule must be invariably acted upon—that *no command, either by word, look, or gesture, should be given, which is not intended to be enforced and obeyed*. It is the rock on which most parents split, in infantile education, that, while they are almost incessantly giving commands to their children, they are not careful to see that they are punctually obeyed; and seem to consider the occasional violation of their injunctions, as a very trivial fault, or as a matter of course. There is no practice more common than this, and none more ruinous to the authority of parents, and to the best interests of their offspring. When a child is accustomed, by

frequent repetitions, to counteract the will of his parent, a habit of insubordination is gradually induced, which sometimes grows to such a height, that neither entreaties, nor threats, nor corporeal punishment, are sufficient to counteract its tendencies; and a sure foundation is laid for many future perplexities and sorrows. The rule, therefore, should be absolute—that every parental command ought to be enforced. And, in order to this, it is requisite that every command be *reasonable*—that a compliance with it produce no *unnecessary* pain or trouble to the child—that it be expressed in the words of *kindness and affection*—and that it ought never to be delivered in a spirit of *passion or resentment*. Reproof or correction given in a rage, and with words of fury, is always considered as the effect of weakness and of the want of self-command, and uniformly frustrates the purpose it was intended to subserve. "I have heard," says Dr. Witherspoon, "some persons often say, that they cannot correct their children unless they are angry; to whom I have usually answered, 'Then you ought not to correct them at all.' Every one would be sensible, that for a magistrate to discover an intemperate rage in pronouncing sentence against a criminal, would be highly indecent; and ought not parents to punish their children in the same dispassionate manner?"

One of the greatest obstacles in the way of acquiring complete authority, is the *want of fortitude and perseverance*, especially on the part of the mother. She is sometimes oppressed with anxieties and difficulties, busied with domestic affairs, or perhaps has a young infant at the breast, that requires her chief attention, or strangers may have paid a visit to the family. Her older child becomes restless and fretful, and runs through the dwelling disturbing every one with his cries. She tries to coax him with flattering promises; but it is of no avail. He is perhaps crying for something which she does not think proper to give. She at length scolds and threatens, and attempts to strike, which generally makes the child redouble his cries. Worn out, at length, with his cries and tears, and anxious to attend to some necessary affairs, she allows herself to be vanquished, and submits to his desires. Sugar, jellies, or plumcakes, are supplied to pamper his depraved appetite, and put an end to his crying; and, being exhausted with screaming, in a short time he drops asleep. The same process is repeated, when similar circumstances occur. Now, it is admitted that there is a difficulty in such cases; but it is a difficulty which *must* be overcome, if we would not become slaves to our children, and render them disobedient and unhappy through life. Were a mother, for a few days, or weeks at most, to make a strong effort, and to sacrifice for a little her own ease, and even some urgent business, and never flinch from the object until complete submission be accomplished, she would soon gain the requisite ascendancy; and, having acquired it, it would save her from a multitude of troubles and perplexities, which must otherwise be felt during succeeding years—prevent the necessity of scolding, threatening, and whipping—and lay a sure foundation for domestic harmony and filial affection. But the longer she delays, the more difficult it will be to acquire the requisite ascendancy; and the mother who trifles with this important duty, from day to day, lays the foundation of many bitter regrets and self-reproaches—renders her children curses instead of blessings—and will, sooner or later, feel the effects of her misconduct, and behold her sin in her punishment.

* This relation is not taken directly from Mr. Cecil's writings. If I recollect right, it was intended to illustrate the nature of *faith*; but it may likewise exemplify the benefits which flow from unreserved obedience to the commands of an affectionate parent.

The violation of parental authority, especially among the children of the lower ranks, is so common, that it ceases to excite wonder or surprise. One can scarcely walk the streets without seeing parental authority disregarded. A father is beheld with a whip or a stick in his hand, driving home his stubborn son, as if he were "a bullock unaccustomed to the yoke"—and a mother running after her child, with looks of fury and words of execration, seizing him by the shoulders, beating him with her fists, and dragging him along like a piece of lumber, while the little urchin is resisting with all his might and bellowing like an ox. A short time ago, I was passing along the suburb of a large town, when I beheld a child of about three years old amusing himself on the footpath before his dwelling. His mother approached the threshold, and called him in. "Come awa' Jamie, to the house, it's a cauld day." Jamie paid no attention to the command, but moved with the utmost deliberation to a greater distance. "Come awa'," says his mother a second time, "and I'll gie ye some good thing." James, however, marched on to a still greater distance. "Come back, Jamie," rejoined the mother, "and I'll gie ye an apple." James paused for a moment, and looked back with a kind of leer; but, recollecting, perhaps, that his mother had often promised, and failed in performing her promises, he set off with more speed than before. His mother now became vociferous, and bawled out, "Come back, you little villain, or I'll whip you, as sure's I'm alive." James, however, who appeared to have known his mother better than she knew herself, still marched on. The foolish mother now became furious, rushed after the child, and dragged him home like a squeaking pig, lamenting that her children were so stubborn and disobedient; and forgetting, in the meantime, that she herself was their instructor, and the cause of their obstinacy and disobedience. Children brought up in this manner are not only unhappy in themselves, but not unfrequently become pests in society, and particularly to the public instructors of youth, who find it extremely difficult, and sometimes next to impossible, to bring them under control and subordination to scholastic order and discipline—without which their progress in learning cannot be promoted.

Some children, even in the same family, are pliant and of tender feelings, and are easily brought under subjection by a judicious parent; while others are naturally proud, self-willed and obstinate. But even in the worst supposable cases, it is quite practicable, by firmness and prudent management, to bring the most stubborn under subjection. This may be illustrated from the following fact, extracted from an excellent little work, entitled "The Mother at Home, or the Principles of Maternal Duty familiarly Illustrated; by the Rev. John S. C. Abbot, of Worcester, America."*

* While I was writing the preceding paragraphs, this interesting little volume was put into my hands,—a volume which I would strongly recommend to the perusal of every parent. Its style is simple and perspicuous, its sentiments rational and pious, and are uniformly illustrated with a variety of appropriate examples taken from real life—so that the most ignorant and illiterate may easily enter into all the views and representations of the author, and feel their propriety and force. Were the principles inculcated in this small volume universally recognized and acted upon, the aspect of the moral world would, ere long, undergo an important change, and a new generation would soon spring up, to renovate the world, and to hail the commencement of the millennial era. The amiable author himself appears to be an affectionate and "Grateful Son;" for instead of attempting to curry favor with the great, by dedicating his work to the Earl of F., the Duchess of G., or the President of the United

"A gentleman, a few years since, sitting 'by his fireside one evening, with his family around him, took the spelling-book, and called upon one of his little sons to come and read. John was about four years old. He knew all the letters of the alphabet perfectly, but happened at that moment to be rather in a sullen humor, and was not at all disposed to gratify his father. Very reluctantly he came as he was bid; but when his father pointed to the first letter of the alphabet, and said, 'What letter is that, John?' he could get no answer. John looked upon the book sulky and silent. 'My son,' said the father pleasantly, 'you know the letter A.' 'I cannot say A,' said John. 'You must,' said the father in a serious and decided tone; 'what letter is that?' John refused to answer. The contest was now fairly commenced. John was willful, and determined that he would not read. His father knew that it would be ruinous to his son to allow him to conquer; he felt that he must at all hazards subdue him. He took him into another room, and punished him. He then returned and again showed John the letter; but John still refused to name it. The father again retired with his son, and punished him more severely. But it was unavailing. The stubborn child still refused to name the letter; and when told that it was A, declared that he would not say A. Again the father inflicted punishment as severely as he dared to do it, and still the child, with his whole frame in agitation, refused to yield. The father was suffering with most intense solicitude. He regretted exceedingly that he had been drawn into the contest. He had already punished his child with a severity which he feared to exceed; and yet the willful sufferer stood before him, sobbing and trembling, but apparently as unyielding as a rock. I have often heard that parent mention the acuteness of his feelings at that moment; his heart was bleeding at the pain which he had been compelled to inflict upon his son. He knew that the question was now to be settled, who should be master; and after his son had withstood so long and so much, he greatly feared the result. The mother sat by, suffering of course most acutely, but perfectly satisfied that it was their duty to subdue the child, and that, in such a trying hour, a mother's feelings must not interfere. With a heavy heart, the father again took the hand of his son, to lead him out of the room for further punishment; but, to his inconceivable joy, the child shrunk from enduring any more suffering, and cried, 'Father, I'll tell the letter.' The father, with feelings not easily conceived, took the book and pointed to the letter. 'A,' said John distinctly and fully. 'And what is that?' said the father, pointing to the next letter. 'B,' said John. 'And what is that?' 'C,' he continued. 'And what is that?' pointing again to the first letter. 'A,' said the now humbled child. 'Now carry the book to your mother, and tell her what the letter is.' 'What letter is that, my son?' said his mother. 'A,' said John. He was evidently subdued. The rest of the children were sitting by, and they saw the contest, and they saw where was the victory; and John learned a lesson which he never forgot: he learned never again to wage such an unequal warfare—he learned that it was the safest and happiest course for him to obey."

The conduct of the parent, in this case, so far

States, he very appropriately dedicates it to his "Father and Mother," of whom he speaks with affectionate regard. The volume is very neatly got up, contains above 140 pages, pretty closely printed, and is sold, neatly bound, for only one shilling; so that it is within the reach of the poorest family.

from being branded with harshness or cruelty, was the dictate of mercy and love. Had the son been permitted to obtain the mastery, it might not only have proved his ruin through life, but have produced a spirit of insubordination among the other branches of the family. The only fault which, perhaps, may be attributed to the father, in the present instance, was his insisting on his son pointing out the letters when he happened to be in "a sullen humor." But, after the contest was commenced, it was indispensable to the happiness and order of the family, that victory should be obtained on the part of the parent. And this circumstance suggests the following rule,—that, *When children happen to be in a fretful or sulky humor, any disagreeable command or injunction that is not indispensable, ought to be avoided*; for it is best to prevent collisions of this kind, at a time when children are disposed to "summon up all their energies to disobey."

Another important maxim in infantile instruction is, *that nothing be told or represented to children but what is strictly accordant with truth*. This maxim is violated in thousands of instances by mothers and nurses, to the manifest injury of the moral principles and the intellectual powers of the young. The system of nature is frequently misrepresented, and even caricatured, when its objects are pointed out to children; qualities are ascribed to them which they do not possess; their real properties are concealed, and even imaginary invisible beings, which have no existence in the universe, are attempted to be exhibited to their imagination. The moon is sometimes represented as within reach of the child's grasp, when he is anxiously desired to take hold of it; a table or a chair is represented as an animated being, when he is desired to strike it in revenge, after having knocked his head against it; a dog or a cat is represented as devoid of feeling, when he is encouraged to beat or whip these animals for his amusement; certain animated beings are represented as a nuisance in creation, when a boy is permitted to tear asunder the legs and wings of flies, or directed to crush to death every worm or beetle that comes in his way; and the shades of night are exhibited as peopled with specters, when a child is threatened with a visit of a frightful hobgoblin from a dark apartment. In these and similar instances, not only is the understanding bewildered and perverted, but the moral powers are corrupted;—falsehood, deceit, a revengeful disposition, cruelty toward the lower animals, superstitious opinions and vain alarms, are indirectly fostered in the youthful mind. Even the pictorial representations which are exhibited to children in their toy-books, too frequently partake of this character. The sun and moon are represented with human faces, as if they were small and insignificant objects, and partook of the nature of animated beings. Peacocks and cranes, foxes and squirrels, cats and mice, are represented in the attitude of speaking and of holding conversation with each other, as if they were rational beings endowed with the faculty of speech. A monkey is represented as riding on a sow, and an old woman mounted on a broom, as directing her course through the air to the moon. Even when real objects are intended to be depicted, such as a horse, an elephant, or a lion, they are often surrounded and interwoven with other extraneous objects, so that the principal figure intended to be exhibited can scarcely be distinguished. Hence, most of our books intended for the nursery, convey little else than vague and distorted views of the objects of nature

and the scenes of human life, and are nothing short of trifling with the ideas that ought to be distinctly exhibited to the infant mind.* If children were permitted to imbibe no ideas but what are true, or accordant with the existing scenes of nature, their progress in useful information would be rapid and sure, and its acquisition easy and pleasant. But, as matters now stand, one of the most difficult parts of education consists in *counteracting* the immoral principles and erroneous ideas which have been impressed upon the mind in early life—which, in many cases, requires arduous and long-continued efforts.

It has a still more pernicious effect on the moral principles of the young, when false assertions and representations are made to them in reference to facts and circumstances of a moral nature. How common is it, for example, for a mother to cajole a child into obedience by promising him an article or a gratuity which she has no intention of bestowing, or which, perhaps, it is out of her power to bestow! She is about to take a walk, or to pay a visit, and little Tom wishes to go along with her. This proposal his mother thinks proper to refuse. Tom begins a-crying, and attempts to assail his mother by his tears. She tries to cajole him, by telling him she will bring home to him apples and oranges, a little coach and four, a fiddle, a drum, or a fine new jacket. Little Tom, perhaps, is somewhat appeased by such flattering promises. His mother leaves home, pays her visit and returns, but forgets her promises, as she never intended to fulfill them. The same thing is frequently repeated, until at length the child learns that no dependence is to be placed on the word of his parent. There can scarcely be a more direct way than this of training children to prevarication and falsehood, and exciting them to view with contempt their parents and guardians.—Such deceptions are very commonly attempted, when children are urged to take nauseous medicines for the recovery of their health. The loathsome drug is represented as pleasant, or in nowise unpalatable, until the child tastes it, and finding it offensive to his palate, spits it out, and absolutely refuses to take any more of the draught—while, at the same time, he clearly perceives that he has been deceived. Mr. Abbot relates the following story, illustrative of this point:—"A mother was once trying to persuade her little son to take some medicine. The medicine was very unpalatable; and she, to induce him to take it, declared it did not taste bad. He did not believe her. He knew, by sad experience, that her word was not to be trusted. A gentleman and a friend who was present took the spoon and said, 'James, this is medicine, and it tastes badly. I should not like to take it, but I would, if necessary. You have courage enough to swallow something which does not taste good, have you not?' 'Yes,' said James, looking a little less

* A considerable degree of knowledge may be communicated to the young by means of pictorial exhibitions; but in order to this, they must be of a different description from what is found in most of our school-books and publications intended for the nursery. Instead of caricatures, and indistinct groups of objects unnaturally huddled together, every object ought to be neatly, vividly, and accurately engraved, and the principal figures well defined and detached from mere adventitious accompaniments; and, if possible colored after nature. The best little books and figures of this description I have seen, are most of those published by Darton and Harvey, London, entitled "Instructive Hints," "The prize for Good Children," "Little Truths, for the Instruction of Children," &c. &c., in which the scenes of human life are neatly and accurately exhibited, and accompanied with many instructive lessons adapted to the capacities of youth.

sulky, 'but that is very bad indeed.' 'I know it,' said the gentleman, 'I presume you never tasted anything much worse.' The gentleman then tasted of the medicine himself, and said, 'It is very unpleasant. But now let us see if you have not resolution enough to take it, bad as it is.' The boy hesitatingly took the spoon. 'It is bad,' said the gentleman, 'but the best way is to summon all your resolution, and down with it at once, like a man.' James made, in reality, a great effort for a child, and swallowed the dose. And whom will this child most respect, his deceitful mother, or the honest-dealing stranger? And whom will he hereafter most readily believe? It ought, however, to be remarked, that, had the child been properly governed, he would, at once, and without a murmur, have taken what his mother presented."

Hence the following practical rules may be deduced:—*Never attempt in any instance to deceive the young.* How can a parent, with any consistency or hope of success, inculcate upon a child, that, "it is wicked to tell a falsehood," when the child perceives his parent setting before him, in his own conduct, an example of this vice? Such conduct necessarily leads a child to distrust his parents, to despise them in his heart, and to practice himself the same arts of deception.—*Never make a promise to a child which is not intended to be punctually performed;*—and—*Never threaten a punishment which is not intended to be inflicted.* Children have better memories in regard to these things than what we are apt to suspect, and they draw their conclusions, and act accordingly. A proper consideration of these things will point out the propriety of being very cautious and circumspect as to what we promise and what we threaten in respect to the young,—if we sincerely wish them to respect truth, and be submissive to their superiors and instructors.

Another rule to be attended to in infant education, is, that—*we should beware of indulging the habit of incessantly finding fault with children.* The same principles and feelings which operate on adult minds are generally found to affect, in a similar manner, the minds of the young. When a man is continually found fault with, in every operation he performs—when his most minute deviations from accuracy are censured and exaggerated, and his prominent excellencies overlooked, and refused their due meed of praise, he becomes disheartened in his pursuits, and feels little stimulus to improvement; whereas, the bestowment of deserved approbation animates the mind, and excites to more assiduous exertions. In like manner, children are discouraged in their aims to please their parents and guardians, when fault is found with almost everything they do; but there is nothing that tends more to cheer and animate the mind of a child, and to produce a desire of pleasing his parents, than the hope of receiving the due reward of his attentions, and the smile and approbation of those whom he is taught to love and obey. Many little irregularities in the conduct of children, if they be not directly vicious, or acts of disobedience, must be overlooked; or if they are reprov'd, it should be as seldom as possible, and with gentleness and affection. We should always be more ready to express approbation, and to reward good conduct, than to chide and frown at every trivial fault that may be committed through thoughtlessness and inattention. And it is surely more delightful to the heart of an affectionate parent to have his children excited to good conduct from the desire of pleasing and the hope of reward, than merely from a fear of offending. But when children are almost incessantly scolded

—when, after endeavoring to do the best they can, they are told that they never do anything right—that they are stupid asses—that they will never be made to learn—that they are continually giving us trouble and vexation—that they are like no other children, and that we will give over attempting to teach them,—such disheartening remonstrances, when daily repeated, tend to chill the susceptible hearts of the young, to sour their dispositions, and to render them indifferent to making improvement either in knowledge or virtue. On the other hand, nothing tends more to promote filial affection, cheerful obedience, a spirit of improvement, and to cherish the best feelings of the human heart, than the prospect of well-merited approbation, and the hope of reward.

Every child should be made to see and feel the natural consequences of his conduct, whether good or bad:—and the punishments and rewards he receives should be of such a nature as to make him perceive the unhappy tendency of thoughtless and obstinate tempers, and the happiness which invariably results from obedient submission, and the exercise of amiable dispositions. There are certain natural and moral laws which cannot be infringed by any one without his feeling the consequences of their violation; and this holds true in the case of children, as well as in that of adults. When a child rushes heedlessly into a room, without looking before him, he is almost certain of getting a fall, or knocking his head against a table. When he climbs on the back of a chair, when he approaches too near the grate, amuses himself with a firebrand, or handles without caution, knives and forks—he is certain, sooner or later, by various pains and accidents, to feel the consequences of his conduct; and in such cases he should be made distinctly to perceive the connection between his fault and his punishment.

But, in the next place, although we should beware of constantly finding fault with children, we must carefully guard against everything that might excite them to vanity and self-conceit. We encourage such vicious propensities, when we expatiate on their good qualities to visitors, and praise them for the excellent things they have said or done, while they themselves are standing by, and eagerly listening to the conversation. At such times we are apt to forget, that they are paying strict attention to everything that is said, and drinking in with pleasure the flattering expressions bestowed upon them. One should never speak in the presence of children about anything which he does not wish them to know, if they are above fifteen or twenty months old. It is amazing how soon children become acquainted with the meaning of language, even before they are capable of expressing their ideas in words, or entering upon a regular conversation. "A little child," says Mr. Abbot, "creeping upon the floor, and who could not articulate a single word, was requested to carry a piece of paper across the room, and put it in a chair. The child perfectly comprehended the direction, and crept across the room, and did as he was told. An experiment or two of this kind will satisfy any one how far a child's mind is in advance of his power to express his ideas; and yet when a child is three or four years old, parents will relate in their presence shrewd things which they have said and done, and sometimes even their acts of disobedience will be mentioned with a smile!"—Another circumstance by which pride and self-conceit are excited in the breasts of the young, is, the conduct of parents

in exhibiting the acquisitions of their children to strangers, and to almost every visitor that happens to call. Little Ann has been taught to repeat by rote a few verses of a psalm or hymn, and Andrew, a little more advanced in years, has learned Sempronius' "Speech for War," or a piece of an old play. Although they know nothing of the meaning of the pieces they have committed to memory, and cannot perhaps, annex a single idea to the words they pronounce, yet their mamma is so enraptured with their attainments, that when any visitors happen to call, or a party is assembled, she introduces them to the company, and encourages them to *spout* in their presence, sometimes to their no small disgust and annoyance. Of course every one pats them on the head, and praises them for the exhibition they have made, while they eagerly catch the words of approbation, to nurse their latent vanity and self-conceit. Such exhibitions, when frequently repeated, cannot but have an injurious effect on the youthful mind. Pride and self-conceit, however common in society, are so odious, and so inconsistent with the character and circumstances of man, that instead of fostering such unamiable principles, every exertion should be made to check their growth, and counteract their influence. And modesty and humility are so amiable, and so congenial to beings so ignorant and depraved as man,—who is but an atom in creation, and stands near the lowest point of the scale of intellectual existence—that everything ought to be carefully guarded against that would prevent their culture, and every mean used which has a tendency to cherish and promote them. I do not mean to insinuate, that it is improper, in every instance, to exhibit the attainments of children; but it should be done with judgment and caution, so that it may produce no immoral effects, or be the means of adding to the impudence and self-conceit which too much abound in the world. The practice of teaching children to repeat, like parrots, what they do not understand, ought to be entirely discarded. The best exhibition of a child's attainments would be, to make him read a passage from any of his toy-books, and give the meaning of the words, and an account of the facts or sentiments it contains.

To the rules on this subject, already stated, may be added the following:—*Never attempt to frighten children to their duty by presenting to their fancy terrific objects, and exciting imaginary alarms.* This rule is violated, when frightful hobgoblins are represented as having been seen in darkness, and during night, and when foolish tales of fairies, witches, and apparitions, are gravely related to children. And, when their minds are thus stuffed with confused ideas of imaginary objects, they are afterward frightened into obedience by the terror of some of these visionary beings suddenly making their appearance. Darkness is thus associated with terrific phantoms, and children are sometimes thrust into dark and narrow rooms, to make them cease their crying, or to frighten them into obedience. It is not uncommon to hear nurses, and even foolish mothers, threatening to send for the "black man," with cloven feet, and horns on his head—to cut off their children's heads, to toss them out of a window, or to send them to the black-hole. Such a mode of frightening children into obedience, not only lays the foundation of superstitious notions, and renders them afterward towards the dark, but is sometimes attended with the most tragical effects. An English writer, says Mr. Abbot, gives an account of two instances in which

fatal consequences attended the strong excitement of fear. He says, "I knew in Philadelphia a child, as fine and as sprightly, and as intelligent a child as ever was born, made an idiot for life, by being, when about three years old, shut into a dark closet by a maid-servant, in order to terrify it into silence. The thoughtless creature first menaced it with sending it 'to the bad place,' as the phrase is; and at last, to reduce it to silence, put into the closet, shut the door, and went out of the room. She went back in a few minutes, and found the child in a fit. It recovered from that, but was for life an idiot."—It is not long since we read in the newspapers of a child being killed by being thus frightened. The parents had gone out to what is called an evening party. The servants had their party at home, and the mistress, who, by some unexpected accident, had been brought home at an early hour, finding the parlor full of company, ran up stairs to see her child, who was about two or three years old. She found it with its eyes open, but fixed; touching it, she found it inanimate. The doctor was sent for in vain; it was quite dead. The maid affected to know nothing of the cause; but some one of the persons assembled discovered, pinned up to the curtains of the bed, a *horrid figure*, made up partly of a frightful mask! This, as the wretched girl confessed, had been done to keep the child quiet, while she was with her company below. It is surely unnecessary to add more, in order to deter parents and servants from practices fraught with such dangerous and appalling consequences. Let children be inspired both with physical and moral courage. Let them be taught, that there is nothing more frightful in the dark than in the light of day, except the danger of knocking against any object we do not perceive. Let them be accustomed, at times, to be in the dark, both in company and alone, in the house, and in the open air, when there is no danger of meeting with accidents. Let them be taught, above all things, to love God and fear him; and that they need not be greatly alarmed at whatever may befall them from any other quarter.

In practicing the rules now laid down, and in every branch of domestic education, it is a matter of the first importance, that fathers and mothers, nurses and servants, *should act in harmony* in the commands and instructions given to children. When a foolish mother, from a mistaken affection, indulges her children in their vicious humors and impertinent whims, and is careless whether or not parental authority be respected—it is next to impossible for a father, however judicious his plans, to maintain domestic order and authority, and to "train up his children in the way they should go." The altercations which not unfrequently happen between parents, as to the mode of managing their offspring, and that, too, in the presence of their children, subvert the very foundations of family government, and endanger the best interests of those whom they profess to hold dear. Little John has, perhaps, been for some time in a sulky humor; he has struck his sister, torn her frock, and tossed her doll into the fire, and obstinately refused to comply with some parental commands. His father wishes to correct him for his conduct, which his mother endeavors to prevent. Punishment, however, is inflicted corresponding to the crime; but the silly mother, instead of going hand in hand with her husband in maintaining family order,—exclaims against the severity of the correction, and, taking the child in her arms, caresses him, and consoles with him on account of the pain he has suffered

—plainly indicating to the child that his father had acted toward him with cruelty and injustice. Wherever such conduct frequently recurs, domestic order is overthrown, the moral principles of the young corrupted, deceit and hypocrisy cherished, filial affection undermined, and a sure foundation laid for many future perplexities and sorrows. However much parents may differ in opinion about certain principles, or modes of conducting family affairs, it ought never to be displayed in the presence of their children; and, for the same reason, parents ought never to speak disrespectfully of any teacher they employ, while their children are listening to their remarks, whatever may be the private opinion they entertain respecting his qualifications or conduct.

III. ON THE INTELLECTUAL INSTRUCTION OF INFANTS.

In regard to the *intellectual instruction* of infants, I have already thrown out a few cursory remarks, and shall afterward illustrate more particularly a few principles applicable to this subject. In the meantime, the following brief hints may suffice.—As the senses are the primary inlets of all knowledge—every object, within view, in the system of nature, which has a tendency to convey a new idea, should be distinctly presented to the eyes of a child. He should be taught to contemplate it for some time with steadiness and attention, and the sound or name by which it is distinguished frequently repeated to him. In order gradually to enlarge the sphere of his information, the objects more immediately around him may, in the first instance, be separately and distinctly pointed out, uniformly accompanying the name with the exhibition of the object. He should next be occasionally led into the fields, and to the banks of a river, the margin of the ocean, and a seaport, if such places lie adjacent, and his attention directed to the most prominent objects connected with those scenes; care being taken not to confuse his imagination with too many objects at one time. Perhaps it may be sufficient to confine his attention to about three or four objects at a time—such as a house, a tree, a cow, and a horse. To these his attention should be particularly riveted, so that the *idea* of the object and its *name* may be inseparably connected, and indelibly impressed upon his mind. Afterward, other objects, as a ship, a boat, a spire, a flower, the clouds, &c., may, in the same manner, be presented to his view, varying the scene, and gradually presenting new objects to his attention. When he has thus acquired some knowledge of the most interesting objects which compose the scene around him, he may be desired to point out any particular object when its name is mentioned. Supposing him in the fields, or on the banks of a river, let him be desired to point to a tree, a sheep, or a boat, if such objects are within view; and by this means, he will become gradually familiarized with the scenery of nature, and the terms by which its various parts are distinguished. His attention may also be directed to the sky, not merely for the purpose of distinguishing its objects, but for tracing their motions. Let him be taken to a certain point, where he will observe the rising sun, and, on the evening of the same day, let him be brought to the same position to behold his setting, and let him be taught to mark the different direction in which he sets from that in which he arose; from which he will naturally conclude, that *motion* of some kind or other has taken place. In like manner, about twilight, when the moon begins to appear, let him

be directed, from a certain station, to mark her position in the heavens with respect to certain objects on the earth over which she appears, and before going to bed, let her be viewed from the same station, and the different position in which she then appears pointed out. Such observations will pave the way for more particular instructions on such subjects, as he advances in years.

In the same manner, *artificial* objects of various descriptions, as windmills, tables, sofas, candlesticks, hammers, scissors, organs, piano-fortes, clocks, watches, globes, telescopes, microscopes, &c., may be exhibited, and some of their uses explained. It might not be improper to give a child of two years old a lesson of this kind every day,—making it a rule to have, if possible, some new object to exhibit to him at every lesson, and occasionally recurring to the objects to which his attention was formerly directed, that they may become still more familiar to his mind.—In communicating to children the names of the various objects of nature and art, all improper pronunciations and *diminutives* ought to be avoided—such as *dogge, cattie, horsie, chairie*, instead of dog, cat, horse, chair. It should be considered as an important rule of infant education—that a *child should never be taught any pronunciation, or any sentiment, opinion, or idea whatever, which he will afterward be obliged to unlearn*. Were this rule universally attended to, in connection with the hints now suggested, the path to knowledge would be rendered smooth and easy—every day would increase the ideas which tend to enlarge the capacity of the infant mind—the way for regular scholastic instruction would be thoroughly prepared—as the youth advanced toward manhood, his knowledge and perceptions, if properly directed, would increase with his growing years—and, as no limits can be affixed to the expansion of the human mind, he may go on to increase his perceptions and intellectual enjoyments to an indefinite extent, not only during the fleeting periods of time, but throughout the ages of eternity. But, in the present state of infant training, a very considerable portion of our scholastic instructions must consist in *counteracting* the impressions which have been previously received.

After various objects of nature and art have been presented to the view of a child, in conjunction with the names by which they are distinguished—their qualities should next be pointed out and illustrated. Objects are either animated or inanimated, vegetable or mineral, hot or cold, rough or smooth, hard or soft—black, blue, green, yellow, or white—round, oval, square, triangular—high, low, long or short, &c. Several properties such as these can easily be illustrated to children by familiar examples. To convey an idea to a child that *fire is hot*, he may be presented with a piece of iron, and caused to feel it; it may then be put into the fire until it becomes just as hot as a person may touch it without danger, and then desire the child to put his finger upon it, which will convince him of the nature of that property which resides in the fire—the epithet *cold* being applied in the first case, and *hot*, in the last. To illustrate the ideas of *roughness* and *smoothness*, he may be made to press his hand along an unhewn stone, and the top of a mahogany table. Seven small boards or pieces of card paper, painted with the seven primary colors of light, red, orange, yellow, green, blue, indigo, and violet—occasionally exhibited, for his amusement, in connection with these terms, would soon teach him to distinguish the prominent colors of natural and artificial objects; and, when he is led into the fields

and gardens, he should be induced to apply his knowledge of colors by naming the prominent color of every flower or shrub that may be presented to him. The qualities *hard* and *soft* may be illustrated by making him press his finger upon a stone or a bar of iron, and upon a piece of clay or a lump of dough. The property of light in enabling us to discover the forms and colors of objects may be shown, by closing the window-shutters, or putting out a candle under night, and then desiring him to name the objects and colors he perceives;—and the correspondence of the organ of vision to the rays of light may be impressed upon his mind by blindfolding him for a minute or two,—and accompanying such exhibitions with appropriate remarks level to his comprehension. The *figures* of objects may be represented by pieces of wood or pasteboard cut into the shapes of squares, parallelograms, triangles, trapeziums, circles, ellipses or ovals, and other mathematical figures, which would gradually impress the names and characteristics of such figures upon his mind, and tend to facilitate his progress in the scholastic instructions that may be afterward imparted. His idea of length, measure, or distance, may be rendered somewhat definite, by presenting to him pieces of wood of the length of an inch, a foot, a yard, and a pole, and causing him to notice how many lengths of the one is contained in that of the other; and the idea of the *specific gravities* of bodies may be impressed, by causing him to lift a weight of brass or cast iron, and another, of nearly the same size and shape, made of light wood. The *sonorous* qualities of bodies may be exhibited by making him strike a small hand-bell with a key or a piece of thick wire, and immediately afterward, an egg-cup, or any small dish made of hard wood. The various odiferous smells connected with the vegetable kingdom may be communicated by presenting to his nostrils, in succession, a rose, a bunch of thyme, of balm, of peppermint and of southernwood. Such experiments and illustrations of the qualities of bodies may be varied and multiplied to an indefinite extent; and as they form the foundation of all knowledge, and may be rendered subservient to the child's amusement, they ought not to be considered as unworthy of our attention.

Many useful ideas might likewise be communicated to infants by means of *engravings*; especially in relation to objects which cannot be directly presented to their view. Foreign animals, such as the elephant, the lion, the buffalo, the camelopard, the monkey, the dromedary and camel, may be in this way exhibited—and also domestic animals, as the cow, the horse, the ass, the dog, &c.—as children feel a considerable degree of pleasure in being able to trace the resemblance between pictures and the objects they have seen, when accurately represented in engravings. Foreign scenes, as towns, churches, bridges, mausoleums, triumphal arches, rural landscapes, mountains, volcanoes, cataracts, lakes and other objects, when accurately delineated, may likewise tend to expand the conceptions of children, and give them an idea of objects which their own country does not exhibit. Various objects of art, as ships, boats, windmills, towers, spires, light-houses, coaches, wagons, smiths' anvils, forges and hammers, weavers' looms, &c., may also be thus exhibited. One of the most pleasing and useful modes of exhibiting real objects by means of pictures, is that of viewing perspective prints of streets, towns, villages and rural landscapes, by means of the *optical diagonal machine*; of which

I shall, in the sequel, give a short description. In exhibiting objects to a child through the medium of engravings, it may be proper, in the first instance, to present to him only *one* object, well-defined and disconnected with every adventitious circumstance, as a *man*, a *horse*, a *mountain*, or a *tree*, so that he may acquire a correct and well-defined idea of the particular object exhibited. Afterward, a landscape in which these and other objects are embodied may be laid before him, and he may be desired to point out the individual objects of which it is composed, when their names are mentioned. It is almost needless to remark, that the pictures contained in most of our nursery and toy-books, are altogether unfitted for the exhibitions to which I allude. They are generally mere caricatures, and are little short of an insult to the young, both as to the *objects* they most frequently represent, and the *manner* in which they are represented. Engravings, calculated to convey instruction, should be on a moderately large scale—every part of the object represented should be accurately delineated—no objects should be placed in awkward or unnatural positions—and they should, in most cases, be colored after nature, care being taken that they be not daubed with fantastic or too glaring colors—a fault which attaches to most of our pictures intended for children. A series of engravings exhibiting all the prominent scenery and objects of nature and art, on a cheap plan, and properly classified and arranged for the purpose now specified, is still a desideratum.

While writing the above hints, I had an opportunity of trying the experiments now suggested, on a fine little boy, a friend of my own, about two years old. Little Tom was first presented with the plates of a book of Natural History, and desired to name the lion, the elephant, the camel, and about twenty or thirty other animals when their figures were pointed out, which he did without the least hesitation. The plates were then put into his hand, and he was desired to turn up any particular animal when its name was mentioned, which he accomplished with considerable facility. A sheet, containing about sixty engravings of birds, quadrupeds, and fishes, where the different kinds of animals were grouped without any order—was next laid before him, when he was requested to point out a particular animal, when its name was given, which he also did, in almost every instance, after casting his eye up and down, and across the engraving, and when he had hit on the object, he pointed to it with exultation, saying, "There's the lion—there's the goat—there's the dromedary," &c. The figure of a compound microscope was next exhibited, which he readily named; and several hours afterward, a microscope of the same construction as represented in the engraving, was placed before him, which he immediately recognized and named, and then turned up the engraving where its figure was delineated, marking the resemblance between the one and the other. The same experiments were made with a terrestrial globe, an orrery, a telescope, a clock, a watch, and various other objects. He was next desired to point to several articles in the apartment—the table, a chair, the tongs, the shovel, the poker, a map, a portrait of a friend whom he knew, and other objects, which he at once recognized and distinguished. Several engravings of landscapes were then presented to his inspection, when he was requested to point out the men, women, trees, ships, houses, &c., of which they were composed; which he did with pleasure, and without hesitation, pointing his little fingers to different

parts of the scene, and saying, "There's a dog—there's a man—there's a house—there's a tree," &c. I next led him into the garden, and placed him in a proper situation for viewing the surrounding objects. I first asked him to point to a windmill—there being one, and only one, in view. He looked around for a few seconds, and, after fixing his eyes on the object, and pointing with his finger, exclaimed with pleasure, "There's windmill!"—and, looking at it with steadiness for a few seconds, said with a kind of surprise, "No going round;" which was actually the case, as there was no wind. He was next desired to point out a flower, a tree, a cow, a ship, and other objects, which he at once distinguished with the same facility.

The desire of this little boy for the exhibition of new objects, especially as represented by pictures, was almost voracious. After spending several hours in succession, in exhibiting to him several hundreds of plates of different encyclopedias, and books of travels, he was still unsatisfied, called for more books, and seemed to forget both hunger and sleep. He recollected, with considerable accuracy, the prominent objects that had been presented before him in these engravings; and, therefore, when a volume containing plates, which he had already seen, was again presented, he pushed it away, and requested another. Every morning, as soon as he was dressed, his first request was, "See more pictures—you please;" and, leading me into the room where the books were kept, pointed to the particular volumes he wished to inspect. Even his cravings for breakfast seemed to be forgotten, amidst the delight with which he contemplated new exhibitions of nature and art. The varieties of animated nature seemed to afford him the greatest degree of pleasure; but every striking and well-defined object, of whatever description, which he had never seen before, particularly arrested his attention. The exhibition of perspective views, through the optical diagonal machine, where the objects appear as they do in nature, afforded him a high degree of gratification while he described, in his own way, the different parts of the scene.—These circumstances evidently demonstrate the innate principle of curiosity, or desire for knowledge, implanted in the infant mind, which only requires to be judiciously regulated, and a series of interesting objects exhibited, in order to raise the human soul to the highest pitch of intellectual improvement. They also indicate the vast capacity of the mind for receiving an indefinite variety of ideas—the pleasure associated with their acquisition—and the boundless desires; after new and varied scenes and enjoyments, which evidently point to a higher state of existence, where they will be fully gratified.

In stating the above circumstances—which to some readers may perhaps appear trifling—my intention is not to insinuate that the child alluded to is superior to others of the same age. Every child, whose physical and mental powers are in a sound state, is capable of making the same acquisitions, and feeling the same enjoyments; provided due care be taken to direct the principle of curiosity into a proper channel, and to supply it with proper objects. Some children, in consequence of their physical organization, may have more vigor of intellect than others, they may feel highly gratified with some objects and pursuits, and indifferently toward others; but they have all, substantially, the same faculties, and the same desire for the acquisition of knowledge, in one shape or another when its objects are presented, in an interesting manner, to their view.—Such exhibitions as I have now described ought not to be viewed as

mere amusements. While they gratify the mind of a child, and increase his enjoyments, they also embody a train of useful instructions, which lay the foundation of mental activity, and of all those improvements he may afterward make during the future scenes of his existence, whether in the present life, or in the life to come. And, if this be admitted, it will evidently appear to be a matter of considerable importance—that nothing but useful and correct ideas be imparted to the infant mind, and that care be taken that everything that is whimsical, fanciful, or inconsistent with existing facts, be excluded from juvenile instruction, so that a child may never afterward have occasion to struggle with youthful prejudices or to counteract any of the instructions or impressions he had previously received. And in order to accomplish this end it is requisite that servants, nurses, and every other person connected with a family, be specifically instructed as to the manner in which they ought to conduct themselves toward children both in their words and their actions,—and strictly looked after, that nothing be said or done inconsistent with the rules of parental tuition.—At the period of life to which I now refer, it would be almost preposterous, to pester the child with learning the characters of the alphabet, or the uninteresting sounds of b a, ba, b i, bi, b o, bo; unless it can be done purely in the way of amusement. For a child is generally disgusted with everything given him as a *task*, and which is not accompanied with pleasing emotions. It is quite time enough, at the age of four years, in ordinary cases, to instruct a child in reading his native language; though, before this time, he may speak it with considerable correctness, and acquire an indefinite number of ideas. And when he has once seriously commenced his scholastic instructions, they should be associated with everything that may have a tendency to render them interesting and delightful—a principle which ought to be kept in view throughout all the subsequent departments of education.

I have enlarged farther on the subject of infant education than I at first intended, from a strong conviction of its primary importance to the improvement of society in knowledge and virtue. If domestic training, during the three first years of human existence, be either trifled with, or not conducted on rational and moral principles, the arrangements in regard to their future education will be to a certain degree frustrated. The habits acquired, and the impressions made upon the mind of a child, during this period, may have an influence on his improvement and happiness, not only in the present world, but throughout the whole of that endless existence to which he is destined.*

* It gives me pleasure to learn, that the subject of infant education is now beginning to excite more attention than it has hitherto received; particularly by the establishment of *Maternal Associations*. The first maternal institution appears to have originated with Mrs. Payson of Portland, province of Maine, North America, about 1815. A maternal association was first organized in Utica, in 1824. It commenced with eight members; but it appears from the Report of 1833, that it now consists of above a hundred. Similar associations were formed, about the same time, in Boston, New England, and at Hartford, and they have lately been organized in Glasgow, Greenock, and several other towns in Great Britain. Their object is to diffuse information in relation to the best methods of training up children in knowledge and moral habits, and promoting their best interests, both in respect to the present life and the life to come. For accomplishing these objects—beside regular meetings for prayer and conversation, at which the children sometimes attend—a periodical has been commenced in America, entitled "The Mother's Magazine," which is reprinted in London, containing various useful facts, narratives, and observations, illustrative of this subject. Such associations, if judiciously conducted, cannot fail of producing a highly beneficial effect on the rising generation, and ultimately on the state of general society.

CHAPTER IV.

ON INFANT SCHOOLS.

Nor many years ago, it would have been deemed romantic, and even absurd in the extreme, to have attempted the establishment of seminaries for the instruction of infants of the age of eighteen or twenty months, or even of two or three years. But such institutions have not only been attempted, but actually established to a considerable extent in various States both in Europe and America and have been attended with the most delightful and beneficial effects. Children, at a very early period as formerly noticed, before they have acquired the alphabet of any language, are capable of receiving a very considerable portion of mental instruction. They possess the *five senses*, in nearly as great perfection as those of mature years; and it is through the medium of these senses that all our knowledge, whether historical, philosophical, or religious, is acquired. Children possess, in a high degree, the desire of *novelty* and the principle of *curiosity*—faculties intended by the Creator to stimulate to the prosecution of knowledge; and it is only requisite that we direct the operation of these faculties in a proper channel, and present interesting and appropriate objects to stimulate their activity.

The principal objects of infant schools ought therefore to be—to exhibit to the view of children as great a variety as possible of the scenes of nature and the operations of art, either by directing their views immediately to the objects themselves, or by means of pictorial representations—to teach them to *distinguish* one object from another, to mark its peculiar qualities, to *compare* one object with another, and to deduce certain useful truths or conclusions, from them—to instruct them how to use their voices, their eyes and ears, their hands and feet—to teach them the properties of numbers, the magnitudes, distances, and relative positions of objects, the forms and habits of animals, the different classes and uses of vegetables and minerals, the various objects to be seen in the fields and gardens, and the general aspect and phenomena of the atmosphere and the heavens—to impress their minds with the existence of a Supreme Being, of their continual dependence upon him, of his Goodness, Power, and Omnipresence, and of the duties they owe him—to teach them the fundamental maxims and rules of the Christian system, and make them reduce them to practice—to train them to kindness and affection toward one another, to habits of cleanliness, neatness, and regularity in all their movements, and to conduct themselves with moral order and propriety, both in the school, the play-ground, and in their domestic associations—in short, to develop all the intellectual and moral powers of the mind, at a much earlier period than has hitherto been deemed expedient, in order to prevent the growth of vicious habits and false opinions, and to prepare them for all the subsequent instructions and scenes of action through which they may afterward pass, that they may become blessings, instead of curses, to the world, and rise up in wisdom

and knowledge, and in favor with God and with man.

In order to accomplish these purposes with the greatest effect, infant schools, as well as all others, should be erected, if possible, in an open and commanding situation, that a full view may be obtained of the heavens, the earth, and the ordinary phenomena of nature. The best dimensions for the school-room are found to be about 80 feet long, by 22 or 24 wide, with seats all round, and a rising platform or gallery at one end. Connected with this should be a room, from 14 to 18 feet square, for the purpose of teaching the children in classes, and for those children who have made greater progress than the rest, that they may be trained for monitors. The furniture necessary for such a school, consists of a desk for the master; a rostrum for the occasional use of the monitors; seats for the children, who should all sit round the school-room with their backs to the wall; a lesson-stand of a considerable elevation, for exhibiting pictures and lessons pasted on mill-board; stools for the monitors; slates and pencils; pictures of natural history, of scriptural subjects, of landscapes, of rural and domestic life, &c.; alphabets and spelling-lessons; brass letters and figures, with boards for them; cubes, parallelograms, geometrical figures of various descriptions, illustrative of plain and solid geometry; the transposition-frame, or *arithmeticon*, for illustrating the properties of numbers. To these should be added various little books, with cuts, level to the comprehension of children; and sets of maps, on a large scale, with the states, kingdoms, provinces, counties, &c., accurately distinguished and neatly colored. It is indispensably requisite that a play-ground be attached to every infant school, containing swings and other contrivances for the purpose of amusement, and that the children may divert themselves without danger, in any innocent way their fancies may devise. This play-ground should be as spacious as possible. Even in towns, where property is most valuable, the space allotted for this purpose (including the school-room and teacher's house) should not, if possible, be less than about 180 feet long, and from 60 to 100 feet broad. In villages where the ground is less valuable, it may be made of still larger dimensions. With such accommodations infants, to the number of 150 or 200, may be trained by a master, and an occasional assistant.

One of the main principles on which infant schools should be conducted, is that of *Love*; and therefore, in commencing such an institution, every action and every circumstance should be attended to, which is calculated to convince them that their teacher sincerely loves them, and wishes to promote their happiness, and that they ought to be kind and affectionate to one another. The first difficulty to be encountered, is to arrest and keep up their attention, to make them act in concert, and to class them according to their age and capacities, causing those who obey any commands

with the greatest promptness to be classed together. Such difficulties are generally surmounted by making them all move their hands and feet at the same time, when repeating any sentence; sometimes by causing them to march in a regular body round the school; sometimes by making them put their hands one on the other when they are repeating a fact or a sentiment, and sometimes by exciting them to dance to the sound of a clarionet or the viol. Monitors are selected by drilling the oldest and the most expert of the children at separate hours, instructing them particularly in the work they have to perform, and making every one of them answerable for the conduct of his class. These little masters frequently conduct themselves with great shrewdness and ability, and sometimes with a degree of importance and pomposity which it is found necessary to check. The children are taught *singing*, by the master singing a psalm or hymn several times in their hearing, until they acquire a certain idea of the tune; after which they are required to join with the teacher, and, in a short time, the greater part are enabled to join in the music with considerable correctness; and nothing can be more interesting and exhilarating to a pious and benevolent mind, than to listen to a hundred young voices thus joining in unison, in a hymn of praise to their Creator. They are taught to repeat hymns generally in the following manner. One of the monitors is placed in the rostrum, with a book in his hand; he then reads one line, and pauses until all the children in unison have repeated it; he then reads or repeats another, and so on in succession until the hymn is finished. The same method is adopted in teaching them spelling, catechisms, moral maxims and precepts, and whatever else is to be committed to memory. It should, however, be attended to, that everything they commit to memory from catechisms, hymns, or other books, should be previously explained; so that in every case, if possible, they may acquire the *ideas* contained in the passages they are to repeat, *before* they charge their memories with the vocables by which they are expressed.

The Alphabet is taught by means of twenty-six cards, corresponding to the number of letters, on each of which is engraved a letter, along with some object of nature or art, whose name begins with that letter. Thus, on the card of the letter A is engraved an apple. This card is held up to the children, who name the letter and the object depicted beside it. A variety of questions is then put respecting the nature, form, and properties of the apple, and of the root, trunk, branches, leaves, &c., of the tree on which it grows; by which the attention of the children is kept alive, certain portions of useful knowledge communicated, and the idea of the letter more deeply impressed upon their minds. On the card of letter C, a cow, a camel, or a cat, is depicted; which is exhibited in the same manner, and various questions put respecting the figure, parts, habits, and uses of either of these animals: and so on through the other letters of the alphabet. This exhibition is varied as much as possible, and practiced only two or three times a week, that the children may not be wearied by its too frequent repetition. Another plan is sometimes adopted,—an alphabet, printed in large letters, both Roman and Italic, is pasted on a board, and placed against the wall; the whole class then stands around it, and the master or mistress points to the letters, desiring the children in a body to pronounce the letter to which he points. In spelling, each child is supplied with a card and tin, on which certain short words are printed. A

monitor leads the rest in the following manner: "C-h-a-i-r;" the other children immediately follow: and when they have spelled one word, he repeats another, until he has gone through all the words on the card. For the purpose of teaching the older children to *write* the alphabet, they are supplied with slates, on which the whole alphabet is engraved—some in capital letters, and others in text; the children then put the pencil into the engraving, and work it round into the shape of the letter, which they can scarcely avoid doing, as the pencil will keep in the engraved part. In this way they gradually learn both to form the letters correctly, and to read written characters and sentences.

The properties and numbers, and the fundamental rules of Arithmetic, are taught by various modes; particularly by an instrument which has been termed the *Arithmeticon*, or Transposition-Frame. The following is a figure and description of the use of this instrument, taken from Mr. Wilderspin:—"The frame is sixteen inches square, and made of wood: twelve wires pass through it at equal distances; on which wires, seventy-eight movable balls are to be placed, beginning with one on the first, two on the second, three on the third, &c., up to twelve." By this instrument may be taught "the first principles of grammar, arithmetic, and geometry. It is used as follows—Move one of the balls to a part of the frame distinct from the rest: the children will then repeat, 'There it is, there it is.' Apply

your finger to the ball, and set it running round; the children will immediately change from saying, 'There it is,' to 'There it goes, there it goes.' When they have repeated 'There it goes,' long enough to impress it on their memory, stop the ball: the children will probably say, 'Now it stops, now it stops.' When that is the case, move another ball to it, and then explain to the children the difference between a singular and plural, desiring them to call out, 'There they are, there they are;' and when they have done that as long as may be proper, set both balls moving, and it is likely they will call out, 'There they go, there they go,' &c. &c. By the natural position of the balls, they may be taught to begin at the first. The master, raising it at the top of the frame, says, 'What am I doing?' Children answer, 'Raising the ball up with your hand.' Q. 'Which hand?' A. 'Left hand.' Then the master lets the ball drop, saying, 'One, one.' Raise the two balls, and propose questions of a similar tendency: then let them fall; the children will say, 'Twice one;' raise three, and let them fall as before; the children will say, 'Three times one.' Proceed to raise the balls on each remaining wire, so that they may say, as the balls are let fall, Four times one, five times one, six times one, seven times one, eight times one, nine times one, ten times one, eleven times one, twelve times one. We

now proceed as follows: 1 and 2 are 3, and 3 are 6, and 4 are 10, and 5 are 15, and 6 are 21, and 7 are 28, and 8 are 36, and 9 are 45, and 10 are 55, and 11 are 66, and 12 are 78. *Subtraction* is taught by this instrument thus;—Take 1 from 1, nothing remains, moving the first ball, at the same time, to the other end of the frame. Then remove one from the second wire, and say, 'Take 1 from 2;' the children will instantly perceive that only one remains: then 1 from 3, and 2 remain; 1 from 4, 3 remain; 1 from 5, 4 remain, &c. *Multiplication* is taught as follows:—The teacher moves the first ball, and immediately after the two balls on the second wire, placing them underneath the first, saying, at the same time, 'Twice one are two,' which the children will readily perceive. Next, remove the two balls on the second wire, for a multiplier, and then remove two balls on the third wire, placing them exactly under the first two, which form a square, and then say, 'Twice two are four,' which every child will discern for himself, as he plainly perceives there are no more. We then move three on the third wire, and place three from the fourth wire underneath them, saying, 'Twice three are six.' Remove four on the fourth wire, and four on the fifth; place them as before, and say, 'Twice four are eight;' and so on, through all the wires and balls.

The first principles of arithmetic are also taught, by means of small cubes. The children are formed into a square, in the center of which is placed a table, on which the cubes are placed—one, two, three, or four at a time. The master puts down three, for example, and inquires of the children how many there are; when they naturally call out, "Three." He puts down two more; and inquires as before, "How many are three and two?" they answer "Five;" and thus goes on until he has put down to the number of fifty or sixty. In a similar manner *Subtraction* is illustrated, by placing, for example, 9 cubes on the table, and saying, "Take 5 from 9, how many will remain?" and, removing 5 cubes, it will be seen that 4 remain, &c. The multiplication table, the pence tables, the tables of money, time, weights, and measures, are taught by a monitor repeating certain portions of them at a time, and being immediately followed by all the children in unison. Thus, when the monitor announces "7 times 8 are 56," or "Forty pence are three and fourpence," the children in a body repeat the same; and in a short time the whole of these tables are impressed upon their memories.

The leading facts of Sacred History are communicated by means of a series of historical pictures, and by a variety of minute descriptions and interrogatories. The more interesting facts of Natural History are exhibited by a number of large cards, on which are pasted engraved representations of quadrupeds, birds, fishes, insects, trees, flowers, and similar objects; in the explanation of which an opportunity is taken of detailing their forms, qualities, and uses, and any anecdotes that may occur respecting them. Knowledge is also communicated in relation to many common and useful subjects, by presenting before them *real objects*, such as gold, silver, copper, brass, tinfoil; a piece of flax, thread, raw silk, twisted silk, cotton, linen, gauze, nankin, gingham, silk velvet, &c., describing the different processes connected with their manufacture, and teaching the children how to recognize and distinguish such substances. But, as I have no intention of entering into the minute details connected with infant schools, I refer those who wish a more particular

account of these institutions, to Mr. Wilderspin's excellent treatise on "Infant Education," and Mr. Stow's "Moral Training,"* and shall conclude this article by a few general remarks on the *advantages* which would result from the universal establishment of such seminaries.

1. The establishment of infant schools in every region of the globe would increase to an indefinite degree, the mass of useful information among mankind. Three or four years of the most important period of human life have hitherto been suffered to pass away without any material intellectual improvement. The young, indeed, during this period, acquired various fragments of useful knowledge, in spite of our remissness and inattention; for the principle of curiosity was always alive, and could never be altogether suppressed, wherever objects appeared by which it might be roused and gratified. But we never thought of directing their senses and mental powers, regularly and systematically, to the forms, qualities, uses, and characteristic features, of surrounding objects, as if such things had been beyond the range of their comprehension; while, at the same time, we tortured their memories with the retention of sounds and sentences with which they felt disgusted, and which they could not understand. But the experiment of infant schools has shown (and if we had not acted like fools in the business of education, it might long ago have been demonstrated), that children from the age of three to six years are capable of acquiring far more of what may properly be denominated *knowledge*, than what had been acquired by our usual insipid modes of instruction at the age of twelve or fourteen. And, what is worthy of particular attention, this knowledge has been acquired, not only without "stripes and imprisonment," but with the highest degree of satisfaction and enjoyment on the part of the young. If the world, therefore, is ever to be thoroughly enlightened, in everything which relates to the present happiness and the eternal interests of mankind, and if the knowledge of Jehovah is "to cover the earth as the waters cover the seas," the foundation must be laid in the universal establishment of infant schools, on the most judicious and expansive plans, in every nation under heaven.

2. It is not only the amount of knowledge actually acquired, during the period alluded to, but the *intellectual habits* formed during its acquisition, which render such instructions of immense importance. For want of these habits being formed in early life, the great bulk of mankind may be said to have "eyes, but see not—ears, but hear not," and consequently "do not understand;" they know neither the proper use of their sensitive organs, nor are qualified to deduce proper conclusions from the objects to which they are occasionally directed; but pass through life without any *rational* application of the senses and faculties with which they are furnished. Is there one out of ten who has ascertained, from his own observations, that the starry heavens perform an apparent revolution round the earth every twenty-four hours, around a certain fixed point called the pole? Is there one out of twenty that can tell at what seasons of the year the new moon will appear at a high elevation above the horizon, and when the full moon will appear high or low? And yet these facts may be ascertained, without

* "Moral Training, Infant and Juvenile, as applicable to the condition of the Population of large Towns. By David Stow, a Director of the Model Schools, Glasgow. Second Edition, enlarged." With plates.

the least difficulty, by a simple application of the organs of vision to the respective objects, combined with a desire to know the results;—in the first case, the object may be determined in the course of a single day, and in the latter case, within the course of a year; and yet it is a fact, that sixty or seventy years have passed away, in the case of thousands and millions of those who are denominated *rational beings*, without their knowing either the one or the other. The same position might be illustrated in thousands of similar instances, where the grossest ignorance prevails in relation to multitudes of objects, which might have been prevented by a rational use of the sensitive organs with which the Creator has endowed us. Now, in infant schools, children are trained to a proper application of their sensitive powers—presented with suitable objects on which they may be exercised, and taught to deduce from them useful truths, with their practical applications. These intellectual habits being formed in early life, will naturally be brought into more vigorous and extensive exercise as they advance in years, and lay the foundation of all the treasures of knowledge they may accumulate, both in the present life and throughout the ages of eternity. Such habits being formed and continually exercised, a *relish* for knowledge, and *activity of mind*, are produced, which will facilitate all their subsequent acquisitions, and render them interesting and delightful; so that, in whatever stations in society they may afterward be placed, they will be distinguished as men of wisdom and intelligence—*provided their subsequent education be conducted on the same rational principles.*

3. What is of still greater importance,—in these schools the *foundations are laid of moral and religious habits*. It has been the practice hitherto, in infant schools—a practice which I trust will never be abolished—that the children have their minds impressed with the idea of an Omnipresent Being, who continually supports them, and to whom they are amenable for all their actions—that their exercises are uniformly commenced with prayer, and with a hymn of praise to the Creator and Redeemer of men—that the leading facts of Revelation are detailed in the most simple and interesting manner, and its moral precepts enforced in all their associations with each other—that the principles of fraud, dishonesty, deceit, hatred and malignity, wherever they appear, are strictly checked and counteracted, and the practice of love, kindness, honesty, justice and truth, enforced and exemplified. Now, such truths inculcated, and such practices enforced and exemplified, for several years, when the mind is susceptible of every impression, and of being molded into any habit, must be of immense importance in a moral point of view—and if such seminaries were universally established, conducted on liberal and judicious plans, and succeeded by seminaries of a higher order, conducted on similar moral principles—society would soon assume a new moral aspect, wickedness and debauchery would be banished from our streets, thefts and robberies would gradually be diminished, brawlings, contentions and execrations would cease, and harmony and good-will be introduced into the schemes and associations of mankind.

It is an injunction inculcated by the highest authority, “Train up a child in the way he should go, and when he is old he will not depart from it.” The last part of this sentence contains a most important truth, stated without the least exception or modification. The interpretation generally

given of it by divines is, “He will not *ordinarily* depart from it.” But what warrant have we thus to limit and modify the dictates of inspiration? Let the declaration be viewed as a universal and eternal truth, and the problem to be solved will be, “Has ever a child hitherto, in all points of view, intellectually and morally, been trained up in the way he should go?” If so, we ought to believe that the declaration in this passage was fully realized in such a case. Much has been said respecting the children of pious parents turning aside from the paths of rectitude in their riper years. But the fact to be determined is, Have such parents trained up their children in a rational, judicious, and benevolent manner? I have seen persons piously disposed, and even ministers of the gospel, train up their children as foolishly and injudiciously as those who made no profession of religion, and even with less wisdom and discretion. Not that they *intended* to train their offspring in any bad principles and practices, but that they were either ignorant of the true mode of training children, or had imbibed false maxims, or indulged a foolish fondness, or had neglected to bring their children under a judicious control, or had humored their whims and pampered their appetites, or were placed in certain circumstances, and in the midst of difficulties over which they had little control. Even in attempting to teach their children the principles of Christianity, their plans have been calculated rather to excite disgust at religion, than to allure their hearts to the practice of its heavenly precepts. What else could be expected, when children, on the Sabbath, were confined to a corner, counting memorial tasks, committing to memory catechisms, Psalms, and chapters from their tattered New Testaments, of which they understood not a single sentence—and at the same time deprived of their usual sensitive enjoyments, and, doubtless, exclaiming in their hearts, “O what a weariness is it! when will the Sabbath be over?”—just as if religion consisted in the acquisition of technical terms, sounds and sentences, and metaphysical dogmas. Is this the way to induce the young to love God, “to call his Sabbaths a delight, and the holy of the Lord, honorable?” or is it to be wondered at, that those who have been brought up in this way have sometimes struck off at a tangent from the restraints of religion to the ways of sin and folly? If the whole train of education through which such children passed, from the first year of their existence to the period when they turned aside from the paths of righteousness, were laid open to our view, we should doubtless, be enabled to account for all such moral aberrations, and to trace the intimate connection between cause and effect.

I have thrown out these remarks for the purpose of showing, that if public and domestic education be conducted with judgment and piety, if children be trained in infant schools and other seminaries in useful knowledge, and to the habits of piety and moral order,—we have the surest grounds for concluding, that, when arrived at mature age, they will become intelligent and useful members both of Christian and of civil society, and that our arrangements and labors in these respects “shall not be in vain in the Lord.” The dictates of Inspiration on this point are in perfect unison with the laws of the moral world, and are corroborated by universal experience. Almost every person feels that early impressions are the most vivid and the most lasting; and it is a fact, that, according to the bent which the habits, dispositions, and conduct the young receive, during the first ten or twelve years of their existence,

such will it generally remain, with a few slight modifications, during the future periods of their lives. Hence the difficulties—in many cases insurmountable—which must be encountered, in order to counteract the habits and vicious propensities acquired during this early period; and hence the comparative ease with which children may be trained to intelligence and moral habits, when they are committed, at a very early age, to the care of a judicious and intelligent teacher of an infant school.*

*As an illustration of the moral and intellectual effects of infant teaching, I subjoin the following examples, taken from Mr. Wilderspin's "Infant Education," as what occurred in the course of his own experience:—

1. *The Whistle.* "Many of the children were in the habit of bringing marbles, tops, whistles, and other toys, to the school, which often caused much disturbance: I found it necessary to forbid the children from bringing anything of the kind. After giving notice two or three times in the school, I told them, that if any of them brought such things, they would be taken from them. In consequence, several things fell into my hands, which I did not always think of retaining; and among other things, a whistle from a little boy. The child asked me for it as he was going home, but having several visitors at the time, I put the child off, telling him not to plague me, and he went home. I had forgotten the circumstance altogether, but it appears the child did not; for some time after, while I was lecturing the children upon the necessity of telling truth, and on the wickedness of stealing, the little fellow approached me and said, 'Please, sir, you stole my whistle.' 'Stole your whistle,' said I, 'did I not give it to you again?' 'No, teacher, I asked you for it and you would not give it to me.' I stood self-convicted, being accused in the middle of my lecture, before all the children, and really at a loss to know what excuse to make, for I had mislaid the whistle, and could not return it to the child. I immediately gave the child a halfpenny, and said all I could to persuade the children that it was not my intention to keep it.—This trifling mistake of mine did more harm than I was able to repair for some time; for if we wish to teach children to be honest, we should never take anything from them without returning it again.—This story shows how necessary it is to teach by example as well as precept—and that children have a clear perception of any discrepancy that may take place in this respect.

2. *The boy and the song.* "One day while I was walking in the playground, I saw at one end of it about twenty children, apparently arguing a subject, *pro* and *con*. From the attitude of several of the orators, I judged it was about something which appeared to them of considerable importance. I wished to know the subject of debate, but was satisfied that if I approached the children it might put an end to the matter altogether. Some of the by-standers saw me looking very attentively at the principal actor; and, as I suppose, suggested to the party the propriety of retiring to some other spot; for immediately they all retired behind a partition, which afforded me an opportunity of distinctly hearing all that passed, without being observed by them. I soon found that the subject of debate was a *song*. It seems that one of the children had brought a song to the school, which some of the monitors had read, and having decided that it was an improper thing for the child to have in his possession, one of them had taken it from the owner, and destroyed it; the aggrieved party had complained to some of the other children, who said that it was *theft* without for one child to take anything from another child without his consent. The boy, nettled at being called a thief, defended himself by saying that he, as a monitor, had a right to take away from any of his class anything that was calculated to do them harm; and was, it seems, backed in this opinion by many others. On the other hand, it was contended, that no such right existed; and that the strength of the argument lay. At last, one of the children observed to the following effect: 'You should have taken it to *master*, because he would know if it was bad better than you.' This was a convincing argument, and to my great delight the boy replied, 'How much did the song cost?' The reply was, 'A halfpenny.' Here, then, take it, says the child, 'I had one given me to-day; so now remember I have paid you for it; but if you bring any more songs to school, I will tell master.' This seemed to give general satisfaction to the whole party, who immediately dispersed to their several amusements. A struggle like this between the principles of *duty* and *honesty*, among children so very young, exemplifies, beyond a doubt, the immense advantage of early instruction.²—Here we have a specimen, in the case of very young children, of nice discrimination in regard to the principles of moral rectitude and of *reasoning*, which would have done no discredit to an assembly of senators.

4. Infant schools are calculated to *rescue thousands of children from the pernicious influence of ignorant and immoral parents, and to prevent most of those crimes which injure the peace and prosperity of society.* The immoral principles and vicious habits in which multitudes of children are trained under the domestic roof, not only lay the foundation of their own unhappiness and ruin, but are productive of many pests and nuisances to general society. In cities and populous towns this fact is too frequently realized. Many children are trained up, even by their parents, to habits of *pilfering*, which they sometimes learn to practice with the utmost cunning and expertness, without the least sense of moral delinquency. It was estimated, that in the year 1819, in the city of London alone, the number of boys who procured the greater part of their subsistence by picking pockets, and thieving in every possible form, amounted to from twelve to fifteen hundred! One man had forty boys in training to steal and pick pockets, who were paid for their exertions with a part of the plunder; and a woman who had entrapped eight or ten children from their parents, had them trained up and sent out in every direction for the purpose of thieving, until she was happily detected. Such children, in all probability, were chiefly procured from the families of the ignorant and the vicious; and when a habit of pilfering is early indulged, it not only leads to the practice of falsehood, cunning and deceit, in all their diversified forms, but entirely blunts the moral sense, and leads to the commission of almost every other crime. It is no uncommon thing to observe in the police reports of London, accounts of boys, and even girls, of six or seven years of age, being apprehended for the offenses of pocket-picking, shop-lifting, stripping children of their clothes and or-

3. *Infant critics.* "Having discoursed one day on the difference between isosceles and scalene triangles, I observed that an acute isosceles triangle had all its angles acute, and proceeded to observe that a right-angled scalene triangle had all its angles acute. The children immediately began to laugh, for which I was at a loss to account, and told them of the impropriety of laughing at me. One of the children immediately replied, 'Please, sir, do you know what we were laughing at?' I replied in the negative. 'Then, sir,' says the boy, 'I will tell you. Please, sir, you have made a blunder.' I, thinking I had not, proceeded to defend myself, when the children replied, 'Please, sir, you convict yourself.' I replied, 'How so?' 'Why,' said the children, 'you said a right-angled triangle had one right angle, and that all its angles are acute. If it has one right angle, how can all its angles be acute?' I soon perceived that the children were right, and that I was wrong.—At another time, when lecturing the children on the subject of cruelty to animals, one of the little children observed, 'Please, sir, my big brother catches the poor flies, and then sticks a pin through them, and makes them draw the pin along the table.' This afforded me an excellent opportunity of appealing to their feelings on the enormity of this offense; and, among other things, I observed, that if a poor fly had been gifted with powers of speech like their own, it probably would have exclaimed, *while dead*, as follows:—'You naughty child, how can you think of torturing me so? Is there not room enough in the world for you and me? Did I ever do you any harm? Does it do you any good to put me to such harm? How would you like a man to run a piece of wire through your body, and make you draw things about? Would you not cry at the pain?' &c. Having finished, one of the children replied, 'How can anything speak if it is dead?' 'Why,' said I, 'supposing it could speak.' 'You meant to say, sir, *dying*, instead of *dead*.'—In this case I purposely misused a word, and the children detected it.—Here we have another instance of the nice discrimination of which children are capable, and of the great importance of their being taught to *think*—one of the most important parts of education, which has been so long overlooked. In consequence of their having acquired the elements of thought, they were enabled, in the one case, to refute the assertion of their teacher, by a conclusive argument; and, in the other, to detect the misapplication of a term. A whole community taught to think and reason, would be the means of preventing numerous evils, and of introducing innumerable blessings into the social state.

nements, and similar depredations committed with all the expertness of an experienced delinquent. And, if such mental activities are so early displayed in the arts of wickedness, how important must it be to bend the active powers of the young in a contrary direction, and how many useful energies might we soon bring to bear upon the renovation of the moral world! For, notwithstanding the depravity of human nature, children may be trained to exert their skill and activities in the cause of virtue, as well as in the arts of mischief, if the same care and ingenuity be employed in their instruction.—Now, infant schools are peculiarly calculated to promote in children habits of virtuous activity. They are taught to think and reason, and to apply the rules of Christianity to their actions and social intercourses with each other—are instructed in the evil of lying, swearing, stealing, and other vices; and some of them who had previously been addicted to these vices have been effectually cured of such evil propensities. Not only so, but the sentiments and habits they have carried home to their parents have sometimes been the means of arousing them to consideration, and turning them “from the error of their ways.” And, although infant schools were established for no other purpose than prevention of crimes, it would save to the public ten times the expense that might be incurred in their erection and superintendence; for, in large cities, such young delinquents as I have now alluded to, regularly supply the place of the hundreds of old and experienced thieves that are yearly convicted and transported to another country; and the expense attending the conviction and transportation of one delinquent, is sometimes more than would suffice for the erection of an establishment for the instruction of a hundred children.

5. In infant schools, *social habits and feelings may be cultivated with safety and with pleasure by the young.* In most other circumstances the social intercourse of the young is attended with a certain degree of danger, from the influence of malignant passions and vicious propensities which too frequently appear in the language and conduct of their companions. “Evil communications corrupt good manners;” so that the minds, even of those who are trained with pious care under the domestic roof, are in danger of being tainted with vice, when allowed to indulge in promiscuous intercourse with their fellows. But in infant establishments, they are, during the greater part of the day, under the inspection of their teachers, both in school and at play-hours, where nothing immoral is suffered to make its appearance; and the exercises in which they are employed, the objects exhibited to their view, the mutual conversations in which they engage, and the amusements in which they indulge, form so many delightful associations, equally conducive to mental improvement and sensitive enjoyment, which will afterward be recollected with a high degree of pleasure.

6. The establishment of infant schools in *heathen lands*, wherever it is practicable, *will, I conceive, be the most efficient means of undermining the fabric of Pagan superstition and idolatry, and of converting unenlightened nations to the faith and practice of our holy religion.* When we would instruct adults in anything to which they have been unaccustomed, we find the attempt extremely difficult, and frequently abortive, in consequence of the strong influence of long-established habits. In like manner, when we attempt to expound the truths of Christianity to the heathen, and enforce them on their attention, we encounter innumera-

ble difficulties, arising from preconceived opinions, inveterate habits, long-established customs, ancient traditions, the laws and usages of their forefathers, the opinions of their superiors, and their ignorance of the fundamental principles of legitimate reasoning; so that comparatively few of the adult heathen have been thoroughly converted to the Christian faith, notwithstanding the numerous missionary enterprises which have been carried forward for the last thirty years. But if infant schools were extensively established, in all those regions which are the scene of missionary operations, we should have thousands of minds prepared for the reception of Divine truth, having actually imbibed a portion of the spirit of Christianity, and being unfettered by those heathenish prejudices and habits to which I have alluded. Every infant school, and every school of instruction conducted on the same principles, at which they might subsequently attend, would become a seminary for Christianity; and we might, on good grounds, indulge the hope that the greater part of the children trained up in such seminaries, when the truths and foundations of religion were more fully exhibited to them, would ultimately make a profession of adherence to its cause and interests, and regulate their conduct by its holy requisitions. In this case, instead of a few insulated individuals occasionally embracing the religion of the Bible, we should frequently hear (to use the language of Scripture) of “nations being born at once, and a people as in one day.” For, the young, thus instructed, when arrived at youth and manhood, would exert a most powerful influence on their fathers, mothers, friends, and relatives, and on all around them—while their own minds have been brought under the most salutary influence, being pre-occupied with those truths and habits which will preserve them from the contamination of the heathenish practices which prevail around them.

It gives me much pleasure to learn, that in the rudest portion of the pagan world (namely, in the regions of Southern Africa,) such institutions have been recently established, and been accompanied with many beneficial effects. Mr. Buchanan, superintendent of the infant school at Cape Town, during the year 1832, established and reorganized a number of these institutions, at Caledon, Pacaltsdorp, Hankey, Bethelsdorp, Port Elizabeth, Theopolis, Philipston, Buffalo River, and other places; and, though the returns of scholars are not complete, they amount to about 500 children. After the school in Theopolis had been established only six months, the number of children in daily attendance amounted to from 110 to 120. Many of the children were capable of giving effect to the monetary system, and their conduct is described as cheerful, gentle, and compliant, although but a few months before they were most of them “in a state of nature.” The infant school at Bethelsdorp, was re-established under the care of a native female. About two years ago it was discontinued, after having been carried on for six months. The advantages, however, which the children had derived during that short period, were evinced, notwithstanding the interval which had elapsed, by the superiority of manner and intelligence which they appeared to Mr. Buchanan to possess over the un instructed children of other stations. They had been accustomed, after the school was discontinued, to assemble in groups, and repeat for their amusement the lessons and hymns they had learned at the school. Mr. Buchanan, on a former occasion, assisted in opening and organizing a school at Caledon. On his late

visit, he perceived a marked improvement in the dress and personal cleanliness of the children. At the opening of the school, out of thirty pupils, two only had any other covering than sheep-skins, and many were unclothed. When he last took his leave of them, they were all dressed like other children, and many of them with considerable neatness. It was apparent, that the children had acquired some sense of the propriety of dress and personal cleanliness, from their manner during the repetition of the lesson, "*To put my clothes on neat and tight, and see my hands and face are clean,*" and it was equally obvious that their parents appreciated the advantages of the institution, from the fact of some of them having voluntarily requested to be allowed gratuitously to clean out the school-room, alternately, and of their having continued regularly to perform that service. The inhabitants of many other villages have expressed the desire for the introduction of infant schools among themselves—offered to appropriate for that purpose the best house they had, and promised, when their lands shall be measured out to them to erect a proper building at their joint expense. In several of the villages they had placed their children under the care and instruction of one of their own number, until a better teacher could be procured. Mr. Buchanan left at Philipston sufficient apparatus and lessons for the establishment of twelve schools—arrangements were in progress for their commencement—and six young persons were attending the schools, to qualify themselves for becoming teachers.*

Such are the auspicious beginnings of infant education in heathen lands, and the pleasure with which its introduction is hailed by the adult population. While many of them are unaware of the blessings to be derived from a reception of the *doctrines* of religion, they are attracted by the beautiful arrangements and exercises of infant establishments, and at once perceive their beneficial tendency and effects on the objects of their affection; and as their children advance in the accomplishments they acquire at these seminaries, they will every day become more interesting and delightful in their eyes; and it is not too much to suppose, that the knowledge and habits acquired by the children will be the means of enlightening the understandings and polishing the manners of their parents. It ought, therefore, to be one of the first objects of every missionary, to whatever part of the heathen world he is destined, to establish, as far as practicable, seminaries for the development and instruction of infant minds; and every facility for this purpose should be afforded him by the Society under whose auspices he goes forth to evangelize the nations.

7. Infant schools ought to be *universally* established for all classes, and in every country of the civilized world. It is an opinion which still too much prevails, that such establishments are chiefly calculated for the instruction of the lower classes of society. But this is a gross misconception of the nature and tendency of infant institutions, and a very dangerous mistake. These schools are adapted no less for the improvement of the higher, than the lower ranks of the community; and, unless they be soon adopted by the superior classes, the lower ranks may soon advance before them, both in point of intelligence and of moral decorum. For, in many of the families of the higher ranks, immoral maxims are inculcated and acted upon, and many foolish and wayward passions indulged, as well as in the families of their inferiors; and,

although the manners of their children receive a superficial polish superior to others, their moral dispositions are but little more improved, and they possess nearly as little of what may be termed *useful knowledge*, as the great body of the lower ranks around them. Until the families of all classes feel the influence of the instructions and habits acquired at such institutions, the world will never be thoroughly regenerated. In the meantime, if the higher classes feel averse that their children should associate with those of an inferior grade, they have it in their power to establish infant seminaries exclusively for themselves. But I am sorry to find, that, in this country, scarcely any schools of this description have yet been established. There ought, however, to be no objections to children of different ranks associating together for the purpose of instruction; unless in those cases where children are accustomed to dirty habits, or where they may be exposed to infectious diseases. In the Northern States of America, perhaps the most enlightened in the world, children of all ranks are taught in the seminaries, without any artificial distinctions;—all are nearly equally enlightened and improved, and society, in its several departments, moves on with the greatest harmony.

In concluding these remarks, it may not be improper to observe, that *teaching the children to read* ought not to be considered as one of the main objects of infant schools. Many parents are still so ignorant and foolish, as to estimate the advantages of such schools, merely by the progress they conceive their children have attained in the art of reading. They are unqualified for appreciating intellectual instruction and moral habits, and have no higher ideas of the progress of education, than what arise from the circumstance of their children being transferred from one book to another; and hence, they frequently complain, that their children are learning nothing, because no tasks are assigned them, and no books put into their hands. But, it ought to be generally understood, that the art of reading is not the main object of attention in such seminaries, and that they would be of incalculable importance, even although the children were unable to recognize a single letter of the alphabet. At the same time, the knowledge of the letters and elementary sounds, and the art of spelling and reading, are acquired in these schools—almost in the way of an amusement—with more facility and pleasure than on any plans formerly adopted.

In throwing out the above remarks, I have all along taken for granted that infant schools are conducted by men of prudence and *intelligence*. It is not sufficient for insuring the beneficial effects of these institutions, that the individuals who superintend them have been instructed in the mode of conducting their mechanical arrangements. They ought to be persons of good sense, of benevolent dispositions, having their minds thoroughly imbued with the principles of Christianity, of an easy, communicative turn, and possessed of all that *knowledge of history, art, and science, which they can possibly acquire*. For no one can communicate more knowledge to others than what he has himself acquired; and no teacher can render a subject interesting to the young, unless he has acquired a comprehensive and familiar acquaintance with it. In order to secure efficient teachers for these establishments, normal schools, or other seminaries, would require to be established, in which candidates for the office of infant teachers might be instructed, not only in the mode of conducting such institutions, but in all the popular branches

* See Evangelical Magazine for December, 1833.

of useful knowledge. For, upon the *intelligence*, as well as the prudence and moral disposition, of the teachers, the efficiency of infant seminaries will in a great measure depend.

The first idea of infant schools appears to have been suggested by the asylums provided by Mr. Owen, of New Lanark, for the infant children of the people who were employed at his spinning-mills. Mr. Buchanan, under whose superintendence they were placed, was soon after invited to London, and a school was opened under his direction and management, on Brewer's Green, Westminster, which was established and patronized by H. Brougham, Esq., M. P., the Marquis of Lansdowne, Zachary Macauley, Esq., Benjamin Smith, Esq., Joseph Wilson, Esq., and about eight or nine other philanthropic gentlemen. Mr. Wilson soon afterward established one at his own expense in Quaker Street, Spitalfields. He built the school-room, and supplied everything that was necessary; and, on the 24th July, 1820, the school was opened. On the first day, 26 children were admitted, on the next day 21, and, in a very short time, the number of children amounted to 220, all of whom came forward unsolicited. Mr. Wilderspin, who has since distinguished himself by his unwearied zeal in promoting the establishment of such institutions, was appointed teacher. The Rev. Mr. Wilson, brother to J. Wilson, Esq., above mentioned, next established a similar school at Walthamstow, of which parish he was vicar; and an excellent lady, Miss Neave, opened one in Palmer's village, Westminster, for 160 children. In Duncan Street, Liverpool, the Society of Friends established, soon after, a very large one, and, in one

day, collected among themselves, for this purpose, no less than one thousand pounds. All these schools were attended with complete success. A few years afterward, namely, on the 1st of June, 1824, the *Infant School Society* was organized, at a meeting held at Freemason's Hall, London. The meeting was addressed, and powerful speeches delivered on the occasion, by the Marquis of Lansdowne, Mr. Brougham, late Lord Chancellor, Mr. Smith, M. P., Mr. Wilberforce, Sir J. Mackintosh, W. Allen, Esq., Dr. Thorp, Dr. Lushington, the Rev. E. Irving, and others; and, before the meeting had separated, a subscription, amounting to upward of £700, was collected.

Since the above period, infant schools have been established in most of the populous towns, and even in some of the villages, of the British Empire; and, wherever they have been conducted with prudence and intelligence, have uniformly been accompanied with many interesting and beneficial effects. They have also been established in many towns on the continent of Europe, and even in Southern Africa, and in the Peninsula of Hindostan. The enlightened inhabitants of the Northern States of America, who eagerly seize on every scheme by which moral and intellectual improvement may be promoted, are now rapidly establishing such institutions, along with Maternal Associations, throughout every portion of their increasing and widely-spreading population; and, I trust, they will soon be introduced into every nation under heaven. But, before society at large feel the full influence of such seminaries, they will require to be multiplied nearly a hundred-fold beyond the number that presently exists.

CHAPTER V.

ON SCHOOLS FOR YOUNG PERSONS FROM THE AGE OF FIVE OR SIX, TO THE AGE OF THIRTEEN OR FOURTEEN YEARS.

DURING a period of two or three centuries, we have had schools established among us for the instruction of the young, during the period of life to which I now refer. There are few countries in Europe where such institutions for the instruction of the great mass of society, are more numerous and respectable than in the island in which we reside;—and had we not unfortunately stopped short at the very porch of the Temple of Science, we might by this time have been as far superior, in point of intelligence, to every other nation, as we now are to the savages of Patagonia and New Zealand. But, what is the amount of all the instruction generally furnished at our common initiatory schools? The elements of spelling and pronunciation—a jargon of abstract grammar rules crammed into the memory without being understood—the art of writing—the capacity of repeating the vocables of a catechism,—and a mechanical knowledge of arithmetic, without understanding the foundation of its rules. This is the sum of all that tuition which is generally considered as necessary for enlightening the human mind, and carrying forward the great body of the community in the path of moral and intellectual improvement,—a system of tuition by which the memory

has been tortured, the understanding neglected, and the benevolent affections left waste and uncultivated. The effects it has produced, are visible to every intelligent mind that looks around and contemplates the ignorance, servility, and licentiousness, which still abound in every department of society.

If we, therefore, desire to behold knowledge and religious principle, more extensively diffused, and society raised to its highest pitch of improvement, we must adopt more rational and efficient plans than those on which we have hitherto acted, and extend the objects of education to all those departments of knowledge in which man is interested, as a rational, social, and immortal being.—The following remarks are intended to embody a few hints in reference to such a system of tuition;—and, in the first place, I shall attend to the

PLAN, SITUATION, AND ARRANGEMENT OF SCHOOL-ROOMS.

The efficiency of any system of intellectual education that may be formed, will in some measure depend upon the situation of school-rooms, and the ample accommodation afforded for the scholas-

tic exercises and amusements of the young. Every school-house should be erected in an airy and pleasant situation in the outskirts of a town or village, detached from other buildings, with an ample area around it;—and, if possible, should have a commanding view of the variegated scenery both of the earth and of the heavens,—to the various objects of which the attention of the young should be occasionally directed, in order to lay a foundation for general knowledge, and for a rational contemplation of the works of the Almighty. Both the interior of the school, and the surrounding area, should be arranged and fitted up in such a manner, as to be conducive to the pleasure, the convenience, and amusement of the young, so that the circumstances connected with education may not only be associated with agreeable objects, but rendered subservient to the expansion of their minds and to their progress in the path of knowledge.

The following is a rude sketch of what might be the plan and accommodations of a village school. The plot of ground allotted for the establishment, might be about 180 feet long, by 100 in breadth, or more or less according to circumstances. Nearly in the center of this plot, the school-house might be erected, which should contain, at least, the following conveniences:—1. A large room, or hall, for general teaching, about 40 feet long, by 30 in breadth, and 12 or 14 feet high. 2. Two rooms, about 18 feet long, and 15 broad, into which certain classes may occasionally be sent, to attend to their scholastic exercises, under the inspection either of an assistant or of monitors. 3. Two closets, or presses, S T, off the large hall, about 12 feet, by 4 in breadth, for holding portions of the apparatus, to be afterward described, for illustrating the instructions communicated to the pupils. 4. At each end of the plot, or play-

H, might be allotted for the classification of certain plants, as illustrations of some of the principles of botany. They might be arranged into 24 compartments, as in the figure, each exhibiting a different class of plants. The remainder of the plot, particularly that portion of it immediately in front of the school-house, might be smoothed and graveled for a play-ground, and be accommodated with a few seats, or forms, and an apparatus for gymnastic exercises. 6. Behind the building, two water closets, I K, should be erected, one for boys, and another for girls, separated by a wall or partition. The roof of the building should be flat, and paved with flag-stones, and surrounded with a parapet, three or four feet high. The pavement of the roof should be formed so as to have a slight slope toward one corner, so that the rain which falls upon it may be collected in a large barrel, or

cistern, placed underneath. An outside stair conducting to the roof may be erected at the posterior part of the building. This flat roof is intended as a stage, to which the pupils may be occasionally conducted, for the purpose of surveying the terrestrial landscape, of having their attention directed to the several objects of which it is composed, and of listening to descriptions of their nature, positions, properties, and aspects,—and likewise for the purpose of occasionally surveying the apparent motions of the stars, and of viewing the moon and planets through telescopes.

Such are some of the external accommodations which every village school ought to possess. The plan here presented, is not intended as a model to be generally copied, but merely as exhibiting the requisite conveniences and accommodations—the plan of which may be varied at pleasure, according to the taste of architects, or the superintendents of education. The plot of ground should not, in any case, be much less than what is here specified; but where ground can be easily procured, it may be enlarged to an indefinite extent. I do not hesitate to suggest, that even two or three acres of land might, with propriety, be devoted to this object. In this case, it might be laid out in the form of an ornamental pleasure-ground, with straight and serpentine walks, seats, bowers, and the various trees and shrubs peculiar to the climate. In these walks, or bowers, busts might be placed, of such characters as Bacon, Newton, Boyle, Penn, Washington, Franklin, Pascal, Howard, Clarkson, Wilberforce, and Venning, and particularly of those who in early life were distinguished for knowledge and virtue. At every short interval, sentences, expressing some important truth, or moral maxim, should be inscribed on posts erected for the purpose; such as *God is everywhere present.—His Wisdom and Goodness shine in all his works.—Thou shalt love the Lord thy God with all thy heart.—Thou shalt love thy neighbor as thyself.—Whatsoever ye would that men should do to you, do ye even so to them.—Love your enemies, do good to them that hate you, and pray for those who despitefully use you.—The Lord is good to all; He maketh his sun to arise on the evil and on the good, and sendeth rain on the just and the*

ground, should be two covered walks, A B, one for boys, and another for girls, in which the children may amuse themselves in the winter season, or during rainy weather; and, during winter, a fire might be kept in them, and a few forms, placed for the convenience of those who come from a distance, who may partake of their luncheon, and enjoy themselves in comfort during the dinner hour. 5. The spaces C D E F might be laid out in plots for flowers, shrubs, and evergreens, and a few forest trees. A portion of these plots, as G

unjust.—God resisteth the proud, but bestoweth favor on the humble.—Lying lips are an abomination to the Lord.—The lip of truth shall be established forever; but lying lips are only for a moment.—To be virtuous, we must strive against many of our inclinations and desires.—The remembrance of virtuous action is the most delightful consolation of old age.—An industrious and virtuous education of children is a better inheritance than a great estate.—The first step to knowledge is to be sensible of our own ignorance and defects.—Wisdom is better than riches.—Virtue and good behavior are naturally productive of happiness and good fortune.—The present life is only an introductory scene to a future and eternal world; and, therefore, the knowledge and habits we now acquire should have a reference to that endless state which succeeds the present, &c. &c.—Such moral truths and maxims, along with brief statements of scientific facts, should meet the eye of the young in every direction, so as to be quite familiar to their minds; and they might occasionally be referred to, and explained and illustrated, in the discipline enforced, and the instructions communicated in school.

FURNITURE OF THE SCHOOL.

In fitting up the principal apartment of the school, it may be expedient that the seats be movable, in order that they may be occasionally arranged, so that the children may sit in one compact body, with their faces toward their instructor. But every seat or form should be furnished with a back, or rail, and a board before, on which the pupil may lean his arm, and feel quite comfortable and easy; for children very soon feel cramped and uneasy, when sitting long on bare forms, without such conveniences. Every boy should likewise have a wooden peg, either before or behind him, for hanging his hat and satchel. The seats in the two smaller apartments may be fitted up to accommodate those who are chiefly employed in writing, arithmetic, or geometry. In these, and various other arrangements, every minute circumstance should be attended to, which may contribute to the convenience and comfortable accommodation of the young, and to the maintenance of good order and regularity in all their movements.

Apparatus and Museum.—The principal furniture of every seminary intended for intellectual instruction should consist of specimens of the various objects connected with Natural History, and an apparatus for illustrating the popular branches of Physical science. These objects may be arranged under the usual divisions of *Zoology*, *Botany*, and *Mineralogy*; or in other words, Animals, Vegetables, and Minerals. Under the first division may be arranged specimens of such domestic animals as can easily be procured; such as, the dog, the cat, the hare, the rabbit, the mole, the rat, the mouse, the bat, &c.—the peacock, the turkey, the partridge, the pigeon, the thrush, the linnet, the canary, the lark, the swallow, the goldfinch, the chaffinch, &c.—together with as many specimens of lizards, serpents, fishes, and insects, as can be most easily collected and preserved. Those foreign animals, such as the elephant, the camel, the lion, and the tiger, which cannot be directly exhibited, may be represented by colored engravings. The leaves of different kinds of vegetables might be stuck on large sheets of drawing-paper, and occasionally exhibited for the purpose of distinguishing the different trees or shrubs to which they belong—several rare exotic plants might be kept in flower-pots—and the sev-

eral vegetable pots around the seminary would furnish various specimens, in their natural state, of which physiological and botanical descriptions might be given. Various fossils and mineral substances, which can easily be procured, may also be collected and arranged in classes,—such as, platina, silver, mercury, copper, iron, lead, bismuth, zinc, nickel, manganese, with specimens of their ores—chrysolites, garnets, agates, corundums, jaspers—sulphur, carbon, bitumen, amber, caoutchouc, asphalt, charcoal—quartz, feldspar, hornblend, &c.—To these may be added various specimens of artificial objects, and of substances used in manufactures, as hemp, flax, cotton, silk, wool, and the various fabrics into which they are wrought.

The Apparatus may consist of such instruments as the following;—an electrical machine, an air-pump, a barometer and thermometer, a magnetical apparatus, various glass tubes and vials, for hydrostatical, pneumatical and chemical experiments, a telescope, a compound and a solar, or an oxy-hydrogen microscope, a camera-obscura, concave and convex mirrors, a phantasmagoria, a sun-dial, a planetarium, a terrestrial and celestial globe, with large planispheres of the heavens,—a burning lens or mirror, with various instruments of recreation on philosophical subjects, such as the optical paradox and deception, the diagonal opera-glass, the communicative mirror, the sensitive fishes, the sagacious swan, the cup of Tantalus, the fountain at command, &c. Models might also be procured of wind and water-mills, steam-engines, diving-bells, common and forcing-pumps, gasometers, and the different mechanical powers.

In addition to the above, it would be requisite to procure systematic sets of well-executed engravings, exhibiting a view of the most striking phenomena of nature and the processes of the arts,—such as, views of rivers, sea-coasts, islands, cities, towns, and villages, streets, squares, aqueducts, columns, arches, public buildings, rural landscapes, ranges of mountains, volcanoes, icebergs, basaltic columns, glaciers, caves, grottos, natural bridges—the operations of brewing, baking, spinning, weaving, pin-making, forging, glass-blowing, ship-building, &c.—in short, of every object, natural and artificial, which can convey to the mind a definite idea of the different parts which compose the landscape of the world, and the operations of human art. Colored maps of the different portions of the globe, on a large scale, should likewise accompany such exhibitions, in order that the positions of the countries, where the different objects are to be found, may be pointed out. These pictorial representations may be hung around the walls, or on posts, fitted up for that purpose, in such numbers as the allotted spaces will conveniently contain.—The specimens of natural history may be arranged around the walls of the school in presses, with wire or glass doors, so that the greater part of them may be exposed to view; and the apparatus and other articles may be deposited, when not in use, in the two large presses or closets formerly mentioned.

Although the various articles now alluded to could not be procured all at once, yet they might gradually be increased, and a considerable variety of them would doubtless be obtained in the way of donations from the private museums of liberal and philanthropic individuals in the vicinity around; and many of the little urchins who attend the school would rejoice in being instrumental in adding whatever they could procure

to augment the splendor and variety of the museum.

There is one very simple instrument, not hitherto duly appreciated, which might be rendered subservient both to the amusement and the instruction of the young; and that is, the *Optical Diagonal Machine*, for viewing perspective engravings. This instrument, as sold by opticians, consists of a pedestal, somewhat resembling a large mahogany candlestick, having a plain mirror and a convex lens, movable at the top. The print to be viewed is placed on a table, before the instrument, in an inverted position. But this form of the instrument generally produces but a very slender effect, owing partly to the small diameter of the lens commonly used, and partly to the circumstance, that the engraving is generally visible to the eye, at the same time the observer is viewing its magnified image through the machine. To obviate those defects, about seventeen years ago, I fitted up a machine of this kind on another and more simple plan, of which the following is a brief description. It consists of the following parts:—1. A box made of thin deal, 2 feet deep, 2 feet long, and 1 foot broad, open in front. 2. In the side opposite to the opening, and near the top, a circular hole, about 6 inches in diameter, is cut, into which a tube containing the lens is put, capable of being moved an inch or two backward or forward. The convex lens is $5\frac{1}{2}$ inches diameter, and 20 inches focal distance, and its center is about 20 inches above the bottom of the box. 3. The reflecting mirror—which is $12\frac{1}{2}$ inches long and 8 inches broad, and which should be formed of the best English plate glass—the longest dimension being perpendicular to the horizon. This mirror is suspended, immediately before the lens, on two pieces of wood connected with a cross-bar, which is capable of being moved backward or forward to its proper distance from the lens; and the mirror itself moves on two pivots like a common dressing-glass, so as to stand at any required angle. When the instrument is properly adjusted, the mirror should stand at half a right angle to the horizon. The top of the box opens by means of a hinge, to afford a facility for adjusting the mirror. The perspective views are placed on the bottom of the box, parallel with the horizon, and in an inverted position with respect to the eye of the observer. The engravings should be at least 17 inches long and 11 inches broad, exclusive of the margins, and colored after nature.—This instrument, thus fitted up, is greatly superior to the one commonly in use, as nothing is seen but the magnified image of the objects, and no conception can be formed of them to distract the attention, until the observer actually looks through the instrument. Every person who has looked through this instrument, has at once admitted its superiority to those of the common construction, and many individuals have got similar machines fitted up after this pattern. It may be fitted up at an expense not exceeding eighteen or twenty shillings; that is, nine shillings for the lens, seven shillings for the mirror, and two or three shillings for the box.

The following figures will convey some idea of this construction of the instrument. Fig. 1 represents a profile of the machine, one of the sides of the box being supposed to be removed. A is the mirror, standing at half a right angle to the lens and the picture, with its back turned to the eye. B is the lens, fixed either in a tube or in a hole cut out of the side of the box next the eye. C D is the bottom of the box, on which

the perspectives are placed. E F is the top of the box, from which the mirror is suspended. Fig. 2 represents a view of the back of the box, or that part which is next the eye when the observer is viewing the prints, in which L represents the lens by which the prints are magnified.

There is one glaring defect in the exhibitions made with this instrument, which has never yet been attempted to be remedied; and that is, that in every landscape the *right* side of the view appears where the *left* should be, which presents a confused and unnatural view, particularly of those objects and scenes with which we are acquainted. This defect may be remedied by cutting out or etching the landscape on the copperplate—not reversed, as is always done, but in its natural position; in which case, the engravings, when thrown off, would be reversed, like the picture formed by the common camera-obscura. Such engravings, when used for the Optical Diagonal Machine, would represent objects exactly in their natural positions; and if the true perspective of a street, a large hall, or a landscape, be accurately delineated, the scene will appear almost as natural and interesting as if we were viewing it from the point whence the picture was taken. As there are thousands of perspectives engraven expressly for this machine, I would humbly suggest to engravers and print-sellers the propriety of having such engravings etched on the plan now proposed. The fineness of the engraving is of very little consequence in such views, provided the perspective has been accurately attended to; but the coloring should be light and natural, and very different from the glaring and clumsy daubings which appear in most of the perspectives which are sold for the use of this machine.

Such are some of the objects and external accommodations which might be procured for every village school. Such a school would form a striking contrast to most of the schools which exist in our country, particularly those which are found in many of our cities and towns, pent up in narrow closes and lanes, in the midst of filth, noise and gloom, destitute of pure air, where the children are packed like hounds in a kennel, cramped in their movements, and can scarcely find a passage from one part of the school-room to another, and where no objects of delight arrest their curiosity and enliven their spirits. Instead of such scanty and wretched accommodations—which may be considered as so many juvenile prison-houses, to which the young are frequently driven by dint of force—we should thus have it in our power to introduce them into a kind of magnificent museum, where every object would excite curiosity and arrest attention. Instead of associating with scholastic exercises the ideas of tasks, stripes and imprisonment, we should thus present to their view a delightful avenue and portal to the Temple of Knowledge, which would

excite a spirit of observation, rouse their intellectual energies, and produce a high degree of pleasure and enjoyment. And nothing can be of more importance to the best interests of the young, and to the cause of the universal diffusion of knowledge, than to strew the path of science with flowers of every hue, and to render all the early associations connected with it exhilarating and cheerful. The road which leads to knowledge, moral virtue, happiness, and the higher enjoyments of the life to come, ought undoubtedly to wear a bright and alluring aspect, and to be divested of every object which has the appearance of austerity or gloom.

In towns, a number of these schools might be connected together in one large square or building, surrounded with as extensive a space as can be procured, forming one grand seminary, where children of all ranks might associate without distinction in their amusements and scholastic exercises. The amusements and the exercises of such numerous groups of the young, both within and without doors, would form a lively and interesting spectacle to every philanthropist; and public schools, when properly situated, and governed on Christian principles, so far from being a nuisance to the neighborhood, as they are generally considered, would constitute one of the best ornaments, and the most delightful scenes, connected with general society. Where large towns diverge into extensive suburbs, a variety of distinct seminaries might be erected at proper distances from each other, to accommodate the inhabitants of the adjacent district, so that the children would not require to go too great a distance from their homes.

SCHOOL-BOOKS.

There are few things of more importance in the arrangements connected with education than the judicious selection and compilation of the *Books* intended to be put into the hands of the young. I have already offered a few strictures on the inefficiency of the school-books which have been most generally in use in our borough and parochial schools; and although of late years several improved school-collections have been introduced, scarcely any have yet appeared completely adapted to an intellectual system of tuition. The following general principles ought to be recognized in the compilation of every class-book for the use of schools:—

1. That the subjects introduced be *level to the comprehension* of those for whose use the book is intended.
2. That every article it contains be *calculated to convey some portion of useful knowledge*.
3. That the selections in general have a *moral tendency*, and that everything that might foster a spirit of pride, avarice, ambition or warfare, be carefully excluded.
4. That moral and physical *facts* should form a prominent feature in such books, and mere *fictions* be entirely discarded.
5. That the lessons be so constructed, that every sentiment and description may produce an *accurate and well-defined idea* in the minds of the young.

These rules proceed on the assumption, that the *communication of ideas—the elements of thought—and the formation of moral character, are the great and ultimate objects of education*.

In the first books put into the hands of children, the lessons should be so constructed that the *leading ideas they contain, or the objects they describe,*

may be immediately pointed out, either by means of the specimens contained in the museum, by pictorial representations, or by the objects around them in the scene of nature; so that every word, or at least every description contained in the lesson, may be associated in the mind of the child with the idea of its objects. Hence the propriety, in the first instance, of restricting the descriptive lessons solely to *sensible objects*. It is through the medium of the senses that the elements of all our knowledge are derived. We perceive, in the first instance, a variety of objects which immediately surround us, and gradually become acquainted with some of their qualities. As we advance in life, and mingle in society, and make excursions from one place to another, the number of our perceptions is indefinitely increased. We have the power of presenting to the view of the mind the *images or ideas* of these objects at pleasure, even when the objects which first produced them are removed. Those ideas are nothing else than *renewed representations* of what we have at any time perceived or felt through the medium of the organs of sensation. Having received such impressions or ideas, the mind has the faculty of contemplating them at pleasure, whether their objects be present or absent—of combining them together, of compounding and decompounding them, and of modifying, comparing, and examining them, in an infinite variety of lights; by which means it is enabled to enlarge the objects of its perception and contemplation, and to acquire an inexhaustible treasure of other ideas, distinct from the former, though necessarily resulting from them. Such is the origin and progress of all our knowledge—and thus the human mind pursues its course from simple perceptions and trains of ideas, and from one discovery and chain of reasoning to another, until it rises from the first dawnings of reason to the full blaze of intellectual light, and to the height of moral improvement.

These considerations evidently point out the mode in which instruction ought to be communicated, and the objects toward which the youthful mind should, in the first instance, be directed—for want of attention to which, many of our school-books are nearly as inefficient for the purpose intended as if they had been written in a foreign language. I have just now lying before me two initiatory books lately published, entitled, “*First*” and “*Second Books for Children*,” in which there is not a single sentence conveying the idea of a sentiment or fact, nor even a single word, that will produce an idea in the mind of a child—every page being completely occupied with such sounds as these—“*gra, cre, dre, dro—guff, puff, groff, sniff—gyve, gyre, gibe—baffle, socle, struggle, &c. &c.*” Such books can never be interesting to the young, and must present to their view nothing but a bleak and thorny path to the temple of knowledge. Nor will such vague sentences as the following, with which our *primers* abound, produce a much better effect:—“*My son, walk not in the way of bad men; for bad men go on in sin all the day.—Set thy heart on the right way, and mind the law of the Lord.—Do not break the laws of God, and shun the ways that lead to death,*” &c. Such *somber* sentiments and exhortations, however sound the morality they inculcate, can never produce a well-defined idea in the mind of a child, or excite to moral action, and consequently cannot have the effect of producing pleasing emotions and a taste for knowledge.—Every sentence of a child’s lesson should convey to his mind a *picture* or represen-

tation of some object; and it is quite possible to accomplish this end, by simplifying our descriptions, and selecting those sensible objects which are calculated to attract attention, and which may be presented to the view. For example:—

“The sun shines. The sky is blue, when it is not covered with clouds. The stars shine forth at night. Snow is white. Rain comes from the clouds. Gold is yellow; silver is white; copper is red. Lead is heavy; cork is light; coal is black. Trees grow in the fields; they have roots, branches and leaves. Flowers grow in the fields and gardens; some of them are red, some are white, some are yellow, others are blue. Corn grows in the fields; when it is ripe it is cut down, and ground into meal, and then baked into bread. A dog has a head, two ears, four feet, and a tail. A bird has a beak, two eyes, two wings, two legs, and a tail; it is covered with feathers, it chirrups and sings, and flies through the air. When we strike a small bell with a key, it sends forth a sound. When we shut our eyes, all appears dark around us, and we can see nothing. When we open our eyes, we can see the sky, the clouds, the fields, the trees, the houses; and men, women, and children, walking along the road, or sitting in the school. The sun rises in the east, and when he rises it is day; when he sets in the west, it is night, and the stars appear in the sky. The sun shines upon the trees, the houses, and the water, and everything looks bright and beautiful when he shines upon it. He shines in all countries, over all the earth. He is so bright, that we cannot look at him, but when he is covered with thin clouds. If you take a piece of red or green glass, and hold it between your eye and the sun, you may look at him without hurting your eyes. The sun gives us light and heat, and he is the most bright and glorious work of God that can be seen in the whole world,” &c.

Such simple lessons may be made to produce a well-defined idea in the mind of every child, by exhibiting to his view, at the moment he is reading, the very object which his lesson describes; and if the object is not present, it may be represented by an engraving. When his lesson states that “lead is heavy, and cork is light,” a piece of cork and a piece of lead of the same size may be put into his hands, which will not only convince him of the fact, but will enable him afterward to recognize these circumstances. When he reads that “a bell, when struck by a piece of iron, produces a sound,” the experiment may be exhibited before him—which circumstances will have a powerful tendency to arrest his attention, and keep alive his interest in the subject of his lessons.

The first class-books for schools should, therefore, be confined chiefly to descriptions of the appearances and qualities of such objects as may be exhibited to the senses of children, and instantly associated with the vocables of which their lessons consist. Descriptions of the form and habits of *animals*, such as the dog, the cow, the ass, the mole, the elephant, the rein-deer, the camelopard, &c.—of *vegetables*, the parts of which they consist, the places where they grow, the manner in which they are produced and cultivated, their forms and flowers, and numberless varieties—of *minerals*, their various qualities, colors, and appearances, the places whence they are procured, the processes through which they pass, and the uses to which they are subservient in human life—might form one department of an initiatory class-book. Descriptions of the more obvious phenomena of nature, such as the apparent motions of the heavens, the rising and setting of the sun, the phases of the moon, the movements and aspect of the clouds, the phenomena of thunder and lightning, winds, rain, hail and snow; the most striking objects which appear in towns, villages, and throughout the fields, on hills, mountains, valleys, rivers, and sea-coasts—might form another department of a school-book; care being taken that the descriptions be sufficiently simple and vivid, and that long and hard words be

as much as possible avoided. Descriptions of some of the innocent games and amusements of the young, accompanied with delineations of some of them, might likewise be introduced. As a supplement or companion to a book of this kind, descriptions might be given of the particular objects connected with the locality in which the school is situated. In the first place, the school itself, with the various objects it contains; the trees, flowers, and shrubbery which surround it; the roads, streets, lanes and walks, and the most remarkable public buildings it contains—might be particularly described, and the descriptions accompanied with a plan or map of the place and its vicinity, and views of the most interesting objects, rural and architectural, which are connected with it. Such descriptions would always be read with interest by the young, and would excite them to habits of observation and reflection, beside affording them materials for conversation in their social walks and intercourses. Children are always extremely fond of having their ideas of sensible objects enlarged, and view, with a great degree of interest and pleasure, the representations of them in well-executed engravings. Yet, strange to tell, when I attended school, it would have been considered as a crime to have looked into a book which contained engravings. I recollect of a boy having brought to school a copy of “The Three Hundred Animals,” but it was carefully concealed from the teacher, and from most of the scholars, through fear of punishment. We were so anxious, however, to see the novel figures it contained—the magnified picture of the louse and the flea, the bee-hive, the peacock, the elephant, and the whale—that we gave pins, marbles, cherry-stones, gooseberries, and even sometimes a whole *halfpenny*, to the proprietor, for half an hour’s perusal of it.

Some persons will perhaps be disposed to object, that such lessons as I now allude to are either trifling, or, at least, not so important as the moral lessons generally introduced into our initiatory books. In reply to such an insinuation, it may be sufficient to say, that it can never be unimportant to convey a well-defined idea of any object worthy of being known, to the mind of a child, if it is admitted that the great object of education is to communicate the elements of thought. And as to producing moral impressions, every pious and intelligent teacher has an opportunity afforded of impressing the minds of his pupils with a sense of the Goodness, Omnipresence, and Agency of God, every time he is teaching a lesson which is descriptive of the works of nature. Morality can never be effectually taught to the young by vague exhortations, and general rules and maxims,—more especially when such exhortations are not thoroughly understood. If we wish to impress the youthful mind with the odiousness of vice, and the excellence of virtue, we must fix upon *particular actions*, apply to them moral rules or precepts, and illustrate, by familiar examples, their nature and tendency. Every teacher has daily an opportunity of directing the attention of his pupils to certain actions, both good and bad, which appear in their general conduct; and the judicious remarks he makes on the temper and dispositions manifested by particular individuals, will make a more definite and lasting impression upon the minds of the young than can be produced by the mere reading or repetition of moral maxims or general rules. And every child who has been regularly taught to understand every sentence he reads, and to exercise his judgment upon it, will undoubtedly

be better prepared than others for forming a judgment of the propriety or impropriety of certain moral actions, when they are explained to him with simplicity and clearness. In a more advanced stage of education, however, moral lessons, accompanied with examples of virtues and vices, may with great propriety be introduced.

Some may likewise be disposed to inquire whether I intend to set aside exercises on the powers of the letters and the elementary sounds. Although I do not attach so much importance to such exercises as has generally been done, yet I would not altogether set them aside. Lists of monosyllables, exemplifying the long and short sounds of the vowels, and the pronunciation peculiar to certain combinations of the consonants, might be pasted upon cards, and hung up in view of the different classes; on which they might be occasionally exercised, rather as a kind of interlude or amusement than as a serious task. But it appears quite preposterous to confine a child for four or five months to the pronunciation of mere sounds, to which no ideas are attached. And, from a good deal of experience, I am convinced that the true pronunciation of words is to be acquired more from reading interesting lessons, and from the occasional remarks of the teacher on particular sounds as they occur, than by long and tedious exercises on the orthography of the language.

In a more advanced stage of education, after the pupil has read two or three small volumes consisting of such easy descriptive pieces as those alluded to above, a volume consisting of selections of a higher order may be put into his hands. So early as the year 1809, I had formed, and partly executed, the plan of a volume of this description, calculated to excite the attention of the young, to convey real knowledge to their minds, and to render the exercise of reading pleasant and profitable. In some papers connected with this projected work, I find the following "General outline of Contents."

1. Short and familiar lessons. 2. *Narratives* of real occurrences and facts. 3. *Juvenile biography*—comprising anecdotes and lives of young persons who had made early progress in knowledge: early life of Sir I. Newton, of Ferguson the astronomer, of Pascal, Gassendi, Grotius, Crichton, Horrox, Baratiere, &c. &c. 4. *Selections from Sacred History*: History of the creation and fall of man—of the deluge—of the destruction of Sodom—of the lives of Abraham, Isaac, Jacob, Joseph, Moses, and Samuel,—of the deliverance of the Israelites from Egypt, and the leading events which befell them in the wilderness and in Canaan—of the life and translation of Elijah—of the deliverances of Jonah, Daniel, Shadrach, Meshech, and Abednego; Paul, Peter, &c.—of the circumstances which attended the birth, transfiguration, crucifixion, resurrection and ascension of Jesus Christ, and the preaching of the Apostles—with illustrative remarks and observations, a map of the land of Judea, plans of the tabernacle and temple, and figures of the sacred utensils and vestments used in the Jewish worship. 5. *Descriptions of objects connected with Natural History and Natural Philosophy*: Forms, habits, and instincts of animals, with anecdotes; *Natural curiosities*—such as basaltic columns, boiling springs, icebergs, glaciers, volcanoes, whirlpools, natural bridges, subterranean caverns, Banian tree, &c.; Brief description of the parts and functions of the human body—the organs of sense, and the different kinds of knowledge they communicate. *Phenomena of Nature in the at-*

mosphere and the heavens: Properties of air—weight and pressure of the atmosphere, with descriptions of a few simple illustrative experiments; Descriptions of thunder-storms, luminous and fiery meteors, the aurora-borealis, the clouds, the rainbow, the ignis-fatuus, rain, hail, dew, water-spouts, hurricanes, sounds and echoes; Descriptions of the mechanical powers—of electrical, magnetical, and optical instruments—of the apparent motions of the heavenly bodies—of the more interesting phenomena connected with the earth, and the other bodies which compose the solar system, &c. 6. *Illustrations and descriptions of certain arts and trades*: Pin-making, weaving, printing, paper-making, glass-blowing, &c. 7. *Useful hints* on various subjects: On taking care of books—cautions respecting the preservation of health—the dangers arising from fire, confined air, noxious gases—the prevention of accidents and infectious diseases—rules for the promotion of order, cleanliness and activity; for cooking victuals, eradicating stains, nursing children, washing, dressing, laying out garden plots, and for promoting domestic economy—characteristics of poisonous plants, cautions in relation to unripe fruits, &c. &c. 8. *Short moral maxims, pithy sayings, and rules for the general regulation of conduct*. 9. *Dialogues*: "The little Philosopher," "The King and the Miller," &c. 10. *Customs and manners of nations*. Sketch of *Geography*,—descriptions of cities, towns, and remarkable places. 11. *Entertaining experiments*, magnetical, electrical, pneumatical, galvanic, mechanical, chemical, &c. 12. *Juvenile amusements*: flying the kite, fives, peg-top, swinging, bathing, &c., with cautionary maxims. 13. *Select Poetry*, consisting only of pieces interesting to the young, and level to their capacity. 14. *Lessons in written characters*, for habituating children to read manuscripts and epistolary correspondence. 15. *List of names and qualities of natural and artificial objects*, as exercises in spelling: during which, short descriptions might be given of the nature and properties of the different objects whose names are proposed as spelling exercises. 16. *List of Greek and Latin primitives and prepositions*, with examples of their meaning, and the effect of their composition in English words. 17. *Definitions of scientific terms*, and of the more difficult words which occur in the lessons. 18. *Tables of money, weights and measures*, with illustrations of the value of coins, the capacity of measures, linear dimensions, &c. 19. *A general set of queries*, referring to some of the principal subjects described in the lessons.

Such was the outline of a class-book which was intended to be published six and twenty years ago. One peculiarity by which it was intended to be distinguished, was—that a set of questions without answers, bearing on every particular object and circumstance detailed, was to be appended to each lesson, for exercising the attention and judgment of the pupil, previous to his being examined on the subject. The various subjects introduced were intended to be partly original composition, partly compilations, and partly selections, abridged, modified, or altered, to suit the object in view. Fables and fictitious stories were to be entirely discarded, and the leading facts to be illustrated by engravings. After composing a preface or introduction, showing the utility of such a work, and obviating objections that might be made to its plan, and having proceeded a certain length in its compilation, I was induced to lay aside the design, in consequence of the apathy and indifference of most of the teachers I con-

versed with on the subject. Some of them who stood high on the ranks of city and parochial schoolmasters told me plainly, that they considered it as no part of their duty to teach their pupils anything but reading or *pronunciation*, and that if their parents wished them to understand what they read, they might teach them at home.

Such a school-book is still a desideratum, notwithstanding some improvements which have lately been made in school-collections. Whether it would be expedient to publish such work at the present time, the public must determine. If properly executed, it would require a considerable degree of labor and research, a discriminating judgment, a familiar acquaintance with the tastes and dispositions of the young, a talent for simplifying descriptions, and rendering them perspicuous to a youthful understanding. Such a book could not be constructed either by the scissors, or by merely copying or abridging pieces from various authors; but by entering thoroughly into the spirit of every subject, and modifying it in such a manner as to interest the affections, and to convey well-defined ideas to the minds of those for whose improvement it is intended. The formation of the questions on each lesson would require a considerable share of judgment and discrimination, so as to render them perspicuous and specific. Most of the questions of this kind which have been attempted in certain school-books, are so general and vague, that they serve no useful purpose either to teacher or scholar, and are frequently so worded and arranged, that a pupil might find out the answers without understanding them or exercising his own judgment. It is, unquestionably, an eligible plan, in every department of learning, to have sets of questions without answers, bearing on every branch of study. Such questions tend to excite the curiosity of the pupil, to exercise his judgment, and to arrest his attention to the subject; and the finding out of the proper answers affords him a certain degree of pleasure. They are also of utility to the teacher, and may suggest to him numerous other subordinate questions connected with the subject. The old plan of constructing books by way of "*Question and Answer*," and causing the vocables of the different answers to be committed to memory without being understood, is too absurd to require a moment's consideration.

It will be admitted, I presume, by every intelligent person, that a class-book, judiciously arranged and executed, and comprising such subjects as above stated, would be far more interesting to the young, and calculated to convey to their minds a much greater portion of useful information, than all the "*Beauties of eminent Writers*," "*Speeches in the Roman Senate*," "*English Readers*," "*Tyro's Guides*," and "*Oratorical Class-books*," which have been so long in use in our English schools. Such a book should contain hints and sketches of everything that has a tendency to expand the intellectual views, and which may be applied to useful practical purposes in the several departments of human life, and be completely purified from everything that might produce national prejudice and partiality, the spirit of contention and warfare, and the indulgence of selfish and malignant affections—in short, a book which might be read with pleasure by the young who understood its language, in every nation of the world. In the hands of a judicious teacher, every idea it contained might be communicated to the understandings of the pupils; and, as early impressions are

the most lasting, the sentiments conveyed, and the impressions thus made upon the mind, could not fail to be of incalculable service to them throughout the whole course of their lives. The foundation of useful knowledge would be laid, and a taste for intellectual pleasures induced, which would stimulate them to still higher pursuits and investigations as they advanced in life. Nor need we have the least fear that children, at an early age, would be incapable of acquiring such knowledge as that to which I allude. If they have not hitherto acquired it, it is because such knowledge as they were capable of acquiring has seldom been judiciously presented before them. We have compelled them to "feed upon ashes"—we have offered them "scorpions" instead of "eggs," and "stones" instead of "bread;" and because they were unable to masticate and digest such substances, we have deprived them of wholesome and nutritious food, and wondered why they have not been strengthened and invigorated. When truth is simplified by familiar illustrations taken from objects with which they are acquainted, and confirmed by appeals to their senses, they imbibe it with avidity, and frequently retain the impressions thus made to the latest period of their existence. The celebrated Fenelon has observed, that "Before they are thought capable of receiving any instruction, or the least pains taken with them, they learn a language. Many children at four years of age can speak their mother tongue, though not with the same accuracy or grammatical precision, yet with greater readiness and fullness than most scholars do a foreign language after the study of a whole life." This circumstance certainly indicates no small degree of intellectual energy and acumen. And to this I may add, that they discover their intellectual powers by connecting the *idea* with the *sign* of it, and acquire many notions of good and evil, right and wrong, in that early period of life. Such are their powers of discrimination, that they can distinguish the characters and dispositions of those with whom they associate, and frequently know the tempers and weaknesses of their parents much better than the parents know theirs, and are dextrous enough to avail themselves of that knowledge in order to obtain their desires and gratify their humors.

A third series of school-books might consist of popular systems of sciences, and descriptions in relation to the *mechanical and liberal arts*. The fundamental principles and the most interesting facts connected with botany, mineralogy, zoology, geography, geology, geometry, astronomy, experimental philosophy and chemistry—and likewise those connected with the arts of weaving, book-binding, printing, clock and watch making, brass-founding, carpentry, &c.—might be familiarly detailed, and illustrated with as many plans and engravings as the different subjects might require. The general knowledge of the sciences, which the pupil would acquire from such compilations, would prepare him for afterward entering on the study of particular sciences, when their principles and applications would be illustrated in more minute detail. The sketches of the different arts and trades would unfold to him some of the leading processes and operations peculiar to the several mechanical employments, and lead him to determine which of these would be most congenial to his own taste and genius.—In compiling such sketches of the sciences and arts, a considerable degree of knowledge, taste, and discrimination, would be requisite. Everything that is intricate or abstruse, or not level to the compre-

hension of young people from the age of ten to the age of fourteen years, should be omitted. Vivid and familiar descriptions of facts and scenery, details of interesting experiments, and engravings of natural and artificial objects, should accompany the explanations of the fundamental principles of the different sciences. In short, everything should be introduced which can be illustrated by sensible objects, and everything discarded which the senses cannot easily appreciate. Mere *skeletons* of the sciences would be quite uninteresting, and would produce no good effect. If any particular science could not be comprehensively illustrated in the space allotted for its details, a selection of its more prominent and popular departments might be substituted, which would be quite sufficient for communicating a general view of the subject, and inducing a taste for its further prosecution at a future period—which is all that is requisite to be aimed at in the first exhibition of science to the youthful mind.

Another class of school-books might be chiefly *Historical*. These should comprise a lucid and comprehensive view of the leading events which have happened from the creation to the present time, omitting those details which would either be improper to be exhibited, or which might prove uninteresting to the young. As a supplement to such a work, a more detailed history might be given of the particular nation or country in which the school is situated.—In compiling such historical works, great caution is requisite that no scenes be exhibited, and no sentiments inculcated, that would pollute the minds of the young, or foster malignant affections. Many of our historians detail the convulsions of nations, and the horrid scenes of devastation and carnage, with a revolting degree of apathy, without interweaving any reflections tending to show the folly and wickedness of war, and to denounce those malignant passions from which it springs. Nay, we frequently find the writings of historians abounding with panegyrics on public robbers and desperadoes, encomiums on war and on warriors, and designating the worst enemies of the human race as *patriots* and illustrious heroes. Hence it has happened, that the study of history, instead of leading the mind to contemplate the character of the Moral Governor of the world, and the retributions of his providence, and to mourn over the malevolent passions and the depravity of man—has not unfrequently tended to excite desires after the acquisition of false glory, and to cherish a spirit of contention and warfare,—the effects of which are visible, even at the present moment, in the ambitious projects which are carrying forward by haughty despots and their obsequious ministers, and in the devastations which are committing, and the contests which are taking place, in almost every region of the globe. If we wish to counteract the effects of pagan maxims and morality, and to imbue the minds of our youth with *Christian* principles and feelings, we must carefully guard against the influence of such anti-christian sentiments. The history of all nations ought to be considered, not merely as the exploits of kings and heroes, but as the *history of the providential dispensations of the Almighty* toward the human race, and the *history of the moral character of mankind*. We should study it, not merely or chiefly, for the purpose of admiring and imitating the exploits of those who have been extolled as illustrious characters (for there are few of them whose deeds deserve our imitation)—but for expanding our views of the character and moral government of

the Ruler of the Universe—for confirming the representations given in the Scriptures of the depravity of man—and for exciting an abhorrence of those lawless passions and deeds of injustice, which have covered the earth with carnage and desolation, and entailed misery upon the race of man. If we wish to study patterns of moral virtue worthy of imitation, we have the example of Jesus Christ set before us, as the pattern of every excellence, “who was holy, harmless, and undefiled,”—“who did no sin, neither was guile found in his mouth; who, when he was reviled, reviled not again; when he suffered he threatened not, but committed his cause to him who judgeth righteously.” We have likewise the examples of his holy prophets and apostles, men as far superior in their moral principles and conduct to the most distinguished sages of Greece and Rome, as the Christian religion is superior to all the systems of theology in the pagan world.—In compiling histories for the young, the historian ought, therefore, to pause at certain periods and events, and direct the attention of his readers to what is moral or immoral in the actions detailed, to what is worthy of being approved or condemned in the scenes described, as determined by the principles and rules of Christianity. He should direct the attention of the young to the scenes of horror which a spirit of ambition and revenge has created, to the malignant passions it has engendered, and to its contrariety to the spirit of true religion and the best interests of man. He should lead them to remark the justice and long-suffering of the Governor of the world—the retributions of his providence in the case of nations and individuals—the accomplishment of Divine predictions—and the evidences which the records of history afford, that man is no longer in a paradisiacal condition, but has fallen from his high estate. In short, he should direct their views to the *means* by which the spirit of warfare may be counteracted and destroyed,—to the happy scenes which would be realized were a spirit of *philanthropy* to reign triumphant,—and to that glorious era, foretold by ancient prophets, when the nations “shall beat their swords into plowshares, and their spears into pruning-hooks, and learn the art of war no more.” Were history studied in connection with such views and instructions,—instead of fostering malignant passions—it might become a handmaid to science and religion, and be rendered subservient for directing the mind to the Great Ruler of the nations, and the plans of his moral government, and for stimulating the exercise of those benevolent affections by which the tribes of mankind may be united in harmony, and the world restored to tranquillity and repose.

All the class-books now described should be embellished with *engravings*, wherever they appear requisite for illustrating the descriptions contained in the text. The subjects of such engravings should not only be accurately delineated, but delicately colored after nature, so as to convey, as nearly as possible, a correct and vivid impression of the objects intended to be represented. Nothing is more pleasing and gratifying to the young, than accurate engravings of the objects about which they read, and nothing has a greater tendency to convey well-defined ideas of those objects which are not present to the senses, and to impress them indelibly upon the imagination. But we have hitherto had no school-books embellished with such engravings as those to which I allude. The expense of such books might probably be objected to, as an argument against their introduction. But if the great end of education be care-

fully kept in view, and the *importance* of conveying clear and comprehensive ideas to the rising generation be duly weighed, no considerations of expense ought to deter us from the execution of any plan by which instruction in the *elements of thought* may be rendered delightful and efficient. Society, if once aroused to consider the importance of an enlightened education, would find no difficulty in defraying every expense connected with its arrangements. If such books were in universal request, and, consequently, many thousands of them thrown off at one impression, they might be afforded at a price very little higher than that of the paltry and inefficient class-books which have been so long in use in our scholastic establishments.

The series of books now described should be accompanied with *dictionaries*, and other books of

reference, for obtaining definitions of words and descriptions of the objects of nature and the terms of science and art. These dictionaries, along with clear definitions of English words and synonyms, should contain short definitions of Latin, Greek, and French primitives and phrases, particularly those which have been adopted into our language, and which, in composition, modify the meaning of many of our own words. The Latin and Greek *prepositions* should be explained, and their force in the composition of English words, and in the terms of art and science, particularly illustrated. Portable cyclopedias or technological dictionaries, with numerous illustrative cuts, such as Crabb's "Dictionary of General Knowledge," would likewise be highly requisite for the occasional use of the higher or primary classes, in all our schools.

CHAPTER VI.

METHOD OF TEACHING, AND THE DEPARTMENTS OF KNOWLEDGE WHICH SHOULD BE TAUGHT IN EVERY SEMINARY.

THE teacher being understood to have a school furnished with the accommodations, museum, and apparatus formerly described, and with a series of books adapted to intellectual instruction—I shall now offer a few *hints* on the mode in which the several departments of instruction might be conducted.

SECTION I.

ENGLISH READING.

In throwing out a few hints on this department, I shall take it for granted that the pupils have acquired a knowledge of the alphabet, in the manner in which it is generally taught in infant schools, and that they are qualified to read, with a certain degree of ease, a few short lessons, consisting of words of one or two syllables. Let us suppose, for example, such a lesson as the following, on the general nature and qualities of certain objects, to be the subject of attention.

1. A bell gives a brisk sound when we strike it with a key, or with a stone, or with a large nail. If we strike an egg-cup made of wood, or if we strike a board or the table with a key, none of these things will give such a sound. A wine-glass will also produce a pretty brisk sound; but if we strike it hard with a nail or a stone, it will break. We hear every sound by means of our ears, which God had formed and placed on each side of our heads, that we might listen to our teachers, and be able to talk with one another.—2. The light which flows from the sun consists of seven colors; red, orange, yellow, green, blue, indigo and violet. The earth is spread over with most of these colors; the fields appear spread over with green, some parts with a light green, and some parts with a dark green color. Fir trees and some poplar trees are dark green, corn and grass are of a light green color. A rose is red; some roses are white. The crowfoot, the cow-

slip, the crocus, and the wall-flower, are yellow. Furze and broom have also pretty yellow flowers. The blue-bottle flower, and some hyacinths, are of a blue color. Some daisies are red, some are white, and some have two or three colors. The corn in the fields, the grass in the meadows, and the leaves of trees, are green.—3. Iron is heavy, copper is heavier, lead is heaviest. Lead will sink, if you throw it into a basin of water, but a cork will swim on the top of the water. A stone will sink in water, but a piece of light wood will swim; and if you push the wood down with your hand to the bottom of the basin, it will quickly rise again to the top.—4. The sun shines from the heavens, and gives us light all the day. He is so bright that we can scarcely look up to him. If we were to look straight toward the sun, it would dazzle our eyes. But if we take a piece of glass that is red or dark green, or a glass that is covered all over with the smoke of a candle, we may look through this glass to the sun without dazzling our eyes. The sun sometimes shines very bright, and sometimes he is covered with clouds. The sun is giving us light at this moment, but we cannot see him. Can any of you tell the reason why the sun is not seen just now when he is giving us light? What hides him from our sight? The sky sometimes appears clear, like a large blue dome or half-globe, and sometimes it is all over covered with dark clouds. When the sun rises in the east, that part of the sky is often covered with bright red and yellow clouds; and when he sets in the evening in the west, the same kind of clouds are sometimes seen. God made the sun, the moon, and the stars; he also made the fields, the trees, and the corn; he formed our bodies and our souls; he gave us eyes to see with, ears, that we might hear, hands to handle with, feet to walk with, and he preserves us every moment. He is present with us in this place, and sees all that we do, though we cannot see him. Let us give thanks to God, for he is good, and let us do what he commands.

None, I presume, will be disposed to deny, that

children of five years of age, who have been previously accustomed to observe the facts around them, may easily be made, under the guidance of an intelligent teacher, to understand every idea contained in such lessons as the above. The lesson should first be distinctly and deliberately read over by the class two or three times, and then illustrated by objects and experiments. Lesson 1, may be illustrated by a small hand-bell, a key, a wineglass, and a piece of wood; and some of the children might be permitted to try the experiments, which would gratify their natural curiosity, and excite an interest in the subject of their lesson—it being always understood that the teacher accompanies such experiments with familiar explanations and remarks.—For illustrating Lesson 2, it would be requisite to have a large white pasteboard painted with the seven primary colors of light, so that the pupils might be exercised upon it, in naming and distinguishing the different colors. The objects whose colors are stated might be shown them; or if any of these objects are not at hand, they may be exhibited by colored engravings.—To illustrate Lesson 3, a pair of scales, a basin of water, a piece of cork, and three pieces of iron, copper, and lead, of equal size, will be required, and then the experiment of weighing the pieces, and plunging them into the water, may be exhibited to the class. When explaining Lesson 4, a piece of stained or smoked glass may be put into the hands of the pupils, when the sun is visible, that each of them may try the experiment. The questions proposed in this lesson, which are not answered, may serve to exercise the judgment of the pupils. They are understood to refer to the circumstance of a cloudy day. Various simple questions of this description should be embodied in the lessons, to give scope to youthful judgment and ingenuity. The latter part of this lesson might afford an opportunity to the teacher of impressing the minds of the class with a sense of the presence, goodness, and universal agency of the Creator. It will scarcely be denied, that in this way instruction may be blended with amusement, and that a considerable variety of useful knowledge might be gradually imparted to the juvenile mind.

Descriptions of animals would form another interesting class of lessons for the young, as in the following example:—

THE PEACOCK.

The Peacock is the most beautiful bird in the world. Its beauty excels that of all other animals. Its bill is about two inches long, and is of a brown color. Its head and neck, and part of its breast, are of a dark-blue color. On the top of its head there is a tuft of pretty green feathers, which adds to its beauty. Its neck is long and slender, and its back of a whitish gray color, spotted with black. But the plumage and tail of this splendid bird are the most beautiful parts of its body. They are adorned with colors so rich and various,

that no human art can make anything like them. When this bird walks in the sunshine, every moment produces a thousand shades of coloring, which are beautiful and evervarying. These fine colors exceed the luster of the finest flowers of the fields and gardens. But, like the flowers, they fade every year, and the feathers drop from their bodies, and are again renewed every spring. The length of the peacock, from the tip of the bill to the end of the tail, is about three feet eight inches. Some of its longest feathers are four feet long. This bird appears haughty and proud, and loves to display its fine colors to those who are looking on, like those little boys and girls who are proud of their fine clothes. The peacock perches upon high places, and lives upon barley and other kinds of grain. Its beautiful plumage does not appear before it is nearly three years old. When it drops its fine feathers in the time of harvest, it does not like to be seen, but seeks to hide itself in some gloomy place. Though the peacock is very beautiful, it utters a very harsh and disgusting cry. For whole hours it will repeat the cry of *Eko, eko, eko*, with the most hideous noise. It cannot sing a pleasant song, like the linnet and the blackbird. It is so wicked that it will scarcely live with any other bird, except the pigeon; and it tears and spoils everything it gets hold of with its bill. This bird was first brought from a far distant country, from the East Indies, and it lives to the age of twenty-five years. Little boys and girls, be not like the peacock, proud and vain, on account of your beauty and your fine clothes; for humility and goodness are always to be preferred to beauty.

In teaching this and similar lessons, a stuffed specimen of the animal described should be placed on a table opposite the class, and its different parts and colors pointed out; but if a specimen is not at hand, a colored engraving should be exhibited, either in the class-book, or on a large sheet pasted on a pasteboard. The terms, *tuft, plumage, bill, perching, &c.* should be explained by a reference to the figure or specimen, and the length of a yard, foot, and inch, or any number of these combined, should be distinctly explained and exhibited, by means of rods of different lengths.—There is another class of lessons for the juvenile classes, which might consist chiefly of descriptions and exhibitions of entertaining experiments. For example—

THE SAGACIOUS SWAN.

There is a nice little amusing toy which is sold in some toy-shops, called the Sagacious Swan. This swan is made of very thin tinplate, or other light substance, and is hollow within. Near its mouth, in the inside, is fixed a small magnet or loadstone. The swan is placed in a large basin full of water, in which it swims. A small rod of metal about five or six inches long, with a piece of bread fastened to one end of it, is held out to the swan, at the distance of an inch or two from its mouth. The swan then moves forward after the rod, as if it wished to take hold of the piece of bread. If you move the rod gently from the swan, it will swim after it all round the basin, and from one side of it to another, as if it were a living swan swimming after its food. But if you present the other end of the rod to the swan, it will swim backward, and try to avoid it, as if you were wishing to mock or insult it.—The rod on which the piece of bread is fastened is also a loadstone. A loadstone attracts or draws to it needles, and any small bits of iron or steel that are near it.

Every loadstone has two ends, which are called its north and south poles. When the north pole of one loadstone is brought near to the south pole of another, they will attract each other. But when the north pole of one is brought near to the north pole of another, they will repel or move from each other. When a small loadstone is placed on a piece of cork or light wood, and made to swim in a basin of water, it will turn itself round, until it points nearly north and south.—The compass which directs sailors in their course along the sea, consists of a small loadstone, which moves upon a pivot. It shows them how to steer to the East and the West, to the North and the South. By means of this small bit of loadstone, they can find their way over great seas and oceans, to the East Indies and America, and round the whole world. God created the loadstone for this purpose; and if we had never known its properties, we should never have been able to bring tea from China, or sugar from the West Indies, or to send Bibles to the people that dwell in the far-distant isles of the sea.

This lesson would of course require to be illustrated by the philosophical toy which it describes. This toy could be easily constructed by an ingenious mechanic, or it may be purchased for about five or six shillings. The experiment of placing a small magnet upon a piece of cork, and suspending it on the water, to show how it fixes itself north and south, might also be exhibited; and by taking another magnet, and suspending it in the same manner opposite to the first, the attraction and repulsion of the different poles of the two magnets might be shown, which would explain the phenomena of the sagacious swan. The power of the magnet in attracting needles, small keys, penknives, &c. might at the same time be shown. A pocket-compass might likewise be exhibited, and its use described; and the attractive and repulsive powers of the magnet shown, by presenting it alternately to the north and south poles of the compass-needle. It might also be shown, that the magnetic power passes through interposing substances, by placing a board between the pocket-compass and the magnet, and causing the pupils to observe, that the needle is made to turn round, by the influence of the magnet transmitted through the board.—This is only one example out of a hundred that might be produced, of rendering entertaining experiments interesting and instructive to children; and when truths are, in this way, associated with sensible representations and experiments, they are seldom erased from their minds to the latest period of their existence.

In the next stage of English reading, the pupil might enter on the perusal of a volume containing lessons on subjects of a higher order, such as those formerly described—which might be substituted in the place of our common school collections. The lessons in such a volume should be distinguished for the perspicuity and neatness of their style, although specimens of what is termed elegance and fine writing may be occasionally introduced. The following may serve as a specimen of the manner in which such lessons may be constructed:—

DESCRIPTION OF VOLCANOES.

Volcanoes are mountains, generally of a large size, from the summits of which issue fire and smoke. On the top of these mountains, there is a vast opening called the *Crater*, sometimes two or three miles in circumference, reaching from their sum-

mits to an immeasurable depth in the bowels of the earth. From these dreadful openings are frequently thrown up to an immense height, torrents of fire and smoke, clouds of ashes and cinders, and red-hot stones, together with torrents of melted lava, which roll down the declivity of the mountain like an immense flaming river. These alarming appearances are frequently accompanied with thunders, lightnings, darkness, quakings of the earth, and horrid subterraneous sounds, producing the most terrible devastations through all the surrounding country.—Previous to an eruption, the smoke, which is continually ascending from the crater, increases, and shoots up to an immense height; forked lightning issues from the ascending column; showers of ashes are thrown to the distance of forty or fifty miles; volleys of red-hot stones are discharged to a great height in the air; the sky appears thick and dark; the luminaries of heaven disappear. When these alarming phenomena have continued for some time, the lava, or stream of melted minerals, begins to make its appearance, either boiling over the top, or forcing its way through the side of the mountain. This fiery deluge runs down the declivity of the mountain, forming a dismal flaming stream, sometimes 14 miles long, 6 miles broad, and 200 feet deep. In its course it destroys orchards, vineyards, corn-fields, and villages; and sometimes cities, containing 20,000 inhabitants, have been consumed and buried under the burning lava. There are reckoned about fourteen of these volcanoes in Europe; of which the principal are Mount Hecla in Iceland, Mount Vesuvius, near the city of Naples, Mount Etna in Sicily, and Stromboli in one of the Lipari islands. Etna and Vesuvius are often quiet for many months, and even years, without the appearance of fire, though the smoke is always ascending from their craters; but the mountain Stromboli is ever at work, and appears to be the only volcano that burns without ceasing; and for ages past, it has been looked upon as the great *lighthouse* of the surrounding seas. Several phenomena of awful sublimity and terrific grandeur frequently accompany the eruptions of these volcanoes. Hecla in Iceland, is a mountain nearly a mile in perpendicular elevation, and a considerable portion of it is covered with snow. In an eruption of this volcano in 1775, a stone weighing 290 pounds was thrown to the distance of 24 English miles. Not far from this mountain, in the year 1783, there happened a most dreadful and appalling eruption, which was preceded by a violent earthquake, which lasted for a fortnight; after which the lava broke out from the earth in three different places, forming three dreadful *Fire-Spouts*. These fire-spouts, or streams of burning lava, after having risen a considerable height into the air, united into one, arriving at last at such an amazing altitude, as to be seen at the distance of more than 200 miles. The height to which this fiery stream ascended was reckoned to be not less than two miles above the surface of the earth. This fire first became visible on the 8th of June, and continued to produce devastation and terror until the 16th of August following. In one direction it formed a lake of fire spreading itself out in length and breadth, more than 36 miles; and, having converted all this tract of land into a sea of fire, it stretched itself out in another direction, and rushed down the channel of a large river with violent impetuosity, tearing up the earth, and carrying on its surface flaming woods, and every thing it met with in its course, and forming other lakes of fire. The whole extent of ground covered by this fiery inundation, was no less than 90 miles.

long, by 42 in breadth, or 3780 square miles, the depth of the lava being from 96 to 120 feet. All the time of this great eruption, the whole atmosphere was loaded with smoke, steam, ashes, and sulphurous vapors. The sun was frequently invisible, or, when seen, was of a dismal reddish color; and the rain which fell through the smoke and steam, was so impregnated with salt and sulphurous matter, that the hair and even the skin of the cattle were destroyed, and the

INTERIOR OF THE CRATER OF VESUVIUS.

VESUVIUS AND NAPLES.

gras of the fields rendered poisonous. Twelve rivers were dried up by this fiery inundation, many lakes were filled up, 20 villages were destroyed, many thousands of sheep and cattle perished, and more than 240 human beings were destroyed. After this eruption, two islands were thrown up from the bottom of the sea, 100 miles south-west from Iceland—one of them 3 miles in circumference, and about a mile in height, which continued for some time to burn with great violence.

In an eruption of Vesuvius, in 1769, about midnight, a fountain of fire was shot up to an amazing height, casting so bright a light, that the smallest objects were clearly distinguishable at any place within six or seven miles of the mountain. On the next day a most violent report was heard, which shook the houses of the town of Portici to such a degree, that the windows were broken and the walls rent by the concussion of the air; and, in an instant, a fountain of liquid transparent fire began to rise, and, gradually increasing, arrived at length to the amazing height of 10,000 feet and upward, when its blaze was reflected with awful grandeur from the sea. A gentleman of Sorrento, twelve miles distant from Vesuvius, read the title page of a book by that volcanic light.—Mount Etna is the largest volcano in Europe. It is above 2 miles in perpendicular height; it is about 30 miles in a straight line along its declivity to the top, its circumference at its base is above 120 miles, and its crater above three miles in circumference. In 1669, burning rocks, 15 feet long, and 50 in circumference, were thrown to the distance of a mile, and showers of cinders and ashes to the distance of more than 60 miles. A fiery stream burst from the mountain, 14 miles long and 6 miles broad,

which destroyed in its course the habitations of nearly 30,000 persons; and, meeting with a lake four miles in compass, not only filled it up, but made a mountain in its place. The quantity of materials thrown out by volcanoes, is prodigious. It was calculated that, in this eruption, the matter thrown out amounted to 150,000,000 cubical yards; so that, had it been extended in length upon the surface of the earth, it would have reached nearly four times round the circumference of the globe. The noise emitted by volcanoes, has been compared to a mixed sound made up of the raging of a tempest, the murmur of a troubled sea, and the roaring of thunder and artillery, confused altogether. The roarings of Cotopaxi in South America, one of the largest volcanoes in the world, have been heard at the distance of more than 200 miles. Volcanoes are found in every quarter of the world. Forty have been observed constantly burning between Cotopaxi and the Pacific ocean; 20 have been seen in the chain of mountains that stretches along Kamtschatka; and many of them are to be found in the Philippines, the Moluccas, the Cape de Verd, the Sandwich, the Ladrone, and other islands in the Pacific ocean. About 205 volcanoes are known to exist, of which 107 are in islands, and 98 on the great continents. All these grand and terrific phenomena of nature are under the direction and control of the Creator of the universe; and they afford presumptive proofs that man has fallen from his original rectitude, and is no longer in a state of innocence.

QUESTIONS ON THE PRECEDING LESSON.

(1.) What is the nature of a volcano? What part of a volcano is its crater? What substances are thrown out from volcanoes? What appearances generally accompany their eruptions? What are the signs or forerunners of an eruption? What is meant by lava? What appearances does it present, and what effects does it produce? What are the principal volcanoes in Europe? What is peculiar with respect to Stromboli? Describe the size and situation of Hecla. What preceded the eruption in Iceland in 1783? What extraordinary appearance did this eruption exhibit? Of what did the fire-spouts consist? at what distance were they seen? and to what height did they rise? How long did they continue to burn? How large a tract of country was covered by the burning materials? and what devastations did they produce? What was the depth of the burning stream? What was the appearance of the sun during this eruption? What effects were produced by the rain, and what was the state of the atmosphere?—What striking appearance was beheld during an eruption of Vesuvius? At what time of the day or night was it seen? What happened before another awful appearance? Describe the size of Mount Etna, and state the circumference of its crater. What were the circumstances attending its eruption in 1669, and what effects did they produce?—(2.) What number of volcanoes has been ascertained? In what countries are they found? How many are in Europe? How many in the mountains of Kamtschatka? What size of stones have been thrown out of Etna and Hecla, and to what distance were they thrown? How many villages were destroyed by the eruption in Iceland? What effect did it produce on the lakes and rivers? and upon animated beings? Were any men and women destroyed? What were the length and breadth of one of the lakes of fire formed by this eruption? Describe the dimensions of the fiery stream which ran down Mount

Etna in 1669. To what has the noise of volcanoes been compared? What effect did this noise produce in the town of Portici? At what distance was a gentleman enabled to read by the flame of a volcano? What was reckoned the height of the stream of fire which ascended from Vesuvius? How many habitations were destroyed by the eruption of Etna? and what effect did it produce on the lake? Have any volcanoes ever risen from the bottom of the sea? From what part of a volcanic mountain does the eruption of lava proceed? and does it always issue from the same part? What was the size of one of the islands thrown up from the sea near Iceland? To what distance have sand and ashes been thrown in the eruptions of volcanoes? What is generally the appearance of the sky, and of the luminaries of heaven previous to an eruption, and during its continuance? At what distance have the sounds of the volcano Cotopaxi been heard?—What is the meaning of the word *subterraneous*? whence is it derived, and of what words is it compounded? Describe, likewise, the meaning of the words *phenomena*, *summit*, *devastation*, *inundation*, *lava*, &c. Point, on the map of Europe, to the situation of Hecla, Vesuvius, Stromboli, and Etna. Point, on the map of the World, to the situations of the other volcanoes mentioned in the lesson. How many volcanoes are situated in islands? What length of a journey is requisite in ascending to the top of Etna? Under whose superintendence are the operations of volcanoes? and what moral instructions may we learn from their terrific and destructive effects?

The above lesson is compiled from five or six different sources, so as to condense as many interesting facts as possible in one description. The language of the original authors has been altered and simplified, and some original sentences interwoven. It is seldom that a mere *extract* will be found, in all its parts, sufficiently perspicuous and interesting to the young; and therefore it would require a considerable degree of labor and research to arrange and compile a volume or two, on the plan proposed. The *questions* are intended to excite the attention and judgment of the pupil, and the answers are understood to be prepared by him previous to his reading the lesson along with his class. At the same time, the teacher has it in his power to put to his pupils as many subordinate questions connected with the subject as he may deem expedient, and to illustrate, by familiar descriptions, any objects either directly or indirectly connected with the facts stated in the lesson.—The first twenty-six questions are stated nearly in the *order of the lesson*; the remaining queries, beginning at No. 2, are intentionally arranged in a different order, to exercise the judgment of the pupil, and to prevent him getting his answers by rote. This arrangement would require to be adopted in almost every lesson. Each lesson should contain a perspicuous description of some well-defined scene or object, the knowledge of which would form a portion of the foundations of useful science. And, were all the ideas comprised in a lesson of this description to be impressed upon the mind of the pupil *every day*, it cannot be doubted, that in the course of a year, when above three hundred such lessons would be studied, a very considerable portion of useful information would be communicated.—A superior in utility and extent to all that has hitherto been acquired by the perusal of Epilogues of stage-players, Speeches in the Roman Senate, Parliamentary debates, the encounters of knights and warriors,

essays on criticism and oratory, and all the other prosing dissertations with which so many of our school-collections are occupied.

Beside the questions referring to the descriptions contained in the lessons, a variety of *miscellaneous questions*, in reference to the common appearances of nature, and the different branches of popular science, might occasionally be proposed to the pupils, to excite their curiosity, and exercise their reasoning powers. For example—

How many miles should we require to travel before we could go quite round the world? What proofs can you give that the earth is round like a globe? Is there more land or water on the surface of the earth? What is meant by the atmosphere? Has the air any weight? By what experiments can you prove that the air presses upon our bodies and upon all parts of the earth? How do you prove that air exists, since it cannot be seen? What is the appearance of the sky during a thunder-storm? Whether is the lightning seen before or after a peal of thunder? By what means could you measure the distance between the earth and a thunder-cloud? What effects does lightning sometimes produce?—How many senses has man? What is the organ of vision? What part of the eye lets in the light? Is the opening which lets in the light always of the same size? What knowledge do we derive by means of the sense of seeing? Have all animals the same number of eyes? What is peculiar in the eyes of flies and other insects? What are some of the different kinds of animals that live in the air, the waters, and the earth? What is the difference between a beast, a bird, and a fish? between a reptile and an insect? &c. Is a lobster a beast, a reptile, or a fish? What are the different parts of a plant? What part of a plant is the stem or trunk? What enables plants to stand upright, although they are tossed with the wind? Do all plants grow upright? What plants are useful for food? for building? for clothing? &c. What parts of our clothing are made from plants? Could we have clothing from animals, if no plants existed? What would be the appearance of fields and mountains, if there were no plants?—What are the tides? How often do they ebb and flow in the course of a day?—At what periods of the moon are the tides highest? Does the sun appear round? Does the moon always appear round? What other phases or shapes does she assume? At what period of the day or night does the moon rise when she appears with a round full face? In what direction does she appear after sunset, when she assumes the form of a slender crescent?—If you take a wine-glass, fill it with water, and press a piece of paper upon the mouth of it, and then turn it upside-down, will the water run out of the glass? If you take a glass tube, and fill it with water, and press your thumb hard upon the top of it, what is the reason that the water will not run out of the bottom of the tube, although it is open? When a boy's sucker is moistened with water, and pressed upon a smooth stone, what is the reason why it is able to lift up a stone of a pretty large size? Would the sucker produce the effect if it were not moistened with water?

Many thousands of queries of this description might be proposed to the young, which, if judiciously selected, explained, and illustrated, could not fail of gratifying their curiosity, and of imparting the elements of useful knowledge, and, above all, of exciting a spirit of observation, of fixing the attention, and of promoting a habit of reasoning on the various objects and operations they perceive around them. An hour or more, during

two or three days in the week, might be profitably spent in such exercises, which should always be accompanied with familiar and minute explanations, and, where the subject admits of it, with amusing and illustrative experiments.*

Another occasional exercise might consist in exhibiting to a class a variety of objects, both natural and artificial,—such as, the model of a ship, a pair of bellows, a mineral substance, a shrub, a flower, a leaf, a bird, an insect, or any other object—and causing the pupils to describe the parts, or qualities of the object exhibited, and the characteristics by which it is distinguished from every other class of objects. If it be a *ship*, the masts, the yard-arms, the bow, the poop, the keel, the different kinds of sails, &c., their uses, properties, and the terms by which they are distinguished, may be pointed out and described.—If it be a *flower*, the calyx, corolla, stamina and pistil, may be pointed out, the class to which it belongs described, and the characteristics by which it may be known from every other flower distinguished. After having several times exhibited and described such objects, they may afterward be held up to the view of a class, or handed round among the pupils for their inspection, and each of them, or at least a few of the more intelligent, interrogated respecting the parts, qualities, uses, or circumstances connected with the object exhibited. The objects which may be thus described are almost innumerable; and hence the necessity, in such a system of instruction, of collecting for every school an extensive museum of natural and artificial objects,—of having an extensive plot of ground connected with the seminary, for rearing trees, shrubs, and flowers of different kinds—and of enjoying an extensive prospect from the roof of the building, with the view of describing as many objects as possible, for the purpose of elucidation and instruction.—The following example, taken from the “Lessons on Objects,” as given in a Pestalozzian school at Cheam, will partly illustrate the plan here suggested:—

Lesson on Glass.—The pupils are supposed to be arranged before a black-board, upon which the result of their observations is written. The glass is passed round the party to be examined by each individual, so that his attention and powers may be exercised about it.

“*Teacher.* What is that which I hold in my hand? *Children.* A piece of glass. *T.* Can you spell the word ‘glass?’ [The teacher then writes the word ‘glass’ upon the slate, which is thus presented to the whole class as the subject of the lesson.] You have all examined the glass, what do you observe? what can you say that it is? *C.* It is bright. [The teacher, having written the word ‘qualities,’ writes under it, ‘It is bright.’] *T.* Take it in your hand and feel it. *C.* It is cold. [Written on the board, under the former quality.] *T.* Feel it again, and compare it with the piece of sponge that is tied to your slate, and then tell me what you perceive in the glass. *C.* It is smooth, it is hard. *T.* Is there any other glass in the room? *C.* Yes, the windows. *T.* Close the shutters: can you see the garden now? *C.* No. *T.* Why cannot you? *C.* We cannot see through the shutters. *T.* What can you say, then, of the glass? *C.* We can see through it. *T.* Can you tell me any word that will express this quality? *C.* No. *T.* I will tell you, then;

pay attention, that you may recollect it. It is *transparent*. What shall you now understand, when I tell you that a substance is transparent? *C.* We can see through it. *T.* You are right; try and recollect something that is transparent. *C.* Water. *T.* If I were to let this glass fall, or you were to throw a ball at the window, what would be the consequence? *C.* The glass would be broken. It is brittle. *T.* Could I in the same manner break the shutters? *C.* No. *T.* Could I break it if I used great force? *C.* Yes. *T.* Would you therefore call the wood brittle? *C.* No. *T.* What substances then do you call brittle? *C.* Those which are easily broken.”

These are probably as many qualities as would occur to children at their first attempt, which, being arranged on the slate or board, form an exercise in spelling. They should then be effaced, and if the pupils are able to write, they may endeavor to remember the lesson, and put it down on their slates. Various other qualities of glass might afterward be described to the pupils, particularly its power of forming images and magnifying objects, when ground into convex lenses, and combined in telescopes and microscopes, which unfold to our view the wonders of the heavens, and the minute parts of creation. The chief business of a teacher, in such exercises, is, to draw out the ideas of children, to direct them in a right channel, to teach them to fix their attention on what is immediately before them, and to employ their reasoning powers in drawing the proper conclusions from the objects they contemplate. Contrary to the almost universally prevailing practice, the *idea* of any object should generally precede the *term* by which it is designated; so that a child having acquired a clear conception of an object, may feel the want of a term or terms by which its nature or qualities may at any time be expressed, and be enabled, on every occasion, to associate the one with the other.

SECTION II.

WRITING AND COMPOSITION.

On this branch of education, I shall offer only a few general remarks, in addition to those formerly stated. Writing is an art of the greatest utility and importance, and to which children should be accustomed at an early period of their lives. In the first instance, they may be taught to write on a slate, with a slate-pencil, which they may be taught to hold in the same way as we hold a goose-quill or a steel-pen. Instead of beginning with straight lines and *parts* of letters, they might at once begin either with complete letters or short words, which should seldom be made of a larger size than half text, as in the actual business of life there is seldom occasion for writing a large text-hand. Mr. Buchanan (a gentleman who has been long a successful teacher in Greenock, and the author of several useful publications) lately showed me a plan he had recently introduced to facilitate the forming of letters, when a child is set to write on a slate. The method is as follows:—Slates are prepared, as in the following figure, with the letters, *a, b, c*, &c. *indented* on the left-hand side. The pupil works his pointed slate-pencil several times throughout the indentings of each letter, and, after he has become familiar with its slopes and curves, and acquires the movements requisite to form the letter, he tries to write a number of the same

* A considerable variety of such questions as those to which I allude, will be found in an excellent little work, by Mr. Jacob Abbot, Principal of Mount Vernon school, entitled “The Little Philosopher.”

letters in succession, on the line drawn on the slate immediately opposite. Mr. Buchanan has found this plan greatly to facilitate the accurate formation of the letters, in the first attempts of children to write on slates; and it certainly deserves a fair trial in other seminaries. Short words might be indented in the same manner; and when the pupil is at a loss as to the formation and the joinings of the different letters, he may recur to the indented model, and by following with his pencil its turnings and windings, three or four times in succession, he will soon be enabled to form the word on his slate.

On a principle somewhat similar, a child may be taught to write with ink upon paper, by setting before him a piece of good writing made with a red pencil, and making him pass and re-pass over all the strokes and curves with a pen full of black ink.—In Professor Jacotot's system of education—instead of commencing with elementary lines, curves, and letters, in what is called text-hand—a complete sentence, written by the master, or engraved in *small hand*, is put before the eyes of the pupil, which he is directed to copy. He writes, as well as he can, the first word—suppose "*The*;" and no further progress must be made, until, by an attentive comparison of his own performance with the original copy, he becomes conscious of the faults and defects of the former. Such questions as these are then put. *Q.* Is this *T* well made? *A.* No; it is too high, or too short, or too long. *Q.* Could it be made better? *A.* I think so. *Q.* What must you then do to improve it? *A.* Make it longer, or broader, or shorter, &c. *Q.* How could you have made it better at first? *A.* By paying more attention, &c.—But I leave it to the writing-master to adopt such plans for teaching the formation of written characters as his experience may deem most expedient, and conclude with two or three general remarks.

The principal object of writing is to communicate our sentiments to others, or to record the fleeting thoughts that pass through our own minds for the subject of future consideration. The art of writing should therefore be made to bear, as soon as possible, on the practical purposes of life. Instead of continuing children for years, at the formal practice of writing from "copy-lines"—as soon as they acquire a tolerable hand, they should be accustomed to write forms of mercantile accounts—statements of arithmetical operations—cards of invitation—letters of friendship or business—forms of address and superscriptions—and whatever else they may afterward have occasion to practice in the actual business of life. The miscellaneous sentiments embodied in the lines and pieces which they copy, should uniformly contain religious and moral precepts and sentiments easily understood, and statements of historical, geographical, astronomical, and scientific facts, in order that no opportunity may be lost in familiarizing the mind to useful knowledge. For example, instead of the unmeaning words generally given as "copies," such sentences as the following might be substituted:

"The eyes of the Lord are in every place, be-

holding the evil and the good. He knoweth our down-sitting and our uprising, and understandeth all our thoughts. The darkness cannot hide from him; for the darkness and the light are both alike to God." "The power and wisdom of God are seen in the construction of the smallest insect. In a single drop of certain kinds of water, hundreds of little animals may be seen, by the microscope, swimming like fishes in a pond, every one of them having eyes, a mouth, stomach and bowels, and instruments of motion." "About sixteen hundred years after the creation, the whole earth was covered with a flood of water, which reached more than twenty feet above the tops of the highest mountains." "Fear God, and keep his commandments. Love your enemies, do good to them that hate you, and live peaceably with all men. If thine enemy hunger, feed him; if he thirst, give him drink. For God is long-suffering and kind, even to the unthankful and the evil; He causeth his sun to rise on the evil and on the good, and sendeth his rain to water the fields both of the righteous and of the wicked." "The world in which we dwell is round, like a globe or ball; and it would require a journey of nearly twenty-five thousand miles before we could go quite round it." "The Atlantic ocean lies between Europe and America, and it is three thousand miles broad." "Africa is a very hot country, and there are great numbers of people living in it whose skin is entirely black." "China is the most populous empire in the world: it contains about three hundred millions of inhabitants. The whole world contains above eight hundred millions." "The moon is two thousand one hundred and sixty miles in diameter; and is two hundred and forty thousand miles distant from the earth." "The sun is ninety-five millions of miles distant; and is more than twelve hundred thousand times larger than the whole earth." "The air, or atmosphere, presses upon every square yard of the earth's surface with a force equal to more than nineteen thousand pounds." "The river Amazon is three thousand miles long, and is the largest river on the globe." &c.

A sentence or two of this description might be given to a whole class of writers, to be copied several times over; and after the class has finished the writing, the fact, or sentiment contained in the sentence might be explained and illustrated. By this means, a number of useful facts and practical rules of conduct might be gradually communicated to the youthful mind; and, being noted down in the pupil's copy-book, they might be reperused and referred to on any future occasion. Perhaps it might not be inexpedient to classify a number of fundamental truths, facts, and aphorisms, under such heads as the following—*Religious, Moral, Geographical, Historical, Astronomical, Chemical, Optical, Botanical, &c.*, allotting two or three pages of the copy-book for each department. The above suggestion proceeds on the principle, that in every department of study, an opportunity should be taken of imparting some new and useful truth to the understanding of the young, or impressing some moral lesson upon the heart.

As soon as the pupil is able to handle the pen with some degree of dexterity, he should be accustomed to write forms of letters, narratives, essays, or real epistolary correspondence. He may likewise at this period, be gradually taught the *art of composition*. This may be effected, in the first instance, by recounting to him a striking narrat' ve,

or an interesting historical fact, and desiring him immediately to repeat it in his own style, and afterward to write it down nearly in the same manner. After being accustomed to write, a few simple narratives, descriptions of some objects connected with natural history, or some striking moral sentiments, may be read over several times in his hearing, as exercises in composition. He may next be requested to give a narrative of any excursion he has made, either alone, or in company, and a description of the scenes he has visited, the events that occurred, and the friends by whom he was entertained. He may also be desired to describe the rural scenery around him, and the streets, lanes, public buildings, and other remarkable objects connected with the town or village in which he resides. A stuffed bird or quadruped, an insect, a plant, a flower, or any other object, might occasionally be presented to him, with a request to describe in writing, its form, parts, proportions, and properties, as they appear to his senses after a minute inspection. The apparent motion of the sun during summer, might be prescribed as an exercise of this kind, in which he might be desired to describe the direction or position of the sun at 6 and 9 o'clock in the morning, at noon, and at 3, 6, and 8 o'clock in the afternoon. A description of the different phases of the moon, and of the positions in the heavens in which she appears, immediately after sunset, when she assumes the figure of a *crescent*, a *half-moon*, a *gibbous* phase and a full enlightened hemisphere—might form another exercise.* Such exercises would tend to excite a spirit of observation, and to impress the mind with various facts, which would be found of immense benefit to the pupil when he should afterward enter on the regular study of the sciences. When such exercises are prescribed to a whole class, a day and hour may be appointed, when a few of the compositions might be read by the teacher in the presence of the class. This will give him an opportunity of offering remarks on the merits of the different compositions, and of showing how the same ideas may be expressed in different language. On such occasions, orthographical and grammatical errors may be pointed out and directions given how they may be avoided. At the same time, instructions may be given in reference to the proper use of capital letters, stops and marks, and the proper arrangement of any piece of composition into sentences and paragraphs.

The utility of such exercises will scarcely be called in question. They would habituate the young to *observation* and *reflection*—instead of looking at the objects and phenomena of nature with an *unconscious gaze*, they would learn to inspect them with minute attention, and investigate their forms, qualities, and effects. In such observations they would feel a variety of pleasing emotions; for the acquisition of new facts and ideas, and knowledge of every description, is a source of enjoyment to every mind, whether young or old. Beside, such studies and employments

would have a tendency to prevent them from engaging in frivolous pursuits and mischievous devices; and, in the future periods of their lives they would be enabled to record and describe, with perspicuity, any remarkable occurrences or facts, that may fall under their observation. We have reason to believe that many interesting facts in relation to geology, mineralogy, zoology, meteorology, and other departments of natural history, have been detected by persons in the lower ranks of life, which have been lost to the scientific world, in consequence of their being beheld with an in-curious eye, and from the observers having been incapable of writing an intelligent description of the objects which came under their inspection. Hence the numerous bones of fossil animals which have been mangled and destroyed, and thrown aside as rubbish, by laborers and miners, had they been preserved entire, might have thrown a new light on the extinct species of the animal kingdom, and on the former state of the world. But in the present state of society, there is not one out of a hundred capable of writing a perspicuous description of any fact, physical, political or moral, that may fall under his observation. If, therefore, young people were early excited to habits of observation, and to record in writing the results of their observations, they might afterward, in a variety of ways, be eminently useful in contributing to the advancement of science and of general knowledge.

SECTION III.

DRAWING.

In connection with writing, Drawing is an accomplishment in which every young person should be initiated. As writing consists in the imitation of characters and words, so drawing is the imitation or writing down of objects. Almost every child feels a desire to imitate the actions of others, and when he has it in his power, to draw representations, however rude, of the objects around him; and in such exercises feels no small share of enjoyment. He may be taught to begin with geometrical figures, as lines, angles, squares, parallelograms, triangles, polygons, arches, circles, ovals, cones, pyramids, cylinders, and the like, as being the foundation of all other proportions. He may next proceed to the drawing of fruits, as apples, pears, cherries, &c., with their leaves; of flowers, as roses, tulips, and daisies; of birds, beasts, fishes, and serpents; of the human body, with its several lineaments; and of houses, spires, public buildings, and landscapes. After he has executed some of these objects from patterns set before him, he should be encouraged as soon as possible to *copy from nature*. For this purpose, he might be directed to begin with attempting to draw the representation of an adjacent building, of the school-house, with its garden and area, of a church, a spire, a tower, or some adjacent public edifice—also the imitation of a tree, a flower, a horse, a cow, a dog, a ship, or a windmill. After drawing several landscapes from copies, he may be requested to delineate a particular landscape in the neighborhood of the seminary; and if such an exercise were prescribed to a whole class, premiums (if such a principle be admitted) might be offered for two or three of the best-finished drawings. Previous, however, to such attempts, some of the principles of perspective would require to be familiarly illustrated. The pupil might next be instructed in

* In order to understand the object of such an exercise, it may not be improper to state, that immediately after sunset, the moon, when in a *crescent* phase, appears near the *west* or *south-west* quarter of the heavens, in our northern latitude—when of the figure of a *half-moon*, she appears nearly in the *south* at the same hour—when of a *gibbous* phase about the *south-east*—and when a *full moon* in the *east*, nearly opposite to the point of sunset, and sometimes a little to the south-east or north-east, according as she is in north or south declination. These circumstances can be easily ascertained in the course of a fortnight, and it is of some importance to a young person that he be enabled to determine them from his own observations.

the delineation of maps, the drawing of architectural plans, garden-plots, and rural ornaments, machinery of different kinds, and optical, mathematical, and philosophical instruments. In the present state of society, and amidst the improvements now going on in all kinds of machinery, a particular acquaintance with this department of drawing would be found of great practical utility, and there are few mechanical exercises in which the young would take greater delight.

Drawing has hitherto been considered chiefly in the light of an *ornamental* study, and has been viewed as principally adapted to the amusement of ladies, and the higher ranks of society; and their attention has been chiefly directed to the copying of paintings, engravings, drawings, and *fancy-pieces*, which have no prototypes in nature. Hence there are comparatively few who have learned this art in the usual routine, that can accurately delineate a landscape from nature, draw an architectural plan, or give a correct representation of any instrument or piece of machinery. The art of drawing ought not to be considered as merely an elegant amusement: it is capable of being rendered of the greatest utility to science, and to those arts which minister to the comfort and rational enjoyments of human life. Were useful knowledge more generally diffused, and were the young universally taught to draw from nature, our views of the landscape of the world, of the facts of science, and of the operations of art, might be indefinitely enlarged. Every traveler would be enabled to take a sketch of the wonders of nature, the varieties of art, the domestic associations, and the more interesting scenery displayed in the different regions through which he passed; and such sketches, being afterward expanded into panoramas, or engraved for the optical machine, might extend our conceptions of the scenery of the world, and convey clear and distinct views of objects which we may never have an opportunity of visiting. Every naturalist would be qualified to delineate an exact representation of any unknown tree, flower, shrub, or uncommon animal, that might fall under his observation. Every one engaged in astronomical observation could represent to others, with accuracy, the phenomena of the solar spots, with their numberless variations—the aspect of the lunar mountains, peaks, and vales, in every phase of the moon, and the changes which may occasionally be taking place—the varied appearances on the surfaces of the planets, as seen through telescopes—and the relative positions, sizes and phenomena of the stellar and planetary nebulae dispersed through the distant regions of space. Every artisan and mechanic would be qualified for sketching any mechanical improvement or invention, either of his own or of others; and every laborer, for delineating whatever curious or uncommon objects he might meet with, either in his rural walks, or in his digging, mining, and agricultural operations.

But, in order to enjoy the advantages which would be derived from universal instruction in the art of drawing, every object which the young are set to copy should be one which has a *real existence in nature*, and which may be instrumental in conveying to their minds a new and correct idea of objects which they may not previously have seen, and thus of adding something to their stock of general knowledge; and they should be given to understand that the object of drawing is not mere amusement, but practical utility; and consequently they should be induced to copy from nature and art as soon as they are able to handle the pencil with any degree of dex-

terity. It appears truly absurd and preposterous to set before children, as patterns of imitation, fancy pictures and imaginary landscapes which have no prototypes in the real world, when there are so many real objects and diversified landscapes around us, and when we consider that every new object which has a real existence, presented to a young mind, adds something to its stock of knowledge. Fancy pictures are of as little use in giving us correct representations of nature and art, as novels and romances are in conveying accurate information of the transactions and events recorded in history. On this ground, I would deem it inexpedient to distract the attention of the young with historical paintings or drawings, however much such pieces may be admired. In short, when we consider how much useful information, as well as pleasure, may be conveyed by accurate pictures taken directly from the scenes of nature and the operations of art, we cannot but view it as highly expedient, in attempting the general diffusion of knowledge, that every young person should be taught to delineate, on any emergency, whatever phenomena or processes of nature, or operations of art, may be thought worthy of being depicted and recorded.

SECTION IV.

ARITHMETIC.

ARITHMETIC is the science which explains the properties and relations of numbers, and the method of computing by them. A knowledge of this subject should form a part of every system of education, as its principles and rules form the groundwork of all the computations connected with commerce, geometry, mensuration, geography, astronomy, navigation, and other departments of science.

Previous to engaging in the regular study of this science, and attempting its more complex operations, the general properties of numbers should be familiarly illustrated by *sensible representations*, in a manner similar to what is generally practiced in infant schools. This may be done either in private by an intelligent parent, or in a public school, as an occasional amusement for those who have not entered on the regular study of arithmetic; which would prepare them for understanding its fundamental rules and computations. A variety of movable objects, as peas, beans, beads, marbles, cubes, &c. may be provided,—or perhaps small pieces of wood cut in the shape of cubes or parallelopipeds, as they do not roll, may be more convenient for this purpose—and a method such as the following, corresponding to the spirit and plan of Pestalozzi, may be pursued. The teacher, placing one of the cubes before the children says, “This is *one* cube;” the children at the same time repeat, “This is *one* cube.” The teacher, adding another, says, “These are *two* cubes,” which the children likewise repeat. This process may be continued until they advance to the number *ten*. Then, taking all the cubes from the table, and throwing down *four*, the question is put, How many cubes are on the table? which the children, after having been for some time familiarized to this mode of notation, will be able to answer. In like manner, other numbers may be successively placed on the table, and similar questions put. This process may be varied as follows: Placing a parallelopiped or oblong figure before

the children, the teacher may say, "Once one"—placing another at a little distance from the first, "Twice one"—adding another, "Three times one;" and so on, making the children repeat the numbers as the pieces are laid down. When the ten oblongs are thus arranged at equal distances and in a straight line, such questions as the following may be put. How many oblongs are there on the table? Do they lie close together? Is the first oblong placed nearer to the second than the second is to the third? Do their long sides lie in the direction of the window or of the door, &c.? Could they be placed differently without changing either their number or distance? When these questions are answered, they may then be desired either to shut their eyes or to turn their backs to the table, when three oblongs may be taken away, and the second moved nearer the first, and the question put, How many oblongs are there now? The children, having counted them, will say, "There are seven." How many were there before? "Ten." How many have I taken away? "Three." Did these oblongs undergo any other change? "You have moved that (pointing to it) nearer to the other." In order to vary these processes as much as possible, the children should be desired to count the number of fingers on one or both hands, the number of buttons on their jackets or waistcoats, the number of chairs or forms in the room, the number of books placed on a table or book-shelf, or any other object that may be near or around them. By such exercises, the idea of number and the relative positions of objects would soon be indelibly impressed on their minds, and their attention fixed on the subject of instruction.

These exercises may be still farther varied by drawing, on a large slate or board with chalk, lines, triangles, squares, circles, or other figures as under.

Having chalked such figures as the above, the children may be taught to say, "One line, one triangle, one circle, one square—two lines, two triangles, two circles, two squares—three lines, three triangles, three circles, three squares," &c. which may be continued to twelve or twenty, or any other moderate number. They may be likewise taught to repeat the numbers either backward or forward, thus: "One triangle, two triangles, three triangles, four triangles"—"Four circles, three circles, two circles, one circle." The nature of the four fundamental rules of arithmetic may be explained in a similar manner. Drawing five squares or lines on the board, and afterward adding three, it would be seen that the sum of 5 and 3 is eight. Drawing twelve circles,

and then rubbing out or crossing three of them, it will be seen that if 3 be taken from 12, nine will remain. In like manner, the operations of multiplication and division might be illustrated. But it would be needless to dwell on such processes, as every intelligent parent and teacher can vary them to an indefinite extent, and render them subservient both to the amusement and the instruction of the young. From the want of such sensible representations of number, many young people have been left to the utmost confusion of thought in their first arithmetical processes, and even many expert calculators have remained through life ignorant of the *rationale* of the operations they were in the habit of performing.

When the arithmetical pupil proceeds to the *compound* rules, as they are termed, care should be taken to convey to his mind a well-defined idea of the relative value of *money*—the different measures of *length*, and their proportion to one another—the relative bulks or sizes of the *measures of solidity* and *capacity*—angular measures, or the *divisions of the circle*—*square measure*—and the measure of *time*. The value of money may be easily represented, by placing six penny pieces or twelve halfpennies in a row, and placing a sixpence opposite to them as the value in silver; by laying five shillings in a similar row, with a crown piece opposite; and twenty shillings, or four crowns, with a sovereign opposite, as the value in gold; and so on, with regard to other species of money. To convey a clear idea of measures of length, in every school there should be accurate models or standards of an *inch*, a *foot*, a *yard*, and a *pole*. The relative proportions which these measures bear to each other should be familiarly illustrated, and certain objects fixed upon, either in the school or the adjacent premises, such as the length of a table, the breadth of a walk, the extent of a bed of flowers, &c., by which the lengths and proportions of such measures may be indelibly imprinted on the mind. The number of yards or poles in a furlong or in a mile, and the exact extent of such lineal dimensions, may be ascertained by actual measurement, and then posts may be fixed at the extremities of the distance, to serve as a standard of such measures. The measures of surface may be represented by square boards, an inch, a foot, and a yard square. The extent of a *perch* or *rod* may be shown by marking a plot of that dimension in the school area or garden; and the superficies of an acre may be exhibited by setting off a square plot in an adjacent field, which shall contain the exact number of yards or links in that dimension, and marking its boundaries with posts, trenches, furrows, hedges, or other contrivances. Measures of capacity and solidity should be represented by models or standard measures. The gill, the pint, the quart, and the gallon, the peck and the bushel, should form a part of the furniture of every school, in order that their relative dimensions may be clearly perceived. The idea of a *solid foot* may be represented by a box made exactly of that dimension; and the *weights* used in commerce may be exhibited both to the eye and the sense of feeling, by having an *ounce*, a *pound*, a *stone*, and a *hundred-weight*, made of cast-iron, presented to view in their relative sizes, and by causing the pupil occasionally to lift them, and feel their relative weights. Where these weights and measures cannot be conveniently obtained, a general idea of their relative size may be imparted by means of figures, as under.

Angular measure, or the divisions of the circle,

might be represented by means of a very large circle, divided into degrees and minutes, formed on a thin deal board or pasteboard; and two indexes might be made to revolve on its center, for the purpose of exhibiting angles of different degrees of magnitude, and showing what is meant by the *measurement* of an angle by degrees and minutes. It might also be divided into twelve parts, to mark the signs or great divisions of the zodiac. From the want of exhibitions of this kind, and the necessary explanations, young persons generally entertain very confused conceptions on such subjects, and have no distinct ideas of the difference between minutes of *time*, and minutes of *space*. In attempting to convey an idea of the relative proportions of *duration*, we should begin by presenting a specific illustration of the *unit of time*, namely, the duration of a *second*. This may be done by causing a pendulum of $39\frac{1}{4}$ inches in length to vibrate, and desiring the pupils to mark the time which intervenes between its passing from one side of the curve to the other, or by reminding them that the time in which we deliberately pronounce the word *twenty-one*, nearly corresponds to a second. The duration of a *minute* may be shown by causing the pendulum to vibrate 60 times, or by counting deliberately from *twenty* to *eighty*. The hours, half-hours, and quarters, may be illustrated by means of a common clock; and the pupils might occasionally be required to note the interval that elapses during the performance of any scholastic exercise. The idea of weeks, months, and years, might be conveyed by means of a large circle or long stripe of pasteboard, which might be made either to run along one side of the school, or to go quite round it. The stripe or circle might be divided into 365 or 366 equal parts, and into 12 great divisions corresponding to the months, and 52 divisions corresponding to the number of weeks in a year. The months might be distinguished by being painted with different colors, and the termination of each week by a black perpendicular line. This apparatus might be rendered of use for familiarizing the young to the regular succession of the months and seasons; and for this purpose they might be requested, at least every week, to point out on the circle the particular month, week, or day, corresponding to the time when such exercises are given.

Such minute illustrations may, perhaps, appear to some as almost superfluous. But, in the instruction of the young, it may be laid down as a maxim, that we can never be too minute and

specific in our explanations. We generally err on the opposite extreme, in being too vague and general in our instructions, taking for granted that the young have a clearer knowledge of first principles and fundamental facts than what they really possess. I have known schoolboys who had been long accustomed to calculations connected with the compound rules of arithmetic, who could not tell whether a pound, a stone, or a ton, was the heaviest weight—whether a gallon or a hogshead was the largest measure, or whether they were *weights* or measures of *capacity*—whether a square pole or a square acre was the larger dimension, or whether a pole or a furlong was the greater measure of length. Confining their attention merely to the *numbers* contained in their tables of weights and measures, they multiply and divide according to the order of the numbers in these tables, without annexing to them any definite ideas: and hence it happens that they can form no estimate whether an arithmetical operation be nearly right or wrong, until they are told the answer which they ought to bring out. Hence, likewise, it happens that, in the process of reduction, they so frequently *invert* the order of procedure, and treat tons as if they were ounces, and ounces as if they were tons. Such errors and misconceptions would generally be avoided were accurate ideas previously conveyed of the relative values, proportions, and capacities of the money, weights, and measures used in commerce.

Again, in many cases, arithmetical processes might be illustrated by diagrams, figures, and pictorial representations. The following question is stated in "Hamilton's Arithmetic," as an exercise in simple multiplication—"How many square feet in the floor, roof, and walls of a room, 25 feet long, 18 broad, and 15 high?" It is impossible to convey a clear idea to an arithmetical tyro, of the object of such a question, or of the process by which the true result may be obtained, without figures and accompanying explanations. Yet no previous explanation is given in the book, of what is meant by the *square* of any dimension, or of the method by which it may be obtained. Figures, such as the foregoing, should accompany questions of this description.

The idea of superficial measure, and the reason why we multiply two sides of a quadrangular figure in order to obtain the superficial content, may be illustrated as follows. Suppose a square table whose sides are 6 feet long, and another of the form of a parallelogram, 9 feet long and four feet broad, the superficial feet contained in these dimensions may be represented as below— $6 \times 6 = 36$, and $9 \times 4 = 36$.

By such a representation it is at once seen what is meant by a *square foot*, and that the pro-

duct of the length by the breadth of any dimension, or of the side of a square by itself, must necessarily give the number of square feet, yards,

6

25	26	27	28	29	30
31	32	33	34	35	36

inches, &c., in the surface. It will also show that surfaces of very different shapes or extent, as to length or breadth, may contain the same superficial dimensions. In the same way we may illustrate the truth of such positions as the following:—That there are 144 inches in a square foot—9 square feet in a square yard—160 square

9

28	29	30	31	32	33	34	35	36

poles in an acre—640 square acres in a square mile—27 cubical feet in a cubical yard, &c. For example, the number of square feet in a square yard, or in two square yards, &c., may be represented in either of the following modes.

1 Sq. Yard.

1 Square Yard.

--	--	--	--	--	--	--	--	--	--

2 Sq. Yds.

2 Square Yards.

When the dimensions of the mason work of a house are required, the different parts of the building, which require separate calculations, as the side-walls, the end-walls, the gables, the chimney-stalks, &c., should be separately delineated; and if such delineations are not found in the books where the questions are stated, the pupil, before proceeding to his calculations, should be desired to sketch a plan of the several dimensions which require his attention, in order that he may have a clear conception of the operations before him. Such questions as the following should likewise be illustrated by diagrams. "Glasgow is 44 miles west from Edinburgh; Peebles is exactly south from Edinburgh, and 49 miles in a straight line from Glasgow. What is the distance between Edinburgh and Peebles?" This question is taken from "Hamilton's Arithmetic," and is inserted as one of the exercises connected

with the extraction of the Square Root; but no figure or explanation is given, excepting the

GLASGOW. 44 miles. EDINBURGH.

PEEBLES.

following foot-note. "The square of the hypotenuse of a right-angled triangle, is equal to the sum of the squares of the other two sides." It should be represented as above.

In a similar manner should many other examples connected with the extraction of roots be illustrated. The following question can scarcely be understood, or performed, without an illustrative figure, and yet there is no figure given, nor hint suggested on the subject, in the book from which it is taken. "A ladder, 40 feet long, may be so placed as to reach a window 33 feet from the ground, on one side of the street; and by only turning it over, without moving the foot out of its place, it will do the same by a window 21 feet high on the other side. Required the breadth of the street?" The following is the representation that should be given, which, with a knowledge of the geometrical proposition mentioned above, will enable an arithmetical tyro to perform the operation, and to perceive the reason of it.

By this figure the pupil will see that his calculations must have a respect to two right-angled triangles, of which he has two sides of each given to find the other sides, the sum of which will be the breadth of the street. The nature of fractions may be illustrated in a similar manner. As fractions are parts of a unit, the denominator of any fraction may be considered as the number of parts into which the unit is supposed to be divided. The following fractions, $\frac{2}{9}$, $\frac{4}{5}$, $\frac{7}{12}$, may therefore be represented by a delineation, as follows:

9 parts.

--	--	--	--	--	--	--	--	--	--

2 parts = $\frac{2}{9}$

--	--

12 parts.

--	--	--	--	--	--	--	--	--	--

7 parts

= $\frac{7}{12}$

--	--	--	--	--

5 parts.

--	--	--	--	--

4 parts

= $\frac{4}{5}$

--	--	--	--

By such delineations, the nature of a fraction, and the *value* of it, may be rendered obvious to the eye of a pupil. A great many other questions and processes in arithmetic might, in this way, be rendered clear and interesting to the young practitioner in numbers; and where such sensible representations have a tendency to elucidate any process, they ought never to be omitted. In elementary books on arithmetic, such delineations and illustrations should frequently be given; and, where they are omitted, the pupil should be induced to exert his own judgment and imagination, in order to delineate whatever process is susceptible of such tangible representations.

I shall only remark further, on this head, that the questions given as exercises in the several rules of arithmetic, should be all of a *practical* nature, or such as will generally occur in the *actual business* of life—that the suppositions stated in any question should all be consistent with real facts and occurrences—that facts in relation to commerce, geography, astronomy, natural philosophy, statistics, and other sciences, should be selected as exercises in the different rules, so that the pupil, while engaged in numerical calculations, may at the same time be increasing his stock of general knowledge—and that questions of a trivial nature, which are only intended to puzzle and perplex, without having any practical tendency, be altogether discarded. In many of our arithmetical books for the use of schools, questions and exercises, instead of being expressed in clear and definite terms, are frequently stated in such vague and indefinite language that their object and meaning can scarcely be appreciated by the teacher, and far less by his pupils: and exercises are given which have a tendency only to puzzle and confound the learner, without being capable of being applied to any one useful object or operation. Such questions as the following may be reckoned among this class. “Suppose £2 and $\frac{3}{4}$ of $\frac{1}{2}$ of a pound sterling will buy three yards and $\frac{2}{3}$ of $\frac{3}{4}$ of a yard of cloth, how much will $\frac{6}{11}$ or $\frac{3}{4}$ of a yard cost?” “The number of scholars in a school was 80; there were one-half more in the second form than in the first; the number in the third was $\frac{5}{3}$ of that in the second; and in the fourth, $\frac{2}{3}$ of the third. How many were there in each form?”

In some late publications, such as “Butler’s Arithmetical Exercises,” and “Chalmers’ Introduction to Arithmetic,” a considerable variety of biographical, historical, scientific, and miscellaneous information is interspersed and connected with the different questions and exercises. If the facts and processes alluded to in such publications were sometimes represented by accurate pictures and delineations, it would tend to give the young an interest in the subject of their calculations, and to convey to their minds clear ideas of objects and operations, which cannot be so easily imparted by mere verbal descriptions; and consequently, would be adding to their store of general information. The expense of books constructed on this plan, ought to be no obstacle in the way of their publication, when we consider the vast importance of conveying well-defined conceptions to juvenile minds, and of rendering every scholastic exercise in which they engage interesting and delightful.

SECTION V.

GRAMMAR.

GRAMMAR, considered in its most extensive sense, being a branch of the philosophy of mind, the

study of it requires a considerable degree of mental exertion; and is, therefore, in its more abstract and minute details, beyond the comprehension of mere children. Few things are more absurd and preposterous than the practice, so generally prevalent, of attempting to teach grammar to children of five or six years of age, by making them commit to memory its definitions and technical rules, which to them are nothing else than a collection of unmeaning sounds. In most instances they might as well be employed in repeating the names of the Greek characters, the jingles of the nursery, or a portion of the Turkish Alcoran. The following is the opinion of Lord Kaimes on this point:—“In teaching a language, it is the universal practice to begin with grammar, and to do everything by rules. I affirm this to be a most preposterous method. Grammar is contrived for men, not for children. Its natural place is between language and logic: it ought to close lectures on the former, and to be the first lectures on the latter. It is a gross deception that a language cannot be taught without rules. A boy who is flogged into grammar rules, makes a shift to apply them; but he applies them by rote like a parrot. Boys, for the knowledge they acquire of a language are not indebted to dry rules, but to practice and observation. To this day, I never think without shuddering, of Disputer’s Grammar, which was my daily persecution during the most important period of my life. Deplorable it is that young creatures should be so punished, without being guilty of any fault, more than sufficient to produce a disgust at learning, instead of promoting it. Whence then this absurdity of persecuting boys with grammar rules?”

In most of our plans of education, instead of smoothing the path to knowledge, we have been careful to throw numerous difficulties and obstacles in the way. Not many years ago, we had two characters for the letter s, one of them so like the letter f, that, in many cases, the difference could not be perceived. We had likewise *compound letters*, such as ct, fl, fh, &c., joined together in such an awkward manner, that the young could not distinguish them as the same letters they had previously recognized in their separate state; so that, in addition to the ungracious task of learning the letters of the alphabet in their insulated state, under the terror of the lash, they had to acquire the names and figures of a new set of characters, before they could peruse the simplest lessons in their primers. Such characters, it is to be hoped, are now forever discarded. We have still, however, an absurd practice in our dictionaries and books of reference, which tends to perplex not only our tyros, but even our advanced students, when turning up such works—I mean the practice of confounding the letters I and J, and the letters U and V, which are as distinct from each other as a vowel is from a consonant: so that all the words beginning with J must be sought for under the letter I, and the words beginning with V under the letter U, causing to every one a certain degree of trouble and perplexity, when searching for words beginning with any of these letters. Most of our school Dictionaries and Encyclopedias are still arranged on this absurd principle, which should now be universally discarded.

In the construction of our books of Grammar for the use of children,—instead of facilitating this study, we have done everything to render it as dry and intricate as possible. We have definitions, general rules, exceptions to these rules, declensions and conjugations, profusely scattered

throughout every part of these scholastic manuals, and a cart-load of syntactical rules and examples, all of which must of course be crammed, like a mass of rubbish, into the memories of the little urchins, although they should not attach a single correct idea to any portion of such scholastic exercises. Nothing can be more simple than the *English verb*, which, unlike the Greek and Latin verb, has only two or three varieties in its termination; yet, we perplex the learner with no less than *six* different tenses—the present, the imperfect, the perfect, the pluperfect, the first future, and the future perfect,—while nature and common sense point out only *three* distinctions of time in which an action may be performed; namely, the *past*, the *present*, and the *future*, which of course are subject to a few modifications. On the same principle on which we admit six tenses, we might introduce nearly double that number. Hence a celebrated grammarian, Mr. Harris, in a dissertation on this subject, enumerates no fewer than *twelve* tenses. It is quite easy to make a child understand that a man is now striking a piece of iron with a hammer, that he did the same thing yesterday, and will perform the same action to-morrow,—in other words, that an action was performed at some *past* time, is performing *now*, or will be performed at some *future* period; but it is almost impossible to convey to his mind a clear idea of *twelve*, or even of *six* tenses, although a hundred distinctions and definitions should be crammed into his memory. A disposition to introduce quibbling and useless metaphysical distinctions has been the bane of *theology*, and one of the causes of the divisions of the Christian church. A similar disposition has rendered grammar perplexing and uninteresting to young minds, and prevented them from understanding or appreciating its nature and *general* principles. By attempting too much, in the first instance,—by gorging their memories with all the distinctions, modifications, and rules, which grammarians have thought proper to inculcate,—we have produced a disgust at the study, when, by attempting nothing more than they were able clearly to comprehend, we might have rendered it both delightful and instructive. There are, properly speaking, no oblique cases in English nouns, excepting the *possessive* case, and yet, in some grammars, we have six cases specified, similar to those of Latin nouns; and in almost every book on grammar, three cases at least are considered as belonging to English nouns. On the same principle, we might affirm that there are as many cases as there are prepositions in the language; for every combination of a preposition with a noun forms a distinct relation, and consequently may be said to constitute a distinct *case*. Were it expedient in this place, many such remarks might be offered in reference to the absurdities and intricacies of our grammatical systems, and the perplexing and inefficient modes by which a knowledge of this subject is attempted to be communicated.

In communicating to the young a knowledge of grammar, or of any other subject, that plan which is the easiest and the most interesting should of course be adopted. All intricate and abstruse definitions and discussions ought to be avoided, and nothing attempted but what is level to their comprehensions, and which may be illustrated and explained by *sensible* images and representations. In endeavoring to impart a general idea of the elements of grammar, I would, in the first instance, lead the pupils to a position where they would have a distinct view of an extensive landscape, where they might see either ships sailing, birds flying, windmills in motion, men dig-

ging the ground, or working with saws and hammers, carriages moving, or reapers cutting down the corn. I would then inform them (if they are acquainted with numbers), that there are about fifty thousand words in the English language, but that they may be reduced to about *eight* different *classes*,* or kinds; or, in other words, that all the words they see in the different books that come into their hands, however numerous they may appear, may be arranged into these classes. I would next tell them that one of these kinds of words is called *nouns*, or terms which express the *names* of all kinds of objects, and desire them to point out, in the landscape before them, some of those objects designated nouns. They would find no difficulty in complying with such a requisition, and instantly, “a house, a tree, a ship, a church, a flower, a man, a horse,” and similar names, would be cheerfully vociferated. They would next be told that certain *qualities* or *properties* belong to every object; that a house may be *high* or *low*, *large* or *small*, *white*, *gray* or *red*—a tree, *tall*, *thick*, or *slender*—that a feather is *light*—gold, *heavy*—butter, *soft*, &c.; and that the words, *high*, *low*, *light*, *heavy*, *soft*, &c.; belong to that class termed *adjectives*, or words expressive of *qualities*. Some particular objects might then be mentioned, and the pupils requested to point out some of the qualities which they may possess. For example, *Boy*. After two or three qualities that a boy may possess are stated, they would soon apply the adjectives, *good*, *bad*, *lazy*, *diligent*, *tall*, *handsome*, *mischievous*, *beautiful*, and other qualities. A *Table*, *round*, *oval*, *square*, *oblong*, *high*, *low*, *long*, *short*, &c., adding the word *table* to each of these qualities. To diversify this exercise a little, a quality might be mentioned, and the pupils desired to name any objects to which it will apply. For instance, the quality *Round*,—when such answers as the following might be given, “A *hat* is round, a *wafer* is round, a *saucer* is round, a *skilling* is round, the *sun* and *moon* are round.” In like manner, *High*, which applies to towers, mountains, trees, the clouds; and *Soft*, which applies to butter, dough, jelly, slime, pudding, snow, &c.

I would next direct their attention to that class of words which express *actions*, and request them to look around upon the landscape, and tell me if they perceive anything *in motion*, or shifting its position from one place to another (for motion, either mental or corporeal, is implied in every action). Should they hesitate in answering this request, an instance or two may be pointed out; but they will seldom be at a loss, and will at once reply,—“Ships are moving—birds are flying—the horse is trotting—men are walking—the mason is breaking stones—the trees are waving—the laborer is digging the earth.” They may also be told to stretch out their hands, to walk a few steps, to strike the ground with a rod, to look up to the sky, or to perform any other action that may

* The words in the English language have generally been arranged into *nine* classes, or “parts of speech;” but it appears almost unnecessary to consider the article and the interjection as distinct parts of speech, particularly the interjection, which is not necessary to the construction of a sentence, being only thrown in to express the emotion of the speaker. It is proper, however, that the nature and use of these words be explained to the young. Perhaps all the words essential to language might be arranged into the four following classes; *Nouns*, *Attributives* (or adjectives), *Affirmatives*, and *Connectives*. Such arrangements, however, are of little importance, provided we convey a clear idea to those whom we instruct of the leading parts of speech which are essential to language, and be careful not to perplex their attention with too minute or unnecessary divisions.

be judged expedient, and then informed, that the words expressive of such actions, as *walking, striking, breaking, flying, &c.* are denominated *verbs*. Having engaged them several times in such exercises, until a clear idea of the nature of a verb is communicated, it will be easy to explain the difference between *active* and *neuter* verbs, and the three tenses, the *past*, the *present*, and the *future*. They may be told, for example, that masons *broke* stones yesterday, and *will break* stones to-morrow—that James *wrote* a letter to his cousin a few days ago, and *will probably write* another in a few days hence—and that birds *flew* through the air last year, and *will fly* in the same manner in the year to come. The *quality* of an action, and the *manner* in which it may be performed, or any *circumstance* that happens to be connected with it, may also be explained and illustrated. Thus, they may be asked, In what manner the clouds move, and the birds fly—*slowly* or *swiftly*? In what manner the laborer performs his work—*slovenly* or *neatly, cheerfully* or *heavily*? In what manner the river runs—*smoothly* or *rapidly*? How James behaves during the time of instruction—*attentively* or *foolishly*? How the house to which I point is situated—*pleasantly, awkwardly, or disagreeably*? They may then be told, that such terms as *slowly, swiftly, smoothly, pleasantly, &c.* which express certain qualities of actions, constitute another class of words, denominated *adverbs*.

Words which express the *relations* in which objects stand to each other, may be next pointed out. They may be directed to observe that a certain house (pointing to it) stands *near* a tower, a river, or a large tree—that a house on the right hand is distant *from* another on the left—that the clouds are placed *above* the earth—that the grass is *under* our feet, and that a certain mansion is situated *upon* the declivity of a hill. Such relations might also be illustrated by desiring one of the pupils to walk to a certain point, suppose a tree, and then to return *from* that point to his former position;—or, to place himself in a position *before* the rest of the pupils, and afterward in a position *behind* them—when the relative positions of objects denoted by the terms *near, above, to, and from, before, and behind,* may be familiarly explained, and designated by the word *prepositions*.

An idea may be given of another class of words, which stand instead of names, by asking such questions as these:—How does that house look among the trees, on the opposite bank of the river? The answer might be, "*It looks beautifully.*" How does that lady walk? *She walks gracefully.* What kind of a scholar is John? *He is a good scholar.* What did two wicked boys do to Arthur a few days ago? *They struck him with their fists.* By such examples, it will be easy to show that the words *it, she, he,* stand in the place of *house, lady, and John;* that *they* and *their* refer to the wicked boys, and that *him* stands instead of *Arthur.* They may be then informed, that such words are distinguished by the name *pronouns*; and, by a few more familiar instructions, they may be made acquainted with the nature and use of the nominative, possessive, and objective cases, both singular and plural, by which they are varied. In a similar way the nature and use of the *article* and of *conjunctions* may be pointed out and illustrated. The plan now described may be varied, by directing the attention of the young to the objects contained in a parlor or a school-room—or, a large engraved landscape, accurately colored, containing a considerable variety of objects, and representing various artificers at work,

and objects in motion, might be placed before them, and used for the same purpose as a real landscape—or, they may be desired to form an imaginary picture, every one being called upon to specify the objects they wish to be put into the picture, along with their qualities, and the actions and movements they wish to have exhibited. This picture may either be *merely imaginary*, or it may be rudely sketched with a pencil on a sheet of paper. One may desire that an elegant mansion may be placed in it; another, a church with a spire, and *near* it a small cottage; another may wish to see exhibited, a smith hammering his iron, or a few persons fishing in a river; and another, a school and play-ground, a cotton-manufactory, or a steam-vessel sweeping along the river.—The exhibitions at a market or fair, a public procession, boys and girls at play, a festive entertainment, with all its accompaniments, the scenes of a sea-port, or any other scene connected with nature or human society, might be conceived or delineated for this purpose, and grammatical exercises connected with it in the manner now illustrated. I should, however, prefer a real landscape, as it appears on a fine day of summer or autumn, to any other exhibition; as real objects make a more lively impression on the mind than any picture can produce, and the view of a beautiful landscape, in the open air, is attended with the idea of liberty, freedom from formal tasks, and various exhilarating circumstances. And it ought never to be forgotten, that, by connecting the process of education with varied and pleasant associations, we gradually enlarge the sphere of juvenile knowledge, and impress more deeply on the youthful mind the instructions we intended to impart. By a few occasional lessons, in the way of amusement, on the plan now stated, which may be varied in every possible mode, more correct ideas of the parts of speech may be communicated, than what is generally done in a year or two by the dry and abstract modes in which this branch of instruction has usually been conducted.

Such a plan of instruction appears to be suggested by the mode in which we may conceive language to have been originally formed. Were we to suppose man just now created, and placed for the first time on the surface of this globe, his attention would, in the first place, be directed to the various objects which he beheld existing around him. These he would endeavor, by some means, to distinguish one from another; and, if it were his design to invent a language by which he might hold a communication with other rational beings, his first effort would undoubtedly be, to give them *names* by which the ideas of them might be at any time recalled, when the objects themselves were absent from his view. These form a copious source of words, which must be common to every language formed for the communication of thought among intelligent beings, wherever existing, throughout the immensity of the universe. He would likewise soon discover that every one of the objects around him was endowed with certain attributes or qualities, to express which another class of words or signs would be requisite. In the course of his further survey, he would perceive certain changes, motions, and events, such as the ebbing and flowing of the sea, the rising and setting of the sun, the flight of birds, the movements of quadrupeds, &c., the expression of which would require a class of words distinct from the former. These classes comprehend all the words which can be deemed *essential* to language, or to a

mutual interchange of sentiments between rational beings. In the progress of the formation of language, however, other words would be found highly expedient, for the purpose of ease or ornament, for connecting the different parts of a discourse, or to avoid circumlocutions or disagreeable repetitions; and hence the invention of pronouns, prepositions, and conjunctions. If this appears to have been the process by which language was originally formed, it likewise suggests the proper mode by which a general knowledge of the object, use, and component parts of language may be communicated to the young.

With regard to *Syntax*, in many of our introductory grammars, there are between thirty and forty syntactical rules, many of them long and complex, and accompanied with numerous explanations, distinctions, and exceptions, all of which are intended to be crammed verbatim into the memory of the grammatical tyro, whether he understand them or not, and however ungracious and irksome the task assigned him. Is such a task necessary to be imposed, in the first instance? and, if imposed, will it tend to inspire the pupil with a greater relish for grammatical studies, or render him more accurate in the art of composition? I have no hesitation in answering such questions in the negative. Although all the rules alluded to were admitted to be useful, it would be highly inexpedient to burden and perplex a young person with such exercises, when communicating the first elements of grammatical arrangement, especially when he cannot be supposed to have a clear conception of the meaning and application of the greater part of such rules. What idea, for example, can a child of six or seven years have of such a sentence as the following, which forms only the *one-fourth* part of the 30th rule of syntax, in Blair's Grammar—"The same adjectives, adverbs, and prepositions, are always understood to apply to their respective parts of speech, when connected by conjunctions; so that, if either of them be changed in the next clause of the sentence, or the mood or tense of the verb be changed, the nominative or its pronoun must be repeated,"—or of the following, which forms another part of the same rule—"All the parts of a sentence should correspond with each other, and a regular and similar construction be carefully preserved throughout; and this corresponding analogy in the construction of sentences constitutes the principal charm of elegant composition."*

I am fully convinced that, in the first instance, it is quite unnecessary to advert to more than three or four fundamental rules in syntax, in order to direct the young in the general construction of sentences. There is one principal rule, which, if punctually observed, would prevent any egregious blunder from being committed either in speaking or writing,—and that is, "*A verb should agree with its nominative in number and*

person." This might be called, with some propriety, *the Rule of syntax*—a rule which is short and simple, which can be easily explained and comprehended, on the observation of which the meaning of a sentence frequently depends, and a rule, in short, which is most frequently violated, even by good writers, especially when their sentences are long and complex. To this rule I would add the following—"Active verbs and prepositions govern the objective case of pronouns;" and, in order to prevent such inaccurate expressions as "*more better*," "*more dearer*," &c., the rule, "Double comparatives and superlatives are improper," may be added. Exercises might also be given to illustrate the two following rules—"The past participle should be used after the verbs *have* and *be*;" and "The verb *to be*, should have the same case after it as before it." It ought never to be forgotten, that the habit of accurate composition depends more on *practice*, and the study of good writers, than on a multitude of *rules*; and I appeal to every one who is in the habit of composing, whether, in the moment of committing his thoughts to writing, he ever thinks of the rules of syntax, except, perhaps, some of those now specified. I have known an individual, in the lower walks of life, who had never been taught grammar, nor perused any book on the subject—who wrote essays on physical subjects, which might have been inserted with propriety (and some of them were actually inserted) in respectable scientific journals. The only inaccuracy which appeared was an *occasional* violation of the first rule of syntax above stated. A more correct idea of the construction of sentences will be conveyed to the young by the occasional remarks of a judicious teacher, during their reading lessons—by exercising them frequently on the rules above stated, particularly the first—in causing them to correct ungrammatical sentences—and by pointing out the inaccuracies which occur in their written compositions,—than by all the formal rules that can be packed into their memories.

All the instructions alluded to above may be imparted without the assistance of any book or manual of grammar, and that, too, almost in the way of amusement. When the pupil has arrived at the age of 13 or 14 years, such books as "*Murray's English Grammar*," and "*Irvine's Elements of English Composition*," may be put into his hands for private perusal, where he will meet with a number of minute remarks and observations on the subject, which may be worthy of his attention. But, at the same time, he may be given to understand, that the careful study of good authors, a clear conception of the subject to which his attention is directed, and the exercise of judgment, taste, and common sense, on every piece of composition, will be of more avail than any system of abstract rules; and that a breach of some of the rules laid down by grammarians may sometimes be as proper as a strict observance of them. In short, in training children to accuracy, both in grammar and orthoepey, it might have a good effect were care uniformly taken, both in the school and the parlor, to correct every expression in their ordinary conversation that is ungrammatical, or incorrect in their pronunciation—to explain the reasons of the corrections, and to endeavor, on all occasions, to induce them to express their thoughts with propriety and precision. In the schools in Scotland every child should be taught to pronounce the *English* language with accuracy, even in his common conversation, so that the Scottish language may be

* Mr. Blair, in his Preface to the Grammar alluded to, says, "A grammar for the use of schools should not contain anything superfluous," and "everything should be expressed in the smallest number of words,"—which are certainly good maxims, and yet some of his syntactical rules occupy nearly a page. He immediately adds, "Whatever it is desirable young people should know, they must learn by rote—the memory is the only faculty of children of which teachers can properly avail themselves, and it is a vain attempt to address their immature powers of reason and reflection." Such sentiments are rather too antiquated for the nineteenth century. This gentleman, whether his name be *real* or *fictitious*, has succeeded much better in the execution of his "*Class-Book*," and his "*Grammar of Natural Philosophy*," than in his "*Practical Grammar of the English language*."

extirpated as soon as possible, since it will never again be the language of literature or science.

SECTION VI.

GEOGRAPHY.

GEOGRAPHY is a branch of knowledge with which every individual of the human race ought to be, in some measure, acquainted. It is scarcely consistent with the character of a rational being, surrounded by the immensity of the works of God, to feel no desire to become acquainted with these works, and, particularly, to remain in ignorance of the form, magnitude, component parts, and general arrangements of the terrestrial habitation allotted for his abode. It is equally inconsistent with a principle of benevolence, and with the relations in which he stands to beings of the same nature and destination, to remain altogether unacquainted with the physical and moral condition of other tribes of his fellow-men, and to feel no interest in alleviating their miseries or promoting their improvement. It is even inconsistent with the spirit of religion and the duties of a Christian, to remain in indifference with regard to geographical knowledge, for "the field" of Christian labor and benevolence is "the world," with its numerous tribes of inhabitants, which it is the great object of this science to investigate and describe. As the depositories of Revelation, of "the good tidings of great joy," which are intended to be communicated "to all people," we are bound to study this subject in all its bearings and relations, and to teach it to our children, and our children's children, that they may feel an interest in the moral condition of the inhabitants of distant lands, and employ their energies in diffusing Divine knowledge, in counteracting moral evils, in abolishing the system of warfare, and preparing the way for a harmonious intercourse among all the families of the earth. This science, therefore, ought to form a subject of study in every seminary devoted to the instruction of the young. Yet it is a fact, that, in the present state of society, we find thousands of our fellow-men almost as ignorant as the horse or the mule, of the arrangements of the world in which they dwell, and of the various tribes of human beings with which it is peopled—as if they had no connection with their brethren of the same family, nor any common relation to the Universal Parent who gave them existence.

This study, like many other scholastic exercises, has too frequently been conducted in a dry and uninteresting manner, and very inadequate ideas communicated of its grand features and leading objects. Lists of the names of towns, cities, countries, rivers, bays, and gulfs, have been imposed as tasks to the memory, without any corresponding ideas; and the mechanical exercises of copying maps, and twirling an artificial globe, have not unfrequently been substituted for clear and comprehensive views of the leading facts and principles of the science. *Physical geography* has been almost entirely omitted in the initiatory books on this subject; and most of them are constructed on this principle, that the meager descriptions and details they contain *shall be committed to memory by rote*. In this way, months and even years have been spent, and as little real knowledge of geography acquired, as there is of theology by the common routine of committing to memory the vocables of the "Church Cate-

chism," or the Westminster Assembly's Synopsis of Divinity.

In communicating a knowledge of geography, it is requisite, in the first place, to give the young a clear and impressive idea of the *size, form, component parts, and general arrangements* of the earth, considered simply as an object of contemplation, and a part of the creation of God. In stating to a class of pupils that "the earth is round like a ball," the *reasons or arguments* which prove this position should be clearly and familiarly illustrated. If they are near the sea-coast, they should be conducted to the margin of the sea, to observe how the hull of a ship, leaving the shore, disappears, near the horizon, before the sails, and the sails before the topmast; and a telescope should be provided, that the observation may be made with perfect distinctness. They may be informed, at the same time, that a ship disappears from the view, in the same manner, *in all parts of the ocean*; and if so, the ocean must form a part of the surface of a sphere; and if the ocean, with its numerous ramifications of seas, straits, and gulfs, be of a spherical form, the surface of the land must be nearly of the same figure, since it is nearly on the same level as the sea, no part of it rising more than a mile or two above this level, except the peaks of a few lofty mountains. Where there is no convenient access to the sea-coast, or the margin of a lake or river, the same fact may be illustrated by the appearance of a person going over the top of a conical hill,—or any waving tract of ground may be selected, and a little boy directed to walk from the one extremity to the other, over the highest point of it; when it will be perceived, after having passed this point, that the lower parts of his body will first disappear, and that the top of his head will be the last part of him that will be visible, as represented in the following figure.

The pupils may next be made to perceive, that if the earth be round like a globe, we might travel directly east or west, and, holding on in the same direction, without turning back, might arrive at the same point from which we set out; and then be informed, that the experiment has actually been made—that ships, at different periods, have sailed quite round the world, the course of which may afterward be pointed out on the artificial globe. But, as these voyages have been made only in an easterly or westerly direction, they may be led to understand that, had we no other proofs of the earth's rotundity, this experiment would only prove that the earth is round in one direction, like a cylinder or a drum. The roundness of the earth, *from north to south*, might, at the same time, be explained from the fact, that when we travel a considerable distance from N. to S. or from S. to N., a number of new stars successively appear in the heavens, in the quarter to which we are advancing, while many of those in the opposite quarter gradually disappear; which could not happen if the earth were a *plane* in that direction, like the longitudinal surface of a cylinder; for, in this case, we should see all the stars of the heavens, from the North pole to the South, on whatever portion of the cylindrical surface we were supposed to be placed. This might be illustrated by surrounding a terrestrial globe, or any other ball, with a large hoop or circle, about twice or

thrice the diameter of the globe, on which some of the stars might be represented. This circle might be made either of wood or pasteboard, and the globe within it connected with a movable plane to represent the horizon, as exhibited in the following figure.

In this figure, the inner circle represents the earth; A, the North pole, and B, the South; and the larger circle, ECFD, a portion of the celestial sphere. It is evident, that if a person be placed at the equator at G, he will see all the stars above the horizon CD, in the hemisphere DFC. If he move to the point H, 45 degrees nearer to the North pole, the movable plane CD may be moved in the direction EF, to represent the horizon of that place, when it will evidently appear that he has now lost sight of all the stars situated between F and D, and that the pole-star C, which, in his former position, was in his horizon, is now elevated 45 degrees above it. In a similar manner it might be shown that no such difference in the aspect of the starry heavens could take place, in traveling from South to North, or from North to South, were the earth of the form of a cylinder; and consequently, that the fact above stated proves the rotundity of the earth in that direction.

That the earth, considered as a whole, notwithstanding the irregularities caused by its mountains and vales, is of the figure of a sphere, may be illustrated from the phenomenon exhibited during the progress of an eclipse of the moon. An explanation of a lunar eclipse, accompanied with familiar illustrations, will be requisite to be given, before the proof of the globular figure of the earth be deduced from this phenomenon. Let the flame of a candle or gas-lamp represent the sun, and a wooden ball, supported by a wire represent the earth; and let a circle, somewhat less than the diameter of the ball, be drawn on a piece of pasteboard, and colored to represent the moon. Let them be placed at a moderate distance from each other, and nearly in a straight line, and let the pupils mark the curve of the shadow of the ball on the circle representing the moon, and that there is no body but one of the figure of a globe that can project a circular shadow in every direction; for, although a counter or a shilling will cast a circular shadow in one direction, yet in every other direction it is either an oval or a straight line. Hence the conclusion is easily deduced, that, if the shadow of the earth falling on the moon is the cause of an eclipse of that orb, and if this shadow, so far as it is seen, is always a portion of a circle, the earth, as a whole, must be nearly of a globular figure. In order to render such explanations clear and impressive—when a visible eclipse of the moon takes place, young persons should be directed to observe such a phenomenon with attention—to mark the figure of the earth's shadow when it first enters on the eastern margin of the moon—before it leaves its

western edge—and during the whole of its progress along the disc, if it happen to be a *partial* eclipse of the moon; and, although they be not directly engaged in geographical studies at the time, yet such observations will afterward prepare them for understanding such explanations as now suggested. Such minute illustrations, so far from being superfluous or unnecessary, are essentially requisite for producing in the minds of the young, a *rational conviction* of the rotundity of the earth. I have known young ladies, and gentlemen too, who had passed through a scholastic course of geography, and yet could assign no other reason for their believing that the earth is globular, than this, "That their teacher told them so, and showed them a representation of it by the artificial globe." Beside, such specific explanations and illustrations tend to exercise the reasoning powers of the young, and to bring to their view a variety of incidental facts and circumstances connected with the subject, and thus their store of general information is gradually increased.

Having, by such methods as the above, produced a clear conviction of the spherical form of the earth, the next step might be to convey an impressive idea of its *magnitude*. For this purpose, let a class of young persons be conducted to an eminence, where they might have a distinct view of a landscape stretching about *eight miles* in every direction. Let their attention be particularly directed to the various objects which compose the scene before them; let them be directed to consider the vast mass of materials contained in the hills or mountains which form a portion of the view—the millions of laborers, and the number of years which it would be requisite to reduce the whole landscape to a perfect level,—the number of trees and shrubs of every kind contained within the range of their view—the almost innumerable millions of flowers of every hue, stalks of corn, blades of grass, mosses almost invisible to the naked eye, and vegetables of every description, which cover every portion of the landscape—the cattle, sheep, horses, dogs, and other quadrupeds, and the multitudes of birds, worms, flying and creeping insects, and microscopic animalculæ, which no man can number, comprehended within the limits of their view—the number of houses and human beings in the towns, villages, and hamlets, which are scattered around, and the labors in which they are employed—the mass of waters in the rivers, and in that portion of the ocean which lies before them, (if such objects be in view), and the numerous tribes of fishes which glide through the watery element. Let them be directed to consider the time and exertions which would be requisite to travel to the most distant parts of the landscape, to go quite round it, and to cross it in forty or fifty directions, so as to attain a more intimate inspection of the multifarious scenes and objects of which it is composed. Let certain general calculations be made of the *number* and *magnitude* of such objects, of the *motion* of the inanimate parts of nature, of the activities of animated beings, and of the quantity of matter which appears on every hand. Having impressed upon their minds, as clearly as possible, such ideas of the *magnitude* and *variety* of the scene before them, let them be informed that the landscape they are contemplating is about 50 miles in circumference, and that its surface contains 200 square miles; but, that the whole surface of the earth contains more than 196 millions of square miles, and, consequently, is *nine hundred* and

eighty thousand times larger than all the objects they behold around them; so that they must conceive 980,000 landscapes as large as the one before them, before they can form an adequate idea of the magnitude of the earth. To impress this idea more deeply, they may likewise be told, that, were they to remain in the station they now occupy, ten hours every day (the time usually allotted for daily labor), and were a landscape of similar extent to that which they behold, to pass before their view every hour until the whole extent and scenery of the terraqueous globe were brought under their observation, it would require more than two hundred and sixty-eight years before they could survey, even in this rapid and imperfect manner, the whole superficial dimensions and variegated scenery of the globe on which we dwell.

Their attention should likewise be directed to the *solidity* of the earth—that it is not a mere superficies, but contains within its bowels an immense and indescribable mass of matter, extending nearly 7900 or 8000 miles in every direction between the opposite portions of its circumference, amounting to more than 263 thousand millions of cubical miles. An idea of this enormous mass of materials may be communicated by such illustrations as the following:—Suppose Mount Etna,—which ranks among the largest insulated mountains on the globe, and which contains around its sides 77 cities, towns, and villages, and 115,000 inhabitants,—to be 120 miles in circumference around the base, about 10 miles in circumference near the top, and 2 miles in perpendicular altitude, and considering its figure to be nearly that of the frustum of a cone, it will contain about 833 cubical miles,

which is only the $\frac{3167156481}{1000000000000}$ part of the solidity of the globe, reckoning it to contain 263,858,149, 120 cubical miles; so that it would require more than three hundred millions of mountains, such as Etna, to form a mass equal to that of the terraqueous globe; and were these mountains placed side by side in a straight line, they would extend 12,100,097,574, or more than twelve thousand millions of miles; that is, more than six times the distance of Herschel, the remotest planet of our system. And were we to travel without intermission, until we reached the extremity of such a line of mountains, at the rate of 25 miles every hour (the utmost speed which our steam-carriages have yet attained), it would require fifty-five thousand, two hundred and fifty-one years, before the journey could be accomplished. And, were they arranged in circles, equal to the perimeter of the sun, they would go 4376 times round the circumference of that stupendous globe, and cover a great portion of its surface. Again, suppose that all the inhabitants of the earth were to be employed in removing a mass of materials equal to that of our globe; suppose all that are capable of laboring to be 200 millions, and that each person removes ten cubical yards in a day, it would require more than 1,970,956,164, or, one thousand nine hundred and seventy millions, nine hundred and fifty-six thousand, one hundred and sixty-four years, before such an operation could be completed; which is more than 337,550 times the number of years which have elapsed since the Mosaic creation.

It is of some importance, that, by such illustrations, we endeavor to convey to the minds of the young a luminous and impressive idea of the magnitude of the globe on which we dwell. For it is only the standard, or scale of magnitude, by which we are enabled to form a conception of the bulk of the sun, and some of the more magnifi-

cent globes of the solar system, and of the immensity of the universe. If we entertain imperfect and contracted conceptions of the size of our globe, we shall be led to entertain similar contracted views of the celestial orbs, and of the amplitudes of creation. No adequate conception of the magnitude of our world can be conveyed to the young, by merely telling them that it is 8000 miles in diameter, and 25,000 in circumference, and showing them its figure and the divisions on its surface by an artificial globe. For, in the first place, few of them have an accurate conception of the extent of one thousand miles, much less of twenty-five thousand; and, in the next place, they are apt to fix their attention merely on the length of a line or a circle, without considering the extent of surface contained in a globe of the above dimensions; and therefore, the number of square miles comprised in the superficies of the earth, amounting to nearly 200 millions, should always be specified, as that which conveys the most correct idea of the amplitude of our globe—and, in the last place, unless an ample prospect be presented to their view, and their attention fixed upon its multifarious objects, while such instructions are imparting, the illustrations of the magnitude of the earth will neither be clear nor impressive. In a private apartment, where the view is confined to the walls of the room, such instructions would lose a considerable part of their effect.

Having thus impressed on the understandings of the pupils clear conceptions of the figure and magnitude of the earth, its leading divisions and grand natural outlines should next be presented to view. An eighteen-inch terrestrial globe should be placed before them, on which they should be directed to mark the great divisions of land and water—that the regions inhabited by man, and other terrestrial animals, lie between two expansive masses of water more than ten thousand miles in length, and one of them nearly the same in breadth, which cover about three-fourths of the surface of the globe—that the northern and southern portions of this watery mass are, for the most part, compacted into a body of solid ice; that the other portions move backward and forward in different directions by a kind of libratory motion, every 12½ hours, producing the flux and reflux of the sea; that currents, such as the gulf stream, are found in different parts of the ocean, flowing uniformly in the same direction—that the land is divided into three principal portions or masses, the Eastern and Western continents, and the territory of New Holland, beside thousands of islands of every form and size, which diversify the surface of the ocean—that lofty ranges of mountains, some of them three or four miles in perpendicular height, run in different directions through these continents, some of them hundreds and even thousands of miles in extent—that hundreds of rivers, many of them above 2,000 miles in length, have their rise in these elevated regions, and carry an immense body of waters into the ocean—that the ocean has been sounded with lines nearly a mile in length, when no bottom was found; that it is probable, it is several miles in depth, and that its bottom is diversified with mountains and vales like the surface of the dry land; that it contains a mass of water sufficient to cover the whole globe to the height of more than a mile and a half; and that, were its caverns drained, it would require more than 20,000 years before they could be filled by all the rivers running into it at their present rate, although they

pour into its abyss 13,600 cubical miles of water every year—that the atmosphere surrounds the whole of this terraqueous mass; that by means of this atmosphere and the solar heat, a portion of the waters of the ocean is carried up to the region of the clouds in the form of vapor, and condensed into rain to supply the sources of the rivers, and to water and fertilize the earth—and that, by these and similar arrangements of Infinite Wisdom, the lives and comforts of myriads of animated beings throughout the regions of the earth air, and ocean, are preserved and perpetuated.

Such general views of the grand features of the globe, when occasionally enlivened with particular details of what is curious and novel to the young, cannot but arrest their attention, and excite their curiosity to acquire more minute information on the subject; while at the same time, they have a tendency to inspire them with sublime and reverential ideas of that almighty being who, “laid the foundations of the earth, who causeth the vapors to ascend, who measureth the ocean in the hollow of his hand, who weigheth the mountains in scales, and taketh up the isles as a very little thing.” After describing such general views, the attention may be directed to various other objects connected with the physical constitution of the globe, such as rocks and insulated mountains, promontories, isthmuses, caverns, icebergs, forests, mines, and deserts—volcanic mountains, and islands that have been raised from the bottom of the ocean by the force of subterraneous agents—lakes, mediterranean seas, fountains, springs, whirlpools, gulfs, and water-spouts—the peculiarities of the different zones—the climates, and the distribution of plants and animals in the different regions of the earth—the atmospherical phenomena in different countries, thunder, lightning, aurora-borealis, the monsoons, trade-winds, sea and land breezes, hurricanes, and tornadoes—the distribution of *temperature* in different parts of the earth—the variety of seasons in the different zones, and the reasons why all the four seasons prevail at the same moment in different countries—the changes which have been produced on the surface of the globe by earthquakes, volcanoes, the action of water, the influence of the atmosphere, and the agency of man—the varieties of the human race, the population of the globe, and the number of individuals that are daily ushered into existence, and of those who daily retire from the living world. To these views of natural scenery may next be added explanations of maps, and of the different circles on the artificial globe, of the nature of longitude and latitude, the division of the circle into degrees and minutes, the variety of days and nights, the reasons why the zones are bounded at particular degrees of latitude by the tropics and polar circles, and the mode by which the circumference of the earth and its other dimensions have been determined. The explanations of *astronomical* geography, such as the causes of the different seasons, the annual and diurnal motions of the earth, and the method of finding the latitudes and longitudes of places, may be postponed until the pupil proceeds to the study of astronomy.

In describing such objects as the above, and other departments of geography, illustrative maps and delineations such as the following, are requisite:—1. A stereographic projection of the globe on the plane of the meridian, which divides it into the eastern and western hemispheres; and another projection on the plane of the equator, having the poles in the center, dividing the earth into the northern and southern hemi-

spheres. Without this last projection, which is seldom exhibited in books of geography, the relative positions of countries in Asia, North America, and other regions, cannot be distinctly traced. On both these maps, the *ranges of mountains* which diversify the globe, and all the *rivers* which flow from them, should be particularly delineated, without any other objects or distinctions, except the names of the countries, seas, oceans, rivers, and mountain-chains, in order to present to the young mind, at one view, this grand and distinguishing feature of our globe. For want of such maps on a large scale, accurately delineated, with the mountains and rivers, represented in their proportional magnitudes, no accurate nor comprehensive ideas are generally entertained of this noble and interesting feature of the terrestrial surface. Three or four extensive chains of mountains may be distinguished, from which flow numerous ramifications, and which, with some interruptions from the sea, extend nearly round the globe. One of these chains runs through Lapland, Finland, and Northern Russia, including the Ural mountains, sending forth branches in different directions. Another runs along the southern parts of Europe, including the Alps and Pyrenees, Hungary, Persia, Thibet, including the Himalaya, and, stretching in different directions, pass through China, Japan, and the Kurile islands toward Kamtschatka, from which another chain diverges, and establishes a connection with the grand chain of the American continent. Another ridge runs along the southern hemisphere, through Africa, Paraguay, the islands of the Pacific, and New Holland; and another extensive chain runs from north to south, along the whole length of America, including the Andes, the Rocky and the Blue mountains. The pupils should be directed to trace these ranges, with all their different branches, not only along the continents, but across the oceans, where the tops of the higher ridges appear in the form of islands, their average elevations remaining below the level of the sea.—2. Another delineation should consist of an elementary map, showing the various objects connected with geography: such as continents, islands, peninsulas, isthmuses, promontories, mountains and plains, woods and forests,—rivers, lakes, seas, gulfs, friths, straits, and channels—and the manner in which cities, towns, forts, roads, shoals, sand-banks, soundings, sunken rocks, and the direction of the winds, are represented in maps.—3. Delineations showing the proportional length and breadth of the principal rivers on the globe. This might, perhaps, be more distinctly exhibited by a number of rods of different lengths, gradually tapering to a point as the respective rivers diminish in breadth, from their mouths to their sources. Other delineations might represent their lengths, not in straight lines, but with all their curves and windings.—4. A chart or delineation of the comparative size of countries, lakes, and islands; so that the proportional spaces on the globe, occupied by such countries as Russia, China, Great Britain, the United States, &c., may be perceived at a glance. These spaces may be represented either by squares, parallelograms, or circles.—5. An *Isothermal chart*, showing the *climates*, and *vegetable* productions of the earth; in which the mean temperature of its different regions, the plants which flourish in them the length of the longest days and nights, the divisions of the zones, and other particulars, may be distinctly noted.—6. A chart of *geographical zoology*, showing the various tribes and species of animals with which the earth is peopled, and the several regions where the different species abound.

The names of the animals might be engraved instead of the names of towns, and if the chart was on a large scale, the *figures* of the most remarkable animals might likewise be engraved.—7. A map of Africa and America, and the Atlantic ocean, lying between them, *on the same sheet*, for the purpose of exhibiting, *at one view*, the whole Atlantic, with its islands, and the relative positions of the coasts of Africa and South America. Also, another map, on the same scale, representing the eastern parts of Asia and New Holland on the one hand, and on the other, the western coast of America, with the Pacific ocean, and its numerous groups of islands which intervene, for the purpose of showing the nearest approach which the old and new continents make to each other, and the relative positions of the islands and countries connected with the Pacific.—8. A map or chart of *Moral* geography, exhibiting the prevailing religion of the several countries, and the moral state of their inhabitants, which might be distinguished, either by different colors or by different shades in the engraving. In this map the countries enlightened by Christianity, and those which are still shrouded in Pagan darkness, might be exhibited at one view; for the purpose of showing to the young what an immense portion of the world is still immersed in heathen ignorance and idolatry, and what exertions are still requisite for enlightening the benighted nations; and for the purpose of stimulating them to bear a part in those philanthropic movements which are now going forward for the enlightening and renovation of the world.—9. Views of cities, public buildings, mountains, caves, grottoes, volcanoes, interesting landscapes, and whatever scenes or objects are most striking on the surface of the globe. Some of these views might be exhibited by the optical diagonal machine formerly described.—10. Sets of colored maps of the quarters of the globe, and its different countries, delineated in the usual way.—11. A projection of the globe *on the horizon* of the particular country where the pupils reside, for the purpose of showing the bearings and distances of places from the country in which they are placed.—12. *Plate globes*, on which the pupil may trace with a pencil the circles of the sphere, the ranges of mountains, the course of rivers, the outlines of continents and islands, and whatever else may tend to familiarize his mind to the general arrangements of the earth. On such globes mistakes may be remedied and inaccuracies corrected by the application of the sponge; and, after the pupil has been for some time accustomed to such delineations, he will soon acquire a clear and comprehensive view of the outlines of the globe, and become familiar with the relative positions of its continents, seas, and islands.—13. Delineations of the *comparative heights* of the principal mountains on the globe—the mountains in the eastern and western hemispheres being arranged in two separate groups. On the same sheet might likewise be delineated, comparative views of the heights of different *ranges*, arranging them into six or seven classes, beginning with views of such mountains as those of Scotland, Wales and Ireland, which do not much exceed 4000 feet, and gradually proceeding to such as the Cordilleras and the Himalaya, whose summits reach an elevation of above 20,000 feet.—14. *Models* of particular countries might occasionally be made of wax or other materials, particularly of mountainous regions, for the purpose of exhibiting an idea of the scenery of a country, the windings of its rivers, and the comparative height of its mountains above the general level of its surface. No map can convey an idea

of such particulars, or of the general appearance and prominent features of any country, similar to that of a well-executed model. I have seen in the Museum of the University of Edinburgh, several models of the kind to which I allude, of the vales and mountainous regions of Switzerland, in which the position of the towns, the course of the rivers, the lakes, the lines of roads, the vales, the rocks, the forests, and the comparative elevation of the mountains, are exhibited, as if one were looking down upon the country from the clouds. The only objections to such models would be the difficulty of getting them executed, and the consequent expense which would be incurred. But, if one model were accurately executed, others could easily be taken from it, on the same principle as phrenologists take casts of the human skull.

By the assistance of such maps and delineations, and with the aid of a judicious text-book, comprising a comprehensive view of the outlines of physical, mathematical, civil, statistical, and historical geography, an enlightened teacher will be enabled gradually to lead his pupils forward to luminous views of this interesting subject. In describing the different countries, he should give a comprehensive outline of whatever is peculiar to each country, and select for particular description, whatever interesting objects of nature or art may have a tendency to excite the attention and gratify the curiosity of his pupils, referring them to their larger systems of geography for more minute details. In such descriptions, the details of moral, statistical, and religious geography should occupy a more prominent place than they generally do in our systems of geography and scholastic courses on this subject. The statistics of our own country, of the various states of Europe, and particularly of the United States of America, which are very imperfectly known, and respecting which there exist numerous misconceptions and unreasonable prejudices on this side of the Atlantic, should be particularly detailed. The moral and mental degradation of the heathen world; the missionary stations which have been fixed in different parts of it for counteracting the influence of barbarism and idolatry, and diffusing the light of divine knowledge; the various success which has accompanied such undertakings; and the philanthropic enterprises which are now going forward in different countries for the moral renovation of mankind, should be depicted to the view of the young with all the vividness and energy which the importance of such subjects demands, in order to allure them to the consideration of such objects, and to secure their endeavors in promoting them. It is a striking and melancholy feature in the records of our race, that almost the whole of history and historical geography is occupied with details of the miseries of mankind, produced by ambition, avarice and injustice, the tyranny of despots, and the desolations of war; and that scarcely a bright spot can be perceived on the surface of the globe, and amidst the gloomy records of past generations, on which the eye of benevolence can rest with unmingled delight. Hence it has happened, that we have scarcely a history of the operations of pure philanthropy, except in the instance of our Saviour and his apostles. And now, when philanthropic plans have been formed, and benevolent enterprises are carrying on, our geographers and men of science, so long accustomed to blaze abroad the exploits of ambition and malignity, will scarcely condescend to notice or record the operations by which the moral world is beginning to be enlightened and regenerated. This is not what it

ought to be, or what we ought to expect from those who are engaged in the diffusion of knowledge. All knowledge should be directed so as to have a moral bearing, and to stimulate the mental activities of the young to those benevolent exertions by which the best interests of their fellow-men, in every land, may be promoted.

Geographical compendiums for the use of schools should be clear and comprehensive in their details, and enlivened with occasional picturesque descriptions of human scenery and of natural and artificial objects, which may be illustrated with neat engravings. They should also abound with questions and exercises of every description connected with the subject, to afford scope for the industry of the pupil, and for the exercise of his judgment and reasoning powers. But however excellent the plan and details of any school-book may be, it ought by no means to be considered as superseding the more familiar illustrations of the teacher, and the conversational lectures alluded to above. No man can be a successful teacher of this science, but he who has a familiar and comprehensive knowledge of all the subjects connected with it, and who can, at any time, illustrate its principles and facts by *viva voce* descriptions and elucidations, which always make a deeper impression on the young mind than can be produced by the mere perusal of the best treatises. In working the usual problems on the terrestrial globe (some of which are of little practical importance), due care should be taken, that the pupils be not guided merely by the rules given for the respective problems, but that they *understand the reasons* why they turn the globe in this or that direction—elevate the pole to a certain degree above the horizon—or set the horary circle to a given hour. In problems which have a reference to the difference of time at different places, they may be taught to perform the operations by a mental calculation, and to ascertain, in the course of a few seconds, what nations have noon, midnight, morning or evening, at a given hour, or summer or winter, spring or autumn, on a given day or month. In commencing the study of geography, a plan or map of the town or village in which the pupils are taught, along with the adjacent country, and some of its prominent objects, might be laid before them, as introductory to the study and explanation of maps. On this map, they might be directed to attend to the cardinal points of the compass, the boundaries of the town, the streamlets or rivers, ponds or hills, and the bearings of the different streets, lanes, public buildings, and other objects, from each other; and various questions and exercises in reference to such objects, might be proposed, which would excite a spirit of observation, and prepare them for understanding maps of countries on a larger scale. A map of the county, and then a map of the state or kingdom, might next form the subject of attention, which would prepare them for the study of the particular quarter of the globe in which they reside, and of all the other countries, seas, and oceans, dispersed over the surface of the earth. This plan is evidently in conformity to the order of nature, although directly opposite to the order generally pursued.*

SECTION VII.

GEOLOGY.

GEOLOGY is a science which, of late years, has excited the attention of philosophers, naturalists, and theologians; and, in consequence of the researches of its votaries, many striking and important facts in relation to the structure of the earth and the changes it has undergone, have been brought to light. Many of the facts which this science discloses have a tendency to convey

work, comprised in a thick 12mo. volume of 500 very closely printed pages, comprehends an immense mass of information on *physical, civil, and statistical* geography, including descriptions of a great variety of facts in relation to the *geological* structure of the earth. It is illustrated by nearly a hundred engravings of natural and artificial objects; such as sections of rivers, canals, comparative elevation of mountains, cataracts, races of men, geological sections, cities and public buildings, which both enliven and elucidate the descriptions. Appended to this work, is a lucid and judicious compend of "Ancient Geography, as connected with Chronology," including sketches of sacred history, mythology, and the early history of mankind, by Mrs. Willard—a lady who appears to have made considerable researches into the different departments of geographical science, and to have promoted the cause of general education. Both these works are admirably calculated for the higher classes in schools, and abound with a great number of questions and exercises, for stimulating the attention and ingenuity of the young. Had this volume been sparsely printed, according to the fashion that prevailed 20 or 30 years ago, like "Playfair's Geography," and other works, it would have occupied two or three quarto volumes of 1500 pages.—2. Woodbridge's "Rudiments of Geography, on a new plan," 18mo., containing 208 closely printed pages, and about 170 cuts, and comprising a very considerable portion of information on the different departments of geography. It may be considered as partly an abridgment of the larger work noticed above, and partly an introduction to it. The cuts, though small, are sufficiently vivid and distinct to convey an accurate idea of the objects they are intended to represent. It has passed through seventeen editions, comprising more than 200,000 copies. Mr. Woodbridge is a corresponding member of the Geographical Society of Paris, and Editor of the American "Annals of Education;" and a gentleman who appears to be quite familiar with all the departments of geographical, physical, and mathematical science. His geographical works are rich in information in respect to every topic connected with his general subject, and have received the approbation of the Geographical Society of Paris, and of many scientific characters on the continent of Europe, particularly Humboldt and Fellenberg.—3. "A Practical System of Modern Geography," by J. Olney, A. M.—an 18mo. of 288 pages, closely printed on a plan somewhat similar to Woodbridge's Rudiments, illustrated with nearly a hundred engravings, and containing a very considerable portion of useful information. This work has passed through fifteen editions.—4. "The Malte-Brun School Geography," by Mr. Goodrich, a large 18mo. volume of nearly 200 pages, and containing about 133 engravings. This work contains a larger quantity of letter-press than the two former, and a great variety of facts in relation to civil and descriptive geography, but is not so full as Woodbridge's volumes in its details of *physical* and *statistical* geography. Fifteen thousand copies of this work were sold in the space of 18 months from the date of its first publication. The *Atlases* belonging to these works are beautifully executed, and contain several of the projections I have suggested above, beside sets of maps as usually delineated, along with a variety of useful descriptions and statistical tables. In the Atlas which accompanies Olney's "Practical System," the population of the respective towns and cities can be ascertained at a glance, by means of certain characters and figures connected with their names. 5. Hall's "Child's Book of Geography," and Peter Parley's "Geography for Children," each of them containing about a hundred pages, in a square 18mo. size, and embellished with a variety of maps and cuts, appear well calculated to interest the minds of youth, and to convey a general idea of the leading features of the world. Some of the above works, with a few alterations, might be published with advantage in Great Britain. They contain more particular maps and descriptions of the United States than are to be found in geographical works published on this side of the Atlantic. A comprehensive and useful compend of geography for the use of schools, might be compiled from the volumes now mentioned, by selecting the descriptions, exercises, and more interesting portions of each, and combining them into a volume calculated for the meridian of our own country.

* Since writing the preceding parts of this work, I have been favored, through the liberality of a respected literary correspondent in the State of Connecticut, North America, with a variety of school-books on *geography* and other subjects, which have an extensive circulation in the New England States. Among these are the following:—1. Woodbridge's "System of Universal Geography, on the principles of comparison and classification, 5th edition, 1833." This

to the mind impressions of the wisdom, and particularly of the *power* of the Creator, in those stupendous forces which produced the convulsions and changes which have taken place both on the surface and in the interior strata of the globe. They are likewise applicable to various practical purposes. A minute and circumstantial knowledge of the various facts which have been ascertained by geologists in different countries, may be of extensive use to those employed in mining operations, when searching for coal, fossil salt, or metallic veins, and might prevent many ruinous speculations to which ignorant projectors are frequently subjected. In excavations for the purpose of forming canals, tunnels, and rail-roads—operations which are now going forward in almost every part of the civilized

Fig. 1.

world—a knowledge of this subject could not fail to be highly beneficial to all parties engaged in such projects. Beside, the study of this science is intimately connected with Scripture history and theology, and its facts, when viewed in a proper light, have a tendency to elucidate certain portions of the Sacred writings, and to illustrate the harmony and the connection which

subsist between the visible operations of the Creator and the revelations of his word. For these reasons, it might be expedient to communicate to the young a general idea of some of the leading facts connected with geology, without perplexing them with any of the speculations of philosophers, or the theories which have been formed to account for geological phenomena; leaving them to deduce their own conclusions at a future period, when their knowledge of such subjects shall be increased, and their judgment matured.

A brief description might be given, in the first place, of the solid parts of the earth, of the various strata of which they are composed, and of the classifications which geologists have made of the different kinds of *rocks*. These rocks are usually arranged under the following classes:—1. *Primary rocks*, which compose the grand framework of the globe, which form the most lofty mountains, and extend to the greatest depths yet penetrated by man, and below all the other formations. The substances of which such rocks are composed, are granite, gneiss, mica-slate, hornblende, granular quartz, &c., but never contain salt, coal, petrifications, or any remains whatever of organized substances; and therefore are supposed to have been formed before the creation of animals or vegetables.—2. *Transition rocks*, which include those rocks that lie over the primitive, and are composed of the larger fragments of the primitive rocks. They contain graywacke, transition limestone, slate, sandstone, &c. Shells are sometimes found in them, but no remains of land animals or vegetables. It is supposed they were formed next after the primitive rocks, and after the creation of some kinds of organized beings.—

Fig. 2.

3. *Secondary rocks*, which lie upon the transition rocks, and appear like deposits, composed of grains which once belonged to primitive rocks. The principal secondary formations are *coal*, *chalk*, *secondary limestone*, *oolite*, *millstone*, *grit*, &c., which contain petrifications of animal and vegetable substances.—4. *Tertiary strata*, which consist of beds of *clay*, *sand*, *marl*, and the newer limestone deposits. These formations are consid-

ered as newer than the secondary, and contain abundance of fossil shells and plants, along with the bones of quadrupeds and fishes.—5. *Volcanic* and *basaltic rocks*, which owe their origin to volcanic fire, and are sometimes forced up to the surface of the earth in a melted state, by the action of subterraneous heat. The principal volcanic rocks are *basalt*, *lava*, and *greenstone*.—6. *Alluvial strata*, which include deposits that are made of

broken strata, consisting of sand, mud, clay, pebbles, &c., which are formed by the currents of rivers, and other causes now in operation.

These classifications of rocks and formations might be illustrated by such figures as in the annexed cut, which is taken from Woodbridge's "System of Universal Geography," where Fig. 1 represents the *strata of the earth*, P the primary strata, T transition, S secondary, A alluvial, B basaltic, V vein, b bed. Fig. 2, represents a section of the earth between latitudes 40° and 45° north. In conjunction with such pictorial representations, a cabinet of materials should be procured, containing at least the following: *quartz, mica, talc, feldspar, limestone, argillite*, or slate, *hornblende, gypsum and chlorite*, which form what has been termed the *alphabet of geology*. Beside these, specimens should be procured of basalt, gneiss, greenstone, lava, porphyry, graywacke, and other substances mentioned above. About thirty specimens in all are sufficient for illustrating the classes of geology. Without an exhibition of these in connection with geological descriptions, no definite ideas can be conveyed to the mind of the student on this subject.*

SECTION VIII.

ASTRONOMY.

ASTRONOMY is a science which has for its object to explain the motions of the heavenly bodies, their various aspects, and the facts which have been ascertained in the planetary system, and throughout the region of the fixed stars. This is a subject of considerable interest and utility. It is intimately connected with geography, navigation, agriculture, commerce, chronology, and other arts and sciences, and has lent its aid to promote their improvement. The study of it is likewise attended with many pleasures and advantages in a moral, intellectual, and religious point of view. It expands the range of the human intellect, and unfolds to our view the most striking displays of the perfections of the Deity, particularly the grandeur of his *Omnipotence*. It sets before us objects of overpowering magnitude and sublimity, and demonstrates the unlimited extent and magnificence of the universal empire of the Almighty. It has a tendency to raise the soul above groveling pursuits and affections, to inspire hope, reverence and humility, and to excite to the contemplation of objects far surpassing everything we behold in this terrestrial scene, and worthy of the dignity of immortal minds. In short, it prepares the mind for the employments of the future world, and demonstrates that the Creator has it in his power to distribute endlessly diversified streams of felicity, among every order

of his intelligent offspring, throughout all the revolutions of eternity. It is a subject, therefore, on which a certain portion of information should be communicated to the young, and to every human being.

In communicating to the young instructions on this subject—instead of commencing with definitions of astronomical terms, and a vague description of the solar system, as is frequently done,—the pupils should be gradually prepared for acquiring a general knowledge of the principles of the science, *by being taught to observe, with their own eyes, the motions and general phenomena of the heavens*. The first object to which their attention might be directed, is the apparent motion of the sun. On some clear evening in the month of June (in our northern latitude), they may be placed in a situation where they may behold the setting sun, and be desired to take particular notice of such objects as mark the place of his going down. Next morning, or the first clear morning afterward, they may be placed in the same situation, and, having first requested them to point to the place where the sun disappeared the evening before, their attention should next be directed to the point of his rising, and to mark the terrestrial objects in the direction of which he appeared to rise. The difference between the points of his setting and of his rising should be particularly impressed upon their minds. On this day, too, about twelve o'clock, they should be directed to attend to the sun's meridian altitude. These observations may either be accompanied with certain appropriate remarks, or the pupils may be left, in the meantime, to ruminate upon them, to consider them simply as *facts*, which may be afterward adverted to, and to form their own conclusions. Similar observations may be made from the same spot about the 23d September, and particularly about the middle of December, when the direction of the rising and setting sun, his meridian altitude, and the apparent diurnal arc he describes, will appear very different, when compared with the observations made in the month of June. Their attention might next be directed to the phases and motions of the moon. About three days after new moon, when the lunar crescent first makes its appearance, they may be directed to mark the *form* of the crescent, the most conspicuous *stars* in its vicinity, and its *apparent distance* from the place where the sun went down. Every clear evening afterward, the gradual increase of the crescent, its motion among the stars, and the apparent distance it has moved during every successive period, should be particularly marked, until it arrive at the eastern part of the horizon after the sun has set in the west, when it will appear a full enlightened hemisphere. During the months of August, September, and October, when the effect of the *harvest-moon* is apparent, they may be directed to trace the gradual diminution of the full moon, through its different stages of *decrease*, until it assumes the form of a half moon or a large crescent. During the months of March or April, their attention may be directed to the difference in the time of its rising on each successive day after full moon, from what takes place during the months of harvest,—in the one case, namely, in harvest, there being only 20 minutes of difference after full moon, in its rising on each successive day; while in spring, the difference is nearly an hour and a half, which prevents her, at that season, from being seen in the form of a half moon, during her decrease, until early in the morning;—whereas, in harvest, she may be seen rising in the north-east,

* Books on geology have, of late years, increased both in number and in the interesting nature of the discussions they contain. The names of Bakewell, Macculloch, De la Beche, Buckland, Ure, Lyell, &c. are well known as cultivators of this department of natural science. The new edition of Mr. Lyell's "Principles of Geology," in 4 vols. 12mo., lately published, is perhaps one of the most luminous and attractive works which has hitherto been published on this subject—though perhaps somewhat deficient in what relates to the primary and secondary rocks, and embodying certain statements which some will be apt to consider as scarcely consistent with the records of sacred history. Dr. Comstock, of Hartford, State of Connecticut, has lately published, in a duodecimo vol. of about 340 pages, an interesting work, entitled, "Outlines of Geology," which contains a popular and comprehensive view of this subject, and is peculiarly adapted to the instruction of general readers.

in the form of a half moon, about 8 or 9 in the evening.

They may next be directed to attend to some of the *principal stars*, and the more conspicuous *constellations*, and particularly to the *apparent diurnal motion* of the whole celestial vault. The month of January is perhaps the most eligible season for such observations. About the middle of that month, at eight o'clock in the evening, the most striking and brilliant constellations visible in the northern hemisphere are then above the horizon. The *Pleiades* or Seven stars, and other portions of the constellation *Taurus*, are nearly on the meridian, at an elevation of above 60 degrees. The splendid constellation *Orion*, to the south of *Taurus*, is a little to the east of the meridian; *Canis Minor* to the east, and *Canis Major* to the south-east of Orion. Nearly due east and near the horizon, is the zodiacal constellation *Leo*. To the west of the meridian are the constellations *Aries*, *Pisces*, *Cetus*, *Andromeda*, *Pegasus*, and *Cassiopeia*, which is not far from the zenith. To the north-east is *Ursa Major*, or the Great Bear, sometimes distinguished by the name of the *Plow*,—or *Charles's Wain*. The star *Aldebaran*, or the Bull's eye, is nearly on the meridian, at an elevation of 54° supposing the place of observation to be in 52° north latitude. It is distinguished by its *ruddy* appearance. The brilliant star *Capella* is nearly 32° north by east from *Aldebaran*, not far from the zenith; and *Rigel*, in the left foot of Orion, is about 27° south by east of *Aldebaran*, and a little east of the meridian. *Betelgeux* is north-east from *Rigel*, and forms a right-angled triangle with it and *Aldebaran*. The stars *Castor* and *Pollux* are east by north from *Aldebaran*, at a considerable distance from it (45°), and nearly half-way between the zenith and the eastern horizon. Nearly straight south from *Pollux*, and east from *Betelgeux*, is *Procyon*. These three stars form a right-angled triangle, the star *Procyon* being at the right angle. Near the south-eastern part of the horizon, and a little elevated above it, is *Sirius*, or the Dog-star, which is generally reckoned the most brilliant fixed star in the heavens. West from *Rigel*, at a considerable distance (46°), and at nearly the same elevation above the horizon, is *Mira*, or the Wonderful star, which changes from a star of the second magnitude, so as to become invisible once in a period of 334 days. The brilliant star *Lyra* is north north-west, very near the horizon. The two stars in the Great Bear, called the *Pointers*, are in a direction nearly north-east from *Castor* and *Pollux*, but at a considerable distance; they direct the eye to a star of the second magnitude, in *Ursa Minor*, at a considerable distance toward the west, called *Abrucabab* or the *Polestar*.

Having pointed out these leading stars and constellations, to serve as so many known points in the heavens, the attention might be directed, on a subsequent evening, about six o'clock, to the apparent motions of these bodies, and of the whole celestial sphere. On the evening of January the 16th, at six o'clock, the star *Procyon* will be seen nearly due east, a very little above the horizon; *Aldebaran*, in an easterly direction, nearly half-way between the meridian and the eastern horizon: *Rigel*, toward the south-east, a little above the horizon; and *Lyra*, in the north-west, about 15° above the horizon. Having marked the terrestrial objects which appear in the direction of these stars, they may be viewed, from the same station, about two hours afterward, when *Procyon* will be found to have risen a considerable way above the horizon; *Rigel*, to have moved nearly 30 degrees to

the westward; and *Aldebaran*, to have arrived near the meridian; while *Lyra* has descended within two or three degrees of the horizon; and *Sirius*, which was before under the horizon, is elevated about ten degrees above it. About ten o'clock, the same evening, *Rigel* and *Aldebaran* will be seen at a considerable distance westward of the meridian; *Sirius*, within 6 or 7 degrees of it; the star *Lyra*, near the northern horizon; and the constellation *Orion*, which in the first observation appeared in the direction south-east by east, will be found to have moved to the westward of the meridian. By such observations, it may be shown that the whole starry firmament has an apparent diurnal motion from east to west. While pointing out these apparent motions to the young, it will be proper to direct their attention to the *Polestar*, which, to a common observer, never appears to shift its position. They may likewise be directed to notice that the stars near the pole appear to move slower, and to describe smaller circles than those at a greater distance from it—that those which rise near the south describe smaller arcs than those which rise farther to the north—that the stars which rise due east, set due west, after an interval of twelve hours—that the stars which rise in the north-east, after describing a large arc of the heavens, set in the north-west, after an interval of about seventeen hours—that all the stars within a certain distance of the pole never appear to rise or set, but describe complete circles above the horizon—that the stars near the pole, such as those in the Great Bear, appear in one part of their course to move from west to east, and in another part of it from east to west—and that the revolutions of the whole, however different the circles they apparently describe, are completed in exactly the same period of time. These positions may afterward be more particularly illustrated by means of a large celestial globe, by which it will be seen that all these appearances are the result of one general apparent motion, which, at first view, will appear to exist in the celestial sphere. An idea of the general motion of the stars may be acquired by a simpler process than what we have now described. Let any observer bring a star, in any position between the zenith and southern horizon, into an apparent contact with a tree, spire, or chimney-top, and, in the course of fifteen or twenty minutes, he will perceive that that star and others adjacent to it have moved a little space from east to west. But the observations alluded to above are calculated to give a more satisfactory idea of this motion, and to make a deeper impression on the minds of the young.

The next series of observations might be those which demonstrate the *apparent annual motion of the sun*. For the purpose of exhibiting this motion, the *Pleiades* or seven stars, along with *Aldebaran*, might be selected as fixed points in the heavens to indicate the progressive motion of the solar orb toward the east. About the middle of January, at eight o'clock in the evening, the *Pleiades* will be seen on the meridian; which observation should be noted down, for the purpose of being compared with a future observation. On the 1st of March, at the same hour, these stars will be seen nearly half-way between the meridian and the western horizon, while all the other stars, at the same declination, will be found to have made a similar progress. About the 15th of April they will be seen, at the same hour, very near the western horizon; and every day after this, they will appear to make a nearer approach to that part of the heavens in which the sun appears until,

being overpowered by the splendor of his rays, they cease to be visible. From these and similar observations, it will be easy to make the young perceive, that the sun has an apparent motion from west to east, through the circle of the heavens, and that the revolution is completed in the course of a year.

They may next be taught to acquire a definite idea of the *measures* by which the apparent distances of objects in the heavens are expressed. To talk to the young, as some are in the practice of doing, of two stars being a foot, a yard, or two yards asunder, is altogether vague and indefinite, unless we are told, at the same time, at what distance the yard or foot is supposed to be placed from our eye. As astronomers divide the circumference of the celestial sphere into 360 parts or degrees, they may be told, that from any point of the horizon to the zenith are 90 degrees, and, consequently, that from the eastern to the western, or from the northern to the southern points of the horizon, are 180 degrees. And, in order that they may have a definite idea, or something approximating to it, of the extent of a degree, they may be told that the breadth of the moon is about *half a degree*—that the space occupied by the three stars in a straight line in the *belt of Orion*—sometimes distinguished by the name of the *Three Kings*, or the *Ell and Yard*—is exactly *3 degrees* in length, and, consequently, the distance between any two of them is *a degree and a half*—that the distance between *Castor and Pollux* is nearly five degrees—between *Dubbe and Merah*, the two *Pointers*, in the Great Bear, is $5\frac{1}{2}$ degrees—and that the space between *Dubbe*, or the northernmost pointer and the Polestar, is about 29 degrees. By familiarizing the mind with such measures, the young will soon acquire a tolerable idea of the distance of any two objects in the heavens, when the number of degrees is mentioned.

All the observations above stated may be made, in the way of an amusement, previous to the time when the pupils are expected to enter on the regular study of astronomy. They may be completed in the course of ten or twelve observations, made at different times, within the space of seven or eight months. They are intended for the purpose of stimulating the young to habits of observation and attention to the appearances of nature around them; so that, in every clear sky, they may learn to make similar observations by themselves, for confirming and amplifying their former views of the motions and aspects of the heavens. Such observations form the groundwork of astronomy, and of all the instructions they may afterward receive in relation to this science, although they are generally neglected. When problems on the celestial globe are prescribed, and vague descriptions of the planetary system given, previous to having made these observations, the subject is seldom understood, and no clear nor expansive conceptions formed by the young, of the motions, phenomena, and relations of the great bodies of the universe.—It may not be necessary, in the first instance, while making these observations, to attempt any explanation of the phenomena, but merely to impress upon the mind a clear conception of the *apparent motions and relative aspects*, of the celestial orbs, as they present themselves to an attentive spectator; leaving the pupil to ruminate upon them until it shall be judged proper to direct his attention to the investigation of the true causes of celestial phenomena.

The pupil's attention might be next directed to the motions of the planets, and the general phenomena of the solar system. When any of the

planets are visible in the heavens, their positions in relation to the neighboring stars should be particularly noted, so that their apparent motions, whether *direct* or *retrograde*, may be clearly perceived, which, in most cases, will be quite perceptible in the course of a few weeks or months. The direct, stationary, and retrograde movements of Mars and Venus should be particularly attended to, for the purpose of afterward demonstrating that the annual motion of the earth accounts for the apparently irregular and complicated motions of the planetary orbs. Large diagrams, representing the apparent motions of Mars, Mercury, and Venus, as seen from the earth during the course of several revolutions, with all the apparently irregular loops and curves they appear to describe*—should be laid before the pupil for his particular inspection, in order that he may perceive the improbability that such motions are real, or that an Infinitely Wise Being, who is the Perfection of Order, would introduce such inextricable confusion into the motions of the most splendid of his works.—A common planetarium, which shows by wheelwork, the relative motions of Mercury, Venus, the Earth, and Mars, may be easily made to illustrate these motions, and to solve all their phenomena. Let a circle, two or three inches broad, and of such a diameter as to surround the planets, with a few stars marked on its inside to represent the Zodiac, be suspended on three pillars, so as to inclose the Earth, Mercury, and Venus. Let a wire be fixed by a socket, on the top of the pillar which supports the ball representing the Earth, and let this wire rest on a slit or fork fixed to the top of the pillar which supports the ball representing Mercury. When the machine is set in motion, the wire will point out on the Zodiac the apparent motions of Mercury as seen from the earth. When he passes from his greatest elongation westward to the superior conjunction and to his greatest elongation eastward, the wire will move *eastward*, according to the order of the signs. About its greatest elongation, it will appear stationary, and immediately afterward will move *westward*, or contrary to the order of the signs, until it arrive at the western elongation, when it will again appear stationary;—so that the pupil will plainly perceive that the direct and retrograde motions of the planets, as seen from the earth, are in perfect accordance with a regular circular motion around the sun as a center; and that such apparently irregular movements arise from the motion of the earth, and the different velocities of the planets, when compared with it,—just as the objects around us appear to move in different directions, and with different velocities, when we are sailing along a serpentine river in a steamboat.

The arguments or considerations which prove that the *Earth is a moving body*, should next be presented to the attention, and illustrated in the most simple and familiar manner of which the subject will admit. The pupil will easily be made to perceive, that, if the earth is at rest, the whole frame of the material universe must move round it every twenty-four hours; not only the fixed stars, but the sun and moon, the planets and their satellites, and every comet which traverses the firmament, must participate in this motion, while, at the same time, they are moving in another and an opposite course peculiar to themselves. He will perceive, that, in proportion as these

* Specimens of such diagrams may be seen in "Long's Astronomy," vol. i, and in plate 3 of "Ferguson's Astronomy," Brewster's edition.

bodies are distant from the earth, in a similar proportion will be the *velocity* with which they perform their diurnal revolutions—that the sun behooved to move *five hundred and ninety seven millions of miles* every day, the nearest fixed star 125,000,000,000,000 of miles in the same time, or at the rate of fourteen hundred millions of miles *every second*, and the most distant stars with a velocity which neither words can express, nor imagination conceive,—and that such motions, if they actually existed, would, in all probability, shatter the whole material frame of the universe to atoms. He may be directed to consider, that such rapid velocities (if they could be supposed to exist) are not the motions of mere points or small luminous balls, but the motions of immense globes, many thousands of times larger than the earth—that a hundred millions of such globes are visible from our abode, beside the myriads that may be hid from human view in the unexplored regions of space—and that it is impossible to conceive how all these innumerable globes, of different magnitudes, at different distances, and moving with different velocities, could be so adjusted as to finish their diurnal revolutions at the same moment, while many of them are at the same time impelled by other forces in a contrary direction. He may be reminded that the Creator, who formed the universe, is possessed of INFINITE WISDOM—that wisdom consists in proportionating *means to ends*, or in selecting the most appropriate arrangements in order to accomplish an important purpose—that to make the whole frame of Universal Nature move round the earth every day, merely to produce the alternate succession of day and night, is repugnant to every idea we ought to entertain of the Wisdom and Intelligence of the Divine Mind, since the same effect can be produced by a simple rotation of the earth in twenty-four hours; and since we find that Jupiter and Saturn, and other globes much larger than ours, move round their axes in a shorter period—that in all the other works of Omnipotence, means apparently the most simple are selected to accomplish the most grand and magnificent designs—and that there is no example known to us, throughout the universe, of a larger body revolving around a smaller. When such considerations are fully and familiarly illustrated, the pupil will soon be made clearly to perceive, that the rotation of the earth must necessarily be admitted, and that it will fully account for all the diversity of diurnal motion which appears in the sun and moon, the planets and the stars.

The *annual* revolution of the earth, and its position in the solar system, might be proved and illustrated by such considerations as the following;—that if this motion did not exist, the motions of all the planets would present a scene of inextricable confusion, consisting of direct and retrograde motions, and looped curves, so anomalous and irregular, as to be inconsistent with everything like harmony, order, or intelligence—that Mercury and Venus are observed to have two conjunctions with the sun, but no opposition; which could not happen unless the orbits of these planets lay *within* the orbit of the earth—that Mars, Jupiter, and the other superior planets, have each their conjunctions with, and oppositions to, the sun, which could not be unless they were *exterior* to the orbit of the earth—that the greatest elongation of Mercury from the sun is only about 20 degrees, and that of Venus 47; but if the earth were the center of their motions, as the Ptolemaic system supposes, they might sometimes be seen 180 degrees from the sun, which never hap-

pens—that some of the planets appear much larger and brighter at one time than at another, on account of their different distances from the earth; but, on the other hypothesis, their brilliancy should be always the same—that Mercury and Venus, in their superior conjunctions with the sun, are sometimes hid behind his body, and in their inferior conjunctions sometimes appear to pass across the sun's disc, like round black spots, which would be impossible according to the Ptolemaic system;—and, in short, that the times in which the *conjunctions, oppositions, stations, and retrogradations* happen, are not such as they would be if the earth were at rest, but precisely such as would happen if the earth move along with all the other planets, in the stations and periods assigned them in the system which has the sun for its center. From such considerations, when properly explained, the annual motion of the earth, and its relative position in the system, may be clearly demonstrated, and the pupil made to perceive the beauty and harmony of the celestial motions, and the necessity of having the great source of light and heat placed in the center of the system. For as the sun is intended to cheer and irradiate surrounding worlds, it is from the center alone that these agencies can be communicated, in a uniform and equable manner, to the planets in every part of their orbits. Were the earth the center, and the sun and planets revolving around it, the planets when nearest the sun, would be scorched with excessive heat, and when farthest distant would be frozen with excessive cold.

There is another consideration by which the earth's annual revolution and its position in the system are demonstrated;—and that is, that the planets Mercury and Venus, when viewed through good telescopes, are found to assume *different phases*, in different parts of their orbits; sometimes appearing gibbous, sometimes like a half moon, and at other times like a crescent, and a full enlightened hemisphere, which could never happen if they revolved round the earth as their center, and if the earth was not placed in an orbit *exterior* to that of Venus. I have sometimes illustrated this argument, with peculiar effect, by means of an *equatorial telescope* and a common *planetarium*. By the equatorial telescope, with a power of 60 or 80 times, most of the stars of the *first* magnitude, and some of those of the *second*, may be seen even at noonday. Venus may be seen by this instrument in the daytime, during the space of nineteen months, with the interruption of only about thirteen days at the time of her *superior* conjunction, and three days at the time of her *inferior*, so that the phase she exhibits may be seen almost every clear day. Having placed the Earth and Venus in their true positions on the planetarium, by means of an Ephemeris or the Nautical Almanac, I desire the pupil to place his eye in a line with the balls representing these planets, and to *mark the phase of Venus* as seen from the earth—whether a crescent, a half moon, or a gibbous phase. I then adjust the equatorial telescope for Venus, if she is within the range of our view, and *show him the planet with the same phase in the heavens*. This exhibition never fails to gratify every observer, and to produce conviction. But it can seldom be made, if we must wait until the planet be visible to the naked eye, and capable of being viewed by a common telescope; for it is sometimes invisible to the naked eye, for nearly one-half of its course from one conjunction to another. Beside, the phases of this planet are more distinctly marked

in the daytime, when near the meridian, than either in the morning or evening, when at a low altitude, in which case it appears glaring and undefined, on account of the brilliancy of its light, and the undulating vapors near the horizon, through which it is seen. As actual observations on the planets in the heavens make a deeper and more convincing impression on the mind of a young person, than mere diagrams or verbal explanations, I consider an equatorial telescope, in conjunction with a celestial globe and an orrery, as essentially necessary to every teacher of astronomy; as, independently of its use, now hinted at, it is the best and most comprehensive instrument for conveying an idea of the practical operations of this science. It may be made to serve the general purposes of a transit instrument, a quadrant, an equal altitude instrument, a theodolite, an azimuth instrument, a level, and an accurate universal sun-dial. It serves for taking the right ascensions and declinations of the heavenly bodies, and for conveying a clear idea of these operations. It may be made to point to any phenomena in the heavens whose declination and right ascension are known; and, in this way, the planets Mercury, Herschel, Ceres, Pallas, Juno, and Vesta, a small comet, or any other body not easily distinguished by the naked eye, may be readily pointed out.*

The cause of the *variety of seasons* may next be explained and illustrated. It is difficult, if not impossible, by mere diagrams and verbal explanations, to convey a clear idea on the subject; and therefore some appropriate machinery must be resorted to, in order to assist the mind in forming its conceptions on this point. The difficulty is, to conceive how the sun can enlighten the North Pole without intermission, during one half of the year, and the South Pole during the other, while the poles of the earth never shift their position, but are directed invariably to the same points of the heavens. This is frequently attempted to be illustrated by means of a brass hoop with a candle placed in its center, and a small terrestrial globe carried round it having its axis inclined to the brass circle, which is intended to represent the orbit of the earth. But this exhibition requires some dexterity to conduct it aright, and after all is not quite satisfactory. An orrery, having all the requisite movements by wheel-work, and where the Earth moves with its axis parallel to itself and inclined to the plane of the ecliptic, is the best instrument for illustrating all the variety of the seasons. When such a machine cannot be procured for this purpose, its place may be supplied by a neat little instrument, called a *Tellurium*, which has been manufactured for many years past by Messrs. Jones, Holburn, London, and may be purchased for about thirty shillings. This instrument consists of a brass ball representing the sun—which may be occasionally screwed off, and a lamp substituted in its place—an ivory ball representing the earth, having the circles of the sphere drawn upon it, a small ball representing the moon, and about eight wheels, pinions, and circles. It exhibits the annual motion of the earth, and the moon revolving around it, with its different phases, the causes of eclipses, the retrograde motion of the moon's nodes, and the inclination of its orbit to the plane of the ecliptic. The earth is movable

on an axis inclined $23\frac{1}{2}$ degrees to the ecliptic, and its axis preserves its parallelism during its course round the sun. The seasons are exhibited on this instrument as follows:—the index, which, points out the sun's place and the day of the month, is placed at the 21st March, the time of the vernal equinox, and the north and south poles of the earth are placed exactly under the *terminator*, or boundary between light and darkness. When the machinery is moved by the hand until the index points to the 21st of June, the time of the summer solstice, then the North Polar regions appear within the boundary of light, and the South Polar within the boundary of darkness. Turning the machine until the index points to September 23d, both poles again appear on the boundary of light and darkness. Moving it on to December 21st, the Arctic circle appears in darkness, and the Antarctic in the light. During these motions, the earth's axis keeps parallel to itself, pointing uniformly in the same direction. This exhibition is quite satisfactory and convincing; the only objection to the instrument is, that it is *small*,—about eight or nine inches diameter—and, consequently, will admit only four or five individuals at a time to inspect its movements with distinctness.

A full and specific description should next be given of all the facts connected with the solar system—the distances and magnitudes of the sun and planets—their annual and diurnal revolutions—the solar spots—the belts and satellites of Jupiter—the rings of Saturn—the phases of Venus—the spots of Mars, and the mountains and cavities of the Moon. After which some details might be given of the facts which have been ascertained respecting comets, variable stars, double and treble stars, new stars, stars once visible which have disappeared, and the numerous *nebulae* which are dispersed through different regions of the heavens. The pupils should now be gratified with a view of some of these objects through good telescopes. A telescope, magnifying about 30 times, will show the satellites of Jupiter, the crescent of Venus, the solar spots, and the rugged appearance of the Moon. With a magnifying power of 60 or 70, the ring of Saturn, the belts of Jupiter, the shadows of the lunar mountains, and cavities, and all the phases of Venus, may be distinguished. But the views of these objects obtained by such magnifying powers are unsatisfactory. No telescope should be selected for this purpose less than a $3\frac{1}{2}$ feet Achromatic, with powers varying from 40 to 180 or 200 times.* A power of 150 is a very good medium for inspecting all the more interesting phenomena of the heavens. With this power, distinct and satisfactory views may be obtained of the solar spots, the phases of Mercury, Venus, and Mars, the belts, and sometimes the spots of Jupiter, and the shadows of his satellites, the ring and some of the moons and belts of Saturn, the spots of Mars, the minute hills and cavities of the moon, several of the double stars, and many of the most remarkable *nebulae*. To perceive distinctly the *division* of Saturn's ring, requires a power of at least 200 times. In exhibiting such objects to the young, especially when the lower powers are used, some attention is requisite to adjust the instrument to distinct vision, as their eyes are generally more convex than the eyes of persons advanced in life, and those who are short sighted will require an adjustment different from that of others. Unless

* A small Equatorial, having the Horizontal, Declination, and Equatorial circles about six inches diameter, surmounted with a twenty-inch achromatic telescope, with magnifying powers of from 30 to 80 times, may be procured for about fifteen or sixteen guineas, which will serve every general purpose in teaching astronomy.

* An Achromatic telescope of this description, with an object-glass 45 inches focal distance, and about three inches diameter, with 4 or 5 magnifying powers, with a brass tube mounted on a brass tripod, may be purchased in London, for 25 guineas.

this circumstance be attended to, their views of celestial phenomena will frequently be unsatisfactory and obscure. In exhibiting the surface of the moon, the period of half moon, or a day or two before or after it, should generally be selected; as it is only at such periods that the shadows of the mountains and vales, and the circular ridges, can be most distinctly perceived. At the time of full moon, its hemisphere presents only a variegated appearance of darker and brighter streaks, and no shadows are discernible; so that, from the telescopic appearance of the full moon, we could scarcely determine whether or not its surface were diversified with mountains and vales.

Previous to exhibiting the moon through a telescope, it may be proper to give the observers an idea of some particular objects they will see, on which their attention should be fixed, and from which they should deduce certain conclusions. For, a view of the moon, for the first time, through a powerful telescope, is apt to overpower the eye and to produce a confused and indistinct perception. As one of the peculiarities of the lunar surface consists in the numerous cavities and plains surrounded with circular ridges of mountains, and insulated mountains rising from a level surface—an idea of the shadows and circumstances, by which these objects are indicated, should be previously communicated. This may be done by means of a saucer, the top of a small circular box, or any other object which may represent a plain surrounded by a circular ridge. In the middle of any of these objects, may be placed a small peg to represent a mountain. Then placing a candle at the distance of a foot or two, so as to shine obliquely upon the objects, the inside of a circular dish farthest from the candle will be seen enlightened, while a considerable portion of the bottom will be covered by the shadow thrown upon it by the side next the candle, and the shadow of the peg will be seen verging toward the enlightened side. This previous exhibition will give them an idea of the form of some of the mountains and vales on the lunar surface, and enable them to appreciate the nature of those striking inequalities which appear near the boundary between the dark and enlightened parts of the moon. Other objects which diversify the moon's surface may be represented and illustrated in a similar manner, and sufficient time should be allowed to every observer for taking a minute inspection of all the varieties on the lunar disc. The *solar spots* may be viewed with ease, by interposing a colored glass between the eye and the image of the sun; but, in looking through the telescope in the ordinary way, they can be perceived by only *one* individual at a time. In order to exhibit them to a company of 30 or 40 persons at once, the image of the sun may be thrown on a white wall or screen. I have generally exhibited them in the following manner. To a $3\frac{1}{2}$ feet Achromatic telescope, I apply a *diagonal eye-piece*, which has a plain metallic speculum placed at half a right-angle to the axis of the telescope. By this eye-piece, after the room has been darkened as much as possible, the image of the sun and his spots is thrown upon the roof of the apartment, which forms a beautiful circle of light, and exhibits all the spots which then happen to diversify his surface. His apparent diurnal motion is also represented, along with the motions of any thin fleeces of clouds which may happen to cross his disc. In this way, too, the proportional magnitudes of the spots may be measured, and compared with the diameter of the sun, and, of course, their *real magnitudes* ascertained.

In illustrating the phenomena of the planetary

system by means of orreries, planetariums, and lunariums, great care should be taken to guard the young against the false and imperfect conceptions of the magnitudes and distances of the planets, which such instruments have a tendency to convey. No orrery, of a portable size, can represent, at the same time, both the proportional distances and relative magnitudes of the different planets. Even those large machines designated *Eidouraniums* and *Transparent Orreries* afford no correct views of these particulars; and some of them convey very erroneous and distorted conceptions of the relations of the solar system, where it is the chief design to dazzle the eye with a splendid show. In some of these exhibitions I have seen the stars represented as if they had been scattered through different parts of the planetary system.—An orrery representing the proportional distances and magnitudes of the sun and planets would require to be more than three miles in diameter; and, even on this scale, Jupiter would be less than 3 inches diameter, the Earth a quarter of an inch, or about the size of a small pea, and Mercury only about the dimensions of the head of a small pin, while the sun would require to be represented by a ball 30 inches in diameter—in which case all the planets would be invisible from the center of the system. To correct, in some measure, the erroneous ideas which a common orrery is apt to convey, the magnitudes and distances should be *separately* represented. Suppose a celestial globe, 18 inches in diameter, to represent the Sun, Jupiter will be represented by a ball about 1.45 inch diameter; Saturn, by one of $1\frac{1}{3}$ inch; Herschel, by one of about $\frac{3}{4}$ inch; the Earth, by a ball of 1.6 inch, or somewhat less than a small pea; Venus, by a ball of nearly the same size; Mars, by a globule of about $\frac{1}{2}$ inch; Mercury, by a globule of $\frac{1}{5}$, and the Moon by a still smaller globule of $\frac{1}{4}$ inch in diameter. These three last might be represented by three different sizes of pin-heads. When balls of these sizes are placed adjacent to an 18-inch globe, and compared with it, an impressive idea is conveyed of the astonishing magnitude of the sun, which is 500 times greater than all the planets, satellites, and comets, taken together. The *proportional distances* may be represented as follows. At one end of a table, 9 feet in length, fix a ball upon a pillar to represent the sun; at 2 inches from the sun's ball, place another to represent Mercury; at $3\frac{1}{2}$ inches, Venus; at 5 inches, the Earth; at $7\frac{1}{2}$ inches, Mars; at 25 inches, Jupiter; at $47\frac{1}{2}$ inches, or about 4 feet, Saturn; and, at 95 inches, or about 8 feet from the sun's ball, place one to represent Herschel. This will convey a pretty correct idea of the *proportional distances* from the sun of the principal primary planets. The distances of Ceres, Pallas, Juno, and Vesta, might likewise be represented, if judged expedient; but as their orbits are more eccentric than those of the other planets, and some of them cross each other, they cannot be accurately represented. When orreries, or telescopes cannot be procured for exhibiting the celestial motions and phenomena to which I have alluded, some of these objects, such as the rings of Saturn, the belts and moons of Jupiter, the phases of Venus, the Moon, and some of the constellations, may be represented in a dark room by means of the *phantasmagoria*. But the representations made by this instrument form but a rude and paltry substitute for the exhibitions presented by the orrery and the telescope, and need never be resorted to, except for amusement, where these instruments can be obtained.

It might next be expedient to communicate to the pupil an idea of the nature of a *parallax*, to prepare him for understanding the mode by which the distances and magnitudes of the heavenly bodies are ascertained. This might be done by fixing a pole or staff, with a pointed top, in a garden or large area, opposite a wall or hedge, F G, Fig. 1, and, desiring one of the pupils to take his station at A, and another at B, and to direct their eyes to the points on the wall which appear in a line with the top of the pole, when the one stationed at A will perceive it to coincide with the point C, and the other stationed at B

Fig. 1.

will perceive it at D. They may be told that C D is the *parallax*, or the difference of the apparent place of the pole P, when viewed from the positions A and B, which is measured by the angle C P D; and that, if the distance between A and B were measured, and the number of degrees or minutes in the angle C P D or A P B ascertained, the distance between the pole and any of the stations can be easily determined. This may be easily applied to the case of the heavenly bodies by means of such a diagram as Fig. 2, where H I K represents the Earth, M the Moon, P a planet, and S T a quadrant of the starry heavens. It is evident, that, if the moon be viewed from the surface of the earth at H, she will appear in the heavens at the point *a*: but if she be viewed from the center C, she will be seen at the point *b*, the angle *a M b* being the angle of parallax. This angle being found, which is the same as the angle H M C,

Fig. 2.

and the base line H C, or the earth's semidiameter being known, which is nearly 4000 miles—the length of the line H M, or the distance of the moon, can be easily determined. It may be proper also to state that the *farther* any heavenly body is distant from the earth, the *less* is its parallax. Hence the parallaxes of the sun and planets are all much less than that of the moon, which is the nearest celestial body to the earth. Thus, the parallax *c d* of the planet P is less than

that of the Moon, M, and the same principle likewise holds true with respect to all terrestrial objects. This subject may soon be rendered quite plain to the pupil, by familiar illustrations, in connection with a few instructions on the nature and properties of triangles, and the first principles of trigonometry.

I have been somewhat particular in some of the hints thrown out above, because it is of some importance that the young should have clear and impressive conceptions of every object presented to their view, in every step of their progress on this subject, and not depend merely on the assertions or the positions announced by their teachers; and because such a train of observations and experimental illustrations has seldom been attended to, in attempting to convey to the juvenile mind a popular view of the leading facts of astronomy. After the pupil has acquired a knowledge of the subjects to which I have adverted, an intelligent teacher will find little difficulty in gradually unfolding to him the doctrines and facts in relation to solar and lunar eclipses—the tides—the form of the planetary orbits—the nature of refraction—the divisions of time—the mensuration of the earth—centrifugal and centripetal forces—the circles of the celestial sphere—and various other particulars connected with astronomical science.

In illustrating the principles and exhibiting the objects of astronomy, the pious and intelligent teacher will have frequent opportunities of impressing upon the minds of his pupils the most sublime ideas of the Perfections of the Creator, and of the Extent and Grandeur of his Empire, and of inspiring them with Love, Admiration, and Reverence; and such opportunities ought never to be neglected. When descending on the number and magnificence of the celestial world, he may very appropriately take occasion to impress them with the idea of the *littleness* of this earth, and its comparative insignificance, when placed in competition with the numerous and more resplendent worlds and systems which compose the universe; and, consequently, with the folly and madness of ambition, and of all those warlike schemes and ferocious contentions, of which our world has been the melancholy theater. He may occasionally expatiate a little on the folly of *pride*, and its inconsistency with the character and circumstances of man, when we consider his comparative ignorance, and the low station which he holds in the scale of creation—and the reasonableness of cultivating a spirit of *humility* in the presence of that Almighty Being whose “glory is above the heavens,” and “whose kingdom ruleth over all,” when we consider, that, when compared with the myriads of more exalted intelligences that people the universe, we are only like a few atoms in the immensity of space. He may direct their attention to the infinitely diversified scenes of grandeur and felicity which the universe must contain, since its range is so extensive and its objects so magnificent; and to the evidence which these facts afford, that the Creator has it in his power to gratify his rational offspring with new objects, and new sources of enjoyment, during every period of infinite duration.—In short, he may excite them, from such considerations, to aspire after that more glorious state of existence where the works of Omnipotence will be more fully unfolded, and to cultivate those holy principles and dispositions which will qualify them for mingling in the society and engaging in the employments of the heavenly world. Such instructions, when amalgamated with Christian views and motives, could

not fail of producing a beneficial impression on the susceptible hearts of the young, which might, in some measure, influence their conduct and train of thought through all the remaining periods of their lives.*

SECTION IX.

EXPERIMENTAL PHILOSOPHY AND CHEMISTRY.

THE object of Natural and Experimental Philosophy is to investigate the phenomena of the material world, in order to discover their causes, and the laws by which the Almighty directs the movements of the universe; and to apply the observations and discoveries we make to useful purposes in human life, and to expand our views of the perfections and operations of the Creator. This department of study has generally been divided into the following subordinate branches, *Mechanics, Hydrostatics, Hydraulics, Pneumatics, Meteorology, Acoustics, Optics, Electricity, Galvanism, and Magnetism*. This is a subject, the popular and experimental parts of which may be rendered highly entertaining and instructive to the minds of the young. But, however important the subject in all its branches may be to the regular scientific student, it would be inexpedient to attempt conveying more than a *general view* of the more *popular* parts of it to young persons from the age of ten to the age of fourteen, although many of the experiments connected with it may, with propriety, be exhibited even to children of an earlier age, in order to excite a taste for the study of natural science. Experimental illustrations of the subjects of Natural Philosophy sometimes require an extensive apparatus, which cannot be procured but at a considerable expense; but there are many interesting experiments, illustrative of scientific principles and facts, which can be performed with very

simple apparatus; and at little expense; and all that I propose, under this article, is to suggest a few of those experiments which almost every teacher may have it in his power to perform.

In the department of *Mechanics*,—illustrations might be given of the *mechanical powers*, which are generally arranged under the heads of the *lever*, the *pulley*, the *wheel and axis*, the *inclined plane*, the *wedge*, and the *screw*. A simple apparatus for illustrating these powers could easily be constructed by an ingenious mechanic, at a trifling expense, and might be rendered conducive both to the entertainment and instruction of the young. In particular, the nature and power of the *lever*, and the principle on which it acts, should be minutely explained, by experimental illustrations, and by showing its effects in the common operations of life. A long bar of iron or hard wood might be erected on a steady fulcrum, and placed in the area adjacent to the school, which might serve both for amusement and for illustrating the power of the lever. This bar might be divided into feet or half feet, or any convenient number of equal parts, and so constructed that any of those parts might be placed upon the fulcrum. By such a lever the different powers to be applied at distances from the fulcrum, when a weight is to be raised, might be familiarly illustrated. A seat or swing might be fixed at one end of the beam, on which a boy might sit, while some of his companions, toward the other end, applied different powers or weights at different distances from the fulcrum, as a counterpoise; which would suggest various calculations respecting the powers requisite to be applied in any given case, according to the distance from the point of support. It will tend to excite their interest in this subject, when they are informed that scissors, pinchers, snuffers, oars, the balance, the *see-saw*, doors turning on hinges, the rudders of ships, cutting-knives fixed at one end, and the bones of the arm, are all so many different kinds of levers; and that the operations of quarrying stones, raising great weights, poking the fire, rowing a boat, digging the ground, and such like, are all performed on the principle of this mechanical power. Similar contrivances might be adopted for illustrating the *wheel and axle* and other powers. A knowledge of the mechanical powers may be useful to every individual, whatever may be his trade or profession in future life, but particularly to those who may afterward engage in the arts of carpentry, architecture, mining, engineering, and other operations where a knowledge of the mechanical powers is essentially requisite; and the impressions made upon their minds in early life by familiar illustrations of these powers, would tend to facilitate their study of such objects when they became the more particular objects of their attention.

The fundamental principles of *Hydrostatics* and *Hydraulics* might be familiarly illustrated by a variety of simple experiments, some of which might be rendered extremely amusing. That fluids press in all directions—that their pressure is in proportion to their perpendicular height—that a small quantity of a fluid may be made to counterpoise any quantity, however great—that a fluid specifically lighter than another will float upon its surface—that the surface of all fluids which communicate with each other will be on the same level—that the velocity with which water spouts from holes in the side of a vessel, is in proportion to the square root of the distance of the holes below the surface of the water:—These, and similar positions, along with the principles on which

* The most celebrated writers on Astronomy are Long, Ferguson, La Caille, Martin, O. Gregory, Vince, Herschel, Robison, La Lande, La Place, Biot, and various others. Popular works on this subject, which may be put into the hands of young persons, are such as the following:—Ferguson's "Gentleman and Lady's Astronomy"—Martin's "Gentleman and Lady's Philosophy," vol. i.—Bonycastle's "Introduction to Astronomy"—Mrs. Brian's "Astronomy"—"The Wonders of the Heavens"—Gregory's "Astronomical Lessons," &c. But none of these works are adapted to the purpose of teaching. The best treatise of this kind I have seen, calculated to be a text-book for an intelligent teacher, is a work entitled "The Geography of the Heavens," by Elijah H. Burritt, A. M., lately published at Hartford, State of Connecticut. This volume comprises 342 closely printed pages, large 18mo., and several appropriate wood-cuts. It contains a very full and lucid description of all the particulars respecting the different constellations and principal stars, the general principles of astronomy, the facts connected with the solar system, problems, astronomical tables, and almost everything that can be deemed interesting to the general student. Every page contains *Questions*, as exercises for the judgment of the pupil. It is accompanied by a large and beautiful Atlas, 16 inches by 14, containing 7 Planispheres or Maps of the Heavens: 1. The visible heavens in October, November, and December. 2. Do. in January, February, and March. 3. Do. in April, May, and June. 4. Do. in July, August, and September. 5. The visible heavens in the North Polar Regions for each month of the year. 6. Do. in the South Polar Regions. 7. Planisphere of the whole heavens on Mercator's projection. "The first four maps are so constructed, that the pupil in using them must suppose himself to face the south, and to hold them directly over head, in such a manner that the top of the map should be toward the north, and the bottom toward the south." In the construction of these maps, and in the composition of the work, the latest discoveries have been carefully inserted. This work, since its first publication in 1833, has had an extensive sale in the United States, and been introduced into many respectable seminaries.

siphons, jets, and artificial fountains act, can be illustrated with an apparatus which every intelligent teacher, if he has the least share of mechanical ingenuity, can easily construct for himself, with the assistance of glass vessels, which are to be found in almost every family. To show that water will find its level, and rise to the same height in tubes which have a communication, an instrument similar to the following, Fig. 1, may be

Fig. 1.

constructed:—A B and E D are two tubes which have a communication with each other by means of the tube B D; if water is poured into the tube A B, it will run through the tube B D, and stand at the same elevation in the tube E D. To save expense, the tube B D may be made of wood, and plugged up at both ends; and the glass tubes A B, E D, fixed into it at each end with cement; and if B D be made flat on its under part, it will stand on a table without requiring any support. An instrument to show that a small portion of water will counterbalance a large quantity, may be made as follows:—A B, Fig. 2, is a vessel

Fig. 2.

Fig. 3.

water—the finger having previously been pressed upon the opening F—as soon as the finger is removed, the water rises in a jet, nearly to the

height of the fountain, A B. A jet may likewise be produced by the instrument recommended, Fig 1, by plugging up the tube E D, and opening a hole at C, when a jet will arise after the tubes

Fig. 4.

are filled with water. To show the different quantities and velocities of water spouting at different distances from the surface of a reservoir, such a vessel as that represented above may be used. The water will issue from the orifice at C with greater velocity, and consequently in greater quantity than at B or A; if the orifice C be four times as deep below the surface as the orifice A, it will discharge twice as much water in a given time as A, because 2 is the square root of 4; if the orifice B be in the center of the column of water, it will project the water to the greatest horizontal distance. The vessel here represented may be made either of wood or of tin-plate, and if a bent tube be inserted at D, and the holes A B C shut up, it may serve to exhibit a *jet d'eau*. The *cup of Tantalus*, the *fountain at command*, the *hydraulic dancers and divers*, and other entertaining devices might also be exhibited, and accompanied with explanations of the principles on which they act. By such means, several of the leading principles of hydrostatics might be easily impressed upon the youthful mind, and would doubtless be found of practical utility in future life, provided the teacher is careful to show, by familiar examples, how they explain many of the phenomena of nature and operations of art.

The science of *Pneumatics* affords scope for many curious discussions and experiments respecting the air and atmospherical phenomena, which may be rendered interesting to the young. In illustrating the pressure, elasticity, and other properties of the atmosphere, the assistance of the air-pump, with its usual apparatus is highly desirable; as, without it, some of the most interesting experiments on this subject cannot be performed. But where this instrument, on account of its expense, cannot be procured, various useful and entertaining experiments may be exhibited by means of a simple apparatus which almost every one can procure. For example, the *pressure* of the atmosphere may be proved to the conviction of every one by such simple experiments as the following:—The common experiment of filling a wine-glass with water, covering its mouth with a piece of paper, and then inverting it, is quite decisive of the atmospheric pressure; for the paper underneath, instead of being convex by the pressure of the water within, is *concave*, by the pressure of the atmosphere from without; and no other cause can be assigned why the water is supported in the glass. Another simple experiment, where no paper is employed, proves the same fact: Take a glass tube, two or three feet long, with a narrow bore; put one end of it into a vessel of water, put your mouth to the other end, and make a deep inspiration until the air is drawn out of the tube, when the water will rush to the top of the tube; then place your thumb on the top to prevent the access of air from above, and when the other end of the tube

is taken out of the water, the column of water will be suspended in the tube by the atmospheric pressure, although the lower end of it is open. When the air is sucked out of the tube, a vacuum is produced, and the external air, pressing upon the surface of the water in the vessel, forces it to the top of the tube; the thumb being applied prevents the air pressing the water down, and the atmospheric pressure on the bottom prevents the water from running out. The same fact is proved by the following experiment: Let a piece of burning paper be put into a wine-glass, so as to rarefy or exhaust the air, and while it is still burning, press the palm of the hand against the mouth of the glass, when it will adhere with a considerable degree of force, by the pressure of the atmosphere on the bottom and sides of the glass. This experiment may be varied as follows: Pour a certain quantity of water into a saucer; invert a wine-glass over a piece of burning paper or burning brandy, and, after holding it a short time in the flame, place it in the saucer, when the water will rush up into the glass in consequence of the atmospheric pressure, as it did in the glass tube when it was exhausted of its air by suction. These and similar experiments, which every one may perform, are as decisive proofs of the atmospheric pressure as those which are performed by means of the air-pump. Such experiments, when conducted by intelligent teachers, may easily be applied to the explanation of the causes of certain natural and artificial processes, such as the firm adherence of two polished surfaces—the action of a boy's sucker in lifting large stones—the operation of *cupping*—the process of a child's sucking its mother's breast—the effects produced by cements—the rise of water in pumps—the firm adhesion of snails and shell-fish to rocks and stones—the action of syphons—what is termed *suction*, as when we take a draught of water from a running stream—the fact, that a cask will not run, in certain cases, unless an opening is made in its top—and many similar processes, some of which will be found of considerable practical utility.

The *elasticity* of the air may be proved by such experiments as these:—Take a bladder, and fill it with air by blowing into it, and then apply a force to the sides of it, so as to compress it into a smaller space; when the force is removed, it immediately expands and fills the same space as before. This experiment proves, not only the elasticity of air, but that, though invisible, it is as much a *material* substance as wood or iron; for no force can bring the sides together, without breaking the bladder, although the parts of an empty bladder may be squeezed into any shape. The same thing is proved by the following experiment:—Open a pair of common bellows, and then stop the nozzle, so that no air can rush out—and no force whatever can bring the parts together, without bursting the leather, or unstopping the nozzle. That heat increases the elasticity of air, may be shown, by placing before a strong fire a bladder with a small quantity of air, when the small portion of air will expand, until the bladder appear quite full and ready to burst. These experiments may be applied to the explanation of such phenomena as the following:—Why the compressed air between the liquid and the cork, in a bottle of beer or ale, bursts forth in the form of froth when the cork is drawn—why fishes, in consequence of their *air-bladders*, are enabled to rise and sink in the water—and why the carcass of a man that has been drowned, in a few days rises and floats on the surface for a short time,

and then sinks to rise no more. The *compressibility* of air may be shown, by taking a glass tube which is open only at one end, and of course full of air, and plunging the open end into a vessel of water, when the water will be seen to have risen to a small height, near the bottom of the tube, which proves that the air which filled the whole length of the tube is compressed by the water, into a smaller space. In a similar way the principle of the *diving-bell* may be illustrated. Let A B, Fig. 1, represent a large tumbler or drinking-glass, which may be nearly filled with water. Place a piece of cork on the surface of the water, and over the cork an ale-glass C D, with its mouth downward, then push the glass perpendicularly down toward the bottom of the tumbler, and the cork will appear swimming a little above the bottom; plainly indicating that there is no water above it in the ale-glass, which is prevented from entering by the resistance of the air within. The water in the tumbler may represent the water of a river or of the sea; the ale-glass may represent the diving-bell, in which a person may sit with safety in the depths of the sea without touching the water, provided fresh air be supplied. A small quantity of water will be found to have entered the ale-glass, and the deeper it is plunged in any vessel the higher will the water rise within it. At the depth of 33 feet, where the pressure of the atmosphere is doubled, a diving-bell will be half filled with water—at the depth of 66 feet, it will be two-thirds filled—at the depth of 99 feet, it will be three-fourths filled, and so on in proportion to the depth; which shows the propriety of having this vessel in the form of a *bell*, that the perpendicular height of the water may be as little as possible. The following simple experiment illustrates the pressure of the atmosphere in a mode somewhat different from those already stated. Procure a tin vessel about six or seven inches long, and three in diameter, having its mouth about a quarter of an inch wide, as E F, Fig. 2. In its bottom make a number of

Fig. 1.

Fig. 2.

Fig. 3.

small holes, about the diameter of a common sewing-needle. Plunge this vessel in water, and

when full cork it up, so that no air can enter at the top. So long as it remains corked, no water will run out—the pressure of the atmosphere at the bottom preventing it; but as soon as it is uncorked, the water will issue from the small holes in the bottom, by the pressure of the air from above. The same experiment may be made by means of a tube, seven or eight inches long, and about three-fourths of an inch in diameter, having two or three small holes in its bottom; and another tube, G H, Fig 3, of the same dimensions, having a small hole in each side, I K, will illustrate the lateral pressure of the atmosphere—the water being retained when it is corked, and running out when the cork is removed. It will likewise illustrate the lateral pressure of water and other liquids.

Several amusing experiments may also be performed by means of *syphons*, when concealed in drinking-cups and other vessels; and the utility of the principle on which they act may be illustrated in certain practical operations. For example, their use may be shown in conveying water over a rising ground. In Fig. 4, let M represent a pond or pool of water, in a quarry or

Fig. 4.

other situation, which is wished to be drained, and where there is no declivity or lower ground adjacent to which the water can be conveyed—it may be carried over the rising ground M N, by means of the syphon M N L; provided the perpendicular elevation N P above the level of the pool M, does not exceed thirty-two feet, for to that height only will the water rise in the syphon by the pressure of the atmosphere; and provided that the end of the syphon at L descends a little way beyond the level of the pool at M,—in which case, when the syphon is filled, the water will rush out at L, so long as any remains in the pond. In the same way may be shown how a cask of liquor may be decanted by a syphon placed in a hole made in its upper side. The use of the syphon might likewise be shown when placed in a reverse position, as in Fig. 5, when it may be applied to the

Fig. 5.

purpose of conveying water from a fountain at R, along a hollow or valley to a house, S, at the same height on the other side of the valley; and however deep or broad the valley may be, the water may in this manner be conveyed, provided the syphon is sufficiently strong near its lower parts to sustain the perpendicular pressure of the water.

The following simple and interesting experiment might be exhibited to show the effects of the expansion of air. Procure a common Florence flask, F G, Fig. 6, and pour into it a large wine-

glassful of water; then take a tube, I H, bent at the top, H, like a small syphon, and fasten it *air-tight* into the mouth of the flask, I, so that its bottom may be immersed in the water at K, but not touching the bottom of the flask. Then immerse the flask into a vessel of

Fig. 6.

very hot water, when in consequence of the expansion of the air in the flask, the water at K will be forced up into the tube I H, where it is received into a wine-glass at H. Holding the wine-glass, into which the water is now received, at the end of the tube, as represented in the figure, take the flask out of the hot water, and plunge it into another vessel full of cold water, and the water in the wine-glass will be thrown back into the bottom of the flask, by the pressure of the atmosphere on its surface at H. The flask may then be again immersed in the hot water, when the water at its bottom will be thrown up into the wine-glass, as before, and the operations may

be repeated as often as judged expedient. This experiment when dextrously performed, seldom fails to produce a pleasing effect upon the spectators, especially when the water is tinged with a red color, by means of the sulphuric or any other acid dropped into an infusion of red cabbage.*

The science of *Optics* affords scope for many delightful and interesting experiments; but some of its instruments are very expensive. I shall therefore state only a few simple exhibitions and experiments which can be made at a trifling expense. Before the teacher can illustrate any of the principles of this science by experiment, it will be requisite that he provide himself with a few convex lenses, some of short and others of pretty long focal distances. For example, double or plano-convex glasses, $\frac{1}{2}$ inch, 1 inch, 3 and 4 inches, focal distance, which may be made to illustrate the construction of a compound microscope, as I have elsewhere shown in my work, "On the Improvement of Society." Also lenses, from 3 to 6 or 8 feet focus, to illustrate the construction of a telescope, and the nature of a camera obscura; and two or three concave mirrors for

* In arranging and performing such simple experiments as those above stated, it is expedient that the teacher or operator should know how to cut vials and glass tubes, and to form syphons. The neck of a common vial may be cut off so as to form a tube, by slightly indenting a portion of the circumference with the sharp edge of a common file, and then, with the point of a hot iron, beginning at the indentation, go round the circumference of the vial, and the head will at once be separated from the body. Otherwise, tie a thread which has been steeped in turpentine or spirits of wine, firmly round the mouth of the vial, then set fire to it, and the operation is performed. In the same manner, long glass tubes may be cut into any lengths. If the tubes be of a small diameter, it is only requisite to indent them with a file at the point where they are intended to be cut, and then holding one end of the tube in the left hand, give a blow with the right on the other end, and the tube will snap asunder.—To bend a glass tube into the form of a syphon: Put the tube through the bars of a common grate, when the fire is burning clear; let the part of the tube which is to be bent be in the center or hottest part of the fire; take hold of the tube at both ends, and when it begins to melt near the middle, gently bend it with both hands, in the form which is wanted, and then remove it from the fire. A little experience will render such operations quite easy and efficient for the purpose intended. If a small bend only at one end of the tube is required, that end may be put into the fire until it begin to melt, then take hold of it gently with a pair of tongs, and bend it in the form required with the right hand.

illustrating some of the phenomena of *reflection*. The principle on which a *compound microscope*, a *solar microscope*, and a *magic lantern* or *phantasmagoria*, are constructed may be shown by one easy experiment. Let A, Fig. 1, represent a convex glass, suppose six inches focal distance, and B the flame of a candle. Hold the glass, A, at a little more than six inches from the candle, and on an opposite wall will be formed a large magnified image of the candle, C E D. This image will be inverted, and larger than the flame of the candle in proportion as the distance, A F, from

Fig. 1.

the glass to the wall, exceeds the distance A B, from the glass to the candle. Suppose the distance A B to be exactly 6 inches, and the distance A E to be 7 feet or 84 inches, then the image of the candle will be magnified in proportion, of 6 to 64, or 14 times. In this experiment the candle represents the *object* to be magnified in a compound microscope, A the object-glass, and C D the image formed by the lens, which is magnified a second time by the eye-glass of the microscope. In reference to the *solar microscope*, the candle represents the small object to be magnified, and C D its magnified image on a white wall or screen; and in reference to the *magic-lantern*, or *phantasmagoria*, the candle represents the figures painted on the sliders, A the convex lens which throws the image of the figures on a screen, and C D the magnified image of the painted figures. In all these instruments, the principle on which the objects are magnified is precisely the same; the size of the image is always in proportion to its distance from the lens by which it is formed; but as the image is enlarged it becomes less brilliant and distinct, and therefore there is a proper medium which must be fixed upon as to the distance between the lens and the screen on which the image is thrown; but a skillful teacher will always know how to modify such circumstances.

The nature of a *telescope* and of the *camera obscura* may be illustrated as follows: Fix a lens of 4, 5, or 6 feet focus, in a hole made in a window-shutter; darken the room, so that no light can enter but through the lens.* If its focal distance be 5 feet, or 60 inches, a white screen placed at that distance will receive the image of the objects without, opposite the glass, where they will be beautifully depicted in all their forms, colors, and motions, in an inverted position, forming a kind of living picture. This exhibition never fails to excite the admiration of the young. If now, a lens, about 2 inches focus be placed 2 inches beyond the image thus formed, and the screen removed—in looking through this lens, the objects will appear magnified in the proportion of 2 inches

to 60, that is, 30 times; and as the image was inverted, so the object, as seen through the glass, will appear as if turned upside down. This is perhaps one of the best modes of explaining the principle of a refracting telescope, and the reason why the object appears inverted, when viewed with a single eye-glass. The same thing may be partly shown by a common telescope. Having taken out all the eye-glasses, except the one next the eye, adjust the telescope to distinct vision, and all the objects seen through it will appear as if turned upside down. The manner in which the image is reversed by the other eye-glasses, and the object made to appear upright, might then be explained. Objects might likewise be exhibited through a telescope, as appearing in different positions and directions. This is effected by means of a *diagonal eye-piece*, which is constructed in the following manner: Let A B, Fig. 2, represent a convex glass about 2 inches focal distance; C D a plain metallic speculum, of an oval form, well polished, and placed at half a right-angle to the axis of the tube; and E F, another convex lens, 2 inches focus. The center of the speculum may be about $1\frac{1}{4}$ inch from A B, and about $\frac{1}{2}$ inch from E F.

Fig. 2.

The rays proceeding from the lens A B, and falling upon the speculum, are reflected in a perpendicular direction to the lens E F, where they enter the eye, which looks down upon the object through the side of the tube. When this eye-piece is applied to a telescope, with the lens E F on the upper part of it, we look down upon the object as if it were under our feet. If we turn the eye-piece round in its socket a quarter of a circle toward the left, an object directly before us in the south will appear as if it were in the *west*, and turned upside down. If from this position, it is turned round a semicircle toward the right, and the eye applied, the same object will appear as if it were situated in the *east*; and if it be turned round another quadrant, until it be directly opposite to its first position, and the eye applied from below, the object or landscape will appear as if suspended in the atmosphere above us. Such experiments, when accompanied with proper diagrams, and an explanation of optical principles, may easily be rendered both entertaining and instructive.

A camera obscura, on a larger scale, and on a different plan from that alluded to above, might be erected on the top of every school-house, which is constructed with a flat roof, as formerly suggested. Fig. 3 contains a representation of a wooden building, on the top of which is a large convex lens H I, about 10 or 12 feet

Fig. 3.

* A lens is a round piece of glass, ground either concave or convex. All lenses that magnify objects, are *convex*, or thicker in the middle than at the edge, such as common magnifiers, reading-glasses, and the glasses used in microscopes and telescopes, except the Galilean perspective, in which the eye-glass is *concave*.

focal distance. At half a right-angle to this lens is a plain speculum, by which the rays of light from the objects O are reflected downward through the lens, which forms a picture of all the objects before the speculum, on a round white table, T, in all their colors, motions, and proportions. If the speculum be made to revolve, the whole of the surrounding landscape may be successively depicted on the table. When the lens is of a long focal distance, as from 10 to 15 or 20 feet, it produces a pretty powerful telescopic effect, so that objects may be distinctly perceived at a considerable distance, and individuals recognized on the picture at the distance of a mile or more. Wherever there are objects in motion, such as ships sailing, birds flying, smoke ascending, crowds of people moving to and fro, or boys and girls engaged in their amusements; this exhibition always affords a high degree of satisfaction. It might occasionally be used, not only as an illustration of optical principles, but also as a reward for diligence and good behavior.

In connection with the above, representations might be given of natural and artificial objects as exhibited by the *phantasmagoria*. Discarding the ridiculous and childish figures which were formerly used in the common magic lanterns, opticians have now constructed sliders which exhibit representations of the telescopic appearances of the heavenly bodies, the different constellations, the motions of the earth and moon, and various objects connected with botany, mineralogy, and zoology; and such objects, when exhibited in this manner, are calculated to produce both instruction and amusement. The solar microscope in particular (or the *oxy-hydrogen*, if it can be procured), should be occasionally exhibited to the young, to convey to them some ideas of the wonderful minuteness of the atoms of matter, and the admirable mechanism displayed in the structure of vegetables and the bodies of animals, particularly in those myriads of animalculæ which are invisible to the unassisted eye. Such animalculæ may be procured almost at any season, but particularly during the summer months, by infusing in separate open vessels, small bits of grass or hay, leaves of flowers, or other vegetable substances, when, after a week or ten days, animalculæ of different kinds, according to the nature of the substances infused, will be perceived in vast numbers, by the aid of the microscope, in every drop of the infusion. A compound microscope is perhaps as good an instrument as any other for giving a steady and satisfactory view of such objects; and the only objection to its use for a school is, that only one individual can see the object at a time. When a teacher is not furnished with an instrument of this kind fitted up in the usual way, he may, with a little trouble, construct a compound microscope, by means of the eye-piece of a common pocket achromatic telescope, which may be purchased for one guinea, or less. The eye-pieces of such telescopes contain four glasses arranged on a principle somewhat similar to that of the glasses of a compound microscope. If we screw off one of these eye-pieces, and look through it in the usual way, holding the object end about a quarter of an inch distant from any small object, such as the letters of a printed book, it will appear magnified about ten or twelve times in length and breadth; remove from the tube the third glass from the eye, which is the second from the object, and look through it in the same manner, holding it more than an inch distant from the object, and it will appear magnified more than twenty times in dia-

meter, or above 400 times in surface. If, by means of small pasteboard tubes, or any other contrivance, we attach the glass that was taken out of the object-glass of the eye-piece, so as to be nearly close to it, we shall have a magnifying power of nearly forty times: or, if we substitute for these two object-glasses a single glass of about a half-inch focal distance, we shall form a pretty good compound microscope, magnifying above forty times in diameter, and 1600 times in surface, which will afford very pleasing views of various objects in the animal and vegetable kingdoms. The magnifying powers now stated will differ somewhat in different eye-pieces, according to their lengths and the focal distances of the glasses of which they are composed. The tube of the eye-piece thus arranged, may be occasionally fitted into a pasteboard tube supported by three pillars, in which it may be moved up or down for adjusting it to distinct vision, and the object placed underneath and properly illuminated. These hints are suggested on the score of economy, for those who have no regular microscopic apparatus.

Various amusing experiments beside the above might be exhibited to the young, such as the *optical paradox*, an instrument through which objects may be seen, although a board or other opaque body be interposed between the eye and the objects—the *prism*, which, in a dark room, separates the primary colors of the solar rays—the *multiplying glass*, which makes one object appear as if there were ten, twenty, or thirty—the *burning-glass*, which, by means of the sun's rays, sets on fire dark-colored paper, wood, and other inflammable substances—and *optical illusions* produced by the various refractions and reflections of light in water, combinations of plane mirrors, and by concave speculums. A concave mirror, about 5 or 6 inches diameter, and 10 or 12 inches focus, which may be procured for about half-a-guinea or 15 shillings, is of great utility for a variety of exhibitions. 1. When held at nearly its focal distance from one's face, it represents it as magnified to a monstrous size. 2. When held in the solar rays, directly opposite the sun, it collects the rays into a focus before it, so as to act as a powerful burning-glass, and in this way a hole may be burned in a thin board. 3. When hung at an elevation of about 5 feet, and a person placed opposite to it, at 6 or 7 feet distant, he will see his image hanging in the air in an inverted position, between him and the mirror, and if he approach a little nearer the mirror, and hold out his hand toward it, the image will appear to do the same, as if about to shake hands, and if he stretch his hand still nearer the mirror, the hand of his image will appear to pass by his hand, and approach nearer his body. 4. Such a mirror is of use in explaining the construction of a *reflecting telescope*. When it is held opposite to a window, the image of the sash and of the objects without the window will be seen depicted in its focus on a piece of white paper held between it and the window, which represents the manner in which the first image is formed by the great mirror of a reflecting telescope;—and the manner in which the small speculum of a Gregorian reflector forms the *second* image, may be shown by holding the mirror at a little more than its focal distance behind a candle, and throwing its magnified image upon an opposite wall, in the same way as the lens, fig. 1, p. 95, by refraction, produced the enlarged image C D. 5. If a bright fire be made in a large room, and a very smooth, well-polished mahogany table be placed at a considerable dis-

tance near the wall, and the concave mirror so placed that the light of the fire may be reflected from the mirror to its focus on the table—a person standing at a distance toward the fire, but not directly in the line between the mirror and the fire, will see an image of the fire upon the table, large and erect, as if the table had been set on fire.

Various illusions and deceptions have been produced by means of concave mirrors. Pagan priests are supposed to have rekindled the Vestal fire by this instrument; and with the same instrument, on a large scale, Archimedes is reported to have burned the Roman fleet. When the mirror is concealed from the view of a spectator by certain contrivances, he may be easily deceived and tantalized with a shadow instead of a substance. He may be made to see a vessel full half of water inverted in the air without losing a drop of its contents. He may be desired to grasp what appears a beautiful flower, and when he attempts to touch it, it vanishes into air, or a death's-head appears to snap at his fingers. He may be made to behold a terrific specter suddenly starting up before him, or a person with a drawn sword, as if about to run him through. An exhibition of this kind was some time ago brought before the public, which was effected by a concave mirror. A man being placed with his head downward, in the focus of the mirror, an erect image of him was exhibited, while his real person was concealed, and the place of the mirror darkened; the spectators were then directed to take a plate of fruit from his hand, which, in an instant was dextrously changed for a dagger or some other deadly weapon.—It may not be improper occasionally to exhibit such deceptions to the young, and leave them for some time to ruminate upon them until the proper explanations be given, in order to induce them to use their rational powers in reflecting on the subject, and particularly to teach them to investigate the causes of every appearance that may seem mysterious or inexplicable, and not to ascribe to occult or supernatural causes what may be explained by an investigation of the established laws of nature; and to guard them against drawing rash or unfounded conclusions from any subject or phenomenon which they have not thoroughly explored, or do not fully comprehend.

Having enlarged much farther than I originally intended on the preceding departments of Natural Philosophy, I have no space left for suggesting any hints in relation to electricity, galvanism, and magnetism. If the teacher is possessed of an electrical machine and a galvanic apparatus, and is acquainted with his subject, he has it in his power to exhibit a great variety of very striking experiments, which can never fail to arrest the attention of the juvenile mind, and prepare it for entering on explanations of some of the sublimest phenomena of nature. But without these instruments very few experiments of any degree of interest can be performed in relation to these subjects. The illustration of the phenomena of magnetism requires no expensive apparatus. Two or three small, and as many large bar magnets—a large horseshoe magnet, a magnetic compass, and a few needles, pieces of iron, and steel filings, may be sufficient for illustrating the prominent facts in relation to this department of philosophy. But as I have already thrown out a few hints on this subject in the lesson on the *Sagacious Swan*,* it would be needless to enlarge.—My only reason for suggesting the

above hints and experiments is, to show that any teacher, at a very small expense, may have it in his power to illustrate, in a pleasing manner, many of the most interesting and practical truths connected with natural philosophy. Most of the apparatus alluded to above could be procured for two or three pounds, provided the experimenter apply his hands and construct a portion of it himself, which he can easily do when the materials are provided. In regard to philosophical apparatus of every description, were there a general demand for it from all classes of the community, it might be afforded for less than one-half the price now charged for it, as certain portions of it might be constructed of cheaper materials than are now used; as elegance in such instruments is not always necessary for use; as competition would reduce their price to the lowest rate, and as there would be no necessity for great profits when the manufacturers were certain of a quick and extensive sale.

CHEMISTRY.

CHEMISTRY, in its present improved state, is a science so interesting and useful, so intimately connected with the knowledge of nature, the improvement of the useful arts, and with every branch of physical and practical science, that an outline, at least, of its leading principles and facts should be communicated to all classes of the young. The distinguishing properties of the simple substances, such as oxygen, nitrogen, carbon, hydrogen, chlorine, iodine, sulphur, and phosphorus—particularly oxygen, nitrogen, carbon, and carbureted hydrogen, should be minutely described, and illustrated by experiments, and their extensive influence in the system of nature particularly detailed. The laws of chemical affinity, the nature and properties of heat its radiation and expansive power, and the effects it produces on all bodies—the composition and decomposition of water, the nature of crystallization, the properties of earths, metals, acids, and alkalies, the nature of combustion, chemical action and combinations, the component principles of animal and vegetable substances, and various other particulars, may be impressed upon the minds of the young, and rendered familiar by a variety of simple experiments which can be easily performed. Many of the most important and luminous facts of this science may be exhibited by the aid of a few Florence flasks, glass tubes, common vials, tumblers, wine and ale-glasses—of which I intended exhibiting some specimens, had my limits permitted. In the meantime I refer the reader to Accum's volume entitled "Chemical Amusements," which contains a perspicuous description of nearly two hundred interesting experiments on this subject, with an explanation of the rationale of each experiment. Griffin's *Recreations in Chemistry*; Thomson's, Turner's, Parkes', Graham's, and Donovan's treatises, or any other modern system of chemistry, may also be consulted.*

* Notwithstanding the numerous excellent treatises on natural philosophy and chemistry, which have been published of late years, we have scarcely any books on these subjects exactly adapted for the use of schools. Blair's "Grammar and Natural Philosophy," and "Conversations" on the same subject by Mrs. Marcet, contain a comprehensive view of the leading subjects of natural philosophy which may be recommended to the perusal of young persons; but they are scarcely adapted to the purpose of teaching. Dr. Comstock of America, formerly mentioned (page 84), lately published a "System of Natural Philosophy," for the use of students and preceptors, which has already passed through nine editions. This volume contains about 300 closely printed pages, and above 200 wood-cuts, and comprises a popular and scientific illustration of the "Properties of Bodies, Mechanics, Hydrostatics, Hydraulics, Pneumatics, Acoustics,

SECTION X.

MATHEMATICS.

A KNOWLEDGE of certain departments of the mathematical sciences is essentially requisite for understanding many of the discussions and investigations connected with natural philosophy, astronomy, geography, and navigation, and for various practical purposes, in the mechanical arts; and, consequently, ought to form a portion of every course of general education. During the first stages of elementary instruction, a knowledge of the names and some of the properties of angles, triangles, squares, parallelograms, trapezoids, trapeziums, circles, ellipses, parallels, perpendiculars, and other geometrical lines and figures, may be imparted, on different occasions, by way of amusement, as is generally done in infant schools, which would prepare the way for entering on the regular study of mathematical science. The usual method of teaching mathematics, is to commence with the "Elements of Euclid," proceeding through the first six, and the eleventh and twelfth books, and afterward directing the attention to the elements of plane and spherical trigonometry, conic sections, fluxions, and the higher algebraic equations, in which the attention of the student is chiefly directed to the *demonstration* of mathematical propositions, without being much exercised in practical calculations. This is the *scientific* method of instruction generally pursued in colleges and academies, and if youths of the age of fourteen or fifteen were capable of the *attention* and *abstraction* of angelic beings, it would likewise be the *natural* method. But a different method, I presume, ought to be pursued in schools chiefly devoted to popular instruction. After the pupil has acquired a competent knowledge of arithmetic let him be conducted through the different branches of *practical geometry*, including the mensuration of surfaces, and solids, artificers' work and land surveying, exhibiting occasionally a demonstration of some of the rules, in so far as he is able to comprehend it. After which, a selection should be made from Euclid (chiefly from the first book), of those propositions which have a *practical* bearing, and which form the foundation of practical geometry and the operations of plane trigonometry. These, which might be comprehended within the limits of thirty or forty propositions, should be arranged into a kind of system, which might be divided into propositions, relating to *quadrilateral* figures, *triangles*, *circles*, and *conic sections*. The demonstrations of these should be clear and explicit, and as simple as the nature of the subject will admit, and the steps of the demonstration of each proposition should be thoroughly understood before proceeding to another. At the same time, the bearing of the truths demonstrated upon the several practical operations of geometry, and their general utility, should be distinctly pointed out as the teacher proceeds in his demonstrations; and the pupil, having previously been occupied in calculations relating to geometrical figures, will be enabled to *appreciate* such demonstrations, and will feel a greater interest in such exercises than he would otherwise do, were he to consider them as relating merely to *abstract truths* which have no useful tendency. He might

next proceed to the statements and calculations connected with the different cases of plane trigonometry, applying them to the mensuration of all the cases of terrestrial heights and distances, and to the determining of the distances, and magnitudes of the heavenly bodies and the altitude of the lunar mountains.

This is the whole course of mathematical instruction I would deem it necessary to communicate *in the first instance*;—and, with a knowledge of the practical operations of geometry and trigonometry, and of the principles on which they are founded, the pupil would be enabled to understand all the prominent parts of useful science to which mathematical principles are applicable, and to apply them to the practical purposes of life. If he feel a peculiar relish for mathematical investigations, or if his situation or profession in future life require an extensive knowledge of the higher departments of this study, he can easily prosecute, at his leisure, such studies to any extent, on the foundation of what he had previously acquired. When a young person, of the age of twelve or fourteen, commences the study of "Euclid's Elements," or any similar work, he is at a loss to conceive what useful purpose can be served by fixing his mind on squares, parallelograms and triangles, and pestering himself in demonstrating their relations and proportions. After encountering some difficulties, he perhaps acquires a pretty clear conception of the demonstrations of the first and most simple propositions; but as he proceeds in his course, the propositions become more complex and difficult to be conceived, and the steps of the demonstration more tedious and complicated; he forgets the conclusions formerly deduced, his mind becomes bewildered, and, in too many instances, he follows his preceptor in the dark, relying more on his authoritative assertions than on a clear perception of the force of his demonstrations; his ideas become confused, and he loses all relish for the study, because he cannot perceive the practical purposes to which such abstract speculations can be applied. This, it may be affirmed, is the case with more than one-half of those who attempt the study of pure mathematics at an early age, without having previously been exercised in the practical operations of the science. It is for this reason I would recommend a short course, or outline of practical geometry and trigonometry before proceeding to the demonstration of theorems, or the more abstract parts of mathematical science. So far as my experience goes, I have uniformly found, that those who had been well exercised in the different branches of mensuration, and the practical parts of trigonometry, previous to their entering on a course of pure mathematics, have acquired a relish for such studies, and become eminent proficient in them; while their fellow students, who had no previous experience in practical calculations, lagged far behind them, and seldom entered into the spirit of such subjects. I could point to several individuals of this description, who ultimately attained the highest mathematical prizes bestowed at the colleges and academies at which they attended.

SECTION XI.

PHYSIOLOGY.

This is a department of knowledge which has never yet been introduced into any seminary, as a

Optics, Astronomy, Electricity, and Magnetism," with questions in the margin of every page for exercising the judgment of the student. It is calculated for being an excellent textbook in colleges and academies; but would require to be somewhat reduced and simplified, to adopt it to the use of common schools.

branch of general education. It is somewhat unaccountable, and not a little inconsistent, that, while we direct the young to look abroad over the surface of the earth and survey its mountains, rivers, seas, and continents, and guide their views to the regions of the firmament, where they may contemplate the moons of Jupiter, the rings of Saturn, and thousands of luminaries placed at immeasurable distances,—that, while we direct their attention to the structure and habits of quadrupeds, birds, fishes, and insects, and even to the microscopic animalculæ in a drop of water—we should never teach them to *look into themselves*, to consider their own corporeal structures, the numerous parts of which they are composed, the admirable functions they perform, the wisdom and goodness displayed in their mechanism, and the lessons of practical instruction which may be derived from such contemplations. An intelligent writer in the “American Annals of Education,” has justly remarked—“The person who should occupy a dwelling seventy, eighty, or a hundred years, and yet be unable to tell the number of its apartments, or the nature and properties of any of its materials, perhaps even the number of stories of which it consisted—would be thought inexcusably ignorant. Yet, with the exception of medical men, and here and there an individual belonging to the other professions, is there one person in a thousand who knows anything about the elementary materials—the structure or even the number of apartments in the present habitation of his mind?” It is not because this study is either uninteresting or unaccompanied with mental gratification, that it is so generally neglected; for to “*know ourselves*,” both physically and intellectually, is one of the first duties of man, and such knowledge has an extensive practical tendency, and is calculated to gratify the principle of curiosity, and to produce emotions of admiration and pleasure. “Does it afford no pleasure,” says the writer I have now quoted, “to study the functions of the stomach and liver, and other organs concerned in changing a mass of beaten food, perhaps some of the *coarser vegetables*, into blood?—of the heart, and arteries, and veins, which convey this fluid, to the amount of three gallons, through all parts of the body once in four minutes?—of the lungs, which restore the half-spoiled blood to its wonted purity, as fast as it is sent into them, and enable it once more to pursue a healthful course through its ten thousand channels?—of the brain, and especially the nerves, which by their innumerable branches spread themselves over every soft part of the human system (and some of the harder parts) which they can possibly penetrate, in such numbers that we can nowhere insert the point of the finest needle without piercing them?—of the skin, every square inch of which contains the mouths or extremities of a million of minute vessels? Is all this, I say, uninteresting? Is there no wisdom displayed in the construction of so complicated, and yet so wonderful a machine, and endowing it with the power of retaining an average heat of 96 or 98 degrees, whether the surrounding atmosphere be heated to 100 degrees or cooled to 32, or even to a much lower point? Is there, moreover, ~~no~~ mental discipline involved in the study of physiology?”*

The evils arising from ignorance of the corporeal functions, and of the circumstances by which they are impaired, are numerous and much to be deplored. From ignorance of the structure and functions of the digestive organs, parents, in many instances, allow their children to eat and drink everything they desire, and to gorge their stomachs, until diseased action of the organs connected with digestion necessarily ensues, accompanied with the other disorders which generally follow in its train. To the same cause is owing the practice of administering to infants, cordials, elixirs, laudanum, and *spirituous liquors*—a practice in which no person will indulge who is acquainted with the laws which regulate the functions of the corporeal frame, and which has a tendency not only to injure the individual, but to perpetuate a degenerated race through successive generations. From ignorance of the nature of *perspiration*, and the *functions of the skin*, children are permitted to wallow in dirtiness and filth, to remain moist, cold, and benumbed, and to pass days and even weeks without being washed or receiving a change of linens; by which they are, sooner or later, subjected to cutaneous and inflammatory disorders. Ignorance of this subject has likewise led to those awkward attempts, particularly on the part of the female sex, to remodel the human frame, as if they could improve the mechanism and symmetry devised by Infinite Wisdom. Hence the derangement of the physical system produced by laced stays, strait jackets, corsets, and other absurd articles of dress, by which the ribs are compressed, the spine bent out of its place, and the free expansion of the lungs prevented; the consequences of which are,—diseases of the breast, shortness of breath, external callosities, defective digestion, tubercles of the lungs, and a tendency to pulmonary consumption. The annexed figures show how such unnatural practices tend to distort even the *very bones*, as well as the muscular part of the body. They are taken from No. 58, of the “Penny Magazine.” Fig. 1, is an outline of the celebrated statue of the Venus de Medicis, which is considered as the most beautiful and symmetrical model of a fine female figure. Fig. 2, is the skeleton of a similar figure, with the bones in their natural position. Fig. 3, is an outline of the figure of a modern fashionable lady, after it has been permanently *remodeled* by stays. Fig. 4, is a skeleton belonging to such a

Fig. 1.

figure as No. 3. From these figures it appears that the size of the chest belonging to figures 3

* Mr. Alcott, “American Annals of Education,” for September, 1833,—a journal which is conducted with admirable spirit by Mr. Woodbridge, which contains a variety of

valuable communications, and much important statistical information, respecting the improvements going forward in Europe and America, in connection with the subject of education.

Fig. 3.

Fig. 4.

and 4, is obviously *much less* than that of figures 1 and 2, and consequently, the parts which it embraces must be *unnaturally* compressed, to the injury of symmetry and beauty, as well as to the impeding of the vital functions.

But it will naturally be asked, How shall we find means to communicate a knowledge of physiology in common schools? A thorough knowledge of this subject, such as a regular medical practitioner requires, cannot be communicated in such seminaries, nor would it be necessary, or even expedient, to make the attempt. Human subjects could not be dissected before the eyes of the young, nor would it be proper to accustom them to witness such operations. A *general* knowledge of the parts of the human frame, of their relative positions, and of the functions they perform in the animal system, is all that is requisite to be imparted; and there are several modes by which such a view of the mechanism of the human body may be exhibited. 1. It is well known that the skill of the anatomist, combined with that of the modeler, has enabled him to construct a model or representation of the human system. This model, which has been sometimes called a *mannikin*, or artificial man, is formed with so much skill and ingenuity as to exhibit the principal veins and arteries, the nerves, the muscles, the lungs, liver, stomach, kidneys, and most other parts, nearly as distinctly as they appear in the real human subject. Such a model, could it be procured, would answer all the purposes of *general* instruction. The only valid objection that could be made to its introduction would be, the *expense* with which it would be necessarily attended. 2. An idea of the form and position of those parts connected with the vital functions, which are contained within the *thorax* and *abdomen*, may be obtained by dissecting some of our domestic quadrupeds. Although the mechanism of these animals is somewhat different from that of man, yet the organs contained in the cavity of the breast and abdomen are essentially the same, though differing in some minute particulars—are placed nearly in the same relative positions, and perform the same or similar functions as in the human system. As hares, rabbits, and other quadrupeds are frequently slaughtered for food, and as dogs and cats sometimes require to be killed, opportunities might be taken of dissecting such animals, and showing the forms and positions of those parts which most nearly resemble those of the human subject. I recollect, when young, having received my first clear ideas of the form and position of the lungs, heart, liver, kidneys, stomach, &c., from the dissection of a *cat*, of which the anatomical figures I had in my power to inspect, could afford no accurate or satisfactory conception. 3. Dried preparations of certain parts of the human body—portions of the muscular parts, such as the

heart, liver, &c., preserved in spirits—skulls, and detached portions of the skeleton—might be occasionally procured, which might serve for the illustration of particular functions. 4 Where such objects as the above cannot be procured, some general and useful ideas on this subject may be communicated by means of *large colored anatomical plates*. These are found necessary to accompany every course of anatomical dissection; and, although they cannot convey the same accurate ideas which may be obtained by a direct inspection of the human subject, yet none will deny that a very considerable degree of useful information may in this way be obtained, especially with the assistance of a teacher who can explain, with simplicity and clearness, the several organs and functions of the animal system. Supposing a person knew nothing of the internal parts of the human body, it is evident, that, from such a figure

as the preceding, an idea might be obtained of the relative situations of the lungs, the heart, the diaphragm, the liver, the gall-bladder, the pancreas, the stomach, the kidneys, and various other parts, and much more so from a variety of separate figures delineated on a large scale, and colored after nature. There would be no necessity for exhibiting or describing any other parts or organs but those which are common to both sexes, so that there would be no room for objections on the score of indelicacy. The female sex, however, as well as the male, ought to be instructed in this science; for, as females have the physical education of children more immediately under their control, it is of vast importance to the human race at large, that they should be endowed with that knowledge of the functions of the human frame, which will enable them to conduct such education with intelligence and discretion. There is no department of science, moreover, in which a pious and intelligent teacher has a better opportunity of directing the minds of his pupils to the *evidence of design*, and of descanting on the wisdom and benevolence of the Creator, than when describing the mechanism of the human frame. In the various articulations of the bones, in the

construction of the venous and arterial system, in the process of respiration, in the circulation of the blood, in the muscular and nervous systems, in the motion of the heart, in the mechanism of the eye and ear, in the construction of the spine, the hand, the skull, and other parts of this admirable machine, the Divine Wisdom and benevolence shine conspicuous; and, when clearly exhibited to the young, must impress their minds with the truth that they are, indeed, "*fearfully and wonderfully made*," and that they ought to consecrate the temple of their bodies for "a habitation of God through the Spirit."

One great practical end which should always be kept in view in the study of physiology, is the invigoration and improvement of the corporeal powers and functions, the preservation of health, and the prevention of disease. For this purpose frequent instruction, illustrated by examples, should be imparted in relation to *diet and regimen*. The young should be instructed in the laws of the animal economy, and the sources of diseases; the practices which induce certain disorders, and the means of counteracting them; the functions of the skin, lungs, stomach, and bowels; the nature and importance of insensible perspiration, the means of regulating it, and the evils which flow from its obstruction; the rules which should be observed in bathing and swimming; the importance of pure atmospheric air to the health and vigor of the animal system, the circumstances by which it is deteriorated, and the means by which its purity may be preserved; the necessity of *cleanliness*, in respect to the hands, face, neck, and other parts of the body, and to the clothes, linens, blankets, sheets, and household furniture, and the rules which should be attended to for preserving the person and dwelling from filth and noxious effluvia; the articles most proper for *dress*, and the mode of constructing it so as not to impede the vital functions; the proper use of *food and drink*, and especially the moral and physical evils which flow from *intemperance*, and the frequent use of ardent spirits; the *exercise and rest* requisite for body and mind, the means by which they may be duly proportioned, and the evils which arise from *immoderate* exertion either of the mental or corporeal powers;* the improvement of the organs of sensation, particularly the organs of vision, and the treatment requisite for preserving them in health and vigor. Instructions on these and similar topics, when occasionally illustrated by striking facts and examples, could scarcely fail to exert a powerful and beneficial influence on the minds of the young, on the families with which they are connected, on society at large, and even on succeeding generations. That such information has never yet been regularly communicated in our schools and seminaries, reflects disgrace on our scholastic arrangements, which are frequently directed to objects of far inferior importance. Until such instructions be generally communicated, in connection with other portions of useful knowledge, man will never rise to the highest dignity of his physical and intellectual nature, nor enjoy the happiness of which he is susceptible even in the present state.

SECTION XII.

LOGIC, OR THE ART OF REASONING.

Logic may be defined to be "that art or branch of knowledge which has for its object *the investiga-*

tion of truth, and the best method of communicating it to others;" or, in other words, the art of employing our rational faculties in the best manner in searching after truth and duty on any subject. Although all men have essentially the same mental faculties, yet there is a great difference in respect to the *vigor* of these faculties in different individuals, according to the *improvement* they have received, and the objects to which they have been directed. The improvement of the reasoning powers, and the manner in which they have been exercised by the wise and learned in Europe, America, and other parts of the civilized world, have raised them almost as high in the scale of intelligence above the Hottentots, the African negroes, or the inhabitants of New Holland or Nootka Sound, as those savages are superior to the beasts of the forest or the fowls of heaven. The acquisition of truth, in relation to all those subjects which are connected with the present and future happiness of man, is obviously a matter of the highest importance. By the proper application of our reasoning faculty we become acquainted with the properties and relations of the objects around us in this lower world, and the distances, magnitudes, and *real* motions of the celestial bodies, and the purposes for which they appear to have been created. By the same means we acquire a knowledge of the perfections of God, the principles of Natural Religion, the Evidences of Divine Revelation, the improvements of art, and the discoveries of science. By the cultivation of reason we discover our duty to God and to our fellow-creatures, either from the light of nature, or from the study of Revelation, and learn to distinguish truth from falsehood, and good from evil; and to apply the truths we thus acquire to the direction of our moral conduct, to the promotion of human happiness, and to the invigorating of our hopes of eternal felicity.

It is therefore a matter of considerable importance, that, at an early period, the reasoning powers of the young be directed, both by precepts and examples, in their inquiries after truth, and guarded from the influence of false principles and fallacious reasonings, by which errors have been propagated, prejudices promoted, truth obscured, and the improvement of the human race prevented.—Were this subject to be illustrated in all its extent, it would be requisite, in the first place, to give a description and analysis of the intellectual powers, which are the means or instruments by which we are to pursue our discovery after truth. In the second place, to exhibit an arrangement and classification of the objects in nature to which these powers are applied. In the third place, to illustrate the most successful method of applying our natural powers in the investigation of truth; and lastly, to explain the best method of communicating the truth to others, when discovered. Under the *first* head, it would be requisite to enter into the discussion of the faculties of sensation and perception, attention, consciousness, memory, conception, abstraction, imagination, judgment, taste, the moral faculty, and other powers; or, according to the phrenological system, the *knowing* and *reflecting* faculties, the moral sentiments, and the animal propensities—which may be considered as so many different modes of the operation of mind. Under the *second*, a brief view might be given of the peculiar characteristics of *mind* and *matter*, and a more particular survey of the sciences, or the knowledge which men have acquired respecting the objects of human thought, which might be arranged under the three following heads:—1.

* See Appendix.

History, comprehending sacred, prophetic, and ecclesiastical history; literary history, including the history of philosophy and the arts; civil history, including particular history, general history, memoirs, antiquities, and biography; also, geography and chronology, which have been denominated the *Eyes* of history; *natural history*, including mineralogy, botany, and general zoology, meteorology, geology, and the facts which relate to the heavenly bodies.—2. *Philosophy*, including ontology, the mathematical sciences, pure and mixed; natural and revealed theology, *esthetics*, or the science of our feelings and emotions; ethics, logic, political economy and legislation; natural philosophy, chemistry, physical astronomy, medicine, the physiology of plants, human and comparative anatomy, &c.—3. *Art*, including the *fine arts*, as poetry, oratory, painting, architecture, gardening, &c.; the *liberal arts*, as practical logic, practical geometry, practical chemistry, surgery, &c.; and the *mechanical arts*, as dyeing, weaving, clock and watch making, &c. Under the *third* head might be illustrated the different kinds of *evidence*, as the evidence of intellection, of sense, of testimony, of analogy, &c., and the means by which evidence on any subject may be most successfully obtained; which would include a discussion of the modes of reasoning by syllogism, induction, analysis, and synthesis—of the sources of error, and of the *dispositions* and *circumstances* among mankind from which errors and fallacious reasonings arise—a subject which would require to be illustrated with considerable minuteness from the facts of history, and the circumstances which exist in the present state of the human race. Under the *fourth* head might be included—1. A general view of the different means, which men have employed for communicating their thoughts to each other.—2. An explanation of the nature of arbitrary signs, and the principles of universal grammar.—3. An enumeration and description of the different qualities of *style*, and the best method of constructing a discourse on any subject.

To a class of young persons, about the age of fifteen or sixteen, a popular illustration of some of the above topics might be attended with many beneficial effects, particularly in inducing upon them habits of reasoning and reflection, and guarding them against the influence of prejudices, and sophistical arguments and reasonings. Although it would evidently be injudicious and premature to attempt such discussions in primary schools, yet a judicious teacher, well acquainted with the science of mind and the nature of evidence, might occasionally illustrate certain parts of this subject, particularly in teaching the young to reason with propriety on any familiar objects or incidents with which they are acquainted. It may be laid down as an axiom, that *from the earliest dawn of reason children should be accustomed to exercise their reasoning faculty on every object to which their attention is directed, and taught to assign a reason for every opinion they adopt, and every action they perform*. Without troubling them with explanations of the various forms and moods of syllogisms, they may be taught the nature of reasoning, and the force of arguments, by familiar examples taken from sensible objects with which they are in some measure acquainted. Logicians define reasoning to be *that power which enables us, by the intervention of intermediate ideas, to perceive the relation of two ideas, or their agreement or disagreement*. This might be illustrated to the young, by such examples as the following:—Suppose there are two tables, A and B, which cannot be applied to each

other, and we wish to know whether A be longer or shorter than B; we endeavor to find an “intermediate idea,” or measure, namely, a three-foot rule, and apply it, first to table A, and then to table B. We find that A measures thirty-six inches, coinciding exactly with the three-foot rule, and that B measures only thirty-four inches, therefore, the inference or conclusion, at which we wished to arrive, is evident, that table A is longer than table B. Again, suppose we would know whether the space contained in the triangle C, be equal to, or greater or less than that contained in the circle E; we cannot apply these figures to

each other, in order to determine this point; we must therefore search for an intermediate idea which will apply to both. We fix on a square—a square foot for example, and from the length of the base, E F, and the perpendicular F G, in the triangle C, we find the number of square feet to be 100. Having the length of the diameter of the circle H I, we find that there are likewise 100 square feet contained within its circumference; and therefore the conclusion is evident, that the space contained within the triangle C is equal to that contained in the circle E. This example, reduced to the form of a syllogism, would stand thus: Any two figures which contain the same number of square feet are equal to one another; but the triangle C contains the same number of square feet as the circle E; therefore the space contained in the triangle C is equal to the space contained within the circle E.

Again, the sun appears to be only a few inches in diameter, and as flat as the face of a clock or a plate of silver. Suppose it were inquired how we may determine that the sun is much larger than he appears to be, and whether his surface be flat, or convex, or of any other figure, the pupil may be requested to search for intermediate ideas, by which these points may be determined. One idea or principle, which experience proves, requires to be recognized, that *all objects appear less in size, in proportion to their distance from the observer*. A large building, at the distance of twenty miles, appears to the naked eye only like a visible point; and a dog, a horse, or a man, are, at such a distance, altogether invisible. We find, by experience, that when the sun has just risen above the horizon in the morning, he appears as large as he does when on our meridian at noon-day; but it can be proved, that he is then nearly 4000 miles (or the half diameter of the earth) nearer to us than when he arose in the morning; therefore, the sun must be at a greater distance from us, at least several thousands of miles, otherwise he would appear much larger in the one case than in the other, just as a house or a town appears much larger when we approach within a mile of it than it does at the distance of eight or ten miles. It is known that the inhabitants of Great Britain, and those who live about the Cape of Good Hope, can see the sun at the same moment; and that he appears no larger to the one than to the other, though they are distant in a straight line more than 5000 miles from each other. We also know, from experience, that when we remove fifty or a hundred miles to the west of our usual place of

residence, the sun appears, at his rising, just as large as he did before; and though we are removed from our friends several hundreds or even thousands of miles, they will tell us that the sun uniformly appears of the same size, at the same moment as he does to us. From these and similar considerations, it appears, that the sun must be at a very considerable distance from the earth, and consequently his *real* magnitude must be much greater than his apparent, since all bodies appear less in size in proportion to their distance. If the distance of the sun were only 4000 miles from the earth, he would appear *twice* as large when he came to the meridian, as he did at his rising in the east; if his distance were only 100,000 miles, he would appear $\frac{1}{25}$ part broader when on the meridian than at his rising—but this is not found to be the case; consequently, the sun is *more* than 100,000 miles distant, and therefore must be of a very large size. Supposing him no farther distant than 100,000 miles, he behooved to be nearly a thousand miles in diameter, or about the size of Arabia, or the United States of America.

To determine whether the sun be *flat* or *convex*, we must call in to our assistance the following ideas. *Every round body which revolves around an axis, perpendicular to the line of vision, without altering its figure or apparent dimensions, is of a convex or globular shape;—and, Every object which appears of a circular shape near the center of such a body, will assume an oval or elliptical form when it approaches near its margin.* This might be illustrated by fixing a circular patch on a terrestrial globe, and turning it round until it appear near the margin. By means of the telescope, it is found that there are occasionally spots upon the sun, which appear first at the eastern limb, and, in the course of about 13 days, approach the western limb, where they disappear, and, in the course of another 13 days, reappear on the eastern limb; which shows that the sun revolves round an axis without altering his shape. It is also observed that a spot, which appears nearly circular at his center, presents an oval figure when near his margin. Consequently the sun is not a flat surface, as he appears at first sight, but a globular body.—Again, suppose it was required to determine whether the sun or the moon be nearest the earth. The intermediate idea which requires to be recognized in this case is the following. *Every body which throws a shadow on another is nearer the body on which the shadow falls than the luminous body which is the cause of the shadow.* In an eclipse of the sun, the body of the moon projects a shadow upon the earth, by which either the whole or a portion of the sun's body is hid from our view. Consequently, the moon is interposed between us and the sun, and therefore is nearer to the earth than that luminary. This might be illustrated to the young by a candle, and two balls, the one representing the moon, and the other the earth, placed in a direct line from the candle.—In like manner, were it required, when the moon is eclipsed, to ascertain whether at that time the earth or the moon be nearest to the sun, it might be determined by the same process of reasoning; and, on the same principle, it is determined that the planets Mercury and Venus, when they transit the sun's disc, are, in that part of their orbits, nearer the earth than the sun is.

Such reasonings as the above might be familiarly explained, and, in some cases, illustrated by experiments; and the pupil occasionally requested to put the arguments into the form of a syllogism. The reasoning respecting the bulk of the sun may be put into the following syllogistic form:

All objects appear diminished in size in proportion to their distances.

The sun is proved to be many thousands of miles distant, and consequently, diminished in apparent size.

Therefore the sun is much larger in reality than what he appears.

The two first propositions are generally denominated the *premises*. The first is called the *major* proposition, the second the *minor* proposition. If the major proposition be doubtful, it requires to be proved by separate arguments or considerations. In the above example, it may be proved, or rather illustrated, to the young, by experiment—such as placing a 12-inch globe, or any similar body, at the distance of half a mile, when it will appear reduced almost to a point. If the *minor* or second proposition be doubtful, it must likewise be proved by such considerations as suggested above; or by a strictly mathematical demonstration, if the pupils are capable of understanding it. But, in the present case, the arguments above stated are quite sufficient to prove the point intended. When the premises are clearly proved, the conclusion follows as a matter of course. Similar examples of reasoning may be multiplied to an almost indefinite extent, and, in the exercise of instructing the young, they should always be taken from *sensible objects* with which they are acquainted.

As it would be quite preposterous to attempt instructing young persons, under the age of twelve or thirteen, in the abstract systems of logic generally taught in our universities—it is quite sufficient for all the practical purposes of human life and of science, that they be daily accustomed to employ their reasoning powers, on the various physical, intellectual, and moral objects and circumstances which may be presented before them; and an enlightened and judicious teacher will seldom be at a loss to direct their attention to exercises of this kind. The objects of nature around them, the processes of art, the circumstances and exercises connected with their scholastic instruction, their games and amusements, the manner in which they conduct themselves toward each other, their practices in the streets or on the highways, and the general tenor of their moral conduct, will never fail to supply topics for the exercise of their rational faculties, and for the improvement of their moral powers. In particular they should be accustomed, on all occasions, to *assign a reason for every fact they admit, and every truth they profess to believe.* If, for example, they assert, on the ground of what they read in books, or on the authority of their teachers, that “the earth is round like an artificial globe,” they should be required to bring forward the proofs by which this position is supported, so that their knowledge may be the result, not of authority, but of conviction. In like manner, when they profess to believe that the earth moves round its axis and round the sun—that the atmosphere presses with a weight of fifteen pounds on every square inch of the earth's surface—that a magnet will stand in a direction nearly north and south—that water presses upward as well as downward—that it is our duty and interest to obey the laws of God—that we ought to exercise justice between man and man—and that children should obey their parents and teachers,—they should be taught to bring forward, when required, those experiments, arguments, and reasonings, by which such truths are proved and supported.

As an illustration of some of the modes of reasoning to which I allude, the following story

respecting the celebrated French philosopher, *Gassendi*, may be here introduced. From his earliest years he was particularly attentive to all that he heard in conversation, and was fond of contemplating the scenes of nature, particularly the magnificence of a starry sky. When only seven years old, he felt a secret charm in the contemplation of the stars, and, without the knowledge of his parents, he sacrificed his sleep to this pleasure. One evening a dispute arose between him and his young companions, about the motion of the moon, and that of the clouds when they happened to be impelled by a brisk wind. His friends insisted that the clouds were still, and that it was the moon which moved. He maintained, on the contrary, that the moon had no *sensible* motion, such as they imagined, and that it was the clouds which appeared to pass so swiftly. His reasons produced no effect on the minds of the children, who trusted to their own eyes rather than to anything that could be said on the subject. It was, therefore, necessary to undeceive them by means of their eyes. For this purpose *Gassendi* took them under a tree, and made them observe that the moon still appeared between the same leaves and branches, while the clouds sailed far away out of sight. This exhibition, of course, was convincing, and at once settled the dispute.

The principle, or "intermediate idea," which *Gassendi* recognized, in this case, for proving his position, was the following, although he could not

Gassendi demonstrating the motions of the clouds.

at that time express it in words:—*When motion appears in the case of two bodies, we ascertain which is the moving body, by causing one of them to appear in a straight line with an object which is known to be fixed.* This principle is of considerable practical utility. By means of it we ascertain, when we see a number of ships in a river, or narrow arm of the sea, which of them are in motion or at rest, by comparing their positions or motions with a fixed point on the opposite shore. When looking at the wheels, pinions, and other parts of a piece of machinery, we can, on the same principle, perceive which parts are in motion and which are at rest, which the eye at first view cannot determine; and, in the same way, the real and apparent motions of the planets in the heavens are ascertained, by comparing them with the position of the stars, which may be regarded as so many fixed points for directing the astronomer in his investigations. The principle above stated, therefore,

was the *major* proposition in *Gassendi's* reasoning, and the *minor* proposition was the following:—*"When we bring a tree, which is a fixed object, in a direct line between our eye and the moon, she appears for a few seconds to have no sensible motion, while the clouds have passed away."* Therefore the conclusion follows, that "the motion which was the object of dispute was not in the moon, but in the clouds."

Subjects might occasionally be prescribed in schools, for the purpose of exercising the reasoning powers of the young, and proving the truth of certain positions. Suppose it were proposed as an exercise, *to prove that air exists, although it cannot be seen*,—a certain time might be allowed for every one to think and to converse on the subject, when some one or other of the following proofs, though in different words, would probably be stated. 1. Take a rod, and make it pass rapidly through what appears empty space, and you will hear a sound and feel a slight resistance. 2. Take a large fan or umbrella, and push it forcibly from you, and you will feel a considerable resistance, and hear a sound, and a person opposite will feel a certain impression made on his face. 3. Take a very large umbrella, and stand on the top of a stair or building, 15 or 20 feet high, and you may jump from such a position, while holding it stretched, and gradually descend to the ground without injury. 4. Plunge a glass jar into a vessel of water, with its mouth downward, and only a very small quantity of water will enter the glass, which shows that there is something in the glass which excludes the water; and this is the reason why we cannot fill a vessel with water by plunging its orifice downward. 5. Take a smooth cylindrical tube, shut at one end, and fit a plug exactly to its open end, and no force whatever can push it to the bottom of the tube, which shows that there is some invisible substance that prevents it. 6. Open a pair of common bellows, and shut up the nozzle and valve-hole, and it will be impossible to bring the boards together, in consequence of the resistance of an invisible substance within. 7. Take a telescope, of a high magnifying power, and look through it to distant objects, in the forenoon of a hot summer-day, and you will see the air undulating about the objects like the waves of the sea! All which circumstances show that there is a *material*, though invisible substance around us, which *resists a force, produces a sound, excludes other bodies* from occupying the same space, and whose *undulations*, in certain circumstances, may be rendered *visible*.

Again, suppose it were required to prove the following position, that "it is highly expedient that the whole community should enjoy the benefits of an intellectual and religious education," such arguments as the following might be brought forward. 1. Such an education invigorates the faculties and enlarges the capacity of the mind. 2. It presents to the view objects of delightful contemplation, which exercise the rational powers, and contribute to the happiness of the individual. 3. It prepares the young for acting an honorable and upright part in society. 4. It qualifies them for the several professions in which they may afterward be employed. 5. It tends to undermine foolish and superstitious notions, and to prevent diseases and fatal accidents. 6. It prepares the mind for a rational contemplation of the works of God, and of his perfections as therein displayed. 7. It fits them for taking a part in the elective franchise of their country. 8. It prepares them for understanding the Scriptures, and for receiving profit by their attendance on the

ordinances of religion. 9. It qualifies them for advancing the cause of useful knowledge, and for promoting the reformation and improvement of their species. 10. It tends to the prevention of intemperance, tumults, crimes, and all those vices and evils which result from ignorance; and leads to the practice of the Christian virtues. 11. It prepares the soul for the employments and the felicity of the heavenly world, &c.—Again, suppose the question, “Is it the duty and interest of all men to love one another?” to be given as an exercise of thought and reasoning. Independently of the positive command of God, in relation to this duty, such considerations and arguments as the following might be brought forward. Men ought to love one another—1. Because they are all brethren of the same family, descended from the same original pair, and formed by the same Almighty Parent. 2. They are possessed of the same bodily organization, and the same moral and intellectual powers. 3. They are subject to the same wants and afflictions, and susceptible of the same pleasures and enjoyments. 4. They inhabit the same world, and breathe the same atmosphere. 5. They are dependent upon each other for their comforts, and connected by numerous ties and relations. 6. To all of them God distributes his bounty, without respect of persons, causing his sun to cheer and enlighten them, and his rains to descend and fructify their fields. 7. They are all animated with *immortal* spirits, and destined to an eternal existence. 8. The exercise of kindness and affection would unite, in one harmonious society, men of all nations, and diffuse happiness through the heart of every human being. 9. It would promote the universal practice of equity and justice between man and man, and prevent all those litigations, contentions, and animosities, which have so long disturbed and demoralized the world. 10. It would “turn wars into peace to the ends of the earth,” and promote a delightful intercourse between all the kindreds and tribes of human beings, wherever dispersed over the surface of the globe, &c.

In prescribing such exercises as the above, the teacher would require, in the first instance, to suggest some of the leading arguments, in order that the pupils may perceive the nature of the mental process in which they are called to engage; and when they had leisure to think on the subject, some of them would doubtless bring forward some proofs or considerations of their own, though perhaps expressed in homely language. At any rate, an exercise of this kind, prescribed once or twice every week, could scarcely fail to sharpen the faculties of the young, to induce habits of rational thinking, and to promote both their moral and intellectual improvement.

It would likewise be of considerable utility to set before them the *springs of false judgment*, or the sources of error—the false conclusions which arise from *prejudices*, or preconceived opinions—the nature of *sophistical reasonings*, and the means of guarding against their influence. The following are *specimens* of the prejudices to which I allude:—1. *We are apt to judge of persons or things merely from their external appearance.* A picture of no value, daubed with bright and glaring colors, is frequently admired by the vulgar eye; and a worthless book, splendidly printed and adorned with flashy engravings and elegant binding, is prized and extolled by a superficial thinker. From such a prejudice we are apt to conclude that a man is happy who is encircled with wealth and splendor, and that he who is covered with

coarse or ragged garments has neither knowledge nor comfort, and is unworthy of our regard.

Hence the Jews rejected the Saviour of the world, and the Corinthians despised the Apostle Paul.—

2. *Another prejudice arises from not viewing an object on all sides—not considering all the circumstances connected with it, and not comparing all the aspects in which it may be contemplated.* Thus, when we view a *cone* placed at a great distance from the eye, we are apt to imagine it a plain *triangle*; and if its base were placed at right angles to the line of vision, we should conclude that it was nothing else but a plain *circle*. Thus, a round plate, when placed obliquely at a considerable distance from the eye, appears as an *oval*; and with its edge turned toward us, as a *line*. Thus, the sun and moon, though globular bodies, appear *flat* to the naked eye. Thus, the rings of Saturn appear sometimes like *narrow*, and sometimes like *broad ellipses*, sometimes like *straight lines*, and sometimes like a *narrow shade*; so that a comparison of all these different aspects was necessary before it could be inferred that these singular phenomena were in reality *rings*. Hence, at their first discovery by the telescope, they were considered as two small globes attached to the planet.—

3. Another source of error arises from the *impressions made on the mind in infancy*, and from *not comparing the intimations given by one sense with those of another*. Children are apt to imagine that books are unpleasant things, and that learning and religion are drudgeries, when they have been driven to such tasks by the force of the scourge. They imagine the sky touches the distant hills, and that the stars are not risen until the sun be set. From this source we are apt to conclude that the air has no weight, because we do not feel its pressure; that the earth is at rest because we do not feel its motion; that the planets and stars are only a few miles distant; and that a vessel at anchor is in motion when we pass her swiftly, when sailing in a steamboat.—4. *Our disposition to account for everything on one or two principles.* To this cause may be ascribed the disposition of some late philosophers to account for almost every phenomenon on the principle of *electricity*. Having traced its agency in producing thunder and lightning, they went so far as to attribute to its sole operation the phenomena of earthquakes, volcanoes, winds, rain, and even the various fluctuations of the animal spirits. To form a world, Epicurus required only a mass of hooked atoms moving in a certain manner; and Des Cartes, from observing that light bodies were moved round in a whirlwind, formed the idea of an immense vortex, or whirlpool in the heavens, to account for the motion of the planets round the sun.

5. *The passions and affections lead to numerous sources of error.* Love induces a mother to think her own child the fairest and the best. Intense hope and desire make a few days as long as so many weeks. The fear of the torture, of the galleys, or of a painful death, has induced multitudes to believe the grossest absurdities of the Romish church. Envy misrepresents the condition and character of our neighbor, and makes us believe that he is much worse than he really is. Above all, *self-interest* induces many to swallow almost any opinion, and to vindicate every practice, however corrupt and absurd. Hence the most glaring abuses in church and state have been vindicated, in the most barefaced manner, by those who derive their emoluments from a system of corruption. It is from a spirit of selfishness, too, that we set up our own opinions in religion and philosophy as the tests of orthodoxy and

truth; and from the same principle has arisen the antichristian practice of *persecution*—a practice as unreasonable as that of the tyrant, who, having a bed exactly fitted to his own size, stretched men of low stature on the rack until they were drawn out to the length of his bed, and cut a portion of the legs off any one whom he found too long for it. Who ever had recourse to violence and torture to prove the truths of *geometry*?

—6. *Our disposition to rely on the authority of others.* We are apt, without sufficient inquiry, to rely on everything we have been taught by our parents and teachers. An author of great respectability frequently drags thousands into mistakes and erroneous theories, merely by the splendor and authority of his name. For more than a thousand years the philosophers and divines of Europe were led into many egregious errors by a reliance on the authority of *Aristotle*; a quotation from his writings was considered as a proof of any position, and useful discoveries were long rejected because they did not quadrate with the opinions of the Grecian philosopher. Luther, Calvin, and Knox were pious men and eminent reformers, and their peculiar opinions are not unfrequently imbibed by their followers, merely on the authority of their names. This is an error into which those are apt to fall who never apply their powers to rational investigations, and who are too indolent to think for themselves.

The above and similar sources of error might be illustrated to the young by numerous examples and circumstances; and rules and cautions given by which they might be enabled to guard against their pernicious influence in the sciences, in religion, in politics, and in the ordinary affairs of life. A brief view might likewise be given of the doctrine of *Sophisms*, and the means by which they may be detected; of which the following are specimens:—1. *Accounting for a phenomenon or fact by assigning a false cause*, or taking an accidental conjunction of things for a *necessary connection*. We fall into this error, when from an *accident* we infer a *property*, when from an *example* we infer a *rule*, when from a *single act* we infer a *habit*. Astrologers commit this error when they deduce the cause of the various events in the lives of men from the different aspects of the stars and planets. We reason on this sophism when we construe the appearance of a comet or an eclipse of the sun as predicting the fate of princes, the revolution of nations, or the infliction of pestilence or famine; or when it rains at the new or full moon, and we infer that the moon is the cause of it; or when a person is in misery or distress, and we conclude that he must needs be a heinous sinner.—2. *When we draw a conclusion from a premise which is only true by accident*. We fall into this error when we reason against anything because of the wrong use which has been made of it; as when we reason against printing, because it has sometimes been employed for raising sedition and promoting immorality; against reading the Bible, because it has sometimes led to heresy; against Christianity, because it has been the accidental occasion of contentions and persecutions, which do not flow from the Gospel, but are mere *accidental circumstances*, with which it has been sometimes attended. Other sophisms are such as the following: Mistaking the question or point to be proved—the *Petitio Principii*, or begging the question—imperfect enumeration—reasoning in a circle—concluding from what is true of a thing in its divided state, as if it were true in its compound state—ambiguity of words, and using them in different senses—with several others.

Of all the species of false reasonings, there is none more common than that of introducing into an argument propositions that are either false or doubtful, or taking for granted facts which have never been satisfactorily ascertained. In this way a false conclusion may be *legitimately* deduced, after such facts or propositions are admitted. Against this fallacious mode of reasoning the young should be carefully guarded, both in their own reasonings, and when listening to those of others; and habituated to scan every proposition or assertion, and ascertain its truth before admitting it into any chain of argument. In the speeches that were lately delivered in parliament in opposition to the Reform Bill, this species of reasoning was one distinguishing characteristic, when those orations had any show of argument. Fictions were brought forward as facts, vague and unfounded assertions were uttered with all the pomp of confidence and authority, and the idea of *revolution*, in its most horrid aspect, was substituted in place of *salutary reformation*, so that the haranguer would have required to have been stopped at almost every other sentence, until he had substantiated the truth of his premises. Such, however, is not unfrequently the way in which our representatives in parliament, the members of our corporations, and vast assemblages of our citizens at public meetings, are hurried along by a bold and impudent declaimer, and induced to *cheer* the sophister who is leading them on to the admission of a falsehood, and to the approbation of measures subversive of human improvement.

It is therefore of vast importance to society, that the young be early trained to the proper use of their rational faculties—that they be accustomed to *entertain clear and well-defined ideas* on every subject—that they be enabled to appreciate the strength or weakness of arguments—that they feel the importance of prosecuting *truth* and *duty* in every department of learning—and that frequent exercises on important subjects be prescribed for stimulating their reasoning powers. It is lamentable to reflect on the deficiency and weakness of the great mass of mankind in this respect. On the most trifling grounds they will yield their assent to hundreds of propositions, most of which they do not understand. They will obstinately adhere to their preconceived opinions in the face of the strongest and most convincing arguments. They will swallow, without the least hesitation, the most absurd and extravagant notions; while all the reasoning we can bring forward will not convince them of the reality of truths and facts which have been clearly demonstrated. So wedded are they to the opinions they had first imbibed, that we might almost as soon attempt to teach a snail or a tortoise the truths of geometry as convince them that the earth turns round its axis, and that it is possible to determine the exact distance of the moon; while, at the same time, they will talk, with the utmost assurance, of the most abstruse mysteries which lie beyond the reach of the human understanding. This representation does not apply merely to the lower, but even to many in the higher ranks of society; and such a state of things has been productive of many injurious effects, in relation to the best interests of mankind. It has been the cause of most of the wars and commotions which have desolated the earth, and of the prevalence of those systems of tyranny, slavery, and injustice, which still so generally prevail. It has led to all the persecutions that have ever disgraced the church or the world. It

has produced hundreds of foolish controversies in the visible church, either with respect to comparatively trifling opinions, or to those subjects which lie beyond the grasp of the faculties of man; and has dissevered Christian society into a number of discordant sectaries. It has prevented the improvement and happiness of the human race, and is the cause of all the ignorance, prejudices, intemperance, and vice, which appear among all ranks of society; for if men were to cultivate their intellectual powers aright, and apply them to rational purposes, few or none of these evils would abound in the world.

But it is deeply to be regretted, that in all ages, and even in the present age, legitimate reasoning has been for the most part thrown aside, and diabolical argument substituted in its stead. When men have been unable to confute their antagonists by the force of arguments, they have had recourse to "club law," and have knocked down their opponents and all their reasonings, by the application of guns and bayonets, and every species of physical force. Louis XIV. of France, like most of his compeers, was so convinced of the strength of this mode of reasoning, that he engraved upon his great guns the following inscription: "*Ratio ultima Regum*," that is, the Logic of princes—or, the last argument of kings. In this mode of arguing, fifty thousand disputers are frequently arranged on each side of a question, and that party which can handle their swords and muskets with most dexterity, and blow the skulls and limbs of their antagonists to atoms, and slash their bodies to pieces, are always reckoned, by their leaders, the most expert logicians. There is another mode of reasoning which has been frequently used with disputants, and that is, *arguing by torture*, in which the argument is sometimes screwed up to such a pitch as to make the refractory disputant confess his belief in any proposition, however wild and extravagant. A mode of arguing nearly akin to this, is the application of whips, sabers, gibbets, dungeons, musketballs, fire and fagots. In this way the Romish Church reasoned with the Hussites and the Waldenses; and with the same weapons confuted every Protestant who dared to call in question the infallibility and the supreme authority of the Roman Pontiff. In this way Queen Mary and her bishops argued with 277 clergymen, gentlemen, tradesmen, and women, when, for adhering to Protestant doctrines, they were delivered over to be devoured by the fires of Smithfield. It was in the same way that Claverhouse and his "bloody bands" reasoned with the Scottish Covenanters, when he hunted them across moors and mosses, and massacred them in cold blood; and that the Star Chamber reasoned with the Non-conformists of England, when all their arguments were confuted by fines, racks, and imprisonment. It is in this way that Nicholas of Russia has argued with the brave Poles, when vindicating their liberties—when he sent them chained, like wild beasts, to wander along frightful deserts, and to perish in the forests of Siberia; and in the same way do all mobs reason, when they furiously demolish the houses, the manufactories, or the churches of their opponents. On the same principles do those men reason, who deprive their fellow-citizens of the right of being eligible to certain civil offices, and attempt to degrade them in the eyes of the public because they nobly assume the right to think for themselves, and to worship God according to their consciences. But, of all the arguments which have been tried, to produce conviction, there is none more powerful than the in-

fluence of gold. This is an argument of so much force and efficacy, that none but a few stubborn minds have been capable of resisting it. It is possessed of the most wonderful properties—in a moment it enlightens the understanding, wins the affections, removes every doubt, silences every objection, clears up every difficulty, banishes every scruple, and generally causes the most sturdy logician to give up his point, and bend to its power. In short, it is an *intermediate idea*, or major proposition, which will lead to almost any conclusion. By this argument the wisdom of the wise, and the understanding of the prudent, have been more quickly and effectually refuted than by all the wisdom of Solomon, or by all the reasonings of philosophy; and its powerful effects are to be seen in our own land, and in every nation under heaven.

Such have been the modes of reasoning which have most generally prevailed in the world. O! foolish and infatuated reasoners! Is it not high time to undermine your logical principles and systems, to build on a new foundation, and to train the rising generation in such a manner, that they may employ their mental powers in accordance with the dictates of reason and the word of God!

SECTION XIII.

NATURAL THEOLOGY.

NATURAL THEOLOGY is that branch of knowledge which proves and illustrates the attributes of the Deity from the works of nature—a study which is open to all the inhabitants of the earth, and from which they may derive impressive views of the existence, the perfections, and the incessant agency of that Great Being who made and who governs the universe. "For, the invisible things of God, even His eternal Power and Divinity, are, when duly attended to, clearly seen by the things that are made," and have been so in all ages, "from the creation of the world;" so that, "even the heathen nations are without excuse," if they neglect to trace in those works the being and attributes of their Creator, and refuse that tribute of reverence and obedience which is due to His perfections. This is a study in which the young should be early initiated. It lies at the foundation of the religion of the Bible; for the inspired writers take for granted that we know the evidences of the existence of the Divine Being, and of some of the attributes with which he is invested, and direct us to the contemplation of the works of his hands, as proofs and illustrations of the truths they unfold. "Lift up thine eyes on high, and behold Him who hath created these orbs: stand still, and consider the wondrous works of God. Great is the Lord, and of great power; His understanding is infinite. His works are manifold, and in wisdom He hath made them all." In exhibiting the works of God to the young, in performing experiments to illustrate their properties, and in describing the laws and mechanism of the material world, every opportunity should be taken of directing them to the displays of power, benevolence, wisdom, and intelligence, which these works exhibit. It should be deeply impressed upon their minds, that it is the highest and noblest end of science, to mark the evidences of wise and benevolent design, and to trace the incessant agency of our Creator in all our surveys and investigations of the work

of creation—without an attention to which, the mere knowledge of natural facts is an acquisition of a comparatively trivial nature.

An intelligent teacher can seldom be at a loss to direct the attention of his pupils to this subject; for there is no part of the scenery of nature in which a discerning eye will not perceive the most evident traces of benevolent design and infinite intelligence, not only in the exquisite mechanism of animated beings, but in the structure of vegetables and minerals, and the general arrangement of the earth, the waters, and the atmosphere. The adaptation of the solid parts of the globe for the habitation of man and other terrestrial animals—the adaptation of the waters of the ocean and of the rivers to the purposes of commerce, and for the abode of countless multitudes of organized beings—the coloring thrown over the canopy of heaven, and over the landscape of the earth—the process of evaporation, and the innumerable benefits it confers—the agency of the atmosphere, the wonderful properties of its component parts, and its extensive influence in the animal and vegetable kingdoms—the solar light, and the infinity of beautiful effects it produces—the thousands of diversified objects which delight the eye in the natural embellishments of creation—the harmony and order, the grandeur and sublimity, of the celestial motions—the arrangements of the planetary system, and the provision made for securing its perpetuity—the relation of man to the agencies of external nature, as the action of water, air, light, heat, electricity, &c.—the proportion between the body of man, and the objects and living beings around him—the mutual relations which subsist between animals and vegetables, and their co-operation in promoting the same design—the adaptation of almost every vegetable to the support of some species of animals—the power of vegetables to reproduce and continue their species, and the variety of admirable means by which it is effected—the various methods employed to disperse the seeds of plants over the surface of the globe, and to adorn it with vegetable beauties—the adaptation of plants to the different climates, and to the necessities of their respective inhabitants—the admirable structure of their seeds, roots, leaves, and sap-vessels, particularly as discovered by the microscope in transverse sections of plants, &c.—their important uses in the system of nature, and the numerous beauties and varieties which they spread over the face of our terrestrial creation; particularly, the curious and admirable mechanism displayed in the construction of animated beings, from the microscopic animalcule, ten hundred thousand times less than a visible point, to the elephant and the whale—the organs of mastication, deglutition, digestion, and secretion, all differently contrived, according to the structure of the animal and the aliments on which it feeds—the eyes of insects, and the thousands of transparent globules of which they consist—the metamorphoses of caterpillars and other insects, and the peculiar organization adapted to each state of their existence—the numerous beauties and minute adaptations in the wings, feet, probosces, and feathers, of gnats and other insects—the respiratory apparatus of fishes, and the nice adaptation of their bodies to the watery fluid in which they pass their existence—the construction of birds, their pointed bills to penetrate the air, their flexible tails serving as rudders, the lightness, strength, and tenacity of their feathers, and the whole structure of their bodies adapted to the air in which they fly, and the food by which they are sustained—above all, the wonders of the hu-

man frame, the numerous parts of which it is composed, the hundreds of bones and muscles, the thousands of veins, arteries, glands, nerves, and lymphatics, the millions of scales and pores in the skin, the heart with its ventricles and auricles, the brain with its infinity of fibers, the lungs with their millions of vesicles, the organs of sense, with their multifarious adaptations and connections, and the harmonious movements, adjustments, and adaptations of all these parts to the system of external nature and to the promotion of the happiness of man,—these, and thousands of similar objects, adaptations, and contrivances, will afford ample scope for expatiating on the Power, Wisdom, and Intelligence, of the Almighty Creator, and on the Benevolent contrivances which appear throughout every part of the universal system; and were specimens of some of the objects now alluded to exhibited to the young, it could not fail of arresting their attention, and inspiring them with admiration of the wonderful works of God.

We have comparatively few books on this subject. Derham's "Physico-Theology," Ray's "Wisdom of God in the Creation," Nieuwentyt's "Religious Philosopher," Paley's "Natural Theology," Lesser's "Insecto-Theology," and several other works, contain a number of valuable fragments illustrative of the being and perfections of God from the works of Nature. But we have no complete or comprehensive system of Natural Theology; and the works now alluded to, however valuable and worthy of being perused, are not adapted to the capacities of the young. We require a comprehensive compend on this subject, for the use of schools, in which the descriptions and reflections should be as much as possible divested of the technicalities of science, and which should be illustrated with numerous engravings. The best treatise of this kind I have yet seen, is "The Youth's Book of Natural Theology," by the Rev. T. H. Gallaudet, lately published at Hartford, Connecticut. This work is clear and explicit in its descriptions, and, for the most part, level to the comprehension of the juvenile mind. But its illustrations are chiefly confined to the human body and the parts and functions of animals. It is thrown into the form of Dialogues, which has a tendency to render it interesting for the private perusal of the young; but a work on this plan is not so well adapted to serve the purpose of a textbook for public seminaries.* By means of instructions on this subject, the young would be prepared for the study of *Christian Theology*, and would be qualified to appreciate the beauty and sublimity of those descriptions, given by the inspired writers, of the agency of God in the economy of nature.

Having enlarged to a greater extent than I originally intended on the preceding departments of knowledge, I shall do little more than barely mention several other branches which should occasionally form the subject of instruction in all our schools. These are such as the following:—*Natural History*, including not only a description of animals, but likewise of the most interesting facts connected with the earth, the waters, and the atmosphere; such as earthquakes, volcanoes, ice-islands, caverns, cataracts, natural bridges, glaciers, boiling-springs, the phenomena of thunder, lightning, aurora-borealis, parhelia, luminous

* The reader is respectfully referred, for some illustrations of this subject, to "The Christian Philosopher," particularly to Chapters i, ii, and iv, and to the author's volume "On the Improvement of Society," &c. Section vi, "On the Influence of Knowledge in promoting Enlarged Conceptions of the Attributes of the Deity."

arches, fiery meteors, whirlwinds, water-spouts, &c. The objects connected with natural history should be among the first that are presented to the view of the young, and they should be introduced as subjects of attention throughout every period of their subsequent education, as they form the ground-work of our physical knowledge and investigations.—*Botany* is another pleasing subject on which sketches might be occasionally given, and which might be illustrated by the shrubs and flowers connected with the garden belonging to the seminary, formerly described. Microscopic views of the seeds and farina of flowers, the vessels and ramifications of the small leaves of minute plants and flowers, the prickles on the leaves of nettles and other shrubs, transverse sections of plants, displaying the beautiful arrangement of the sap-vessels, and similar objects, should be exhibited, and the attention directed to the fine polishings, the numerous minute vessels compressed into the smallest space, and the other exquisite pieces of Divine workmanship connected with the process of vegetation.—*Mineralogy* is another department of nature, on which a few instructions might be given, wherever there are specimens to illustrate the descriptions. But descriptions of metals or minerals, without presenting to view the metallic substances described, will be of little avail.—Sketches of *Political Economy*, illustrating the principles of commerce and manufactures, and other topics connected with this subject, might be given to the advanced pupils, as soon as they are able to enter into the spirit of such disquisitions. In such sketches, noble and liberal views should be inculcated; the selfishness and antipathies of nations, and the inconveniences and absurdities of those restrictions which one nation imposes upon another, should be strongly reprobated; and a spirit of good-will and generosity enforced toward other nations and communities, considered as members of the same great family to which we all belong. In connection with this subject, they should be taught something of the civil and criminal laws of their country, of the duties of magistrates, and of their own duties as subjects; of the form of government under which they live, and of their social rights and privileges. Of no less importance to all classes, particularly to the lower, are instructions on *Domestic Economy*—including directions and rules respecting orderliness and cleanliness in dwellings—the best modes of cooking victuals—the proper nursing and management of children—the rearing and treatment of domestic animals—the economy of bees—the cultivation of gardens, and the best mode of rearing culinary vegetables—the decoration of their houses, areas, and flowerpots, and whatever else has a tendency to promote health and comfort, especially among the working-classes of society. In short, instructions in *Vocal Music* should be occasionally interspersed with the other scholastic exercises, and church tunes and airs, adapted to some beautiful or sublime pieces of poetry, might be sung, at convenient seasons, in unison, by all the pupils. The words adapted to the different airs should be calculated to convey instruction, and to raise the soul to some interesting or sublime objects. All such vulgar and debasing ideas as are generally interwoven in our popular songs, and which are little else than a compound of sensuality and selfishness, should be carefully discarded. A good organ or other musical instrument might be used for leading the vocal strains. Music, both vocal and instrumental, has long been too frequently prostituted to the most worthless purposes; it is

now high time that it should be consecrated to moral objects, and to the celebration of the perfections and the works of the Most High.

In addition to the mental exercises now alluded to, pupils of every description should be daily employed in *bodily* exercises, for invigorating their health and corporeal powers. Every school should have a play-ground for this purpose, as extensive as possible, and furnished with gymnastic apparatus for exercising the muscular activities of the young of both sexes. Swings, poles, hoops, see-saws, pulleys, balls, and similar articles, should be furnished for enabling them to engage with spirit and vigor in their amusements. In walking, running, skipping, leaping in height, length, or depth, swinging, lifting, carrying, jumping with a hoop or a pole, they will not only find sources of enjoyment—when these exercises are properly regulated to prevent danger and contention,—but will also strengthen and develop their corporeal energies, and invigorate their mental powers. All imitations, however, of war and military maneuvers should be generally prohibited; as it is now more than time that a martial spirit should be counteracted, and checked in the very bud,—and those who encourage it in the young need not wonder if they shall, ere long, behold many of them rising up to be curses instead of benefactors to mankind. They might, likewise, be occasionally employed in making excursions, in company with their teacher, either along the sea-shore, the banks of a river, or to the top of a hill, for the purpose of surveying the scenes of nature or art, and searching for minerals, plants, flowers, or insects, to augment the school museum, and to serve as subjects for instruction. If every school had a piece of ground attached to it for a garden, and for the cultivation of fruit-trees, potatoes, cabbages, and other culinary vegetables, children of both sexes, at certain hours, might be set to dig, to hoe, to prune, to plant, to sow, to arrange the beds of flowers, and to keep every portion of the plot in neatness and order. Such exercises would not only be healthful and exhilarating, but might be of great utility to them in after life, when they come to have the sole management of their domestic affairs. They might also be encouraged to employ some of their leisure hours in the construction of such *mechanical* contrivances and devices as are most congenial to their taste. If, instead of six or seven hours' confinement in school, only five hours at most were devoted to books, and the remaining hours to such exercises as above-mentioned, their progress in practical knowledge, so far from being impeded, might be promoted to a much greater extent. Such exercises might be turned, not only to their physical and intellectual advantage, but to their moral improvement. When young people are engaged in their diversions, or in excursions along with their teacher, their peculiar tastes, tempers, and conduct toward each other are openly developed; they act without restraint, they appear in their true colors, and a teacher has the best opportunity of marking the dispositions they display. He can therefore apply, at the moment, those encouragements and admonitions, and those Christian rules and maxims, by which their characters and conduct may be molded into the image of Him "who hath set us an example, that we should walk in his steps." The incidents and the atmospherical phenomena which may occur on such occasions, will also supply materials for rational observations and reflections, and for directing the train of their affections, and the exercise of their moral powers; and no opportu-

nity of this kind, for producing useful impressions upon the young, should be lost by a pious and intelligent instructor.

Thus I have endeavored, in the preceding pages, to exhibit an outline of some of those branches of knowledge, in which every individual of the human race—the female sex as well as the male—should receive a certain portion of instruction. Hitherto the female sex have been sadly neglected, their education, where they have not been altogether overlooked, has been more showy than substantial; and they have been generally treated as if they were not possessed of the mental powers requisite for acquiring all the useful branches of science. Without entering into the question, Whether the female character possesses the same degree of intellectual energy as that of the other sex? it may be affirmed, without the least hesitation, that, when their education is properly directed, they are capable of acquiring every branch of knowledge which can improve or adorn the human mind. We have numerous examples to corroborate this position. It is sufficient to mention the names of Mrs. Barbauld, Miss Aitken, Miss Edgeworth, Mrs. Wakefield, Mrs. Hemans, Mrs. More, Mrs. Marcet, Miss Taylor, Miss Landon, Mrs. Somerville, Mrs. Willard, Mrs. Phelps, &c., which are only specimens of many others, most of whom are still alive and actively employed, both in Britain and America, in instructing their own sex and society at large, and in promoting the interests of general knowledge. The female sex possesses *essentially* the same intellectual faculties as the male, whatever may be said as to the *degrees* of vigor in which the primitive powers exist. But even in respect to the *degree* of acuteness and energy of the female intellect, we have examples of individuals who, without the advantage of an academical education, have explored the system of the universe, composed commentaries on the Newtonian philosophy, and prosecuted the most abstruse mathematical investigations; and I have no hesitation in asserting, that academical honors should be conferred on such accomplished females, no less than on the other sex who have enjoyed more opportunities of improvement.* Females have more in their power than the other sex in forming the tastes and dispositions of the young, and in giving them those impressions in early life which may be either beneficial or injurious to society. They are the more immediate guardians and instructors of the rising generation during the first stage of their existence, and upon the discretion and intelligence they display in superintending the evolution of the youthful mind, will, in a great measure, depend the intelligence and the moral order of the social state to which they belong. Their influence is powerful, not only on the tastes and manners of society, but on the moral principles and characters of mankind. Beside, they are beings destined for immortality, and equally interested as the other sex in all that is awful or glorious in the revelations of Heaven; and therefore ought to have their minds enlightened in every branch of knowledge which may

have a beneficial influence on their present conduct and their future destiny. Until more attention is paid to the cultivation of the female mind, among all ranks, society cannot be expected to make an accelerated progress in the course of moral and intellectual improvement.

In specifying the preceding branches of knowledge as subjects in which all classes of the young should be instructed, I do not mean to insinuate, that, in the first stage of their education, such subjects are to be studied in regular courses, as in academies and universities, though at a future period this plan may be adopted. While they are learning English reading, composition, writing, arithmetic and other branches, illustrations may be given of the more interesting and popular parts of the physical sciences—which will tend to give them a *relish* for such subjects, and to prepare them for entering on the more particular study of such branches of knowledge, at a period when their faculties are more matured. Nor ought it to be objected, that, in this way, young persons would only receive a smattering of learning, which would puff them up with vanity, and do them more harm than good. If every portion of knowledge communicated to them, however detached and insulated, be clearly explained and illustrated, and thoroughly understood, it must necessarily be *useful*, either in expanding their views, or in its practical applications. For example, if, by certain pneumatical and hydrostatical experiments, they are made to perceive clear proofs of the atmospheric pressure, and its operation in the case of *siphons*—if they are made to see, by similar experiments, that, on this principle, water may be conveyed either over a rising ground, or along a valley to an opposite hill,—this single fact, clearly understood, might be of considerable use to them on many occasions, even although they were unacquainted with all the other principles and facts connected with pneumatical science. The great object to be attended to is, to convey, on every subject, a clear and well-defined idea to the young, and to guide them to the *practical* application of knowledge.

There is a line of Mr. Pope which has been hackneyed about for a century past, which is in everybody's mouth, and which is generally misapplied, when an allusion is made to this subject—

“A little learning is a dangerous thing.”

How such a sentiment came to be almost universally quoted and admired, I am at a loss to divine. It is a proposition which cannot be supported by any mode of reasoning with which I am acquainted, and is itself “a dangerous thing,” if by learning is understood the acquisition of any portion of useful knowledge. Every one must acquire “a little” portion of knowledge, or learning, before he can acquire a larger share. A child must acquire the knowledge of the letters and elementary sounds, before he can read any language with fluency—and must form some idea of the objects immediately around him, before he can acquire an accurate conception of the subjects and scenes connected with geography. If the proposition be true, that “a little learning is dangerous,” then it should follow, that a very great portion of learning, or knowledge, must be *much* more dangerous. If it be dangerous for a boy to know that the earth is 25,000 miles in circumference, and to be able to prove that it is round like a globe, then Newton and Bacon must have been extremely dangerous individuals, whose knowledge extended to an almost unlimited range. If a little learning is dangerous, then absolute igno-

* Mrs. Somerville has lately been elected member of the Literary and Philosophical Society of Geneva, the first time an honor of the kind was ever conferred on a female. An American paper states, whether truly or not I cannot determine, that “The Legislature of Indiana have chartered a college, to be called the Christian College, in which degrees are to be conferred on both males and females. There are to be degrees of *Doctress* of Natural Science, of English Literature, or Belles Lettres, of Fine Arts, and of Arts and Sciences.” However ludicrous this may appear to some, I can see no impropriety in following out such an idea.

rance and destitution of all ideas, must be the safest and the happiest state of human beings. But how can even "a little" knowledge be dangerous? Suppose a young person to have read only the Gospel of Luke, and to have acquired a knowledge of all the facts it records—would he be less happy in himself, or more dangerous to society, on this account, because he had little acquaintance with the other portions of Scripture? or, would he have been better to have read nothing at all? Or, suppose he had been instructed in the fact, that foul air of a *deadly* nature, is frequently to be found at the bottom of old wells, and that it is requisite to send down a lighted candle to determine this point before a person attempts to descend into such places,—would the knowledge of such circumstances be dangerous to him, because he is not acquainted with the properties of all the other gases, or with the whole system of chemistry? Would an acquaintance with a portion of geography, suppose the States of Europe, be dangerous to any one, because he had not minutely studied all the other quarters of the globe? or would a knowledge of hydrostatics be useless, because he was unacquainted with several other branches of natural philosophy? Such conclusions are obviously absurd, and therefore the proposition under consideration is absolutely untenable. The persons who most frequently reiterate this sentiment are those who are opposed to the universal education of the lower orders, and to the general diffusion of knowledge. I know of no class of men to which such a sentiment will apply, except, perhaps, to a few *pedants* who have got a smattering of Greek and Latin at a grammar school or a college, without any other substantial acquirement, and who pique themselves on this account, as if they were elevated in point of knowledge far above the vulgar throng.

But although I have admitted that, during the first stage of instruction, only a few fragments of knowledge would be communicated, yet before the course is finished, a very considerable portion of all that is really useful in the sciences might be imparted to the young. Suppose that, on an average, every child is able to read with tolerable fluency by the time he is arrived at the age of seven or eight, and that the course

of instruction for every member of the community shall be prolonged until he arrive at the period of fourteen years—in the course of six or seven years, a summary view of all the more interesting principles and facts connected with the sciences above specified, might be communicated, even supposing that half a year were exclusively devoted to each. But there would be no necessity for restricting the pupil to one branch of knowledge at a time. While, at one hour, he was receiving instructions, and witnessing experiments in natural philosophy or chemistry, during other hours of the day he might be prosecuting arithmetic, algebra, geometry, or composition. Thus, during little more than the time usually spent in acquiring a knowledge of Latin and Greek, a very considerable portion of useful knowledge might be acquired, which would expand the range of the juvenile mind, increase its sources of enjoyment, and lay a broad foundation for future usefulness and improvement. And I trust there are few, in modern times, who will hesitate to admit, that the knowledge thus acquired would be infinitely preferable, in point of utility, to all the scraps of classical literature usually picked up, during the same period, at our grammar schools.—But why, it may be asked, should such an extent of knowledge be communicated to the *lower orders* of mankind? I answer, in a few words, Because they are rational beings, furnished by their Creator with faculties capable of acquiring it; because it will increase their enjoyments and render them more useful in society; because it will tend to prevent vices and crimes, and to raise their souls above the degrading pleasures of intemperance and sensuality; because it will render them more expert in their mechanical professions; because it will fit them for becoming improvers of the arts and sciences, and for taking a part in all those movements by which society may be improved and the world regenerated; and because they are beings destined to immortality, and therefore ought to be instructed in every department of knowledge which has a bearing on the future world to which they are advancing, and which is calculated to prepare them for its pleasures and its employments. But, as I have already written a volume chiefly in relation to this point, it would be unnecessary, on the present occasion, to enlarge.

CHAPTER VII.

MORAL AND RELIGIOUS INSTRUCTION.

In the preceding sketches I have taken for granted, that during the whole process of education, the attention of the young should be directed to the manifestations of the Divine attributes in the works of nature—the fundamental principles of Christianity—the rules of moral action—and the eternal world to which they are destined. These are subjects which should never be lost sight of for a single day, and which should be interwoven with every department of literary and scientific instruction. In a particular manner it should be deeply impressed upon the minds of the young, *that the instructions they receive, and the studies in which they now engage, are intended, not merely to qualify them for the business of the present life, but likewise to prepare them for the*

felicities and the employments of the life to come. This is one of the ends of education which has been glaringly overlooked in most of our initiatory schools, and particularly in the arrangements connected with a *fashionable* education—a circumstance which seems to indicate, that the superintendents of such an education either do not believe the doctrine of a future state, or view it as a matter of little importance, or consider that no specific training is requisite to qualify a depraved human being for engaging in the sublime contemplations and exercises of the heavenly world.—Having occasionally adverted to this subject in the preceding discussions, I shall, at present, offer only a few general remarks.

On all occasions, the young should be frequent-

ly reminded, that they are *dependent creatures*, who derive their existence from an Almighty Being who is without beginning and without end—that their daily comforts and all their powers and faculties are bestowed by Him, and are the effects of his unbounded Goodness—that, though invisible to mortal eyes, he is present in all places, and that they are every moment surrounded by his immensity—that his presence and agency are seen in the solar light, the majestic movements of the heavenly orbs, the succession of day and night, the ebbing and flowing of the sea, the falling rain, the winds, the lightnings, the rolling thunders, and in every movement within us and around us—that though we could climb the heights of heaven, or descend to the center of the earth, we should still be within the range of his omniscient eye—that his eye penetrates through the dark night as well as through the clear day—that he knows every thought and purpose that is formed in our hearts—that he beholds, at the same moment, whatever is taking place, in every part of the world, and throughout all the regions of the universe, among all the tribes of mankind, and among all the hosts of angels—that his dominion extends over thousands of worlds, and that his universal government shall endure forever—that he is good to all, and that his kindness extends to the birds of the air, the fishes of the sea, and even to the smallest insect that crawls on the ground—that he is “righteous in all his ways and holy in all his works,” unchangeable in his purposes and faithful to his word—that to this Great Being we are all accountable for every thought, word, and action—and that there is a day approaching when “he will judge the world in righteousness, and render to every one according to his works.”—Such characteristics of the Divine Being should be illustrated, in so far as is practicable, from *sensible objects*,—His *goodness*, from the numerous creatures He has brought into existence, and the ample provision He has made for all their necessities,—His *wisdom*, from the numerous adaptations which are found in our own bodies, and in the elements around us,—His *power*, from the vast bulk of this world, and of the planetary orbs, and the amazing rapidity of their motions,—His *justice*, from the judgments inflicted on wicked nations,—His *faithfulness*, from the accomplishment of promises and prophecies, as recorded in the history of the world,—and His *love and mercy*, in “sending His Son into the world to be the propitiation for our sins.”

In attempting to explain the attributes of the Deity, and to impress the minds of the young with a deep sense of his universal presence and agency, it is not necessary that they should commit to memory complex and technical definitions and descriptions of the Divine perfections. Such exercises, unaccompanied with specific and familiar illustrations, can produce no clear and well-defined conceptions of the objects to which they refer; and when mere words are crammed into the memory unconnected with ideas, they must produce a hurtful effect, and lead the young to rest in the *form* of knowledge without the *substance*. Beside, every memorial task in which the *ideas* connected with the words are not clearly perceived, is always accompanied with a *painful* effort. As all our ideas on every subject are originally derived from the objects of sense, so it is by sensible illustrations alone that we can convey to any mind, whatever, distinct conceptions of the character and attributes of the Almighty. Although a definition of any of the Divine perfections may be stated to the young, yet it is chiefly by *examples*

illustrative of the subject, that a clear and comprehensive idea of it can be conveyed. For example, suppose it were intended to explain what is meant by the *wisdom* of God, we might tell them in the words of one author, that “Wisdom is that whereby the soul is directed in the skillful management of things, or in ordering them for the best,”—or, in the language of another, that “The wisdom of God is that perfection by which he selects and adopts the most proper means for accomplishing good or important ends;” but such definitions, simply announced, would convey no definite conception of the thing intended. We must produce objects or examples, in which wisdom is displayed, and describe them in the most minute and familiar manner. We must illustrate, in the first place, what is meant by the wisdom of men, by producing a clock, a watch, a planetarium, a microscope, a ship, or similar machine—pointing out the *object* intended to be accomplished by such instruments or machines, and directing the attention to the *means* employed, and the harmonious co-operation of every part in accomplishing the end intended. In a watch, for instance, the object is to point out the hour of the day. The means employed to effectuate this purpose are—a coiled elastic spring, communicating its action to the *fusee*, thence to a series of wheels and pinions, the teeth of which apply to each other, conducting the motion to the balance, and thence to the indexes which point out the hour and minute. The proper position and arrangement of all these parts, the size and shape of the whole, the number of teeth they respectively contain, the materials of which they are constructed, the connection of one part with another, and the harmonious co-operation of the whole to produce the respective motions of the hands, indicate *wisdom* and *design* in the contriver of such a machine, in his selecting the proper means to accomplish the purpose intended. In a similar manner, the wisdom of the Creator must be illustrated by selecting, out of the many thousand of instances within and around us, a few examples, which should be particularly described and elucidated. For example, the admirable structure of the *eye*, the different humors of which it is composed, for the purpose of forming an *accurate* picture of every object on the retina—the apparatus for the contraction and dilatation of the pupil, to adapt it to different degrees of light—the muscles by which the ball of the eye may be easily moved in every direction, and preserved in perfect steadiness; the bony socket in which it is lodged, to secure it against accidents—the *lid* which likewise defends it against injuries, wipes off the superfluous moisture and covers it during the hours of sleep—with many other curious contrivances, all adapted to the nature of *light*, and to the purpose of producing vision in the most easy and delightful manner, showing the most admirable selection of means to bring into full effect the end proposed. In like manner, the curious structure of the ear, and the adaptation of all its parts for receiving impressions from the undulations of the atmosphere—the different articulations of the bones, according to the movements they are intended to produce—the adaptation of the air to the *lungs*, and the vesicles of the lungs to the nature and properties of the atmosphere—the proportioning of the size of man to that of the plants and animals which exist around him—the structure of the various animated beings, and the diversity of organization which exists among them, exactly adapted to their various wants and modes of existence—the gradual approaches of light and darkness—the harmony and order of the celestial motions—and similar exam-

ples, when particularly explained and illustrated, will convey clear ideas of what is meant by the *wisdom* of God, and the manner in which it is displayed in the scenes of creation; and in no other way can we impart clear and well-defined conceptions on such a subject. And, when once a clear conception of this attribute of the Deity is impressed upon the mind by such examples, it may be applied to *moral* subjects, and illustrated from the moral dispensations of God toward our race, as recorded in the Sacred History, and in the general history of the world.

Again, suppose we wish to explain the *Infinity* or *Immensity* of the Divine Being, it is not enough to say that "God is without all bounds or limits;"—we must endeavor to illustrate the idea by sensible representations, in so far as they are capable of assisting our conceptions on the subject. It may be laid down as a principle, that "Wherever God acts, there he is, and that there is no part of the universe in which we do not perceive the exertion of an agency which, either mediately or immediately, proceeds from the Deity." The motions of the moon and the planets, the ebbing and flowing of the sea, the gentle breeze, the impetuous whirlwind, the process of vegetation, the movements of animals, the motions of our fingers and eyelids, the pulsation of our hearts, and every other agency within and around us, are sensible evidences of the presence and incessant operation of the Almighty. And although we were to wing our flight beyond the limits of this sublunary sphere, there is no part of space with which we are acquainted, in which we should not find ourselves surrounded with the emanations of *light*, the action of *gravitation*, and the influence of *caloric*, and other agencies with which we are at present unacquainted.—With regard to the idea of *infinity*, in so far as a partial conception of it can be conveyed, we must likewise have recourse to *sensible* objects and illustrations. We must endeavor, in the first place, to communicate an ample and impressive idea of the extent of the globe on which we dwell, by such methods as stated under the article *Geography*. We may next endeavor to give the pupil an idea of the distance of the moon; then of the distance of the sun, which is placed 400 times farther from the earth; then of the distance of the nearest star, which is two hundred thousand times farther from us than the sun; then to the remotest stars visible through the best telescopes, whose distance is immensely greater; and then to the boundless regions of space, which extend in every direction, beyond all that is visible to the eye of mortals. Time must be allowed for the mind to pause and dwell with particularity on each of these dimensions, and on the immense magnitude of the numerous objects contained within them, until it is lost and overpowered in the immensity of the prospect; and then be informed that all this magnificent scene is but a *small portion*—only like a drop to the ocean—of the infinity of space, which is filled with the Divine presence, and in which the Deity continually operates. Without such illustrations, all the definitions or metaphysical descriptions that may be given, will convey no impressive conceptions of the immensity of God—they will be only words without meaning, and the semblance of knowledge without the substance. It is on a principle of this kind that the Psalmist conducts his description of the Omnipresence of the Deity in the 139th Psalm—"Whither shall I go from thy Spirit? or whither shall I flee from thy presence? If I ascend into heaven thou art

there; if I descend into *hades*," or the invisible regions of the earth, "behold thou art there. If I take the wings of the morning, and dwell in the uttermost parts of the sea; even there shall thy hand lead me, and thy right hand shall hold me." When the inspired writers display the characters and attributes of the Deity, they do not perplex us with definitions and abstract descriptions, but direct us to his visible operations in Nature and Providence, as descriptive of his character and perfections; and this circumstance must be considered as suggesting the proper mode of illustrating his attributes, either to the young, or to any other class of individuals.

In connection with such instructions as the above, the juvenile mind should be directed to the *History of the Divine dispensations*, as recorded in the Old and New Testaments. It is a striking fact, that the greater part of the Revelations of Heaven is communicated in a *historical* form. Had the limited views of man been adopted, as to the *mode* of a communication from heaven, it would have been thrown into the form of an artificial system of propositions or doctrines, similar to some of our metaphysical compends of theology. But "He who knoweth our frame," and who is the Source of intelligence, has selected the historical form as the most proper mode of conveying instruction on those subjects which have a reference to our present and everlasting happiness. This mode of instruction is evidently attended with many and peculiar advantages. It is calculated to arrest the attention, to influence the affections, to awaken the power of imagination, to carry conviction to the mind, to render truth and duty more level to the understanding than abstract doctrines or precepts, and to make a deeper impression upon the memory than any other mode of instruction. Beside, the Sacred history, in a particular manner, is remarkable for its beauty and simplicity, the dignity of its style, and the fidelity and impartiality with which its narrations are conducted. It delineates, with an unerring pencil, the true characters of men, traces the invisible springs of human actions and events, relates with uniform fidelity the faults of the most illustrious saints, and exhibits examples of vicious characters to be shunned, and of virtuous characters blended with certain imperfections, as models for our general imitation. Above all, it embodies virtue in its most amiable and sublime form, in the account which it gives of the life, transactions, and sufferings of Jesus Christ, who is set before us a *perfect* pattern of universal holiness.

The young should, therefore, be early directed in the study of all those portions of Sacred history which are most congenial to their feelings and level to their comprehension;—particularly the history of the creation and the fall of man—the circumstances which attended the universal deluge—the destruction of Sodom—the lives of Abraham, Isaac, Jacob, Joseph, Moses, and Samuel—the deliverance of the Israelites from Egypt, and the leading events which befell them in the wilderness, and in the land of Canaan—the life and transactions of Elijah and Elisha, the deliverances of Jonah, Daniel, Shadrach, Meshech, Abednego, Peter, and Paul—the circumstances which attended the birth, the transfiguration, the crucifixion, the resurrection, and ascension of Jesus Christ—the preaching of the gospel by the Apostles, and the various persecutions and success which attended their labors—together with every similar detail in the history of the Bible, that may be calculated to arrest the attention of the

juvenile mind. In connection with the *facts* which these histories record, all the essential *doctrines* of religion are clearly stated, and its *precepts*, or the true principles of human action, are powerfully, though in some cases silently, inculcated. Thus religion is exhibited, not merely as a creed or a series of abstract propositions to be believed, but in an *embodied form*, in which the doctrines and duties of Christianity are connected with a train of events, incidents, and sensible objects, and with the delineation of characters and moral actions, which form so many links of *association* between doctrine and practice which cannot be dis severed. It is evident, then, that the mode in which Revelation has been communicated to man is intended as a *model* to direct us in imparting religious instructions to the young, or to any other class of society. And, when we substitute, in the *room of the Scriptures*, catechisms, or any other abstract compends of divinity, however orthodox, we virtually declare, that the wisdom of man is superior to the wisdom of God, and that the plans devised by erring mortals are to be set in competition with the plan of *inspired men*, who derived their instructions immediately from the Divine Spirit. Beside, the instructions on religion derived from such compilations, even when understood (which they seldom are), are received by the young merely on the authority of the authors or compilers, and can never produce such a thorough and rational conviction of their truth and obligation, as if they were delivered in the language of men who derived their instructions and commission immediately from Heaven. In deviating from the plan of Divine Revelation, numerous disputes and dissensions have arisen in Christian society. Almost all the controversies and dissensions which have taken place as to the manner of conducting Sabbath-schools, have arisen from such a circumstance as this—Shall the words of a certain *Catechism*, whether understood or not, be crammed into the memories of all the pupils? With one party it is of little consequence although the same leading *truths* be communicated in scriptural or other language, unless the precise vocables of the formulary they approve of be strictly adhered to and committed to memory, as if they were the immediate dictates of inspiration. Hence a sectarian spirit has been engendered, contentions and wranglings have been introduced, the advantages which might have been derived from the study of the pure oracles of heaven prevented, and the religious improvement of the young sacrificed to party rancor and hostility.

It appears to me unnecessary, in the first instance, to perplex the minds of young persons with a great variety of doctrinal opinions, such as are generally inculcated in most of our Confessions and Catechisms. It is only requisite that a few of the fundamental and leading doctrines of Christianity be exhibited, such as the moral attributes of the Deity—the fall of man, and his consequent depravity—the necessity of a Saviour—the love of God in sending his Son into the world to be a propitiation for our sins—repentance toward God, and faith toward our Lord Jesus Christ, the necessity of being renewed in the spirit of our minds, and of prosecuting the path of universal holiness—the connection of the present state with the future, and the important realities of the eternal world. These, and similar truths intimately connected with them, should be specifically illustrated, and deeply impressed upon the mind as the first principles or axioms of the Christian system. In conjunction with these, some of

the leading moral precepts of the Bible should be particularly inculcated, and illustrated by appropriate examples, such as, “Thou shalt love the Lord thy God with all thy heart—Thou shalt love thy neighbor as thyself—Whatsoever ye would that men should do to you, do ye even so to them—Love your enemies, do good to them that hate you—Bless them who curse you—If thine enemy hunger, feed him, if he thirst, give him drink—Let love be without dissimulation—Live peaceably with all men—Be not desirous of vain glory—Recompense to no one evil for evil—Put on *humbleness of mind*, meekness and long-suffering—forbear one another, and forgive one another, if any man have a quarrel against any: as Christ forgave you, so also do ye—Put away *lying*, and speak every man truth with his neighbor—Children, obey your parents—Be followers of Christ, who did no sin, neither was guile found in his mouth, and who hath left us an example that we should walk in his steps.” Such Christian precepts, frequently brought to the view of the mind, and familiarly illustrated by examples derived from Scripture, and from common life, could not but make an impression on the young, far more beneficial than if it were possible to cram into their memories all the definitions, distinctions, and dogmas of metaphysical theology. Such heavenly injunctions, when clearly explained, come home to the understanding and the feelings; they are recognized as the pure dictates of the Spirit of God; and although there were no other precepts presented to view but those I have now stated, a full recognition of such heavenly principles, in all their practical bearings, would, ere long, completely regenerate the world, and cause righteousness and praise to spring forth before all nations.

In endeavoring to teach young persons the *morality* of the Bible, and to imbue their minds with its holy principles, it is not enough that its precepts be announced, and that they be accustomed to *recite* them. They should be pointedly applied to every moral incident that may occur, and to whatever tempers or dispositions may be displayed in their conduct. *Every time a vicious disposition manifests itself, a Christian precept should be applied to counteract it.* Is a boy, for instance, taking revenge on his companion for an injury either real or supposed, such precepts as these should be pointedly addressed to him;—“Recompense to no man evil for evil.—Avenge not yourselves, but give place to wrath.—Bless them that curse you, and pray for them that despitefully use you.” Does he manifest a proud and overbearing disposition? Apply such divine maxims as these:—“God resisteth the proud, but he giveth grace to the humble.—A proud heart is an abomination to the Lord.—Though God is high, he hath respect to the lowly; but the proud he knoweth afar off.—Put on humbleness of mind, meekness and long-suffering; and let each esteem another better than himself.” Does a principle of envy, hatred, or malice, manifest itself? Those passages of Scripture which condemn such dispositions should be brought forward and illustrated:—“Let all bitterness, and wrath, and clamor, and evil speaking, be put away from you, with all malice.—The works of the flesh are hatred, strife, envies, murders, &c.—He that hateth his brother is a murderer.—If a man say, I love God, and hateth his brother, he is a liar.—Where envy and strife is, there is confusion and every evil work.” The tendency of such dispositions, and the dreadful consequences which frequently result from them, should be illustrated by such examples as these:—The brothers of

Joseph envied and hated him, and under the influence of these diabolical affections, would have murdered him, if the providence of God had not prevented.—Ahab envied Naboth, and caused him to be put to death.—Haman hated Mordecai, and caused a gallows to be prepared for his destruction, on which he himself was hanged.—The Jews, from hatred and “envy,” delivered up Jesus to the Roman governor to be crucified. In like manner it may be shown, that all the wars, contentions, and persecutions, which have convulsed and desolated the world, are the natural results of envy and hatred, and that the indulgence of such principles *unfits* the soul for the enjoyment of eternal life.

There can scarcely be a doubt, that the best mode of impressing the minds of the young with the moral principles of Christianity is, to exhibit the operation of these principles in real life, and to point out specifically those dispositions and modes of conduct which are directly opposed to the precepts laid down by our Saviour, and to the example he has set before us. For this purpose, a watchful eye should be kept on their conduct, and on the temper it displays. Even the most minute ramifications of their conduct should be strictly inspected; and those looks and gestures, words and actions, which may at first sight appear trivial or indifferent, should not be altogether overlooked; for, in many instances, they manifest the existence of an evil principle ready to burst forth into action, and which should be carefully counteracted. There are a great many dispositions of this kind which are daily manifested in families, and at public seminaries, which are either altogether overlooked, or considered as the mere ebullitions of youthful frolic or amusement, which nevertheless, involve principles altogether inconsistent with the dictates of inspiration, and with the harmony and order of the intelligent universe. And if such evil principles be not destroyed in the bud, they will “grow with their growth, and strengthen with their strength,” until they appear in all their noxious luxuriance in the active scenes of social life. The following are some of the practices to which I allude:—Tossing away hats and caps, calling nicknames, tearing books, acting deceitfully in making bargains, pinching and scratching, boxing and fighting, taking delight in teasing and vexing one another, mocking at natural defects and infirmities, valuing themselves on account of the finery of their dress, taking revenge of injuries, envying their companions on account of their acquirements and the approbation bestowed upon them, manifesting a spirit of pride and domination, mocking the aged, the lame, or the blind, wanton cruelty toward the inferior animals, or encouraging them to fight with each other, injuring trees, shrubs, or flowers, cutting or hacking walls, tables, or any useful piece of furniture, equivocating when giving evidence in relation to any fact,—and many similar practices, which are too seldom counteracted by the proper application of Christian principles. In particular, the practice of boxing and fighting, and every other revengeful action, should be reprobated and condemned with the utmost firmness and decision, as subversive of every principle that pervades the Christian system. That such practices have abounded at our public schools, and still too much abound, is a disgrace to our character as a professing Christian people, and to those who have the superintendence of the morals of the young. The practice of *prying* should likewise be promptly checked, and a strict regard to honesty and uprightness encouraged and enforced.

However trifling the value of the article—although it should be only a pin, a gooseberry, a pea, a marble, or a cherry-stone, no one should be allowed to interfere with it, if it is claimed as the property of another; for it is not the value of the article, but the *principle* of the action, which demands our consideration. Above all, *lying* should be represented in such a light as to be held in universal abhorrence; and the importance of *truth*—which is the bond of society, and the basis of the intelligent universe—should be illustrated and enforced by every scriptural and rational consideration.

For the purpose of illustrating the principles of moral action, and of applying the precepts of Christianity to particular cases of delinquency, it might be proper to set apart a portion of one day in the week for inquiring into moral conduct, whether blamable or praiseworthy. Cases of this description would be known to the teacher, and others would be brought forward by the young people themselves. A particular case should be stated in all its circumstances, and the attention of the whole school directed to it. Suppose a boy has been convicted of *falsehood*—having sauntered about the fields in company with some idle companions, when he should have been at school, and having afterward informed his parents that he was then regularly attending on his instructions. The precepts of the Word of God which bear against falsehood, should, in the first place, be brought forward,—such as, “Thou shalt not bear false witness.—The Lord hateth a lying tongue.—Lie not one to another.—Putting away lying, let every man speak truth with his neighbor.—All liars shall have their part in the lake which burneth with fire and brimstone.” The dismal consequences which would follow, if truth were universally violated, might next be stated. All confidence among intelligent beings would be completely destroyed:—there could be no friendship nor affectionate social intercourse—no improvement in knowledge—no seminaries of learning, no villages or towns could be reared, nor fields cultivated—every one would shun the society of his neighbor, and we could become acquainted with nothing but what we ourselves had seen or experienced. The happy effects which would result from a universal adherence to truth might then be illustrated, and a narrative or two might be read, exemplifying the importance of truth, and the mischievous effects of falsehood. Abundance of such narratives will be found, both in civil and in sacred history, and they should always be at hand for illustrating and enforcing instructions of this kind. The delinquent should then be reasoned with on his conduct, and admonished with such *seriousness* and *mildness* as may tend to convince him that you have his best interests at heart. In like manner should all other kinds of delinquencies be publicly investigated, and the opposite virtues explained and inculcated. When a youth has been found frequently guilty of committing the same fault, after repeated admonition, it may be proper that punishment of some kind or other be inflicted upon him. Corporeal punishment, however, will seldom have any good effect. Few cases, I presume, will be found, where either young or old have been *whipped* into the paths of wisdom and holiness. The punishment selected should be such as has a tendency to excite reflection on the evil of the offense, and to lead to penitence. Until repentance and amendment be clearly manifested, the delinquent should be banished from the play-ground, and from all the usual sports and associations of his companions, that he may feel ashamed of his con-

duct; and when he has given full satisfaction to his teacher and his school-fellows, let him be cordially received into favor, and reinstated in his former privileges. This is the principle which the Apostle Paul lays down with respect to the members of Christian Churches:—"Withdraw yourselves from every brother that walketh disorderly." And I see no reason why the same principle may not be applied to accomplish the same end in the case of the juvenile members of public seminaries. It is to be understood, however, that it is only those faults which are publicly known that should be publicly investigated,—those which are known only to the teacher and the delinquent should be discussed in *private*, in the manner now suggested, or in any other way that circumstances may dictate.

Actions which are praiseworthy should likewise be publicly noticed, and mentioned with due commendation. If any young person has rescued a little girl from the hands of wicked boys who had been maltreating her, and conducted her safely home—if he has shared a morsel of his bread with a hungry fellow-creature—if he has found a toy, a book, a pocket-handkerchief, or a piece of money, and restored it to the owner—if he has showed kindness to the blind or lame—if he is attentive to his learning, and obedient to his parents and instructors,—such examples of virtuous conduct should receive their due meed of praise, and be exhibited as patterns for imitation, and those Christian precepts which enjoin them brought forward and inculcated. Commendation animates and encourages the minds of children, and when it is merited should never be withheld. At the same time, they should be reminded, that when they have done all that they were commanded, they have done nothing more than what was their duty to do; and, that no services of ours, however praiseworthy, can be *meritorious* in the sight of God; that such actions, however, are *essentially necessary* as evidences of a renewed nature and of our subjection to the authority of God—that they promote our own comfort and the happiness of others—and that they prepare us for the employments and the society of heaven, where all the Christian virtues will be displayed in perfection without any mixture of evil.—Were such instructions and illustrations of moral principle, as now suggested, regularly attended to, and every disposition and action of the young submitted to the test of Christian principle, there can scarcely be a doubt that the most beneficial results would soon appear, and the moral state of society be improved far beyond what we have ever yet experienced. But, if we are remiss in our attention to the best interests of the young, and refuse to bring into full operation a rational system of moral and religious instruction, we have no right to complain of the vicious dispositions of the rising generation, or the licentiousness and depravity of general society.

In recommending to the young the study of the Scriptures, every requisite direction and assistance should be afforded to guide them in their researches into the oracles of God. When reading the historical parts either of the Old or the New Testament, maps of Palestine, and of the adjacent countries, should be put into their hands, that they may be enabled to trace the journeyings of the Israelites in the wilderness, the relative positions of the twelve tribes in the land of Canaan, the travels of Jesus Christ and his apostles, and the situations of the principal cities, towns, mountains, rivers, lakes, and seas, mentioned in the Bible. To assist their conceptions of the

Jewish tabernacle and temple, plans of these buildings should be presented, along with figures of the altar of burnt-offering and of incense, the ark of the covenant, the table of show-bread, the golden candlesticks, the brazen laver, and other sacred utensils. To illustrate the antiquities of the Jews and other eastern nations, their customs, buildings, &c., sketches should be given of their *manners and customs*, arts, sciences, vegetable productions, and peculiarities of climate, which are frequently alluded to by the sacred writers, and which should be illustrated by engravings in so far as they tend to convey ideas on the subject. They should be taught to acquire clear conceptions about everything they read, and, when they meet with difficulties or obscurities, never to rest satisfied until they receive the requisite explanations. When they read a description of any scene or transaction, such as the Israelites passing through the Red Sea, or assembled around Mount Sinai—our Saviour teaching the multitudes from a ship on the Lake of Genesareth—or Paul standing on Mars hill, addressing the people of Athens—they should be instructed to *represent in their imagination the various objects which compose the scene* as delineated by the historian, whether mountains, rivers, seas, corn-fields, buildings, or assembled multitudes, which would tend to connect with sensible objects the moral instructions to be derived from such narratives. In forming such pictures of imagination they might be assisted by the teacher selecting parts of those scenes in their own country with which they are acquainted, and leading them to imagine the objects and transactions recorded in the Bible as passing immediately before them amidst the scenery with which they are familiar; or by presenting before them accurate engravings of the natural and artificial objects connected with Judea and other eastern countries, in so far as they can be procured. In this point of view, it is much to be regretted, that almost all the pictorial illustrations of our "Family Bibles" are absolutely worthless and worse than useless, omitting almost everything that is instructive and consistent with fact, and introducing silly and fictitious scenes, full of anachronisms, inconsistencies, and violations of costume, which have no other tendency than to convey a degrading and distorted conception of the scenes recorded in sacred history. Above all things, the young should be directed to consider, that every transaction recorded in Scripture is intended to produce an intellectual and a *moral* effect, either to display the perfections of God, the character of his moral government, the safety and happiness of those who put their trust in him, the evil tendency of disobedience to his laws, or the path of duty in which we ought to walk in the various circumstances in which we may be placed. "All Scripture is profitable for doctrine, for correction, for reproof, and for instruction in righteousness;" and therefore the study of no portion of sacred history should be discontinued, until its moral instructions be clearly perceived and applied. Questions and exercises of various kinds, in relation to Scriptural facts, doctrines, and duties, should be prescribed, to excite the attention, and direct the judgment of the young in their investigation of divine subjects; but as we have now various little books calculated to direct the juvenile mind in such exercises, it is needless to dwell on the subject.

It might not be improper to have a *text-book* or two, selected from Scripture, and interspersed with occasional remarks, tending to elucidate certain passages and events. We have class-books

for schools, the greater part of which is selected from plays, novels, farces, and *Pagan* historians and moralists. And why should we not have a text-book selected from the oracles of inspiration, which contain a *greater variety* of sublime and important matter than is to be found in any other source of information? Such a text-book might comprise selections on such topics as the following:—*Subjects which tend to expand our intellectual views of the Deity, and of the universe he has created*—comprising descriptions of the Majesty and Supremacy of Jehovah, the eternity of his existence, his universal presence and agency, his love, faithfulness, and immutability, his unbounded goodness, the wisdom and rectitude of his moral government, and the care he exercises over every order of his creatures—the existence of angels, and the offices they perform under the Divine administration—the immortal destiny of man and the prospects opened to the righteous of eternal felicity in the future world. Selections in reference to the *affections and the duties incumbent upon persons in the different relations of life*. In this department those duties and affections which are *peculiarly Christian*, should stand prominent, such as humility, lowliness of mind, love to enemies, doing good to those who hate us, striving against sin, loving our neighbor as our-

selves, cultivating heavenly desires and affections, &c. *Selections addressed to the taste and imagination*—embodying the beauties of history, poetry, and eloquence, which are profusely scattered throughout the sacred writings. *Selections of biography*, including the lives of Jacob, Joseph, Moses, Elijah, Hezekiah, Daniel, John the Baptist, the Apostle Paul, &c. These, along with selections on *various other subjects*, might be illustrated with critical remarks, extracts from works on Eastern manners and customs, descriptions of modern Palestine, and the adjacent countries, the accomplishments of Scripture prophecies, as recorded in history, anecdotes of young persons, the lives of true Christians, the judgments which have befallen persecutors and apostates, the progress of Christianity through the world, and the benign effects it has produced on the state of society. Such a work, if judiciously arranged and executed, and studied with care, could not but produce a beneficial influence on the taste and affections of the young, and lead them to admire and venerate the oracles of heaven. It is, doubtless, one cause of the low state of Christianity, and of the influence of *Pagan* maxims in general society, that such text-books have never yet been introduced into our seminaries of education.

CHAPTER VIII.

SABBATH-SCHOOLS.

OF late years these institutions have rapidly increased, both in Great Britain and in the United States of America, and, if properly conducted, are calculated to produce a highly beneficial effect on the religious improvement of the rising generation. In a preceding part of this volume I offered a few strictures on the mode in which some of these institutions were formerly conducted; and, although the evils there complained of still exist to a certain extent, I am happy to say, that in many of these schools a more rational and efficient system is now beginning to be adopted. The teachers, many of whom are men of piety and intelligence, are now convinced of the utility of mere memorial exercises, and are beginning to address the *understanding* and the *affections* of their pupils, so that they may be enabled to enter into the spirit and meaning of the truths inculcated. Still, however, I am decidedly of opinion, from all that I have ever witnessed in these institutions, that the system of religious instruction is far from having reached its highest pitch of improvement, and that it is susceptible of being carried to a degree of perfection which it has never yet attained. The evils and defects which adhere to the system as it exists in most of our Sabbath-school institutions, are such as the following:—1. The memory is still too much exercised and burdened with the *attention* of words, while a corresponding degree of attention is not paid to the exercise of the rational faculty. 2. *Religious instruction is too much confined as to the range of its objects and illustrations*. Instead of confining it chiefly to a few propositions in re-

gard to what are termed the fundamental doctrines of the Gospel, it should extend to the whole range of objects comprised within the compass of Divine Revelation, and to all the illustrations of those objects which can be derived from history, geography, the sciences, and the works of nature. 3. Discussions on systematic theology too frequently usurp the place of pointed moral instructions addressed to the affections and the conscience. 4. Catechisms and other human formularies are too frequently set in competition with the instructions to be derived directly from the Scriptures. 5. Many of the teachers, however pious and well-intentioned, are deficient in that degree of biblical and general knowledge which all religious instructors ought to possess. This last circumstance I consider as one of the greatest deficiencies in our Sabbath school arrangements, and therefore shall offer a few remarks on the subject.

It is generally admitted, that a professor of any science, such as chemistry, ought to be acquainted not only with all its principles and facts, but with those subjects, such as natural history, experimental philosophy, and physiology, with which it stands connected. It is also admitted, that the religious instruction of the adult population, in order to be respectable and efficient, requires that the ministers of religion be trained to all those branches of knowledge which tend to prepare them for their office, and that they may be men not only of piety, but of talent and intelligence, and found qualified by their superiors for the duties they undertake. And can we suppose,

that either the literary or the religious tuition of the *young*, can be intelligently or efficiently conducted by men who are comparatively ignorant, and who have undergone no previous training for such an office? On the contrary, I have no hesitation in asserting, that instructors of youth ought to have as much information on every subject as is usually judged necessary for a respectable minister of the Gospel, and even more than many of this class actually possess. Beside, they ought to possess not only *clear conceptions* of every portion of knowledge they wish to impart, but also the best modes in which it may be communicated with effect to the juvenile mind. It requires even more information and greater powers of mind to simplify knowledge, and render it perspicuous to the opening intellect, than to convey it to the understandings of those who are advanced in years. The man who wishes to act as an intellectual and religious instructor, should, if possible, acquire a comprehensive view of the whole of the revelations of Heaven, and of the collateral subjects with which they are connected—of the leading facts of ancient and modern history—of the scenery of nature in all its varied aspects—of the operations of the Creator which are displayed in the “firmament of his power,” and of human nature as exhibited in all the scenes and relations of social life. For it is from these, and similar sources, that he is to derive his *illustrations* of divine subjects; and unless such subjects be illustrated by sensible scenes and objects, no clear and distinct ideas can be communicated to the young, nor any deep impressions made upon their hearts. The instructor of the young must have the faculty of ascertaining the *range of thought* possessed by his pupils—of *adapting his instructions* to that range of thought—and of rendering the ideas they have already acquired subservient for increasing their number, and for opening a wider field of intellectual vision. For this purpose, his imagination must roam over the whole circle of his own knowledge, to select objects, events, scenes, circumstances, and similes, adapted to the comprehension of his pupils, and calculated to expand their views, and to illustrate the particular subject to which their attention is directed. He must sometimes extend his views to the histories of ancient times, both sacred and profane, to the circumstances which attended the accomplishment of ancient prophecies, and to the doctrines, maxims, and precepts of the Bible—sometimes to the knowledge he has acquired of the earth, the ocean, or the atmosphere, the animal and vegetable creation, or the glories of the heavens—and sometimes to the state of barbarous nations, the persecutions of the church, the lives of good men, the progress of the Gospel among unenlightened tribes, the scenes of domestic life, or the wars and revolutions of nations. Circumstances, incidents, anecdotes, descriptions, and similes, derived from such sources, he will find expedient, and in some cases necessary, to be brought forward for explaining and illustrating many portions of Divine Revelation. And therefore, were it possible for a teacher to be a man of *universal knowledge*, so much the more qualified would he be for imparting religious instruction, provided he had the art of *simplifying* his knowledge, and rendering it subservient to moral improvement. If religious instruction, indeed, consisted in nothing more than prescribing *tasks*, and hearing children recite catechisms, psalms, hymns, and passages of Scripture, any man, however ignorant, who had been instructed in the art of reading, might be

considered as qualified for such an office;—and hence, I have seen men, pious and well-meaning, perhaps, but ignorant of almost every branch of knowledge, and without any *clear ideas* on the subject of religion, appointed as Sabbath-school teachers, who did nothing more than take the Psalm-book or Catechism into their hands, and put on their spectacles to see that the youngsters repeated their prescribed tasks with tolerable correctness. But if the great object of religious instruction is, or ought to be, the communication of clear ideas respecting the attributes of God, the principles of his moral government, the variety and immensity of his works, the history of his providential dispensations, the plan of his redemption, and the way in which its blessings are to be obtained, the principles of moral action, and the rules of duty he has prescribed, and whatever tends to display the riches of his grace and the glories of his universal kingdom—in so far as such subjects can be imparted to the youthful mind—then it is evident, that a religious instructor ought to be a person endowed with as much general and Biblical knowledge as he can possibly acquire.

In throwing out the above remarks it is by no means intended to insinuate, that no good has been effected in Sabbath-schools where the teachers were comparatively ignorant; as I believe many good impressions have been made upon the youthful mind by pious and well-meaning men whose range of information was extremely limited. But it is evident, at the same time, that were such instructors more enlightened than they have generally been, a much greater degree of important instruction would be communicated, and a more powerful moral impression made upon the heart.

It is consistent with the dictates of reason and the general practice of mankind, that every man should be trained for the profession he adopts, and be found qualified for any office before he enter on the performance of its duties. And is the religious instruction of the young a matter of so trivial importance, that such a rule should be set aside in appointing teachers to Sabbath-schools? If not, then every one who wishes to devote himself to the religious tuition of the rising race, should be regularly trained in all those branches of sacred knowledge which are requisite for rendering his instructions fully efficient for the purpose intended. It should likewise be ascertained whether he be of a communicative turn of mind, and has acquired a facility of imparting ideas to the youthful understanding; and for this purpose his qualifications should be tried by experiment, by placing under his superintendence, for a few days, the instructions of a religious seminary. Every one found duly qualified for the office should receive a pecuniary compensation, as well as the teachers of other seminaries, provided he chooses to accept it. Hitherto our Sabbath-schools have generally been taught *gratis* by the benevolent individuals who have devoted themselves to this service, and if duly qualified instructors can be found who will give their services without remuneration, no objection, of course, can be brought against such labors of love; but it is nothing more than equitable, that every man who devotes his time and the energies of his mind to any object, should receive a fair compensation for his exertions, especially when he is under obligation to cultivate his intellectual powers, and to pass through a course of training for this purpose.

The departments of knowledge to which religious instructors should devote their attention, are such as the following:—1. *Sacred History*, or, in

other words, the Records of the Divine dispensations, as contained in the Old and New Testaments. For elucidating certain portions of this history, unraveling difficulties, answering objections, and explaining various circumstances connected with the Jewish worship and economy, the perusal of such works as Horne's "Introduction to the Study of the Bible," Shuckford's "Connection of Sacred and Profane History," and Stackhouse's "History of the Bible," particularly the last, will be found of great utility in expanding our views of the revelations of Heaven, and of the facts connected with the moral government of God. For illustrating the history of the Jews and surrounding nations, from the time of the prophet Malachi to the birth of Christ—a period of more than four hundred years, during which many of Daniel's prophecies were accomplished—the First Book of "The Maccabees," Josephus' "Antiquities," and his "History of the Wars of the Jews," and Prideaux's "Connection of the History of the Old and New Testament," will be found particularly useful.—2. *Ancient History and Geography.* The history of such nations as the Egyptians, Assyrians, Babylonians, Medes and Persians, is so interwoven with the sacred history and the predictions of the prophets, that a knowledge of it is, in many instances, necessary for understanding the descriptions and allusions of the inspired writers. Millot's "Elements of General History," part i, and "Rollin's Historical Works," particularly his "Ancient History," will afford the most satisfactory information on this subject. In connection with the history of ancient nations, *ancient geography* should be particularly studied, for the purpose of acquiring clear ideas of the boundaries and divisions of the Land of Palestine, and of the relative positions of the countries that lie adjacent to it, which are so frequently alluded to in the history both of the Old and New Testaments. Without some knowledge of this subject we can have no clear conceptions of many interesting circumstances recorded in the writings of the Prophets and Evangelists, and must frequently read their narratives without ideas. *Maps* on a large scale, of the countries to which I allude, are of course indispensably requisite, when engaging in this study; and such maps should be hung up in every Sabbath-school, and referred to for illustrating the narratives of the sacred historians. Wells' "Sacred Geography," and his "Set of Maps of Ancient Geography," and similar works, will afford the requisite information on this subject.—3. *The circumstances connected with the fulfillment of ancient prophecies.* The accomplishment of prophecy is recorded either in the sacred history itself, in the annals of civil and ecclesiastical history, in the present state of the nations and the events passing under our daily observation,—or it is to be looked forward to in the prospects which will open on future generations. Hence the necessity of being acquainted with the *history of the Church and of the nations*, and with the political and religious movements now going forward throughout the world, if we wish to trace the faithfulness of God in the accomplishment of the predictions of his word. Such works as Newton's "Dissertations on the Prophecies," and Keith's "Fulfillment of Prophecy," and his "Signs of the Times," will direct the mind to many interesting views on this subject.

4. Another subject which deserves the attention of religious instructors is, *Biblical Criticism and interpretation.* As the Scriptures form the

groundwork of all religious knowledge, it is of importance to ascertain that the copy or edition which we use approaches as nearly as possible to the original; and when we are satisfied on this point, it is equally important to determine the rules by which the different portions of the Bible are to be *interpreted*, according to the subjects on which they treat. This includes an inquiry into the *literal* meaning of words, and the *figurative* sense in which they are frequently used—the scope of the writer—the parallel passages—the sources of poetic imagery, or the objects whence the sacred writers derive their figurative representations—the principles of symbolical language—and a knowledge of the *localities* in which the writers were placed, and the *historical circumstances* to which they allude. On this subject many voluminous works have been written; but the general reader may, perhaps, be sufficiently gratified by the perusal of such volumes as Carpenter's "Scripture Difficulties," and his "Popular Lectures on Biblical Criticism and Interpretation."—5. *The manners and customs of the Eastern nations.* The manners, customs, arts, and sciences of the Hebrews, and the natural and artificial scenery with which they were surrounded, exerted a powerful influence upon their literary productions—even upon those which were dictated by inspiration. Without a knowledge of these it is impossible, in many instances, to unravel the sense of the inspired writers, to perceive the beauty and emphasis of their compositions, or to feel the full force of their narratives and allusions. For the elucidation of this subject we are now furnished with a variety of interesting works, of which the following are specimens:—Paxton's "Illustrations of Scripture;" Harmer's "Observations on certain passages of Scripture;" Taylor's "*Fragmenta*," appended to Calmet's Dictionary; Burder's "Oriental Customs;" Carpenter's "Scripture Natural History;" and the reports of certain modern travelers, such as Burckhardt, Buckingham, Leigh, Dr. Jowet, and the American Missionaries. In the first six volumes of "The Modern Traveler," compiled by Dr. Conder, almost everything will be found requisite for the illustration of the physical geography, climate, seasons, &c. of Judea, and the surrounding countries. An occasional reference to such subjects for the elucidation of Scripture, could not fail of exciting the attention and improving the understandings of the young.

6. *The study of the system of Nature*, or the material works of God, as displayed throughout the earth, and the starry firmament. To these works the inspired writers, on numerous occasions, direct our attention, as evidences of the Power, Wisdom, and Goodness of Jehovah, and of his superintending Providence. They should therefore be studied with care, and contemplated with an eye of intelligence, as illustrative of the perfections of the Deity, and of the declarations of his word. There is nothing to which young people listen with more attention than to familiar discourses upon the wonders of creation, when they are delivered in a clear and distinct manner, and made level to their capacities; and when the works of God are brought into immediate connection with the truths of his word, a more powerful impression of these truths, on the principle of association, will be made upon the mind. For example, when we describe the immense mass of water in the caverns of the ocean; the lofty ranges of mountains; the flaming volcanoes; the magnitude of our globe; the rapid motion with which it flies

through the voids of space; or the immense number and size of the celestial orbs—and bring these objects in connection with such passages as these: "He holdeth the ocean in the hollow of his hand; he hangeth the earth upon nothing; he meteth out the heavens with a span; and taketh up the isles as a very little thing—Great is our Lord and of great power, his understanding is infinite—Great and marvelous are thy works, Lord God Almighty:" &c.—when these passages are at any time recalled to mind, the objects which illustrate them will naturally occur; and, when the objects themselves are directly contemplated, the mind will revert to the dictates of inspiration with which they were formerly associated. For the purpose of acquiring some general knowledge on this subject, religious instructors should peruse some of the popular works which have been lately published on the subjects of Natural History, Geography, Astronomy, Experimental Philosophy, and Chemistry, such as those formerly recommended, and particularly those works which treat of Natural Theology, and the connection of science with religion.*—Beside the above departments, the Sabbath-school teacher should study with particular attention *human nature* in all its varieties and modes of operation. He should learn to contemplate, with the eye of a Christian philosopher, the dispositions of mankind, as displayed in their social intercourses, the scenes of public and domestic life, the various modes in which the principle of evil operates, and the practices, whether good or bad, which prevail either in Christian or in general society. From such sources he will derive many home illustrations of the effects of sin, and of the manner in which Christian principle should operate in all the ramifications of human society. He should likewise study some of the best works on the "Evidences of Christianity"—a system of Divinity such as "Dwight's Theology"—and, above all other branches of knowledge, he should study with the utmost care the discourses of our Saviour, as reported in the Evangelists, and the *practical parts* of the writings of the Prophets and Apostles, which, in religious instructions, are too frequently thrown into the shade.

In teaching Sabbath-schools a practice which is not uncommon should be carefully avoided—and that is, *addressing long-winded discourses to young people*, most part of which they do not understand. I lately visited a school in a neighboring town, containing from 80 to 100 catechumens. Among these were about 20 young persons, chiefly females, from the age of 16 to the age of 24; the rest were children from 7 to 12 years of age. After the *repetition* of texts, psalms, catechisms, and passages of scripture, more than an hour was consumed in some crude dissertations, in a preaching style, on the meaning and references of some passages in the prophecies of Isaiah, which none of the younger persons could possibly understand; and only about a dozen general questions, for the sake of form, were put to the younger class, to which the answers, "yes," or "no," were chiefly required. It seemed as if the chief aim of the teacher had been to recommend himself to the attention of the adult part of his audience, while the children were sitting in a state of apathy, playing with their fingers, and eagerly wishing to be gone. Such a conduct is quite preposterous, and tends to frustrate the great object of such institutions. No address to young people

should be continued beyond five or ten minutes at a time, unless the subject be extremely interesting and the attention exclusively fixed upon it. The method of teaching by *Interrogatories*, and interspersing occasional remarks on the different topics, will be found in general the best mode for keeping alive the attention of the young.

Sabbath-schools should not be considered as confined to the children of the poor, or of those who are inattentive to the spiritual interests of their offspring, but as embracing the instruction of all classes of society. It is indeed a duty, from which no parent can be exempted, to impart instruction to his children in the principles of religion, and "to train them up in the nurture and admonition of the Lord." But, without neglecting this duty in private, their children might derive important *additional* instruction by attending a public religious seminary. If the system of religious instruction were once improved, and carried to that pitch of perfection of which it is susceptible; and, if that superior intelligence and wisdom, which we hope ere long to see displayed in the department of religion, were to pervade all the details of juvenile instruction, I have no hesitation in asserting that the children of the most learned and intelligent of the community would derive much advantage from attending such seminaries of instruction. Nor should such seminaries be confined to young persons under 12 or 14 years of age, as they too frequently are; but schools should be organized, adapted to persons from the age of 15 to the age of 20, and upward, in which they may be trained in the higher branches of knowledge connected with religion, and thus be enabled to take more expansive views of the revelations of Heaven, that they may be "thoroughly furnished for the performance of every good work." For the instruction and superintendence of such schools, the study of those departments of sacred knowledge referred to above, will be found an indispensable qualification. In order that properly qualified teachers may be obtained for such seminaries, colleges or academies might be established for their instruction. Evening lectures on the different branches of sacred knowledge and popular science, accompanied with various other mental exercises, might be delivered two or three times every week, to which all might have access who wish to devote themselves to the religious instruction of the young. Various discussions might likewise be entered into relative to the best modes of communicating knowledge and impressing divine truths upon the heart; and *experiments* in the art of instruction might be occasionally tried by collecting a number of children for this purpose, and observing the effects which different instructors and different modes of teaching produce upon their affections and understandings. In the meantime, before such systems of instruction be established, it might be expedient for the teachers of Sabbath-schools in large towns, to meet once a week, or once a fortnight for mutual instruction, and for discussing the various subjects connected with their official duties. A library might be formed of the best books connected with Sacred History, Theology, and general information, to which each of them might have access for the purpose of private study. By such means the knowledge of our teachers would be enlarged, their interest in carrying forward improvements kept alive, and the system of religious instruction would gradually approximate toward perfection. To guide the teacher in his selection of books on

* See p. 108.

Sacred Literature, he may be referred to the Rev. E. Bickersteth's "Christian Student," which contains lists of books in the various departments

connected with the study of Divine revelation, interspersed with a variety of judicious remarks.*

CHAPTER IX.

SCHOOLS FOR YOUNG PERSONS, FROM THE AGE OF FOURTEEN TO THE AGE OF TWENTY AND UPWARD.

It is one of the grand defects of our present system of education, that it is considered as terminating about the period when our youth arrive at the age of fourteen or fifteen years. Prior to this period, little more than the *rudiments* of knowledge can be communicated, even where education is conducted on an intellectual plan. The whole period of our existence should be considered as the course of our education; and there is no portion of human life of more importance in this respect than that which intervenes between the age of fourteen and the age of twenty. At this period, the rational powers are advancing toward perfection, and are capable of acquiring clear and expansive views both of scientific truths and of scriptural doctrines. At the same time the moral powers and propensities are beginning to arrange themselves on the side either of virtue or of vice; and, in the great majority of instances, the character of the future man depends on the intellectual views and the moral habits which are then formed. It is therefore a matter of the utmost importance, that the human mind, at this interesting period, should be properly directed as to its views of truth and of duty, and guarded against the temptations and allurements which might turn it aside from the paths of rectitude. It is somewhat unaccountable, that this important period in the life of man—so pregnant with blessings or curses to society—should have been almost overlooked in the view of the Christian philanthropist, and that no specific arrangements have been made to promote moral and intellectual instruction during its continuance. About the age of fifteen the greater part of those who have enjoyed a common education are employed as apprentices or servants. At this period, new passions begin to operate, and new pursuits engage their attention. They mingle with new associates, are frequently exposed to vicious indulgences, and, in many instances, are set free from the restraints of their parents and guardians. If, in such circumstances, no rational or religious instruction is regularly imparted, they will be apt, as too frequently happens, to be led away by their vicious companions, and their sensual appetites, into the paths of folly and intemperance. Hence the propriety of establishing institutions, and

arranging a system of instruction adapted to the wants and the circumstances of this interesting portion of our population.

The subjects to which the attention of this class of young persons should be directed might be such as the following:—1. The *Physical sciences*, as Geography, Astronomy, Natural History, Experimental Philosophy, and other subjects more particularly noticed in the preceding pages. The illustration of these subjects might occupy a wider range, and the topics connected with them be more fully discussed than in the primary schools to which I have already adverted.—2. *Logic*, or the art of reasoning. This subject might be treated in a popular manner, and the various kinds of reasoning and of sophisms illustrated from the sciences, historical facts, the phenomena of nature, and the conduct of men in general society. One great object in such discussions should be, to teach the pupils to habituate themselves to clear ideas and conclusive reasonings on every subject—and to expose the false principles and sophistical reasonings by which princes, statesmen, clergymen, and others, have supported tyranny, slavery, oppression, and abuses of every description in church and state, and by which deists and skeptics have attempted to undermine the fabric of Christianity. If properly illustrated, there are few subjects more important than this to young men when entering on the active scenes of life. But we have no system of logic, with which I am acquainted, in which the subject is treated in the popular and practical manner to which I allude.—3. *Practical mechanics* and the useful arts—including discussions on the various applications of *steam*—rail-roads, canals, and machinery of different kinds—the processes connected with the different arts, the improvements of which they are susceptible, and the experiments that require to be tried in order to carry them to perfection.—4. *Ethics*, or a system of moral philosophy founded on the principles and precepts of Revelation—or, in other words, a system of practical Christianity, explaining the duties incumbent upon men in the various relations of life, and illustrating them from the facts connected with the scenes of history and of common life. In the discussion of this subject, the following topics, among others, would require to be particularly illustrated:—The true foundation of moral action, or the *principles* which form the basis of the moral order of the universe—the *laws* which God has promulgated in his word for the regulation of human conduct—the *reasonableness* of these laws, and their indispensable necessity and obligation—the *happiness* to which the observance of them uniformly leads—the *misery* which is necessarily consequent on their violation—and the *confusion* which would arise throughout every part of the social system, were these laws

* Sabbath-school teachers will derive much useful instruction from the writings of Mr. Jacob Abbott, Principal of the Mount Vernon School, Boston, particularly his "Young Christian," and "The Teacher, or Moral Influences employed for the Instruction of the Young." He should also peruse "The Mother at Home," and other works of the Rev. John S. C. Abbott, of Worcester, America, formerly recommended. In the process of teaching, the books published by Mr. Gall on the "Lesson System," will frequently be found of great utility. But, it ought never to be forgotten, that no plans we may adopt, and no books, however good in themselves, can be a substitute for the scriptural knowledge and general information of the teacher.

reversed or universally violated. The history of all nations, both savage and civilized—the facts related in the history of the Bible—the narratives of voyagers and travelers—and the scenes of public and domestic society,—would furnish appropriate illustrations of such topics.—5. *The Evidences of Christianity*—illustrations of *Sacred History and Geography*—explanations of *Scripture difficulties*, and of the accomplishment of prophecies—elucidations of Christian facts, doctrines, and precepts—and other topics connected with the great objects of religion and the realities of another world,—should hold a prominent place among all the other departments of instruction. Such instructions are essentially requisite, if we wish to see mankind rising in the scale of intellectual and religious improvement, and if we wish to behold vice and intemperance banished from our streets, and harmony and happiness throughout every department of the moral world.

Such subjects as the above might be varied according to circumstances, and elucidated, in more or less detail, according to the ages, capacities, or pursuits of the pupils; but, in every instance, the chief portion of instruction should have a particular bearing on their moral and religious improvement. Three or four days in the week, from eight to half-past nine o'clock in the evening, might be devoted to such studies and exercises,—and the same apartments which are used for the instruction of the junior classes might serve as places of meeting for engaging in the discussions to which I allude, so that no additional expense would be requisite for such accommodations. Every arrangement in such seminaries should be adapted to the convenience of apprentices, journeymen, shopkeepers, clerks, laborers, and all others who are employed in active labor, or other professional duties, during the day;—at the same time, persons of every rank and of every

age may be invited, when public discussions take place, or public lectures are delivered.—Similar institutions might be established for the improvement of the female sex, in which instructions in natural history, logic, morality and religion, similar to those suggested above, might be imparted, together with all those useful and ornamental branches of knowledge which are peculiarly adapted to the stations and relations they occupy in society. In certain cases, where public lectures on physical or moral subjects are delivered, arrangements might be made for the attendance of persons of both sexes, which, under certain regulations, would tend to enliven the scenes of instruction.

Such institutions have never yet been established, so far as I know, in any part of the civilized world; nor can we hope for their establishment, until the influence of *avarice* be in some measure undermined—until our shops and manufactories be shut up at more early hours than they now are, and until our laborers, shopkeepers, and artisans, have more leisure to devote to the cultivation of their moral and mental powers. Many of our manufactories are kept open until between the hours of eight and nine in the evening; and our grocery-stores and other shops, until near the hour of midnight; so that, from seven in the morning until near eleven at night, our apprentices have scarcely two hours of leisure, even for their meals. Such long hours of labor, during which many of the working classes are obliged to toil from day to day, tend not only to retard the progress of the human mind, but to reduce mankind to a species of slaves, or mere animal machines; leaving them scarcely any reasonable portion of their existence, either for cultivating their intellects, or for preparing for the world to come. On this subject I shall afterward offer a few remarks.

CHAPTER X.

QUALIFICATIONS OF TEACHERS, AND SEMINARIES FOR THEIR INSTRUCTION.

To all that is stated in the preceding pages, it will likely be objected, that we have few teachers possessed of the talent and information requisite to carry the plans I have proposed into effect. It is indeed much to be regretted, that an opinion has long prevailed, that the most slender qualifications are sufficient for a teacher, and that little preparation is requisite for conducting a common school. If a man is unfortunate in trade, enfeebled in body, or disinclined to manual labor, it is considered that he may still be sufficiently qualified for a teacher, after having spent four or five months at a seminary of education. If he can read his mother-tongue, write a good text-hand, and has acquired a tolerable knowledge of arithmetic and book-keeping, he is considered as fully warranted to set up the trade of a teacher; and if in addition to these he has acquired some knowledge of Latin and French, he is viewed as moving in the higher rank of instructors. Such opinions, indeed, are now beginning to be reckoned as somewhat antiquated, and many of our

teachers are rapidly rising in the scale of intelligence; but it is, at the same time, a fact, that many of our parochial and other schoolmasters are possessed of few qualifications beside those now stated. On the Continent, until lately, the office of schoolmaster, in country villages, was considered one of the lowest employments in society. Even in Prussia, about the middle of the last century, "All that was required of their schoolmasters, who were chiefly mechanics, was to be able to read, say the catechism, sing tolerably a few well-known psalm-tunes, and to write and cipher a little. Numbers of shepherds, employed in summer time in keeping sheep, during winter assume the office of teachers of youth. The nobility used generally to bestow the place of schoolmaster (if it was at their disposal) on their valets or grooms, as a reward for past services."* In many instances the offices of village

* Report of the Primary Normal School at Potsdam, by F. L. G. Striez.

barber, fiddler, and schoolmaster, were conjoined in the same person.

It may be affirmed, without the least hesitation, that there is no office in general society more honorable and important than that of an instructor of the young, and none on which the present and future happiness of the human race so much depends. But, in consequence of the circumstances now stated, the office has been rendered inefficient for the great purposes of human improvement, and the teacher himself degraded from that rank which he ought to hold in the scale of society. It is not a little unaccountable, that, in this country, no *seminaries* have ever yet been established for training young men for the office of teachers, so that the important ends intended by a system of education may be fully accomplished. A watchmaker, a smith, a mason, a carpenter, or a weaver, serves an apprenticeship of from four to seven years, before he is considered qualified to exercise his profession. A clergyman generally undergoes a course of training for eight or nine years, before he is licensed to perform the functions of the sacred ministry. Even a menial servant, a stable-boy, a cook, or a laundry-maid, must devote a certain portion of time and attention before they are considered as qualified for such occupations. But the office of an instructor of youth is frequently assumed at random. If a man *imagines* he can execute such an office, and publishes an advertisement of his intention, he is believed to be qualified for what he undertakes, although, perhaps, he has never applied his mind to investigate the principles on which instruction should be communicated, nor the objects which education should embrace. Such an *anomaly* in the state of civilized society, in regard to a matter of such vital importance, is a disgrace to the character of an enlightened age, and ought no longer to exist. If we had right views of all the important objects which a system of moral and intellectual education should embrace, and its extensive effects upon all ranks of society, in relation both to the present and the future world, we should at once admit, that an instructor of youth should be a man possessed of almost universal knowledge, conjoined with a high degree of moral probity and fervent piety.

How then, it may be asked, are we to proceed in elevating the teachers in the scale of intelligence, and thus laying a sure basis for an efficient education? The first arrangement, which is obviously requisite, is to establish seminaries or colleges for their instruction. In these *Preceptorial Colleges*, as they might be called, such branches as the following might be taught.—1. Arithmetic, Drawing, Algebra, and the Mathematical sciences, particularly those which are more immediately applicable to practical purposes.—2. Grammar, Logic, History, and Christian morals.—3. Natural History, Natural Philosophy, Geography, Astronomy, Chemistry, Physiology, and Vocal and Instrumental Music.—4. Natural Theology, the Evidences of Christianity, Sacred History, Christian doctrines and duties.—To teach these sciences with effect, three or four Professors would be required. They should be taught, not merely by lectures, but by regular examinations and numerous exercises connected with the several topics of discussion; and, where the subjects admit of it, by experimental illustrations. The course should be as popular in its plan and illustrations as the nature of the subjects treated of will admit, and all the discussions should, if possible, be made to bear upon matters of practical utility. Of course, all abstract metaphysical disquisitions, intricate mathe-

matical questions and theorems which are more curious than useful, and all theological speculations respecting mysteries and questions which are beyond the reach of the human faculties to resolve—should be carefully avoided. The great object of these instructions should be, not to make the students *profound* mathematicians, philosophers, or divines—but to communicate to them a clear and comprehensive view of all those subjects of a practical nature which are level to the comprehension of the bulk of mankind, which may present to them objects of delightful contemplation, and which may have a bearing on their present and future happiness. In connection with these subjects, instructions and exercises should be given in the *art of communicating knowledge*, and on the various modes which may be employed to excite the attention, and to convey clear and well-defined ideas to the understandings of the young. The plan and routine of teaching, the various evolutions requisite for preserving order in a school, the divisions of time, the arrangement of classes, the moral treatment of the youthful mind, the punishment of offenses, the best methods of impressing upon the heart the truths of religion and the rules of morality, the method of using the different class-books, and everything else which has a relation to moral and intellectual tuition—should be explained and illustrated in minute detail.

For the purpose of exercising the students in the practical application of these instructions, *two schools should be connected with every Preceptorial College*—one for the *primary* and the other for the *higher branches* of education. Over these schools the professors, though not constant or regular teachers, should be invested with a special superintendence and control. Under their direction, each student, in turn, should be appointed to engage in the business of instruction, so as to reduce to practice the philosophy of teaching. Remarks on the manner in which he executes his office, may be made in private, and hints by which he may be enabled to correct any of the errors or defects into which he may have fallen. These remarks should have a reference not only to the mode of communicating knowledge, but likewise to the moral dispositions displayed toward the children, and the treatment they receive. While a proper degree of respect and authority is maintained, the young teacher should be taught to address his pupils in the language of kindness and affection, as a father does his children, and to avoid everything in his manner that has the appearance of being boisterous or domineering. Beside being occasionally employed in scholastic teaching, the students should be frequently exercised in the *art of composition*, and, at certain distant intervals in delivering lectures of their own composition, to the rest of the students, on any physical or moral subject they may choose to select. This practice would tend to prepare them for becoming public lecturers on the different branches of useful knowledge, in the districts where they might afterward be appointed as teachers. All the public exercises of the students, both in learning and in teaching, should be commenced with *prayer*, and a recognition of the superintendence and agency of the Divine Being, and the business of the day concluded in the same manner—a practice which, in this country, has almost fallen into disuse, especially in those seminaries devoted to the promotion of a fashionable education. In short, the whole system should be considered as chiefly of a moral and religious nature—having for its main and ultimate object,

not merely the communication of literary and scientific knowledge, but the promotion of moral order and happiness among mankind, and their preparation for the felicities and employments of the world to come. Such a noble object can only be obtained by impressing such views on the minds of the rising teachers, and training them up to habits of universal benevolence and of Christian piety and devotion, that, in their turn, they may communicate the same habits, feelings, and affections, to young immortals over whose instructions they may be afterward called to preside.

Every candidate for the office of schoolmaster, previous to being received into such a college or seminary, should be strictly examined as to his mental powers and natural capacity for acquiring and communicating knowledge, his moral principles and conduct, and his leading motives and aims in wishing to devote himself to the office of an instructor. It should be understood that he has previously acquired the elements of a common education—can read his native language with some degree of correctness, can write a tolerably good hand, and has acquired a knowledge of the leading rules of arithmetic. For it would be inexpedient to spend much time in such elementary instruction, except in the higher departments of arithmetic, and in demonstrating its fundamental rules. No candidate should be under eighteen or above thirty years of age. From eighteen to twenty-four would, perhaps, be the most eligible period for admission. The course should continue at least three years; and if the student can afford the time and expense, it may be expedient to extend it to four years. About eight or nine hours every day might be employed in public and private studies—and ten months every year, allowing a vacation of a month about midsummer, and another of the same length about Christmas. During the period now specified, under the direction of zealous and enlightened professors, a far greater portion of *substantial and practical knowledge* might be accumulated than is generally acquired at our universities, in a course of instruction extending to more than eight years. Examinations should take place, at least once a-week, to ascertain the progress made by every student, and the degree of attention he bestows on the several branches of study. After having passed through the usual course of instruction, a more minute and extensive examination should be appointed of all the candidates for the office of schoolmaster, on all the branches of instruction, both theoretical and practical, to which their attention had been directed. Those who are approved should receive a certificate, or *license*, signed by all the professors, specifying the progress they have made, and their qualifications for the art of teaching—which certificate should be considered as a sufficient guarantee to secure their admission as teachers into any vacant schools for which they may apply. Those who are found deficient in qualifications may be recommended to remain another year, or other period, to revise their studies. The teachers who had been inducted into office, previous to the arrangements now supposed, should be enjoined, or at least requested, to attend two months every year at the Preceptorial College for three or four years in succession, in order to finish their education in all those branches which are considered as necessary for an accomplished instructor.

The proper training of teachers lies at the very foundation of a moral and intellectual system of education; and no class of men but those whose

minds are furnished with a large stock of general knowledge are capable of carrying it into effect. It may be laid down as a general principle, that no man can communicate to others knowledge of which he himself is not possessed; and consequently, whatever knowledge it may be judged necessary to impart to the great mass of society, must previously exist in the minds of those who are appointed to instruct them. Even the lowest class of schools, such as infant schools, and the details of primary instruction, require men of general knowledge as superintendents and teachers. For it requires more care and attention, more experience and sagacity, and a more intimate acquaintance with the principles of human nature, to direct the opening intellect in its first excursions in the path of knowledge, than to impart to it instructions respecting any particular science in after-life. An infant school teacher, for example, should be intimately acquainted with the facts of sacred history, with general history, with physical and geometrical science, with the phenomena of nature, and the processes of the arts, with human nature in its different aspects, and with the scenes of domestic life. For, it is from these sources that he is to derive those facts, exhibitions, descriptions, and illustrations, which are requisite to excite the attention, to interest the affections, and to gratify the curiosity of the infant mind. He must tell them stories borrowed from sacred and civil history—he must describe the appearances of nature—he must perform entertaining experiments—he must tell them of other countries, and the manners of their inhabitants—he must describe the conduct of bad children and of good, and have a story at hand to illustrate his descriptions. He must *vary all his descriptions*, experiments, and anecdotes, as much as possible, so that new scenes and subjects may be gradually opening on their view, to prevent that satiety which a frequent repetition of the same topics would necessarily produce. It is evident, then, that no one but a person possessed of extensive knowledge is qualified fully to accomplish such objects.

It is an egregious mistake to imagine, that *the knowledge of a plan of teaching*, or of the mere routine of a system of education, is all that is requisite for conducting the instruction of children. This is an error, which of late has been too frequently acted upon, and which threatens to strike at the foundation of many of our infant schools. A young man, or a young lady, who has acquired only the elements of a common education, and who has never been in the practice of teaching in any seminary, is sent for six weeks to an infant school, to *learn the system*, and to witness its movements; after which they are considered as properly qualified, and inducted as superintendents of infant seminaries, without much attention being paid to the range of information they possess. I am aware, indeed, that several worthy persons of this description have conducted these institutions with considerable energy and success, especially when they entered with vigor into the spirit of their office, and felt ardent desires for their own further improvement. But it would be dangerous to the existence and utility of such institutions to recognize such a practice as a general rule,—although in their first establishment, necessity compelled their patrons to select as teachers, pious and discreet persons, however deficient in general information. For the reasons hinted at above, I am clearly of opinion, that an infant school teacher should be instructed in all the branches of knowledge to which I have

already referred as requisite for other instructors; and on this ground chiefly I rest my hopes of the permanency and efficiency of the system of infant training which has been lately introduced. In short, if the world is to be ever thoroughly enlightened and regenerated—if men of all nations and of all ranks are to be raised to the dignity of their moral and intellectual natures, and fitted for “glory and immortality,” it is *essentially requisite* that teachers of every description, whether superintending infant, parochial, or Sabbath schools, or any other seminaries, be men of decided piety, of the highest moral attainments, and possessed of *as large a measure of useful knowledge as mortal can acquire*. And, although we may not be able to procure persons endowed with such high qualifications for another generation or two, yet nothing short of such an elevated standard should be ultimately kept in view. Such characters, of course, would occupy a rank and station in society far more respectable and elevated than they have ever yet attained, and be looked up to as the directors of the intellectual and moral faculties, and the best friends and benefactors of the human race.

Four preceptorial colleges, at least, would require to be established in Scotland, and about six times that number in England, for the training of teachers. Much expense would not be requisite in their erection, excepting what behooved to be laid out in the purchase of a library, a museum, and a philosophical apparatus; which articles would be indispensable in such a seminary, and the more extensive the better. In the meantime, as a temporary expedient, arrangements might be made for establishing such a system of instruction in the different universities and colleges which already exist; as the same class-rooms presently used for the different departments of academical

instruction, might, without much inconvenience, at separate hours, be devoted to the system of instruction now proposed. The principal country in which such seminaries have yet been established, is the kingdom of Prussia, where they are designated by the name of *Normal Schools*. In 1831 there were thirty-three of these schools in full operation, containing from 40 to 100 pupils; that is, one Normal school for every 385,660 souls; the population of Prussia, according to the latest census, being 12,726,823. From these seminaries are furnished almost all the masters of the public schools, elementary and intermediate, in the kingdom. The annual expense of these establishments is 110,553 thalers, or £16,583, of which the state contributes £13,260. M. Victor Cousin, in his voluminous and somewhat tedious “Report on the state of public instruction in Prussia,” states a variety of minute details in reference to the economy and regulations of these schools, but affords us no clear idea of the *manner* in which the different branches of knowledge are taught to those who are intended to be the future teachers of primary and burghal schools. Although these institutions are, doubtless, the most respectable and efficient that have hitherto been established in any country, yet the range of instruction is not so extensive as that to which I have alluded, nor is the office of a teacher placed in that elevated rank which it ought to hold in society. Teachers in Prussia are still considered as belonging to a grade inferior to that of ministers of the Gospel, and are placed partly under their superintendence. But if teachers were once endowed with all the knowledge and qualifications to which I have adverted, they ought to be regarded as moving in a station equal to that of the most dignified clergyman.

CHAPTER XI.

ON THE PRACTICABILITY OF ESTABLISHING SEMINARIES FOR INTELLECTUAL EDUCATION.

To any new proposals for the improvement of society, however just or rational, numerous objections from different quarters are generally started. Difficulties are magnified into impossibilities, and a thousand prejudices are mustered up against innovations on established practices, and in favor of existing institutions. In attempting to establish such seminaries as now proposed, the most formidable objection would be founded on the difficulty of obtaining pecuniary resources adequate to their erection and endowment; and, it is frankly admitted, that a very large sum of money, reckoned, not by thousands, but by *millions* of pounds, would be requisite for their establishment and support. A rude idea of the requisite expenditure will perhaps be conveyed by the following statements.

It may be assumed as a fact, that the number of children in any State, from the age of two to the age of fifteen years, is about *one-third* of the whole population; at least, this proportion cannot be materially different from the truth. We find that in the States of Massachusetts, Maine, and Connecticut, North America, there is *one* out of every four of the population attending a seminary

of instruction. In the State of New York, the proportion of pupils to the whole population is as 1 to 3.9, a greater proportion than is to be found in any other country in the civilized world. The ages of the children attending these schools are, in all probability, from four or five to fifteen or sixteen years; for I presume that the children attending infant schools are not included in this enumeration. But although they were, it is well known that infant schools have not yet been multiplied to such an extent as to furnish instruction for one-fifth of the children who would require to attend these institutions. We may therefore fix on *one-third* as the proportion of the population that requires to be instructed at infant schools, and the higher seminaries of education. This position being assumed, the number of schools required in any city or country may be at once determined. Suppose, for example, we fix on a town of a medium size, such as Dundee, we can easily ascertain the number of seminaries requisite for the instruction of its juvenile inhabitants. The population of Dundee is about 48,000; the one-third of which is 16,000, or the number of individuals that require instruction. Suppose 80

scholars, at an average, to attend each school, there would require to be no less than 200 seminaries erected to supply adequate instruction for such a town. Of these, 50 would be requisite for *infant instruction*, and 150 for the instruction of children from the age of six to the age of fifteen, in the higher branches of education specified in the preceding part of this work. According to a statement made in Parliament, by Mr. Colquhoun, in June, 1834, there is only *one-fifteenth* of the population of this town at present receiving the rudiments of a common education; so that, instead of 16,000 receiving instruction, there are only 3,200, and instead of 200 schools, averaging 80 children in each, there are only 40 schools* on an average, containing the same number, which is only *one-fifth* of the number of schools which require to be established. *In order to supply Dundee with proper education*, a large building has lately been erected at an expense of about £10,000, which is called "*The Dundee Seminars*," where about 200 or 300 children receive education. The expense was supplied partly by subscriptions, and partly by funds belonging to the town; and the whole of this sum has been expended merely to afford accommodation for the children of 100 or 150 genteel families! while the great mass of the population has been entirely overlooked. There is no law against the children of the middling and lower classes attending that seminary; but the fees demanded amount, in their case, to an absolute prohibition. With the same sum of money, *ten* commodious seminaries, capable of containing accommodation for 200 pupils each, or 2000 in all, might have been established. It has never yet been stated to the public, *on what principle* education is to be conducted in these seminaries—whether it is to be conducted on the *old system*, or whether a plan of intellectual instruction is to be prosecuted—a most important matter, which ought to have been determined before a stone of the building was laid, or even before a plan of it was selected. For the plan and arrangements of any building intended for intellectual instruction ought to be materially different from those of others, and to have conveniences and arrangements peculiar to itself. But the erection of an expensive and *splendid building*, as an ornament to a commercial town, seems to have been an object of far greater importance, in the view of the Committee of Education, than the arrangement of an efficient plan of moral and intellectual tuition. Such are the principles and views of many in this country who profess to be the patrons of education!

Let us now consider the number of seminaries which the whole of Scotland would require. The population of Scotland, according to the census of 1831, is nearly 2,400,000, the one-third of which is 800,000. Supposing, as before, 80 children at an average in every school, there would be no less than 10,000 schools required for the efficient instruction of all the youth from two to fifteen years of age—of these 2500 would be infant schools. According to Mr. Colquhoun's statement, "the number of parishes in Scotland is 907, and the parochial schools of Scotland at this moment, 1005;" so that, in Scotland it would be requisite to establish *ten times* the number of schools that presently exist, in order to the efficient instruction of the whole population. On the supposition that there are about 1000 private schools, beside the parochial

or two schools, at an average, for every parish there would still be required 8000 additional schools, or *five times* the number presently existing. Taking the population of England at 14,000,000, the number of children to be educated will be 4,666,666, and the number of schools, allowing 80 for each, 58,333, or nearly six times the number of schools required for Scotland; so that in the whole island of Great Britain there would require to be established *sixty-eight thousand three hundred and thirty-three schools*.*

Let us now consider the expenses which would be incurred in the erection of such schools. Estimating the expense of each school at £1000, that is, about £700 for the building and playground, and £300 for maps, views, library, apparatus, museum, &c., the neat cost of the schools for Scotland would be *ten millions* sterling. But, if infant schools, wherever they are required, were to be connected with the other schools, so as to be under the same roof, the former on the ground-flat and the latter on the upper,—a building consisting of two stories, with suitable accommodation for both departments, could, I presume, be erected for the sum of £700. In this case, the number of erections would be reduced to 7500; and the whole expense would amount to £7,500,000. On the same plan, the number of school-houses required for England would be reduced to 43,750, and the expense would be £43,750,000; that is, about *fifty-one millions* for the whole of Great Britain. If we suppose, what is not improbable, that the number of infant schools, instead of bearing a proportion to the other schools as one to three, as here supposed, would require to bear a proportion of one to two, or half the number of the other schools, the number of school-houses would be reduced to 6666 for Scotland, and the expense to £6,666,000; and for England, to 38,889 schools, and the expense to £38,889,000; so that the whole amount of expenditure for both divisions of the island would be about 45½ millions.

This will appear, in the eyes of many, a most prodigious sum—a sum which we can never hope to realize. It is admitted, that the sum is great; but nothing in proportion to the magnitude and importance of the object intended to be accomplished—which is nothing less than to raise the great mass of our population from degradation and misery,—to irradiate their minds with knowledge—to inspire them with moral principle and holy affections—to render them happy in this world—and to prepare them for the noble enjoyments of the life to come;—in short, to strike at the foundation of every moral evil—to counteract the principles of vice and criminality of every kind—and to make the moral world, in all its departments, move onward in harmony and order. Surely, if such objects could be accomplished, we need not grudge the expenditure even of a hundred millions of pounds. And such objects will never be accomplished, nor will the moral world be ever thoroughly improved, until such a system of moral and mental tuition as we have faintly sketched, be universally established. We sometimes talk about the approaching Millennium, and look forward to it as if it were to be introduced by some astonishing miracle, similar to that which caused the chaotic mass at the Mosaic creation to be enlightened, and reduced to beauty and order. But such views are evidently fallacious, and contrary to what we know of the general plan and tenor of the Divine government; and they have

* There is a greater number of schools in Dundee than the number here stated, but the average attendance of scholars is only 43 in each school.

* On the same data, the number of schools required for the United States of America, would be above 54,000.

no other tendency but to unnerve our energies, and to damp our exertions in the cause of human improvement. Throughout the whole range of the Divine dispensations recorded in Scripture, we can point out no miracle that was ever performed, where the operation of the established laws of nature, and the ordinary powers of human agents, were adequate to accomplish the end intended. Man, under the present dispensation, is "a worker together with God,"—in accomplishing his purposes; and, under the agency of that Almighty Spirit which "moved upon the face of the waters" at the first creation, is able to accomplish all that is predicted respecting the Millennium—provided his *rebellious will* were subdued, and his moral energies thoroughly directed to this grand object.

It is owing to the sin and rebellion of man that this world has undergone such a melancholy derangement, both in its physical and moral aspect; and it will be by the moral and mental energies of man, when properly directed by the Divine Spirit, that the chaotic mass of the moral world will be reduced to harmony and order, and the wastes and barren deserts of the physical world adorned with fertility and rural and architectural beauty, so that "the wilderness and the solitary place will rejoice and blossom as the rose." It is one chief ingredient in the happiness of man, and an honor conferred on him, that he is selected as an agent, under God, for bringing about such a glorious consummation; and there is no man that ought to assume the name of a *Christian*, who is not ready to exert his activities, and to sacrifice a considerable portion of his wealth in this service.

Under the Old Testament economy, the pious Jews brought forward to the service of God, their tithes and free-will offerings, their bullocks and rams, and "the first-fruits of their increase." When Solomon had dedicated the temple, he offered a sacrifice of 22,000 oxen, and of 120,000 sheep; and when Hezekiah set himself to purify the worship of God, and to promote reformation in Israel, he gave to the congregation a thousand bullocks, and seven thousand sheep—the princes gave a thousand bullocks and ten thousand sheep—and the common people "brought in abundance, the first-fruits of corn, wine, and oil, and honey; and of all the increase of the field, the tithe of all things, brought they in abundantly, and laid them in heaps upon heaps," for four months in succession, so that Hezekiah was astonished at the voluntary liberality of the people, "and blessed the Lord and his people Israel." When the tabernacle in the wilderness was about to be reared, "both men and women, as many as were willing-hearted, brought bracelets and ear-rings, and rings, and tablets, all jewels of gold; and every man that offered, offered an offering of *gold* unto the Lord. Every man with whom was found blue and purple, and scarlet, and fine linen, and goats' hair, and red skins of rams, and badgers' skins, brought them. Every one that had silver and brass and shittim-wood for any work of service, brought them. All the women that were wise-hearted did spin with their hands, and brought that which they had spun, both of blue and purple, and scarlet, and of fine linen. And the rulers brought onyx stones, and stones to be set, for the ephod and for the breast-plate. Every man and woman brought a willing offering to the Lord, until they had much more than enough for the service of the work which the Lord commanded to make."* These offerings were, doubtless, em-

blematical of the exertions which would be made, and of the costly offerings which would be brought forward for rearing the fabric of the New Testament church. But what are all the offerings which have been hitherto received for this purpose, compared with the offerings now stated, or what is requisite to accomplish this grand object! One of the offerings above stated as made by Solomon is equivalent to more than five hundred thousand pounds of British money, which is more than the amount of the funds of the British and Foreign Bible Society, and all its auxiliaries, during the first ten years of their operation. Christians do not seem to have yet recognized their duty, to devote a certain portion of their substance to the service of God and the improvement of man. The pitiful sums hitherto devoted to these objects, compared with what is expended in gratifying pride, and ambition, and luxury, is a libel on the Christian world. If we had right views of the grandeur and importance of such objects, instead of contributing sixpences, shillings, and guineas, we should behold wealthy Christians devoting hundreds, and even thousands a-year, to the improvement of society and the advancement of the interests of religion; and all this could be done by thousands in our country, without depriving themselves of a single comfort or sensitive enjoyment.

Let us consider, for a moment, the sums we have expended in madness and folly, in the pursuits of ambition and the desolations of war—and we shall be able to determine whether it be not in our power to raise 40 millions of pounds for the improvement of society. It has been calculated, that, out of 127 years, commencing with 1688, and terminating in 1815, England spent 65 years in war, and 62 in peace. The war of 1688, after lasting nine years, and raising our expenditure in that period 26 millions, was ended by the treaty of Ryswick, in 1697. Then came the war of the Spanish succession, which began in 1702, was concluded in 1713, and absorbed 62½ millions of British money. Without noticing the wars of the Pretender in 1715 and 1745, the next was the Spanish war of 1739, settled for at Aix-la-Chapelle in 1748, after costing 54 millions. Then came the seven years' war of 1756, which terminated with the treaty of Paris, in 1763, in the course of which we spent 112 millions. The next was the American war of 1775, which lasted eight years, in which crusade against the liberties of mankind, we expended no less than 186 millions. The French revolutionary war began 1793, lasted nine years, and exhibited an expenditure of 464 millions. The war against Buonaparte began in 1803, and ended in 1815. During those twelve years of extravagance and carnage, we spent the enormous sum of 1159 millions! 771 of which were raised by taxes, and 388 by loans. In the war of 1688 we borrowed 20 millions; in the war of the Spanish succession, 32½ millions; in the Spanish war of 1739, 29 millions; in the seven years' war, 60 millions; in the American war, 104 millions; and in the revolutionary war, 201 millions;—so that the sums borrowed in these 7 wars, during 65 years, amounted, in all, to above 834 millions. During the same time, we raised by taxes 1499 millions—forming a total expenditure of 2333 millions! which is equal to about £100 for every man, woman, and child in Scotland, or about £600 for every family; and which would be sufficient to establish a system of education, such as we have described, for a population of about 820 millions; or, in other words, for all the inhabitants of the globe. Thus we see, that when

* See Exod. xxxv. 21-30, &c.—2 Chron. vii. 5; xxx. 24, and xxx. 5-8.

ambition and revenge are to be gratified, when tyranny is to be supported, when the human race is to be slaughtered by millions, and when all the arts of mischief and destruction which the demon of war has devised, are to be brought into operation—there is no want of funds to carry such schemes into effect. During the war with Buonaparte 40 millions would have been considered as a mere item in the national expenditure, amounting to little more than the war taxes of a single year. And shall it ever be said that such a sum cannot now be raised for counteracting moral evil and human misery, and training our population to “glory and immortality?” That man who would oppose such a grant, whatever rank he may hold in society, ought to be branded as an enemy to his species. It was but the other year that twenty millions were granted for the emancipation of our colonial slaves, and scarcely a voice was lifted up against it; and there is not an individual at this moment that can say that he personally feels any part of the burden. It requires only that a similar sum be doubled in order to set in motion a machinery which would, ere long, promote the renovation of the British population, and ultimately, of all the inhabitants of the globe.

Let us consider, further, a few more items of our expenditure, which might be saved and appropriated to purposes of human improvement. We have, for example, a *pension-list*, the amount of which, for the last half century, would more than accomplish all the objects to which I allude. This list includes the names of many hundreds, nay thousands of individuals, who never performed the least service for the benefit of their country, and yet have been permitted to devour thousands, and even millions, of the wealth of the nation. A considerable portion of these individuals are *ladies*, connected with the nobility and gentry, no one of whom ever wrote a treatise on any subject, promoted a useful invention, or handled a single musket in defense of their country. One of these ladies, since 1823, has pocketed more than £10,000; another, since 1803, above £16,000; another, since 1784, above £28,000; and two ladies, belonging to the same family, £28,096. One family, consisting of four individuals, one of whom is a lady, since 1787, has swallowed up no less than £86,000 of the national resources; and two individuals, belonging to another family, the sum of £60,816. About a dozen individuals, belonging to seven or eight families, have consumed no less than £280,000, wrung from a nation ground down under the load of excessive taxation. What, then, would be the amount of *all the sums* which have been expended on the *thousands* of individuals whose names have been recorded in the pension-list during the last 50 years! And, be it remembered, that most, if not all, of these persons are possessed of independent fortunes, are connected with the higher circles of society, and scarcely a dozen of them have performed a single action that entitled them to such remuneration—while many worthy individuals, men of science and philanthropy, who have promoted knowledge and the best interests of society, have been left to pine in poverty, and to pass their lives in an inglorious obscurity.—Another item which might be saved, and devoted to the purpose of mental improvement, is the immense sums which have been expended in *electioneering contests*. In some instances, no less than *forty thousand pounds* have been expended by a single family in endeavoring, for selfish purposes, to obtain for a friend a seat in Parliament, which were wasted in promoting bribery, perjury, broils, contentions, rioting, and

drunkenness. In the late elections (January, 1835) we have reason to believe that several millions have been expended. Supposing that there were only 550 contested elections—that only two individuals were opposed to each other—and that the average expense of each candidate amounted to £3000, the whole sums wasted in this manner would amount to *three millions three hundred thousand pounds*. In one or two instances it is asserted, that the expenses incurred by a single candidate were no less than twelve and fifteen thousand pounds.—The expenses, too, connected with *sinecure offices*, which have been bestowed on wealthy individuals, would be nearly sufficient to pay the annual interest of the sum requisite for establishing all the institutions to which I have adverted. It has been calculated, that the incomes of only eleven persons connected with the “Peel and Wellington ministry,” along with some of their friends—derived from sinecures, places, and pensions—amount to about £88,000 per annum, beside their official salaries as ministers of the crown. The Duke of Wellington alone—including pensions and interest of grant—is said to cost the country £33,104 a year.—Almost all the money expended in elections might be saved, if proper laws and regulations were adopted, and if electors were uniformly *permitted* to act as rational beings, and to vote according to the dictates of their consciences; and if only half the expenses usually incurred on such occasions were devoted to nobler objects, it would form an important item in the expenses requisite for establishing philanthropic institutions. As to sinecures, either in church or state, it is nothing short of barefaced robbery of the national wealth, and an insult offered to an enlightened people, that such offices should exist; and, particularly, that they should be bestowed on those who are living in splendor and luxurious abundance.

Beside the savings which might be made in the public expenditure, there is still a greater sum which might be saved from various *items* in the private establishments of wealthy individuals, which might be devoted to national improvements. The saving of a single bottle of wine a-day, would amount to £50 a-year; the discarding of an unnecessary servant, to nearly the same sum; keeping four horses instead of six, would be a saving of at least £60; and discarding a score of hounds would save more than a hundred pounds a-year. There are thousands in our country, who in this way could save £500 a year, to be devoted to rational and benevolent purposes, without feeling the least diminution of their sensitive enjoyments. There are hundreds of thousands in the middle ranks of life who could save £20 a-year, by discarding *unnecessary* luxuries, in regard to houses, furniture, food and clothing, and feel themselves just as comfortable as before; and there are many more among the lower ranks who could save several pounds every year, which are now wasted either in folly or intemperance, and find themselves richer and more comfortable at the close of the year than at any former period. Let us suppose, what is perhaps not far from the truth, that there are 50,000 individuals, or the 1-320th part of the British population, who, at an average, have incomes of £3000 per annum, and could devote £300 a-year to public purposes—some much more, and some less; this would amount to *fifteen millions* a-year. There may next be reckoned about 200,000 with incomes, at an average of £300 per annum, who could devote a similar proportion, namely £30 per annum; which would amount to *six millions*. Supposing

the population of Great Britain to be 16,000,000, and that only one-fourth of this number, namely 4,000,000, have it in their power to devote a certain portion of their income to the purposes alluded to, there would still remain 3,750,000 of the lower classes, who might be supposed, on an average, able to devote *one guinea* a-year, to the same objects, which would amount to nearly four millions. So that *twenty-five* millions of pounds might be raised *annually* for literary, philanthropic, and religious purposes, without any one feeling the loss of any sensitive enjoyment, but, on the contrary, enjoying the purest gratification in beholding improvements going forward, and the plans of benevolence gradually accomplishing. Passing many other considerations of this kind, the only other item of expenditure I shall notice, is, that which is spent in the purchase of *spirituous liquors*, which are for the most part devoted to the purposes of *intemperance*. According to an estimate made by Mr. Buckingham and the committee appointed by Parliament to investigate the state of intemperance, it appears, that, within the limits of Great Britain and Ireland, there is a loss sustained by the use of ardent spirits amounting to nearly "*fifty millions sterling per annum!*" It is stated, that, in the city of Glasgow alone, the sum expended in intoxicating drinks "is nearly equal to the whole amount expended on public institutions of charity and benevolence in the entire united kingdom." This item alone would be more than sufficient for all the purposes of philanthropy and universal improvement. I shall only add further, that, were all the *bishoprics* in England reduced to £2,000 a-year, the balance would furnish several hundred thousands of pounds a-year which might be devoted to educational purposes; and both religion and education would be promoted by such an arrangement. Still, our bishops would have more than double the income of the Protestant bishops on the Continent, and would likely perform more substantial services than they now do to the cause of religion. Conversing lately with an intelligent Prussian gentleman on this subject, he informed me that the clergy in Prussia of the same rank with vicars and rectors in the Church of England, have an income of from £100 to £250, reckoned in British money; and that the salaries of the bishops are only from £300 to £500, and that they are far more actively engaged in the services of the church than the bishops of England.

Thus it appears, that, there is, in reality, no want of resources for establishing an efficient system of moral and intellectual education on the most splendid and extensive scale. Instead of forty millions in all, we could raise forty millions per annum, and would ultimately be gainers by such a sacrifice, in the diminution of crime, the protection of property, the progress of improvement, and the increased physical and mental powers of our population. We have the *power* and the *means* to promote the reformation of society, and even the renovation of the world at large, if we had the *will* to apply them. But this is the grand desideratum. To attempt to convince some of our dukes and marquises, our bishops and squires, our fox-hunters, horse-racers, and fashionable gamblers, that it is their duty to contribute of their abundance for such an object, would be as vain as to beat the air, to speak to the hurricane, or attempt to interrupt the dashings of a cataract by the breath of our nostrils. But there is one class of the population to which I would address myself with some hopes of success—namely, members of the Christian Church on whom Provi-

dence has bestowed a considerable portion of wealth and influence. Many of these have already come forward with a noble liberality in the cause of missions and of general philanthropy; and they require only an additional stimulus to excite them to still more liberal exertions in the cause of human improvement. But the generality of Christians seem to have forgotten the Divine declaration, "The silver is mine, and the gold is mine, saith the Lord of hosts;"—and that a goodly portion of the wealth which God hath bestowed upon them, ought to be *directly* consecrated to his service. The church itself has hitherto been too remiss on this point, and has not been careful to enforce upon the consciences of its members, their indispensable obligation to devote their treasures to the promotion of religion and of public improvement. How many nominal Christians do we see living under the influence of that "*covetousness* which is idolatry,"—hoarding up hundreds and thousands of pounds, for the purpose either of avarice or ostentation, or under pretence of providing fortunes for their families, while it is with the utmost difficulty that a single guinea can be squeezed from their pockets for any object of benevolence or public utility? Almost every one seems to reason, like the Duke of Newcastle, that he has a right "*to do what he pleases with his own*," not considering that he is responsible to God for the use he makes of his riches, and for every shilling he withholds from his service.

Under the Mosaic economy, the Jews were enjoined to devote a *tenth part* of their substance to the Levites and the Priests, or, in other words, for the purpose of supporting education and the worship of God; for the Levites were the principal instructors of the people. Under the Christian dispensation, the same proportion, if not more, ought to be voluntarily offered for carrying forward those plans which have a tendency to promote the honor of God and the good of mankind. In certain cases, where a wealthy individual has no family of his own, I conceive it is his bounden duty to devote at least the one-half of his riches to such purposes. Until such views and practices become more general among Christians, we must still look forward to a *distant* period for the arrival of the Millennium. For the purpose of hastening the approach of this glorious era, we are told, in ancient prophesy, that the "kings of Tarshish and of the isles, shall bring presents and offer gifts"—that "the flocks of Kedar and the rams of Nebaioth," shall be brought as acceptable offerings to the altar of God,—that "the glory of Lebanon, the fir-tree, the pine-tree, and the box together, shall beautify the place of his sanctuary;"—and that, "they shall come on camels and dromedaries, and bring *gold* and incense, and show forth the praises of the Lord." Such offerings are expressions of our gratitude to God for the bounties of his providence and the riches of his grace, and of our desire to co-operate with him, in bringing into effect the purposes of his will and the predictions of his word; and no one who is indifferent to such objects ought to assume the character of a follower of Jesus. And, let Christians remember, that by carrying forward such a system of education as that to which I refer, they are using the most efficient means for promoting the extension of the Gospel. For the Gospel can never be universally understood or appreciated, until the young be universally educated. It is owing to the want of education, and the ignorance and vicious habits that result from it, that multitudes refuse to enter within a place of worship, and

when they do come, are incapable of fixing their attention on religious objects, or of understanding the truths delivered.

In the above statements and remarks, I have taken for granted, that the government of this or of any other country might afford, from the national funds, a grant of money adequate to the establishment of all the institutions to which I have alluded—whether infant schools, Sabbath evening institutions, seminaries for the higher branches of moral and intellectual instruction, or preceptorial colleges for the training of teachers. But although no government were to feel the least interest in such institutions, it is *in the power of the people*, and within the range of the *means* they actually possess, to establish them, independently of any extraneous support. This, I trust, will appear from the considerations stated in the preceding paragraphs. Let a general “agitation” be excited on this subject—let the *importance* of it be clearly proved and illustrated—let the *necessity* of doing something more than has hitherto been done in this respect be fully established—let a *conviction* be deeply impressed upon the minds of the influential classes of society, of the *utility* of such exertions for counteracting immorality and crime, for improving the social state of human beings, and preparing them for future felicity—let societies be formed and subscriptions entered into for this purpose—and let a few seminaries of the description referred to, be erected in different districts of the country,—and I have little doubt that a spirit of improvement in this respect would ere long pervade the mass of the community. Although many would stand aloof, and even spurn at such movements, yet I trust there is still as much virtue, and liberality, and philanthropy among us, as would lead to no inconsiderable exertions in the advancement of society in knowledge and religion. For my own part, I have no hesitation in pledging myself to devote one-fifth of my annual income, in the first instance, and *one-tenth* of it every year afterward, for the promotion of the objects now stated: provided three hundred individuals in this or any other country, shall come forward and pledge themselves to dedicate a similar proportion of their incomes to the furtherance of the same object.* Such is the importance I attach to the subject and the plans under consideration; and I feel confident, from the improvements now going forward and in agitation, that something more extensive and efficient in this respect than has ever been attempted, will, ere long, be accomplished. There is a certain people, at whom many of our British grandees and newspaper critics are disposed to sneer, and upon whom they affect to look down with a certain degree of contempt, who, I am confident, will be the first to move forward in this work of improvement. They have already made

an advance in education beyond that of any other civilized nation, but their system is not yet perfect, nor universally extended. The subject, however, is exciting among them almost universal attention, and whenever a hint for further improvement is given, it will, I doubt not, be eagerly seized upon, and speedily reduced to practice. They have lately undermined, to a great extent, the cause of *intemperance*, and they have it now in their power to consecrate the millions of dollars which were formerly spent in degrading sensuality, to the furtherance of education, and the cause of national improvement.* If Britain does not soon arouse herself from her slumbers and move forward in the cause of education, it will be degrading to the rank she holds in the civilized world, to reflect, that she is far excelled in this respect by a republic on the one hand, and a despotical government—(Prussia) on the other. The only grant of money that was ever directly given by the British Parliament for the promotion of education, was £20,000, which was conceded by the House of Commons in 1833; and Mr. Colquhoun stated in 1834, that “the utmost that Scotland required (ultimately) for the supply of education was a provision of £60,000 per annum.” The proposal of such *pitiful sums* for so grand and extensive an object, is little short of an insult offered to the cause of education, and plainly indicates the imperfect and limited views which are still entertained on this subject. Some of our members of Parliament, when they talk of education, appear to mean nothing more than giving the mass of the community a few general instructions in reading, writing, and arithmetic, according to the old inefficient system which has so long prevailed. The only gentleman who has broached this topic in the House of Commons, and who appears to entertain clear and comprehensive views on the subject of education, is Mr. Roebuck; but, unfortunately, his proposals and his luminous exposition of this subject, seem to have been, in a great measure, unappreciated and neglected.

Supposing seminaries established to the extent which the population of any country requires, a difficulty still remains to be surmounted; and that is, How we shall be enabled to induce parents and guardians of all ranks to send their children to the different schools appropriated for their instruction? It would certainly be eligible, in the first instance, to try the effects of *moral suasion*—to represent to reluctant parents, in the most affectionate manner, the utility and importance of rational and moral instruction, both to themselves and to their offspring—the beneficial effects that would accrue to them even in the present life, and the moral certainty that they would be directed in the path which leads to happiness in the life to come;—and, in every instance, where poverty, or a disinclination to pay the fees, stood in the way, the children should be educated free of expense to the parents. For this purpose, about ten millions more, for Great Britain, would require to be annually raised, for defraying the charge of educating the children of the poor, and affording salaries for the teachers in every case where salaries are required. Few parents would be found who would perseveringly resist the force of such arguments. But, should moral suasion be insufficient for this purpose, a law might be passed, as in Prussia, rendering it imperative on every parent to have his children, of a certain age, regularly attending an appropriate seminary.

* To prevent misconceptions, it may be proper to state, that the author's income, like that of Goldsmith's “country clergyman,” has, for eight years past, scarcely exceeded “forty pounds a year,” exclusive of the house in which he lives; but should it be increased in future years, the same proportion shall be allotted for the object now specified, and a similar proportion shall be deducted from whatever profits he may derive from the publication of the present volume, or any other that may succeed it. Three hundred gentlemen whose incomes average £200 a year, could, in the first instance, furnish a sum to commence with, amounting to £12,000, and every succeeding year a sum of £6000 to carry forward their operations; so that, in the course of ten years, £66,000 would be raised, which would be sufficient to establish nearly seventy seminaries, with their libraries, apparatus, and museums. However romantic it may appear to some to expect such sacrifices, the sums now specified are nothing more than what were paid as a *tax* on such incomes during the late war with France; and they are now solicited only in the shape of a voluntary donation.

* Here I allude to the Northern States of America, particularly to Pennsylvania, New York, New Jersey, Massachusetts, Connecticut, and Maine.

Such a law would not require to be rigidly enforced beyond the period of a generation, or even a period of twenty years. For the children, once thoroughly trained in morality and religion, and in all the branches of useful knowledge formerly specified, when they arrived at manhood, and had families of their own, would require no persuasion or extraneous excitement to induce them to give their offspring all the education that can possibly be obtained. The advantages they themselves have experienced from instruction, and the relish for knowledge they have imbibed, would be instead of a thousand arguments to impel them to

seize upon every mean of instruction within their reach; and any individual who reasoned or acted otherwise, would be considered as a *phenomenon* in society. Ignorance and its usual accompaniments, obstinacy and self-conceit, are the chief obstacles which prevent rational arguments from producing their effect, and which render compulsory measures, in certain cases, expedient. But when a community has become once thoroughly enlightened and moralized, the path of duty is clearly perceived to be the path of interest and of happiness, and compulsory enactments are rendered unnecessary.

CHAPTER XII.

ON THE UTILITY OF ESTABLISHING SEMINARIES FOR UNIVERSAL EDUCATION.

VARIOUS insulated remarks on this topic have been interspersed in the preceding pages, and "the advantages which would result from a more general diffusion of knowledge among all ranks," have been illustrated in a separate volume.* I shall, therefore, in this place, advert to only two or three additional considerations.

I. The establishment of schools for universal instruction, while it counteracted ignorance, and improved the intellect—*would tend to the prevention of crime*, and might ultimately extirpate those dispositions and affections which led to it.

It was lately stated in the *Times* newspaper, as the result of a moderate calculation, that there are 50,000 thieves and pickpockets in and about London. According to the statement of an intelligent person, who acted several years as the teacher of the boy-prisoners in Newgate,—there are above fifty committals to this prison every week, on an average, or nearly 3000 in the year. The persons committed, of course, are not all new offenders, as the same individuals frequently return again. But, although on this account we subtract two or three hundreds from this sum, the black catalogue swells to a dreadful amount when we add to it the number of prisoners committed to the penitentiaries, correction-houses, and other jails of the metropolis. The trials at the Old Bailey average 2550 in the year, and they are said to be hurried forward with appalling rapidity; the average time given to each case being only eight minutes and a half; though many cannot occupy two, three, or at most five minutes, as the average time now stated includes trials that will last a day, and others that occupy several hours. According to a Report of a Committee of the House of Commons, there were confined in prisons and bridewells, during seven years, ending in 1831, 122,000 persons accused of crimes, or at the rate of 17,428 per annum. Of these, 85,000 were convicted of the crimes laid to their charge, so that 12,142 was the average amount of the yearly convictions. It has been estimated, in regard to juvenile delinquency, that more than 1500 boys, in London alone, are employed in thieving, picking pockets, and committing all kinds of petty depredations. It is also found, that crimes, so far from diminishing, are,

in this country, regularly increasing. From the Report of a late Committee of Parliament, it appears, that, during the last 14 years they have increased in the proportion of *twenty-four to ten*, that is, they have been far more than doubled in the course of that short period. These statements exhibit a frightful view of the extent and the progress of crimes. Nor is it to be wondered at, when we consider the present state of education, and the manner in which it is conducted—the principles on which our penal code has been constructed, and the manner in which our criminal laws are executed. Our penal code, throughout all its departments, is deeply imbued with the spirit of *revenge*. To produce *pain and disgrace* to the criminal appears to be its principal object; and, in the great majority of instances, it has the effect of hardening and rendering more desperate the persons whom it ought to have softened and reformed. To reform the criminal, to cure him of the moral disease which led him into crime, to impart appropriate instruction to his mind, and to prepare the way for his restoration to society as a renovated character, are circumstances which seem to have been entirely overlooked in the arrangements connected with our criminal legislation. In this respect a dreadful infatuation seems to have seized upon our legislators, implying a deficiency both of wisdom, of humanity, and of benevolence. When certain species of crime are on the increase, laws still more severe are enacted, and put in execution with all the pomp and rigor of authority and revenge. If whipping and imprisonment, toiling at the tread-wheel, laboring in the hulks, and transportation beyond seas, are insufficient to arrest the progress of crime, then *executions* without number are resorted to, in order to sweep the culprits at once from the face of the earth. One enactment after another issues from the source of power; one law comparatively mild is canceled, and another more severe substituted in its place; a severe punishment is sometimes modified and rendered less severe; the sentence of death is commuted into transportation for life, and a year's labor at the tread-mill for seven years' transportation. Every year new enactments, laws, and regulations, with alterations and modifications of former laws, issue from the legislative department of government; but all is of no avail to stop the progress of immorality and crime. Nor need we wonder at such a result; it is pre-

* "The Improvement of Society by the Diffusion of Knowledge," first published in 1833, of which two editions have been published in Scotland, and four or five in America.

cisely such as we ought to expect from such a mode of legislation as now exists. Our state physicians act nearly in the same manner as the quack, who, instead of striking at the root of a sore which is undermining the constitution, covers it over with a slender skin, and leaves the internal *virus* to gather strength until it break out in incurable ulcers, throughout every part of the system. They attempt to lop off the twigs and branches from the tree of crime, while they leave the root and the trunk to break forth afresh in still greater luxuriance. No efficient *preventive* system has yet been arranged to strike at the root of crime, to prevent its growth, and to make the machinery of society move onward with smoothness and harmony. And, so long as preventive measures are overlooked, and moral training neglected, the severest laws that can be framed will be altogether inefficient to counteract the criminal propensities of the human heart.*

Our legislators and political quacks tell us, that the design of severe punishments is to deter others from the commission of crimes. But even this object they are altogether insufficient to accomplish; for it is well known, that in those countries where punishments are most appalling and severe, crimes are the most frequent. Even the dreadful punishment inflicted in Russia on the pirates and robbers who infested the banks of the Wolga, who were hung alive on hooks fastened into their ribs, and left to pine away in agonizing torture for days together, and in hundreds or thousands at a time, was insufficient to put a stop to the robberies it was intended to prevent; and it has been lately abolished. If we compare the crimes committed under some of the despotical governments of Europe, with those committed in the United States, where the laws are comparatively mild and equitable, we shall find that there are *much fewer* crimes committed in the latter case than in the former. That capital punishments have little influence in deterring from criminal practices, appears from the circumstance of robberies being frequently committed among the crowds assembled during the time of an execution. The following example, extracted from "The Schoolmaster in Newgate," will illustrate our position:—"One morning a boy," who appears to have been previously in the habit of pilfering, "came into his father's room, and seeing nothing to eat for breakfast but bread and butter on the table, he said, 'What! nothing for breakfast? Ah! wait a bit.' He then went out, and in a quarter of an hour came back with rump steaks and a pint of rum, beside having money in his pocket. He had gone out, and stolen a piece of Irish linen from a shop on Ludgate Hill, took it to a buyer of stolen goods, and bought the articles he had brought home, all in the short space of fifteen minutes; and this was not an uncommon thing for him to do, although his parents were not in need. The boy was at length transported, when he was only fourteen years of age. He subsequently detailed to me all his practices, and how he got into crime. His parents resided

in a court running out of the Old Bailey, and he had witnessed every execution which had taken place during his short career." So much for the effect of executions, as supposed to deter from crime;—indeed most of the boys engaged in crime appear to have a great pleasure in attending executions. The author adds: "These boys are capable of receiving impressions, and are as susceptible of sentiments of gratitude as any lord's son, if the proper treatment were used to draw them out. It is only by cultivating the best feelings of our nature, that any human beings can be improved; all other systems are fallacious, and founded on gross error." The same author informs us, that "There are *whole families* who had never any other calling but that of *thief*—ay, hundreds of such families are now in being in London who have continued the same course, some for twenty, thirty, or forty years. One old woman said, last year, when her seventh son was transported: 'Ha! I know not what I shall do, now poor Ned is going; he was a good lad to me; and though I say it, he was as good a hand at his business as any in London.' 'O, then, he was brought up to business,' I replied. She rejoined: 'God bless you, no! I thought he had told when you made his brief that ours was a right sort of *cross* family;' adding, 'and so was their father's father, and good ones they all were; now there's little Dick, my eldest son's boy; but I think he'll never make the man his father did—he's dull; beside, he's not old enough quite for any good business yet.' Some of these pathetic mothers will, when warmed with the *cream*, speak of the numbers which have fallen in their families with as much pride and exultation as a Spartan mother of old used to do, when numbering her sons who had fallen in their country's cause. The increase of these families is daily going on, through intermarriages, and other ramifications of family connections; and thus, in a great measure, is the problem solved, as to the increase of crime. This is an epitome of the history of the poor in London and its environs, which might have been given of them forty years ago, and will apply, for ages to come, unless the legislature grapple with the subject at once." Such facts evidently show, that neither severity of punishment, nor any other arrangement yet made by our legislators, is adequate to arrest the progress of crime, and to promote the reformation of society.

The *deficiency of education* in our country, as well as the inefficiency and absurdity of our penal enactments, will account for the increase of crime. Instead of one out of four of the population, attending instruction, it is estimated that in England only one out of sixteen, in Scotland one out of ten, and in Ireland but one out of eighteen, are receiving scholastic instruction, which, in most cases, is miserably deficient; "every miserable garret or hovel in which weakness or decrepitude ekes out a wretched subsistence, by abusing the title of teacher—being dignified with the name of a school." But let us come to particulars. According to the "Report of the British and Foreign School Society," for 1833, it is intimated that in the Metropolis alone, above 150,000 children are growing up without education. In one village, containing 273 families, consisting of 1467 persons, only 562 were found able to read. In other districts, villages are pointed out containing 1000, 1500, or 2000 inhabitants, without any efficient school. Whole families are described as having reached maturity, without any member of them being able to read a single letter; in short, that

* America is almost the only country where a considerable degree of attention has been bestowed on this subject. The inhabitants of the United States are greatly in advance of European governments in this respect, having established systems of penitentiary discipline, on enlightened principles,—connected with regular labor and religious instruction—in Auburn, Sing-Sing, Weathersfield, Pittsburg, and other places, which have already been attended with the most beneficial effects. Of course, several defects still attach themselves to these establishments; but the plan lately proposed by Mr. Livingston, Secretary of State at Washington, promises to carry such penitentiaries, in their principle and operation, very near to perfection.

many thousands of children are growing up in utter ignorance, not only of the elements of learning, but of all moral and religious obligations. In the town of Nottingham, it is asserted, in a circular lately published, that above a *thousand* children of an age suitable for school, are growing up in total ignorance. From a canvass lately instituted by the Committee of the Herefordshire Auxiliary Bible Society, it appears that out of 41,017 individuals visited, only 24,222, or little more than one-half, were able to read.* In the Report of the British and Foreign School Society for 1831, is the following statement: "Debasement prevails to an extent which could not be credited, were it not verified by the closest investigation. The facts which have been elicited respecting the moral and intellectual state of those counties which have been disgraced by riots and acts of incendiarism, are truly affecting, and yet they are but a fair representation of the actual state of our peasantry. Out of nearly 700 prisoners put on trial in four counties, upward of *two hundred and sixty* were as ignorant as the savages of the desert—they could not read a single letter. Of the whole 700 only 150 could write, or even read with ease; and nearly the whole number were totally ignorant with regard to the nature and obligations of true religion." In the reports of the same Society for 1832-3 it is stated, "In September, 1831, out of 50 prisoners put on trial at Bedford, only four could read. In January, 1833, there were in the same prison between 50 and 60 awaiting their trials, of whom not more than *ten* could read, and even some of these could not make out the sense of a sentence, though they knew their letters. At Wisbeach, in the Isle of Ely, out of 19 prisoners put on trial, only *six* were able to read and write, and the capital offenses were committed entirely by persons in a state of the most debasing ignorance.

Not only in England, but even in *Scotland*, we shall find a glaring deficiency in the means of education. In Glasgow, at the last census, there were between the ages of 5 and 15, 46,000, that is, between one-fourth and one-fifth of the population at an age to receive education. But, in point of fact, it is found that there are only *one-fourteenth* at school, or 14.25, reckoning the whole population at 200,000; consequently there are 31,715 children absent from the means of instruction, who ought to be attending them; and it is found that there are about 6000 living by crime, a large proportion of whom are young. In the Abbey parish of Paisley, which contains nearly one-half of the whole population, only *one-twentieth* attend school. In this town there are 3000 families among whom education does not enter, and where children are growing up wholly untaught. "In Perth, the proportion attending school is under one-fifteenth; and in Old Aberdeen only *one-twenty-fifth*. As to the country districts, in the 132 parishes in the counties of Banff, Elgin, and Aberdeen, the average of the whole is one-eleventh; and there are instances of one-twelfth, one thirteenth, one fifteenth, and one-twentieth, in the other parishes, taken indiscriminately over the south and central parts of Scotland. In a parish in the county of Berwick, the proportion at school is one-fifteenth; in a parish in the county of Dumbarton one thirteenth; and, lest it should be surmised that this deplorable state as to education exists only in manufacturing parishes, where a dense population has recently arisen, it is proper to state, that several of these instances

are in *rural* parishes; the two worst instances—those in the counties of Banff and Aberdeen—being entirely *country* parishes. In the 143 Highland parishes, out of 500,000, there are 83,000 who cannot read, and have no means of learning; and there are 250,000 who cannot write."* Such is the deplorable deficiency of education even in Scotland, which has been so much lauded on account of its parochial establishments, and the intelligence of its population; and therefore we need not wonder that, even here, immorality and crime have of late been on the increase.

What is the remedy, then, which will counteract, and ultimately subvert the moral evils to which we have adverted? I answer, without the least hesitation—*Intellectual, moral and Religious instruction, universally extended*—not the form of education without the *substance*, not merely pronunciation, ciphering, and conning memorial tasks, not merely committing to memory, formulas, catechisms, speeches, psalms and hymns; but the imparting of *clear and comprehensive ideas*, on all those subjects on which man is interested as a rational, social, and immortal being. There has never yet been a complete and efficient system of education, of this description, established in any country under heaven; the improvements lately introduced in the United States, Prussia, Wirtemberg, Bavaria, and other places, being only approximations; and hence society, in such countries, though greatly meliorated, is not yet half moralized or reformed.—That such a system of instruction, universally established and judiciously conducted, would raise the tone of moral feeling, and counteract criminal propensities, no sane mind will presume to call in question. We find, from the facts above stated, that *ignorance and crime are intimately connected*—that those who rendered themselves amenable to the laws of their country, had been allowed to grow up without instruction—and that "the capital offenses were committed entirely by persons in a state of the most debasing ignorance." Indeed *all* the cases stated, may be considered as cases of absolute ignorance; for although some of the criminals alluded to, "knew their letters, they could not make out the sense of a sentence;" and the bare circumstance of being able to read, or, in other words, to pronounce the sounds of words and characters, is unworthy the name of education, though it is too frequently dignified with this appellation.

If ignorance, then, with all its usual debasing accompaniments, be one of the chief sources of crime, we have only to remove the *cause* in order to prevent the *effect*. Wherever the mind has been thoroughly enlightened and *judiciously* trained from infancy in moral habits, the tendency to criminal practices has been at the same time subdued. "Train up a child in the way he should go, and when he is old he will not depart from it." I question if a single instance can be brought forward inconsistent with this position. (See page 48.) This likewise holds true in the case of nations as well as individuals—in proportion to the *extent* and the *efficiency* of the means employed. In Ireland, there is more crime than in England, and in England more than in Scotland; and this is corresponding to the proportion of the means of instruction in the respective countries. In the Northern States of America, particularly New England, where almost the whole population is well educated, there is perhaps less crime and

* The above facts are abridged from Mr. Colquhoun's statements in Parliament respecting education in Scotland—who deserves no little praise for the labor and attention he has bestowed on the subject.

misery than in any other country in the world.* In regard to New York, it is worthy of remark, in this point of view, that there was no conviction for murder or any other capital offense, in that State, comprising two millions of inhabitants—during the year 1832. The number of schools in New York, that year, was 9270; the number of scholars about 500,000, beside those attending academies and colleges; and the total expenditure for common schools the same year 1,126,486 dollars, or £250,329, which is more than *four times* the sum which Mr. Colquhoun says Scotland would require for the supply of education, although its population exceeds that of New York by 400,000. In Prussia, since an improved system of education was established in that country, it is found that crimes have been greatly diminished, and that newspapers, magazines, and other publications, have, in many places, increased more than tenfold. Were we possessed of accurate statistical statements of the progress of education and of crime in the different countries of Europe and the States of America, I have no doubt it would clearly appear, that crime is regularly diminished nearly in proportion to the progress of an enlightened and *efficient* education. But let no one presume to affirm that the inhabitants of any country are *educated*, when little more than the *form* of instruction is imparted, and where less than *one-fourth* of the population is actually instructed.

* In reference to the city of Boston, the capital of New-England, Mr. Stuart, in his "Three years in North America," has the following remarks—"This city is clean and well paved, and seems to be not only entirely free of beggars but of any population that is not apparently living comfortably. I did not observe a single individual in the streets of this city who was not well apparelled, nor an individual of what we call the lower orders."—"At Boston there is not the semblance of idleness and filth among the people anywhere. All are, or seem to be, in the full enjoyment of the necessities of life; and all busy, active, and employed. What a contrast, in these respects, between this city and the city of Dublin, which, in July, 1827, I saw crowded with beggars almost naked, even in the heart of it; and, on the arrival of a mail-coach in Sackville Street, scrambling for the half-pence which the passengers threw among them."—"In 1830, the number of schools in Boston was 235, of which 80 were public, and 155 private schools, beside about a dozen academies and classical schools, several of which are exclusively devoted to *female* pupils. The total expense of the schools in 1829, for tuition, fuel, books, &c., 136,829 dollars, or about £43,739, which is more than double the grant for education voted by parliament in 1833, to be distributed over the whole of Britain."—"Where education is so general and well-conducted, almost every individual is a reader. Hence the number of publications in Massachusetts, Connecticut, &c., exceeds that of any other country. In Boston, there are regularly published 10 daily newspapers, 7 twice a week and 26 weekly, being 43 in all—beside Magazines, Reviews and Religious and Literary Journals of various descriptions; of which there is *one* published every half-year; 7 every quarter; 5 every two months; 3 every fortnight, 22 monthly, and nine annually, including six almanacs; being, in all, 47 periodicals, in a city containing only 69,000 inhabitants. These periodicals, it is evident, would never be published and sold, unless the inhabitants at large were universally given to reading.—And where a habit of reading useful publications is general, the hydra of *Crime* will seldom lift up its head—the mind being preoccupied with nobler pursuits. As an evidence of the immense quantity of literary works distributed in these states, I was lately informed by a literary correspondent in Connecticut, that one of the printers in Hartford, the capital of the State, containing only 8000 inhabitants—had printed during the year 1833, of *Geographies alone*, great and small, no less than 200,000 copies.—The general state of education in Massachusetts is as follows:—The whole number of towns in the State is 305, and the whole population 610,014. The population of 99 towns from which returns were lately made, is 201,681. Of these 57,866 attended public or private schools, which is equal to the proportion of 1 to 3½; or three times the number in proportion to the population of those attending schools in Scotland. In addition to which it ought to be considered that the education in New-England is far more efficient and comprehensive than in this country.—The above statements are selected from the "American Quarterly Register" for May, 1833, and the "American Almanac" for 1834.

Had I not already dwelt too long on this topic, it might have been shown, that the *expense of punishing crime*, and the losses of property to society in consequence of its prevalence, *would be more than sufficient to support an efficient national education*. It has been estimated, that the expenses attendant on the imprisonment, the conviction, and the punishment of criminals, will average more than a hundred pounds for each individual. According to a statement formerly made, there are yearly committed to jail 17,428 persons accused of crimes. At £115 for each, the annual expense of the whole would amount to more than *two millions*. If we add to this the interest of the money expended in the erection and repair of jails, penitentiaries, bridewells, bulks, and houses of correction—the salaries of jailers, judges, bailiffs, and all the other officers connected with criminal courts, together with the fees of pleaders, attorneys, &c. we shall have at least other *four* millions. If we were to make a rude estimate of the loss of property sustained by criminal depredations, the amount would be enormous. "I have been assured," says "The Schoolmaster in Newgate," "that £200 and even £300 in a week, has been obtained by one man and a boy, merely by abstracting the money in shops which is kept in tills and desks." But supposing, on an average, only £120 *per annum*, as the amount of depredation committed by each thief and pick-pocket—the number of such characters in London being estimated at 50,000, the loss sustained by such depredations will amount to *six* millions; and if we reckon the depredations in all the other parts of the kingdom to amount only to the same sum, we shall have *twelve* millions of loss sustained by depredations on property. The police establishment in London costs above £200,000 a-year; and if we take into account the expenses connected with all the other police establishments of the nation, which may be reckoned at seven times that sum, we shall have an amount of £1,400,000 on this head:—whereas, less than one-fifth of that sum would be sufficient for the preservation of order among a *renovated* population. Many other items might have been stated, but the above sums, amounting to nearly *twenty millions*, would be more than sufficient for carrying forward a system of national education on the most ample and splendid scale. It is therefore madness in the extreme to attempt any longer to repress crime by such a machinery as has hitherto been employed, while we neglect the only efficient means by which its operations may be controlled, and its principle extirpated. The very principle of *economy*, if no higher motive impel, should induce us to alter our arrangements, and to build on a new foundation. It was lately said to the public of Edinburgh, with great propriety, when solicited to contribute to the erection of a school,—"*Give your pence to infant schools*," (I may add, to well conducted seminaries of all descriptions), "*and save your pounds on police establishments, jails, bridewells, transportations, and executions*." In this way we should be enabled, at the same time, both to improve society, and to increase our national resources.

II. Such an education as now proposed, universally extended, would improve the mental faculties, and *raise the character of man far beyond the level to which it has hitherto attained*. During almost the whole of the past periods of this world's history, the human faculties have been seldom exerted with vigor, except for the purpose of promoting mischief, procuring the means of animal subsistence, or indulging in childish and degrading

amusements. Even in the present *enlightened age*, as it has been termed, what are the pursuits which fascinate and absorb almost the whole attention of the higher classes of society? Horse-racing, fox-hunting, prize-fighting, gambling, dueling, coach-driving, "steeple-chases," slaughtering moor-fowl "o'er hill and dale," masquerades, theatrical amusements, and dissipations of all kinds. And what are the employments of a great proportion of the lower ranks, beside their stated occupations? Cock-fighting, gambling, sauntering about the streets, indulging in drunkenness, licentiousness, and cruel sports and diversions—while they remain in ignorance of all that is grand and beautiful in the Creator's works, and feel no relish for intellectual enjoyments. Even the acquirements and pursuits of professed *Christians* are far inferior to the standard of intelligence and morality which religion prescribes; for we behold, even among this class, ignorance of most subjects with which every rational and religious being ought to be acquainted, combined with hatred of all religious sects but their own, with wealth-engrossing dispositions, and "covetousness, which is idolatry."

What a pitiful picture of ignorance and degradation behold the inhabitants of this world present to the view of intelligences of a higher order! Were an inhabitant of the planet Saturn to wing his flight to this globe of ours, and were he capable of communicating his sentiments in language intelligible to man, we should expect to learn from him a minute detail of the history and geography of the globe to which he belonged, of the peculiar phenomena of nature in that region, of the various aspects of the moons, the diversified appearances of the magnificent rings which encircle that world, and descriptions of the different scenes of nature, the operations of art, the sciences cultivated by its inhabitants, and the plan of God's moral government among them; and, doubtless, our curiosity to become acquainted with the physical and moral arrangements of another world, would be abundantly gratified. But were an inhabitant of our globe, from among the *lower* or even from among many of the *higher* classes, to be transported to one of the planets, what account could he give of the arts and sciences, of the history, statistics, and natural scenery of our world? What could he say of its continents, rivers, islands, oceans, and volcanoes; its mountain scenery, and the properties of its atmosphere, of the variegated surface of the moon, and the peculiarities of its motions, of the history of its inhabitants, or the progress they had made in knowledge? What description could he give of the arts and inventions of modern times, of the construction of the instruments by which we view distant objects, and by which we penetrate into the scenes invisible to the unassisted eye, of the principle of air-balloons, steam-engines, air-pumps, mechanical powers, electrical machines, or galvanic batteries? Above all, what could he tell them of the moral dispensations of the Creator toward our world, and of what is contained in the revelations of his word? He could perhaps tell them that there were hills, and rivers, and four-footed beasts, and men that were employed in killing each other; but could convey no precise idea of anything in which this world differed from that to which he had been transported. He would be looked down upon with pity as a kind of *lusus nature*: unworthy of the name of a *rational* being. Of 800 millions of men that people our globe, there are at least 750 millions of this description, who could give

little more information respecting the peculiarities of our world to the inhabitants of another planet, than they could receive from an elephant or a beaver, if such creatures had the faculty of communicating their ideas.

Such is the present character of the great majority of this world's population—and how is it to be elevated to a standard befitting a rational and immortal intelligence? Only by the universal extension of such an education as that, the outlines of which we have faintly sketched. The communication of *knowledge* is the first part of that process by which the human character is to be raised and adorned, as *light* was the first agent employed in the arrangement of the material creation; and this knowledge must, in every instance, be conjoined with religious principle and moral conduct, otherwise it will only prove the intelligence of demons. Man, although, in one point of view, he is allied to the beasts of the field, in another, he is allied to superior natures, and even to the Deity himself; and therefore ought to be rendered fit for associating with such intelligences—for receiving from them communications of knowledge and felicity, and for imparting to them similar benefits in return. If man is destined to a future world, as we profess to believe, he will, doubtless, mingle with beings of various orders during that interminable existence which lies before him; and his *preparation* for such intercourse will, in a great measure, depend on the training he receives, and the principles he imbibes, during his sojourn in this sublunary sphere. There is no *essential* difference between men on earth, and the highest created beings in any region of the universe, but what consists in the degree of *knowledge*, and the degree of *holiness*, or moral perfection, which they respectively possess. When man is endowed with a competent measure of these qualifications, he is fitted for the highest degree of social enjoyment, both in this life and in the world to come; and therefore, in so far as we refuse to lend our aid to the cause of universal instruction, or set ourselves in opposition to it, we do everything in our power to debase the character of our fellow-men, to prevent them from rising in the scale of intelligence, and to interpose a barrier to their present and future happiness.

I might likewise have shown the utility of universal education, from the tendency it would have to induce the mass of mankind to lend their aid in promoting every scheme which tends to advance the improvement of the social state of man; the cultivation of the soil, the forming of spacious roads and foot-paths, canals, rail-roads, and bridges; the universal illumination of towns, villages, and the country at large, by gas-lights and other contrivances; the establishment of expeditious conveyances in every direction by sea and land; and the carrying forward to perfection the various arts and sciences. But as I have elsewhere adverted a little to some of these objects, I shall only add, in the meantime, that the *value and security of property in any country, depend, in a great measure, upon the intelligence and morality of its population*. If the whole mass of society were thoroughly enlightened and moralized, we should no longer hear of "strikes" taking place among workmen, of servants embezzling the property of their masters, or of combinations being entered into in opposition to the interests of their employers. Every man's house would be his castle; and we should lie down to rest in the evening in perfect security from the incendiary, the insidious pilferer, and the midnight depredator. This security has already been partially felt

in those countries where an enlightened education is general. Mr. Stuart, when describing the New England States, remarks, that "robberies very seldom happen in that country, and that the doors of houses are frequently left *unlocked* during night"—the inhabitants having little fear of either depredations or annoyance from their neighbors.

III. Intellectual and religious education, universally extended, in combination with every other Christian exertion, would be more efficient than any other arrangement hitherto made for hastening the approach of the *Millennium*. That a period is about to arrive, when knowledge, holiness, and joy, shall distinguish the inhabitants of the world in a degree far surpassing what we have yet experienced, is clearly predicted in the oracles of inspiration. By these oracles we are informed, that "*All the ends of the world shall remember and turn to the Lord, and all the kindreds of the nations worship before him*"—that "*the earth shall be full of the knowledge of Jehovah, as the waters cover the seas*,"—and that "*all shall know him, from the least to the greatest*,"—that "*the glory of the Lord shall be revealed, and all flesh see it together*,"—that "*the heathen shall be given to Messiah for his inheritance, and the uttermost ends of the earth for his possession*,"—that "*all kings shall fall down before him, all nations serve him, and the whole earth be filled with his glory*,"—that during the continuance of this happy era, "*Wars shall cease to the ends of the earth, and the nations shall delight themselves in the abundance of peace*,"—that "*the earth shall yield her increase, and be fat and plentiful*,"—that the inhabitants "*shall build houses and inhabit them, and plant vineyards and eat the fruit of them, and shall long enjoy the work of their hands*,"—that "*they shall go out with joy and be led forth in peace*,"—that "*there shall be nothing to hurt or destroy*," and that "*righteousness and praise shall spring forth before all nations*." In what manner, then, may we conceive that such predictions will be accomplished? Are we to suppose that, by one appalling act of Omnipotent power, the wicked will at once be swept from the face of the earth, and that the physical aspect of our globe will be instantly changed and renovated by the same Almighty energy, as at the first creation? Or, are we to conclude, that this auspicious era will be introduced in consistency with the established laws of nature, and by the agency of human beings, under the influence and direction of the Divine Spirit? For the former supposition we have no evidence whatever in any of the intimations given of this event in the Scriptures, and it would be inconsistent with all that we know of the by-past operations of the Divine government; as might be clearly shown, by an induction of facts and arguments of various kinds, were this the proper place to enter into such a discussion. If, then, we admit the latter conclusion, it will follow, that the *Millennium* will be introduced by a concentration of the moral and intellectual energies of mankind directed to this great object—by following out those plans which are calculated to promote the renovation of the world—by the consecration of a far greater proportion of our treasures for this purpose than has ever yet been thought of—and by directing our eyes to the Supreme Disposer of events for that wisdom which is "profitable to direct us" in all our arrangements, acknowledging Him as the original source of all our activities, and who alone can render them successful.

What, then, are those means by which the

moral world may be renewed "*in knowledge and holiness, after the image of Him who created it*?" Undoubtedly the *efficient* training of the young from the earliest period of infancy to the age of manhood, is one of the first and most important steps to the thorough renovation of the world—a subject which has hitherto been egregiously trifled with, and almost overlooked, in our Christian arrangements. We have all along laid too much stress upon the mere *preaching* of the Gospel, or, in other words, the delivery of a piece of human composition to a mixed multitude, the one-half of whom are unprepared by previous instruction either to understand or to appreciate its truths; and hence the comparatively feeble effects which have been produced on the moral characters of men; hence the confused conceptions entertained of Divine truth; and hence it happens, in certain cases, that the truth delivered rebounds from the heart like a ball of cork from a wall of adamant, because it has not been previously prepared for its reception; and, to palliate our remissness and inactivity, we have sometimes had the presumption to ascribe this effect to the withholding of Divine influence. Let it not, however, be imagined that I mean to discourage the preaching of the gospel. No: nothing is further from my intention. Let the Gospel be proclaimed still more extensively, and with far more energy and pathos than have ever yet been displayed; and let missionary exertions, and every other Christian activity now in operation, be carried forward with still greater vigor. But let our chief attention be directed to the *preparation* of the minds of the young for the reception of the truths of religion—to invigorate their rational powers and their principles of action, and to counteract, on the first appearance, every evil propensity,—and then we may expect that the "Word of God" will soon run like a mighty river through the world, and "have free course and be glorified," enlightening the understanding, purifying the affections, and "bringing into captivity every thought to the obedience of Christ." An intellectual, moral, and religious* education, universally extended, constitutes the *essence* of the *Millennium*; it is one of its chief characteristics, and will form the foundation of all the happiness which will then be enjoyed; for it is one of the distinguishing circumstances connected with that period, that "*all shall know Jehovah, from the least to the greatest*." But how can we expect that the superstructure can be reared, if the foundations be not laid, or that "*the desert will rejoice and blossom as the rose*," while the hand of industry is never applied to root up the briars and thorns, and to cultivate the soil?

Is it inquired, *when* may we expect the *Millennium* to commence? I reply, *just when we please*. Are we *willing* that it should commence in the present age? We have the *means* in our power, if we choose to apply them. In the course of *forty years* from this date the *Millennium* might not only be commenced, but in a rapid progress toward the summit of its glory,—*provided we are willing at this moment to concentrate all our moral and intellectual energies, and to devote all our*

* In this and various other parts of this work, I have used the words *moral* and *religious*, in compliance with common usage, as if they conveyed distinct ideas. But I conceive that the ideas they express are so intimately connected that they can never be separated. There can be no true morality but what is founded on religion, or the principles of Christianity; and religion can have no real existence but as connected with the *morality* of the Bible—the promotion of which, in principle and conduct, is the great object of all the revelations of Heaven.

superfluous wealth, or at least a tenth part of it, to the furtherance of this object. Nay, in the course of half that period, we should have a generation rising up in knowledge and holiness, far superior to any race which has appeared in the world during the ages that are past. For, were we just now to commence a universal system of infant instruction, and continue the course through all the higher departments formerly specified—in the course of twenty years all the children who are now about two years of age (if continued in life) would have arrived at the age of *twenty-two*, in an enlightened and moralized state, and would form the most numerous and influential portion of the population, and give a tone to all ranks of society. Even the *physical aspect* of the globe, within the course of another century, might be *renovated*, and adorned with everything that is beautiful and sublime. The wealth that has been expended in the madness of *warfare*, even by *civilized* nations, during a century past, had it been appropriated to philanthropic improvements, would have been sufficient to have cultivated all the desolate wastes of our globe, to have made its wilderness like Eden, and its deserts “like the garden of the Lord,”—in short, to have transformed it into something approaching to a terrestrial paradise. We have it in our power to accomplish all this in the century to come, if we are *willing* to devote our energies and our treasures to the purposes of philanthropy and general benevolence.

But, is it of any avail to address the majority of our fellow-men on this subject? No: we might as soon speak to the tides and currents of the ocean, and expect them to stop at our command, as to expect that the current of licentiousness, folly, ambition, and avarice, in which three-fourths of mankind are carried headlong, will stop its course, and diverge into the channel of religion, philanthropy and beneficence. But I trust there is still a select band of Christian philanthropists who only require to be convinced of the necessity of extraordinary exertion, and to receive an additional stimulus, in order to excite them to a godlike liberality. What sacrifice would it be to a man who has £500 a year to devote annually £100 to the purposes of religious and intellectual improvement? to another who has £1000 a year to devote £300, and to another who has £10,000 to allot £4000 *annually* for the same object? It would not deprive any one of them either of the necessities or of the luxuries of life, or of anything that contributes to comfort, honor or sensitive enjoyment. It is now high time that the *sincerity* of a profession of Christianity should be tried by the test of pounds, shillings and dollars. We have beheld numerous instances of ministers and others aspiring after the highest stations and the largest salaries, in order to increase their incomes. Let us now see what sacrifices they will make of the wealth which God has given them for the purpose of promoting his glory in the world. Let us see whether God or Mammon, whether the promotion of the best interests of mankind or “the lust of the flesh and the pride of life,” rule supreme in their hearts. That man who refuses to come forward with his wealth, when it is proved to be requisite for the purposes alluded to, ought not to assume the name of a *Christian*. He has never felt the influence of that divine maxim of our Saviour, “It is more blessed to *give* than to receive.” He virtually declares, that “laying up treasure on earth,” providing fortunes for his family, keeping up a certain rank in society, and living in luxurious abundance, are matters of far greater importance

than the approach of the Millennium and the regeneration of the world. If a man is in doubt with respect to the existence of religious principle in his soul, I know not a better test than this, by which to try the sincerity of his Christian profession: Is he willing, at the call of God, to give up a portion of his possessions to His service, and even “to forsake all,” to prove himself “a follower of Christ?” There is a certain class of religionists who are continually whining about the low state of religion and the wickedness that prevails among all ranks; and there is another class who are frequently talking about the *calculations* that have been made respecting the *predicted period* of “the latter-day glory;” but when you ask any of these classes to put their hands in their pockets, in order to supply means for improving society and hastening the approach of that glory, they will rebound from you as the north poles of two magnets rebound from each other, and will tell you, with an air of apathy and spiritual pride, “that the spirit is not yet poured out, that man can do nothing of himself, and that God’s time is not yet come.” If Christians were universally to act upon such views, the predicted glory of future ages would never be realized. “It is not for us to know the times and the seasons which the Father hath reserved in his own power;” but we know that it is our *present duty* to consecrate to the service of God and the good of mankind all the powers and faculties with which we are invested, all the energies we are capable of exerting, and all the treasures not essential to our comfort, to carry forward the building of the Spiritual Temple, and to “prepare the way of the Lord.”

In short, it is now more than time that true Christians were rising above the false maxims of the world, the calculating spirit of commerce, the degrading views of the sons of avarice, and the pursuit of earthly honors and distinctions, and acting in conformity to the noble character by which they wish to be distinguished. Let them come forward in the face of the world, and declare by their conduct, and their noble generosity, that while they enjoy and relish the bounties of the Creator, they despise the vain pageantry of fashionable life, with all its baubles, and are determined to consecrate to rational and religious objects all the superfluities of wealth which have been hitherto devoted to luxury and pride. Every Christian hero should be distinguished in society (whether he be sneered at or applauded by the men of the world) by his determined opposition to worldly principles and maxims—by his abhorrence of avarice—by his active exertions in the cause of philanthropy—and by the liberal portion of his substance which he devotes to the cause of education and religion: and the Church ought to exclude from her pale all who refuse, in this way, to approve themselves the disciples of Jesus. Better have a Church composed of a select band of a hundred “right-hearted men,” ardent, generous, and persevering, than a thousand lukewarm professors, who are scarcely distinguishable from the world, and who attempt to serve both God and Mammon. Such a select band of Christian heroes, in different parts of the Universal Church, “shining as lights in the world, in the midst of a perverse generation,” and exerting all their influence and power in counteracting ignorance and depravity, and promoting the diffusion of every branch of useful knowledge, would do more to prepare the way for the approach of the Millennium, than ten times the number of a mixed multitude of professing Christians who are sunk into a state of apathy, and have little more of religion

than the name. Their influence would be *powerful* in every circle in which they moved—they would make the rich professors of religion ashamed of their parsimony and their indolence—they would induce the lukewarm Christian either to come cheerfully forward with his wealth and influence, or give up the profession of religion altogether, and take his stand at once among the men of the world; and they would stimulate the young generation around them to consecrate the vigor of their lives to such holy activities. They would doubtless be sneered at by the licentious, the avaricious, and the gay; and even by the proud and wealthy ecclesiastic, who has never imbibed the spirit of a *Neff* or an *Oberlin*; but every one who is conscious that “his witness is in heaven, and his record on high,” will look down with a becoming indifference on the scorn of such men, and “hold on his way rejoicing.” “Who, then, is a wise man among us, and endowed with knowledge,”—“to whom God hath given riches, and the power to use them?”—let him come forward with his stores of knowledge and his treasures of wealth, and dedicate them to the service of the Most High; and bring along with him a few more congenial minds to embark in the same undertaking, and great shall be his reward. “For they that be wise shall shine as the brightness of the firmament, and they that turn many to righteousness as the stars forever and ever.”

It is said, that when the town of Calais, after a siege of twelve months, wished to surrender to Edward III, he demanded that six of the most considerable citizens should be sent to him, carrying the keys of the city in their hands bareheaded and barefooted, with ropes about their necks, to be sacrificed to his vengeance. This cruel demand threw the inhabitants into a state of unutterable consternation, and they found themselves incapable of coming to any resolution in so distressing a situation. At last, one of the principal inhabitants, Eustace de St. Pierre, stepped forth, and declared himself willing to encounter death for the safety of his friends and companions; another, animated by his example, made a like generous offer; a third and a fourth presented themselves to the same fate, and the whole number was soon completed. Shall such a sacrifice as this, extending even to life itself, be cheerfully made; and shall we not find as many Christians in every town willing to sacrifice the third, or fourth, or at least the tenth part of their property for the good of mankind, and the regeneration of society? The offerings, in ancient times, for the service of God, far exceeded anything that has yet been attempted under the Christian economy. The gold and silver alone, offered for the rearing of the tabernacle, amounted to upward of £300,000 of the present value of British money, beside the brass, the shittim wood, the linen, the embroidered curtains, the onyx stones and jewels, and the regular *tithe* which every Israelite annually paid of all that he possessed. When the temple was about to be erected, David along with his princes and captains, contributed no less than 108,000 talents of gold, and 1,017,000 talents of silver, which amounted to more than 900 millions of pounds sterling; and the expense of the sacrifices offered on this occasion amounted to several hundred thousand pounds.—1 Chron. xxii, 14,—xxix, 3-9. These offerings were a tribute of gratitude to God, the original bestower of every enjoyment; and, hence, David, when he blessed the Lord before all the congregation, declared, “All things come of thee, and of thine own have we given thee. All this store we have prepared to build an house, for thy holy

name cometh of thee, and is *all thine own*.” The *tithes*, or tenth of their income, were designed as an acknowledgment that they had received their estates from his free gift, and held them by no other tenure but his bounty. They were a kind of *quit-rent* annually paid to the Great Proprietor of the soil, for the maintenance of his worship, and the instruction of the People. And why should not the estates of Christians be viewed in the same light, and a similar portion of them be devoted to the same purpose? The tenth of the incomes of the inhabitants of Britain would annually amount to *many millions*; yet all that has been collected by the British and Foreign Bible Society, the most popular of all our religious institutions, during thirty years of its operation, is only about *two millions* of pounds. Notwithstanding, however, the general apathy which exists on this subject, I am disposed to indulge the hope, that, ere long, thousands of Christians in different parts of the Church, will come cheerfully forward and consecrate, not merely a tenth, but in many instances, *one-half* of their substance, for carrying forward the designs of Providence for the reformation of the world. Such offerings are nothing more than what is requisite for accomplishing this grand object; and when such a spirit of liberality becomes general in the Christian Church, we may confidently expect that the happy era is fast approaching, when the light of divine truth shall shed its radiance on every land—when “The glory of Jehovah shall be revealed, and all flesh shall see it together—when the wilderness and the solitary place shall be made glad, and when righteousness and praise shall spring forth before all nations.”

The inhabitants of New England, I am confident, will be among the first to set such a noble example to every other nation. From small beginnings, they have advanced more rapidly in religious and intellectual improvement than any other people under heaven; but they have not yet attained the *acme* of improvement, “neither are they already perfect”—but “must press forward to the mark,” without “looking back” with self-complacency on the advancement they have hitherto made, and “stretch forward toward those things which are before.” There are, perhaps, few circumstances in the history of mankind more remarkable than the landing of the persecuted *pilgrims* of New England on the rock at Plymouth, and the important consequences which have been the result of the settlement of that small and distressed colony. About a hundred individuals, driven from their native land by the demon of persecution, landed at that point, near the middle of winter in 1620, with prospects the most dismal and discouraging—fatigued by a long and boisterous voyage—forced on a dangerous and unknown shore on the approach of the most rigorous season of the year—surrounded with hostile barbarians, without the least hope of human aid—worn out with toil and suffering, and without shelter from the rigor of the climate; so that, in the course of three or four months, forty-six of their number were carried off by mortal sickness. Yet this small band of Christian heroes laid the foundation of all the improvements in knowledge, religion, liberty, agriculture and the arts, that distinguish the New England States; which now contain a population of nearly two millions of souls. Through their instrumentality, and that of their successors, “the wilderness has been turned into fruitful fields,” hundreds of cities and towns have been founded, colleges and splendid temples have been reared, civil and religious

liberty established on a solid basis, the education of the young, and mental and moral improvement, promoted to an extent beyond that of any other nation upon earth. These circumstances furnish a proof of what a small body of persevering and well-principled men can achieve in the midst of difficulties and discouragements, and a powerful motive to excite us to engage in every

holy activity. And I trust, the descendants of these pilgrims, animated by their noble example, will rise to still greater heights of intelligence and virtue, until knowledge become universal—until moralevil be completely undermined—until “righteousness run down their streets like a river,” and until the influence of such moral movements be felt among all the families of the earth.

CHAPTER XIII.

PRINCIPLES ON WHICH A NATIONAL SYSTEM OF EDUCATION SHOULD BE ESTABLISHED.

In attempting to establish any new system, however excellent, many obstacles and impediments present themselves, arising from the feelings, interests, and preconceived opinions of mankind. In establishing such a system of education as we have described, one great obstacle would arise in this country from the interests and conflicting opinions of religious sectaries. Religion, which was intended by its Author to introduce harmony, and to promote affection among mankind, would, in all probability, be brought forward to interrupt the noblest efforts of benevolence in the cause of universal instruction. Every sectary would be apt to insist on its peculiar dogmas being recognized, and especially those which are more directly patronized by the State would prefer a double claim for the superintendence and control of all the arrangements connected with the education of the young. Such conflicting elements and party interests have already prevented the establishment of institutions which might have proved beneficial to the rising generation, and would, doubtless, mingle themselves with any future discussions or deliberations that might take place on this subject.

In the year 1820-21, Mr. Brougham (now Lord Brougham) introduced a Bill into the House of Commons, entitled, “A Bill for better providing the means of education for his Majesty’s subjects,” which was imbued with a spirit of illiberality and intolerance which would have disgraced the darkest ages of the Christian era. The following were some of its leading provisions. “1st, No person is capable of being elected as *School-master* by the Parish, who does not produce a certificate that he is a member of the Church of England, as by law established.” In this sweeping regulation, it is roundly declared, that, among all the six or seven millions of respectable dissenters; that, among all that class of men who have descended from the congregations formed by Baxter, Owen, Watts, Doddridge, and a host of other illustrious Divines, renowned for their sterling piety and learning; that, among the whole of that class of men who, for the last forty years, have shown more disinterested zeal and activity for the instruction of the poor than any other class in the British empire! there is not a single individual that deserves to be intrusted with the education of youth! and for no other reason than because they have dared to think for themselves, and refused to submit to ceremonies and ordinances which are not appointed in the word of God. In another regulation, power is given to the clergyman of the parish “to call before him the person chosen by the parish, and to examine him touch-

ing his fitness for the office, and if he shall not approve of the person chosen, he may reject his appointment,” as often as he pleases, without assigning any reason, save his own will and pleasure, and *from this decision there was to be no appeal!* which rendered nugatory, and little short of a mere farce, the previous election made by the qualified householders of the parish. After the teacher was supposed to be approved of and fixed in his situation, a set of arbitrary regulations and restraints were imposed upon him by “the rector, curate, or other minister of the parish.” “He may at all times enter the school, examine the scholars, question the master touching his government of the school: may direct, from time to time, *what portions of Scripture shall be read, either for lessons or for writing in the school*, which direction the master is hereby required to follow.” The teacher was also enjoined “to use select passages (of the Bible) for lessons, whereby to teach reading and writing, and shall teach no other book of religion without consent of the resident minister of the parish where such school is held, and shall use no form of prayer or worship in the said school except the Lord’s Prayer, or other select passages of the Scriptures aforesaid.” Such regulations and injunctions reduced the teacher to something very little superior to a mere machine, or to a slave in the hands of a clerical despot. He was every day liable to be degraded and insulted in the presence of his scholars, whenever a haughty clergyman took it into his head to enter the school, and to display his magisterial and consequential airs. By the regulations enacted in this Bill, the children of Dissenters were likewise degraded. For, although they were to be permitted to attend the schools to be established, yet they were to be distinguished, in many respects, as *speckled birds*, different from those of the immaculate churchman, and compelled “to learn the liturgy and catechism of the Church, and, to attend the divine service of the Church of England,” unless their parents “*proved themselves to be Dissenters from the Established Church*, and notified the same to the master.” Such is only a specimen of the spirit and enactments which pervaded “Brougham’s Education Bill;” enactments repugnant to the views of every liberal mind, and pregnant with bigotry and intolerance. It was a fortunate circumstance that the bill never passed the House of Commons; otherwise, it might have prevented the establishment of a liberal and efficient system of education for a century to come.*

* Lord Brougham has displayed more enlightened views on the subject of education, in his speech delivered in the House

It is to be hoped, that, in any future deliberations on this subject, a more noble and liberal spirit will be displayed in the arrangements connected with education. Indeed, no efficient system of national instruction can be established on an exclusive or sectarian principle. Persons of all religious denominations ought to be eligible as teachers, visitors, superintendents, and members of school-committees, on the sole ground of their intelligence, piety, and moral conduct—and of the knowledge they have acquired of the true principles of education, and the mode in which they should be applied. As, in every country, numerous classes are to be found differing in sentiment respecting subordinate points in religion, it could not be expected that they would come forward either with voluntary subscriptions, or submit, without reluctance, to be taxed for such establishments, if any particular sectary were to be invested with the sole superintendence, and all others excluded from a share in the deliberations and arrangements connected with their operation. Such an arrangement would be an act of glaring injustice to the parties excluded, since they have an equal right of management on the ground of their subscriptions, or of the taxation to which they would be subjected; it would foster invidious distinctions between the different parts of the same community; it would tend to prevent independence of thinking on religious subjects, and to promote a spirit of hypocrisy and sycophancy in inducing persons to sacrifice the dictates of conscience to the emoluments of office; it would throw into a state of unmerited degradation a large portion of the most respectable characters in Christian society—for eminent piety, intelligence, and benevolence, are not confined to any section of the Christian church; it would nourish a spirit of alienation among the different portions of religious society, which has too long rankled in the human breast; it would prevent some of the most worthy and enlightened characters from coming forward as candidates for the office of instructors; it would interpose a barrier to that harmony and affection which should subsist among all ranks and denominations of society; and would ultimately frustrate, to a very great extent, the grand objects which an enlightened education is intended to accomplish. Nothing but a spirit of selfishness and ambition, of bigotry and intolerance, inconsistent with the harmony of society and the principles of our holy religion, will again attempt to establish education on such illiberal and exclusive principles. In this point of view, we cannot avoid reprobating an attempt which is now making by certain individuals, to extend the system of parochial schools, so that there shall be no occasion for teachers of any other description. We object to this object on the following grounds; 1. Because it is assumed that the education generally imparted in parochial schools, and the plan on which instruction has usually been communicated, are to be considered as patterns of excellence, and, consequently require only to be more generally extended. In the preceding pages, we have endeavored to show,

that, in common with most other schools in this country, the parochial system is miserably defective and inefficient as to the great objects which an enlightened education ought to embrace; and, in proof of this, we need only appeal to the ignorance and vice which have hitherto prevailed, and still prevail, among the great mass of the population. That parochial schools have been, on the whole, of considerable advantage to Scotland, none will deny. But they have not produced the one-tenth part of the moral and intellectual effects they might have done, had they been established on a more liberal and enlightened basis; and, consequently, were the system to be extended, it would tend to prevent, for an indefinite period, the establishment of a more enlightened, comprehensive, and efficient system of moral and intellectual instruction. 2. We object, on the ground of the *exclusive principles on which parochial schools are conducted*. They are considered as so intimately connected with the established church, that no one but a member of that church is eligible as a parish teacher. Consequently, in attempting to extend the parochial system until it is supposed capable of affording instruction to the whole population, it is virtually declared, that, among all the dissenters in this country, amounting to more than one-third of the population, and whose moral and intellectual character stands as high as that of the other two-thirds, there is not one who ought to be intrusted with the education of youth, however respectable the qualifications he may possess. Those who countenance a principle of this kind have, surely, never studied the principles of religious liberty or of natural justice, nor opened their eyes to “discern the signs of the times.” In so far as the individuals alluded to have it for their object to improve the plan of public instruction, and to raise the qualifications of the teachers, we wish them every success; but the community will certainly pause before it gives its sanction to a principle which would deprive nearly one-half of the nation of all interest and superintendence in regard to an object in which they are all equally concerned.

Hitherto, the superintendence of education, both in Scotland and England, has been chiefly intrusted to the clergy; and, at the time when our parochial and other scholastic institutions were established, there was perhaps a propriety in this arrangement; since, at that period, clergymen were almost the only educated persons, and literature was chiefly concentrated in their order. But the case is quite different in the present day, when a liberal education is not confined to any one rank of society, and when *classical learning* is not considered as the most important accomplishment. There is not, therefore, the same reason why the superintendence of education should be *exclusively* intrusted to clergymen, or to any other class of community. We should deprecate the idea of the education of the general mass of the population being intrusted exclusively either to the established church, or to dissenters of any denomination. Clergymen of all denominations should be considered as eligible, in common with other intelligent individuals, as superintendents and members of Educational Committees; but experience proves that it is dangerous to the general interests of the community to intrust its affairs, especially those which relate to education, to any privileged class of society; for in such a

of Lords, on the 21st of May, 1835, and the resolutions founded upon it, than he did in his “Education Bill” of 1831, or even in 1833, when he declared, that there are sufficient means of education in England, and that “he had become a convert to the opinions of those who thought it would be unwise to disturb a state of things which produced such admirable results.” It is to be hoped, for the good of the nation, that his lordship’s suggestions will soon be carried into effect; and that the principles on which a national system of education is established, will be such as to meet the approbation of an enlightened and religious public.

case the general good of the public has frequently been sacrificed to the interests or ambition of a party.

One of the chief pretenses generally set up for exclusive clerical superintendence, is the promotion of the interests of religion. It is much to be deplored that religion, which was intended to promote "peace on earth, and good-will among men," should so frequently have been used as a pretense for sowing dissensions in society, and violating the principles of natural justice. Whether "pure religion and undefiled" is promoted by attempting to raise one portion of the community and to crush another, and to throw a large body of respectable characters into a state of unmerited degradation, on account of their adherence to the dictates of conscience—is a question which may be safely left to every unbiased inquirer to decide.—With regard to the *religious* instruction of the *young*, no difficulty could arise from the circumstance of persons belonging to different religious parties having the superintendence of it; since almost every denomination of Christians recognizes the *essential* facts, doctrines, and duties of Christianity, which are the only religious topics which ought to be exhibited to the young either in public or in private. The man who, overlooking such subjects, would attempt to expatiate before the young on sectarian points of controversy, ought to be considered as destitute of that prudence and discretion which are requisite for a public instructor. If religion were taught as it ought to be, directly from its Original Records, instead of being inculcated from human formularies, there would soon be little difference of opinion respecting its main and leading objects. The religion of Heaven has been communicated to us chiefly in the form of historical narrations, unfolding to us the Divine dispensations, in relation to the fall, the recovery, and the renovation of mankind, and embodying certain leading truths and moral precepts, to direct our affections and conduct—the great end of which is, not to engender strife and a spirit of metaphysical speculation, but to counteract moral evil, and to promote union, harmony, and love, among all who acknowledge its authority. There is no believer in revelation that calls in question the facts of Scripture, the perfections of the Deity it unfolds—the death, resurrection, and ascension of Christ—the immortality of the soul—a future state of punishments and rewards—or the propriety of the moral principles it inculcates. These are the leading topics of revelation; and to insinuate that such subjects cannot be taught directly from the Scriptures themselves, without the aid of human formularies, is nothing short of throwing a reflection on the wisdom of God, on account of the *manner* in which he has communicated his will, and of affixing a libel on the character of the inspired writers, as if their writings were not sufficiently plain and perspicuous.

The efficiency of religious instruction deduced from the Scriptures alone, is clearly proved from the mode of tuition in infant schools. In these schools, religion is taught by familiar descriptions and details of scriptural facts—by illustrations, taken from Scripture and the scenes of nature, of the perfections of God—and by enforcing the moral precepts of the Bible on the young, and showing how they ought to be exemplified in all their intercourse with each other. Now, I appeal to every one who has witnessed the religious knowledge of the children in these schools, and its influence upon their conduct, if this mode of tuition is not infinitely preferable, as to its practi-

cal effects, to the usual method of instruction by catechism, or any other formulæ. Let us take a number of children at random from any common school, who have learned the "Shorter," or any other catechism, from beginning to end, and compare their knowledge and feelings in regard to religion with those of the children of a well-conducted infant school, and the superiority of the infant school children will be strikingly apparent, even although they are much younger than the former.—Should parents, however, wish to inculcate upon their children the *peculiar* tenets of the sect to which they belong, they have an opportunity of doing so at *home*, or by means of the pastors belonging to that denomination to which they are attached; but, in public schools, to attempt the inculcation of sectarian opinions, would be equally injurious to the interests of religion and the cause of universal education. This was attempted by the Church of England, in the enactments contained in Brougham's "Education Bill," and the same principle led the dignitaries of that church to oppose the Lancastrian system of education, and to patronize that of Dr. Bell, in which the peculiar tenets of the Episcopal church were to be exclusively inculcated.

That Christians of different denominations may cordially co-operate in the arrangements of education, appears from various existing facts. In the Northern States of America, as already noticed, education is far more general than in this country, and conducted on more rational and enlightened plans; and persons of all denominations in religion co-operate in its superintendence. In the 24th "Annual Report of the Trustees of the Public School Society of New York, for 1829," it is stated, among many other interesting facts, that "The Board of Education consists of members of eight or ten religious denominations, *all acting with entire harmony*"—that "they discharge the important duties of their trust, with a single eye to the public good"—and that they received the sanction of "an independent set of examiners, who have repeatedly inspected the schools, and are acquainted with the operations of the Board"—who express in their Report "their full confidence that the literary, moral and religious instruction, calculated to fit the young for the duties of life, and to prepare them for the happiness of futurity, is properly attended to, and the school moneys strictly and most beneficially applied to their legitimate purposes." This board has the superintendence of "21 schools, with 21 principal and 24 assistant teachers, and 6007 children," the expense of which amounted to 62,000 dollars: beside which there were above 450 private, charity, and other schools in the city of New York.—We know, too, that the "British and Foreign School Society" is conducted on similar principles—its Directors consisting of persons belonging to the established church and the various denominations of dissenters; and the same is the case with the institutions for infant education which have been lately established in many of our populous towns. The hand-bill, announcing the objects of the Model Infant School, Glasgow, which was framed by the Rev. Dr. Welsh, then of St. David's church, states, as one of the objects of this institution, that it is "for the reception of children from the age of two to that of six years, with the view of imbuing their minds with the knowledge of religious truths,"—and that "the plan of communicating religious truths is by the narratives, the precepts, and the plainest announcements of Scripture." In short, the liberal plan now suggested has been adopted in all its extent in the

kingdom of Prussia, where a national system of education has been established in which all classes of religionists, whether Protestants or Catholics, have an equal interest, and which, for more than half a century, has been conducted with the greatest regularity and harmony. So that there is no impossibility in persons belonging to different religious persuasions co-operating in the business of education, where there is a sincere desire to promote the improvement of the young, and the best interests of general society.

But should it be found impossible to induce the dominant sect in any country to co-operate with dissenters in the arrangements of education, perhaps the following might be the most eligible plan of procedure:—Let the government allot a sum adequate to the erection and endowment of all the schools requisite for an enlightened and efficient system of education—let this sum be divided between churchmen and dissenters, in a fair proportion, according to their respective numbers—and let the application of this sum, and the details respecting the patronage of the schools, the qualifications of teachers, and the mode of instruction, be left to the respective parties, to be arranged as their judgment and circumstances

may direct—specifying, however, some of the grand and leading principles on which the schools must be established. A plan of this kind would, indeed, still preserve the invidious distinction between churchmen and dissenters; but it would be infinitely preferable to bestowing the whole patronage and superintendence of education on any one sectary or class of men whatever.—Should government refuse to grant any pecuniary assistance to such an object, dissenters and all others have it in their power, by coming forward, in one grand combination, with *voluntary* contributions, to accomplish this noble design, independently of aid from any power under heaven; provided they are *willing* to make some of those small sacrifices formerly suggested. (See page 137.) And if they *will not* stand forward as bold champions, with their purses in their hands, ready to be delivered up for the support of this good cause, they will declare themselves to be unworthy of the name of *Christians* or of *lovers of their species*, and will deservedly be deprived of all the advantages, in time and eternity, which might result from the accomplishment of this object, to themselves and to their offspring, both in the present and future generations.

CHAPTER XIV.

MAXIMS, OR FIRST PRINCIPLES IN EDUCATION.

I. *The idea should go before the word which expresses it—or, in other words, A clear and distinct conception of an object should be impressed upon the mind, before the name or terms which express it be committed to memory.*

This may be considered as the first and fundamental principle of intellectual instruction; and, if admitted, the following rule should be strictly adhered to in the business of education:—*Let no passages of any book be committed to memory before the leading ideas they contain be clearly understood.* If this principle were universally introduced into education, it would overturn almost every system of instruction which has hitherto prevailed both in secular and religious tuition. An opposite principle has almost uniformly been acted upon; and hence, catechisms, psalms, hymns, grammar rules, chapters of the Bible, and speeches in the Roman senate, have been prescribed as memorial *tasks*, before any of the ideas contained in them could be appreciated. We may ask, in the name of all that is wise and rational, Of what use is it to stock and overburden the memories of children with a medley of words to which no correct ideas are attached? Although a child could commit twenty catechisms to memory, or could even repeat the whole of the Old and New Testaments, what purpose would it serve, if he did not enter into the spirit and meaning of the truths therein recorded? I have conversed with an individual who could repeat the whole Bible from beginning to end, and yet was entirely ignorant of the meaning of almost every proposition it contained, and its most interesting truths appeared to have made no impression upon his heart. As in the original formation of language, the objects of nature must *first* have been observed and known, before words or signs were fixed upon to

distinguish them; so, in communicating the elements of thought, the objects of thought must first be recognized and described before the terms and epithets which express their natures and qualities be committed to memory. Instead of obtruding a medley of words before they are understood, upon the memories of the young, they should be made to *feel* a desire for terms to express their ideas; and, in this case, the ideas and the words which express them will afterward be inseparably connected.

II. *In the process of instruction, Nothing (if possible) should be assigned to the young merely as tasks.*

Everything prescribed for the exercise of the faculties, should be represented both as a *duty* and as a *pleasure*; and if the young *understand* the nature and objects of their scholastic exercises, and the manner in which they should be prosecuted, they will find a pleasure in endeavoring to surmount every apparent difficulty. I once knew a gentleman, the Rector of a grammar school, who, on his admission to his office, boasted that he would conduct his school without inflicting any corporeal punishment—instead of which he prescribed from twenty to sixty or eighty lines of Virgil or Horace, as memorial *tasks*—and, when not accurately repeated, increased their number. But this practice had no other tendency than to excite revengeful feelings, and to produce disgust at the process of learning.

III. *Everything that is cheerful and exhilarating to the young should be associated with the business of education.*

Hence, school-rooms should be spacious, light, and airy—comfortably heated during winter, and erected in delightful and commanding situations. The school-books should be neatly printed, and

enlivened with pictures and engravings colored from nature—amusing and instructive experiments should frequently be exhibited—and the pupils should be occasionally gratified with excursions into interesting parts of the country, to view the beauties of nature and enjoy the bounties of Providence; so that all their scholastic exercises may be connected with delightful associations.

IV. In the practice of teaching, the principle of Emulation should be discarded.

By a principle of emulation I mean, the exciting of the young to exertion from the hope of reward when they excel their companions in intellectual excellence, or from the fear of punishment or degradation, when they fall beneath them in industry and acquirements. Many teachers have asserted that they could not conduct education with any effect without the aid of this principle. But whatever effect it may have in an intellectual point of view, it almost uniformly produces an injurious effect on the moral temperament of the young, on their companions whom they excel, and on their parents and guardians, who are led to form false estimates of their progress and acquirements by the prizes they receive and the places they occupy in their respective classes. One grand end of instruction, which has been too much overlooked, is to cultivate and regulate the moral powers—to produce love, affection, concord, humility, self-denial, and other Christian graces. But the principle of emulation has a tendency to produce jealousy, envy, ambition, hatred, and other malignant passions, and to exhibit intellectual acquisitions as of far greater importance than moral excellence. Beside, it is only a *very few* in every class that can be stimulated to exertion by this principle, and these few are generally of such a temperament as to require their ambitious dispositions to be restrained rather than excited. In the "American Annals of Education," for January, 1833, there is an excellent paper on this subject by Miss C. E. Beecher, of Newport, Rhode Island, a lady well known as an efficient teacher. After enumerating the evils which uniformly flow from the principle of emulation, she states the following motives, as those which she has found "not only *equal*, but *much more* efficient, in reference to all the objects to be gained in education:—1. *Personal influence*—endeavoring to gain the esteem, the affection, and the confidence of the pupils," &c. In this connection she justly remarks, "that commendation for improvement needs to be practiced much more frequently than reproof for deficiency. 2. By habitual appeals to the *Bible* as the rule of rectitude, and to *conscience* as the judge. 3. By cultivating a love of knowledge for its own sake, that is, for the pleasure it imparts; and also for the sake of the increased good it will enable us to do for our fellow-beings. 4. By efforts to form a correct public sentiment in school, so that it shall be unpopular to do wrong. 5. By appeals to parental influence, and that of other friends. This is accomplished by transmitting frequent accounts both of deficiency and improvement to the friends of the pupils. 6. By cultivating in the pupils a sense of obligation to God, of his constant inspection, and of his interest in all their concerns." These principles (which are more particularly explained and amplified in the paper referred to), she adds, "I have chiefly depended upon during the last three or four years of my experience as a teacher. Every year has added to my conviction of their efficacy, and every year has increased my satisfaction that the principle of emulation has

been banished with no consequent evil, and much increase of good."

Mr. Morgan, in his late "Address to the Proprietors of the University of London," expresses sentiments in accordance with the above. Speaking on the subject of *prizes*, he says, "A prize is the least effectual mode of accomplishing the desired object; it is founded on injustice, inasmuch as it heaps honors and emoluments on those to whom nature has already been most bountiful, and whose enjoyments are multiplied and increasing in a greater ratio than others by the mere easy acquisition of knowledge." "Praise, and invidious comparisons, are only other forms of the same principle, alike fruitful in envy, pride, scorn, and bitter neglect. In the curiosity of children, there is a sufficient and a natural stimulant of the appetite for knowledge, and we live in a world abounding in the means of useful and pleasurable gratifications. All that is required of preceptors is to aid the development of the faculties with affection and judgment." A certificate of diligence and good conduct seems to be all that is necessary to distinguish from the vicious, the idle, and slothful, those who have employed their time and talents in a proper manner.

V. *Corporal punishments should be seldom or never inflicted*—and when they are determined upon as the last resort, they should be inflicted with calmness and affection.

There is something revolting and degrading in corporal punishments, and the necessity of resorting to them generally indicates, that there had been a want of proper training in the earlier stages of life. It is vain to imagine, that children can be *whipped* either into learning or religion; and, if an enlightened and judicious mode of tuition were universally adopted, there would seldom be any necessity for resorting to such a stimulus. But in the modes of teaching which have most generally prevailed, corporal punishments are almost indispensable. In the German "Pedagogic Magazine," for 1833, we are told that "there died lately in *Swabia*, a schoolmaster, who, for 51 years, had superintended an institution with old-fashioned severity. From an average inferred from recorded observations, one of the ushers calculated, that, in the course of his exertions, he had given 911,500 canings, 124,000 floggings, 209,000 custodes, 136,000 tips with the ruler, 10,200 boxes on the ear, and 22,700 tasks to get by heart. It was further calculated, that he had made 700 boys stand on peas, 600 kneel on a sharp edge of wood, 5000 wear the fool's cap, and 1708 hold the rod,"—amounting in all to 1,421,208 punishments, which, allowing five days for every week, would average above a hundred punishments every day. There is something extremely revolting in the idea of such a series of punishments being connected with learning; and we may justly infer, that, however much classical learning may have been advanced, very little useful knowledge or moral principle was communicated in that seminary. For, a system of moral and intellectual instruction, calculated to *allure* the minds of the young, is altogether incompatible with such Gothic rudeness and severity.*

* Corporal punishments have generally a *hardening* effect on the minds both of young and old. A blacksmith brought up his son, to whom he was *very severe*, to his own trade. The orphan was, nevertheless, an audacious dog. One day the old vulcan was attempting to harden a cold chisel which he had made of foreign steel, but could not succeed. "Horsewhip it, father," exclaimed the youth, "if that will not harden it, nothing will."

VI. *Children should not be long confined in School—and never longer than they are actively employed in it.*—A school ought never to serve the purpose of a prison. If the junior classes are incapable of preparing their lessons by themselves, they should either be provided with some amusing toys or picture-books, or be turned out to romp about in the open air, or under a covered shed, in rainy weather, and called in when their lessons are to be explained.

VII. *Young people should always be treated as rational creatures, and their opinions occasionally solicited as to certain points and scholastic arrangements.* The reasons of the treatment they receive, and of the exercises prescribed, in so far as they are able to appreciate them, should occasionally be stated, and explained and illustrated.

VIII. *Reproofs should always be tendered with the utmost calmness and mildness.*—When they are uttered in passion, and with looks of fury, they seldom produce any good effect, and not unfrequently excite a spirit of revenge against the reprover.

IX. *One great object of education should be to fix the attention on the subjects we wish to explain and elucidate.*—On the proper exercise of the faculty of attention depends almost all our improvement

in knowledge and virtue. Even the senses are improved by the exercise of this faculty. Hence the peculiar delicacy of touch observable in the blind, and the quick-sightedness of the deaf; hence the distinct perception of distant objects acquired by sailors, and of delicate and minute objects by watchmakers and jewelers,—in all which cases the attention has been specially directed to particular objects. It was by fixing his attention on the subject, or “continually thinking about it,” that Newton, as he himself declared, discovered the laws of the planetary motions, and was enabled to unfold the true system of the world. Hence the propriety of presenting sensible objects to the view of children—of exhibiting before them interesting experiments, and of having their books adorned with lively and accurate engravings. Hence, too, the propriety of teaching them to notice every object within the reach of their vision, and to mark every minute change that takes in the form, color, and situation, of the objects around them, and to give an account of what they may have seen or heard in any of their excursions: all which circumstances have a tendency to induce a habit of *attention*, without which there can be no solid improvement in any department of instruction.

CHAPTER XV.

MECHANICS' INSTITUTIONS.

On these institutions I intended to offer a few particular remarks, and to suggest some arrangements by which they might be rendered more extensively useful than they have hitherto been, both in a moral and intellectual point of view, but as this volume has already swelled to a considerable size, I shall confine myself to a very few general observations.

It is now more than twenty years since I had an opportunity of suggesting the establishment of such institutions, under the designation of “*Literary and Philosophical Societies, adapted to the middling and lower ranks of the community.*” The details in relation to this subject, consisting of a series of five successive papers, were published in the London “*Monthly Magazine*” for the year 1814—more than eight years before any mechanics’ institutions were organized in this country.* Although these papers have seldom been referred to, in the history of mechanics’ institutions, yet the author is aware that they were the means of suggesting, to certain individuals, the idea of establishing such societies; and, not above a year or two after their publication, a society was organized in the vicinity of London, on the plan and principles suggested in these papers, of which the author was elected an honorary member. Instead of inserting, in this place, the substance of these papers, as was originally intended, I shall merely give a short sketch of their contents.

In the first communication, after a few introductory observations in reference to existing associations, and other particulars connected with the dissemination of knowledge, the following, among many other advantages, were pointed out as likely to flow from the extensive establishment of such institutions:—1. They would serve to unite and concentrate the scattered rays of genius, which might otherwise be dissipated, and enable them to act with combined vigor and energy in the discovery and the propagation of useful knowledge. 2. They would tend to promote the rapid advancement of general science; for if the labors of those societies which already exist have produced a powerful effect on the progress of science, much more might be expected were their number increased to eighty or a hundred fold. 3. They would have a tendency to produce an extensive diffusion of rational information among the general mass of society, particularly among those in the inferior walks of life, by which the narrow conceptions, superstitious notions, and vain fears, which so generally prevail, might be gradually removed, and a variety of useful hints and rational views suggested, which would tend to elevate and ennoble the mind, and promote domestic convenience and comfort. 4. They would induce a taste for intellectual pleasures and rational enjoyment, in which those hours generally spent in listlessness, foolish amusements, and the pursuits of dissipation, might be profitably employed, and, consequently, the sum of general happiness augmented. 5. If properly conducted, they could not fail of producing a benign influence on the *state of morals* and of general society. As vice is the natural offspring of ignorance, so true virtue can only flow from elevated and enlightened principles; and where such principles exist, their

* See “*Monthly Magazine*,” vol. xxxvii, for April and July, 1814, pp. 219, 507, and volume xxxviii, for August and September, 1814, pp. 23, 121, and for January, 1815, p. 503. These communications occupy more than 22 closely-printed columns, and contain several minute details in relation to what should be the *leading objects* of such institutions, and the *means* by which they might be established.

operation, in a greater or less degree, will always appear. The habits of order, punctuality, and politeness, which would prevail in such associations, would naturally be carried into the other departments of life, and produce their corresponding effects. The frequent intercourse of men of different parties and professions, associated for the purpose of promoting one common object, would gradually vanquish those mutual prejudices and jealousies which too frequently exist even in cultivated minds, and a liberal, candid, and humane spirit would be cherished and promoted. Society would thus acquire a new polish, and wear a different aspect from what it now exhibits in the inferior ranks of life; more especially, *if the means now suggested be combined with the operation of Christian principles.*

The other communications illustrated the arrangements and regulations requisite in the operation of such institutions, particularly in relation to the following circumstances.

I. *The Admission of Members.*—In regard to this circumstance, the two following extremes should be guarded against—the indiscriminate admission of all who may wish to become members, whatever may be their literary or moral characters—and the giving an undue preference to certain individuals on account of their rank, who have not a corresponding share of common sense and literary acquirements. In a literary society, the distinctions of rank ought to be, in a great measure, if not altogether, overlooked; while, at the same time, the utmost decorum and politeness ought always to prevail. It is now high time that human characters were estimated according to their real and intrinsic worth, independent of those external and adventitious circumstances with which they may be accompanied; and it will be highly becoming in rational associations to set an example of estimating the characters of men on principles purely of a moral and intellectual nature. Although money is a useful article in all societies, yet it would be inexpedient to solicit any individuals, not otherwise qualified to become members, chiefly with a view of their contributing to the pecuniary interests of the association. Such persons would not only be a dead weight upon the society, but, by the undue influence they would have, might tend to impede its progress, and prevent its chief design from being accomplished. Beside their literary acquirements, the *moral qualifications* of those who desire admission ought not to be altogether overlooked. Knowledge is chiefly desirable in proportion as it is useful. If it does not lead its possessor to propriety of moral conduct, its utility, at least to him, may be much questioned. In all rational institutions, the melioration of the moral characters and dispositions of mankind ought to form as prominent an object as the illumination of their understandings.

II. *The Subjects of Discussion, and the mode of conducting it.*—Every subject which has a tendency to induce a habit of rational thinking, to elevate and ennoble the mind, and to present sublime and interesting objects of contemplation—every subject which tends to unfold the wise arrangements of nature, and the laws by which the economy of the universe is regulated, which displays the attributes of the Divinity, and leads the mind upward “from Nature to Nature’s God;”—every subject which tends to promote the progress of science, the advancement of the liberal and mechanical arts, and the moral improvement of mankind, might occasionally become topics of discussion in a society constituted on the principles to which I have alluded. These subjects would com-

brace the prominent parts of natural history, geography, astronomy, experimental philosophy, chemistry, natural theology, ethics, education, arts and manufactures, physiology, domestic economy, and similar branches of knowledge. Although party politics, and sectarian views of religion should be excluded, yet there are certain general topics connected with these subjects, which might form legitimate subjects of discussion: such as the general principles of legislation, the causes of the wealth of nations, the effects of different modes of taxation, and other branches of political economy—the character and attributes of the Deity, the principles of moral action, the immortality of the soul, the facts of sacred history, and the evidences by which they are supported—the harmony of nature and revelation, and the means by which the character of the human race may be elevated and improved, and the moral world regenerated.

In the discussion of such subjects, there are four different modes which might be occasionally adopted.—1. The first mode is that of *public lectures*. A lecture might be delivered once a week, or fortnight, or oftener, according to circumstances, on some interesting subject on natural history, chemistry, or experimental philosophy, accompanied with experiments. In order to raise a sum for remunerating an intelligent lecturer, persons not members of the society might be invited to attend, on the condition of paying a small contribution, the members at the same time contributing a little, though in a smaller proportion. In order to excite attention, and to stimulate the exercise of the rational faculty, an *examination* of such of the auditors as chose to submit to it, on the different particulars detailed in the lecture, might take place either at the conclusion of the lecture, or at some future hour; and, at the same time, an opportunity offered of putting questions to the lecturer, and stating any difficulties or objections which may have occurred to them, in order to their solution.—2. By the more intelligent members *composing essays on particular subjects, and reading them to the society*. For the benefit of young writers, it might be proper, in a *candid and friendly manner*, to point out the grammatical blunders, improper phrases, erroneous statements, or other improprieties which may be found in the essay; and the writer ought to consider such hints as so much new and useful information, by the help of which he may be enabled to render his future compositions more correct. In order to make a respectable figure as writers of essays, particular attention should be given to the arts of grammar and composition; and exercises and instructions on these subjects might occasionally form a part of the business of the society. As some essays may occasionally be read of which the society may wish to have copies for future inspection, in order to save the trouble of the secretary transcribing them, it might be proper to recommend that every essay be written on paper of the same size, so that they might afterward be bound in regular volumes, to be preserved as part of the records of the society. In this way, the literary communications made to the society would be recorded in the handwritings of their respective authors, free of those errors which might be occasioned in their transcription by another hand.—3. Another method of discussion might be by *Forensic disputations*. In this case, a question is proposed and stated, and opposite sides of the question are supported by different speakers. This method has its advantages and its disadvantages. Its *disadvantages* are, that persons, in their

eagerness to support the side they have taken, are sometimes apt to contend more for victory than for truth; and, unless they watch over their tempers, are ready to fall into a spirit of altercation and ill-humor, and to throw out unhandsome epithets against their opponents. Many persons, too, from their having ably supported the erroneous side of a question, have been insensibly led to adopt that opinion; though, in the first instance, they defended it merely for the sake of argument. Its *advantages* are, that it excites interest and attention, exercises the reasoning faculty, and affords an opportunity to every member of taking a part in the discussion. It may, when properly and calmly conducted, suggest useful information, and throw light on many obscure and interesting subjects. It has a tendency to teach persons not to be too rash in adopting opinions until they have weighed the objections that may be brought against them. As the discovery of truth ought to be the chief object in all literary debates—in order to insure this object, an intelligent person, who has taken no direct share in the debate, might be appointed to sum up the arguments on both sides, and endeavor to balance them, in order to ascertain on which side the truth seems to lie. In certain cases, it will be found, that the truth does not lie directly on either side, but in a middle position between the two extremes. This mode of discussion, when adopted, should be used with extreme caution, with an equable temper, and with a sincere desire to discover truth, wherever it may be found; otherwise it may be attended with hurtful consequences.—4. Another mode of discussion, is the *determining of a question by an induction of facts or reasons*, in order to illustrate a particular subject; or, in other words, by an inquiry into causes and effects. For example, suppose such questions proposed as the following:—What are the different causes which operate in the production of rain? On what principles are we to account for the various phenomena attendant on thunder-storms? By what means may the stroke of lightning be averted? What are the various useful purposes to which the late discoveries respecting the *gases* may be applied? By what means, and on what principles, may human beings be transported from one place to another with a more rapid motion than has hitherto been effected? What are the best means for undermining the principles of avarice, and counteracting its effects? What are the most efficient methods for diffusing knowledge, and improving the moral and intellectual powers of man? On such questions, every member might be called upon to suggest whatever occurs to him that has a tendency to elucidate the subject, and to determine the inquiry; and the remarks of all the members who deliver their sentiments, when combined, could not fail to throw some light on an interesting question, or, at least, they would tend to excite to further inquiry at a future period.

III. *The Funds of the Society, and the purposes to which they might be applied.*—Money is a necessary article in every association, and is indispensable in the vigorous prosecution of scientific objects. Little of it, however, is required for rational and literary purposes, compared with what is spent in the pursuits of folly and dissipation.—Although it is not usual in most societies to make any difference in the sums to be paid by every member, yet it appears somewhat unreasonable, that a person whose income is known to be very limited should contribute as much as one whose income is five or six times greater. A minimum, however, ought to be fixed, below which the poor-

est member should not be permitted to go, except in very singular cases. Those whose incomes are known to be considerable should be requested to give separate subscriptions, beside the regular quarterly or annual fees, for the purpose of more speedily accomplishing the objects of the institution. Two or three different rates of annual fees or subscriptions might be fixed upon, a maximum, a middle, and a minimum, and every member left at liberty to choose that rate which suits his circumstances. Nor ought those who are unable to pay the maximum rate, or to give separate subscriptions, to be on this account, considered as inferior to their fellows; for it is no disgrace for a man to be poor, if he is honest, prudent, and industrious, and has not wasted his substance in folly or dissipation; as it is no honor to a fool to possess wealth which he was not instrumental in acquiring. The purposes to which the funds of a literary institution may be applied are such as the following:—

1. *The purchase of Books.*—These are the grand depositories of human knowledge, and, therefore, it should be the first object of every literary establishment to procure a judicious selection of the best books, in every department of science. In regard to the *general subjects* of the books to be purchased, it may be proper that every member have it in his power to give his vote and opinion; but the selection of the individual books on any particular science, should perhaps be intrusted to a committee composed of such members as are best acquainted with the present state of literature.

—2. *The purchase of philosophical instruments.*—It may perhaps be a considerable time before the funds shall permit the purchase of an extensive apparatus of this kind, yet if a certain portion of the funds be appropriated to this object, in the course of 20 years 500 guineas might be devoted to it, supposing the society to consist of 100 members, every one contributing annually half a guinea, and that only one half of the funds are appropriated to this purpose. Nor should it be considered as an object too grand and extensive, to have ultimately in view the erection of an observatory for astronomical observations, and a complete apparatus for illustrating the doctrines of chemistry, natural philosophy, and all the other departments of natural science. Specimens of interesting objects in botany, zoology, mineralogy, and geology, might also be procured, along with models of useful machines for illustrating mechanical powers and operations. Where there is an ardent love of science, and an animated perseverance in prosecuting its objects, all the ends now stated might, from small beginnings, be in due time accomplished.—3. Another purpose to which the funds may be applied might be, the *distribution of premiums* to those who solve any difficult and useful problem, or who produce the best essay on a given subject. If the propriety of bestowing premiums in such cases be admitted, the following principle might be adopted as to the nature of the premium; namely, that it be such as can be procured at a moderate expense, and, at the same time, be of some *utility* to the person to whom it is adjudged. Instead of a gold or a silver medal,—a pocket compass, a sun-dial, a pocket telescope, a small microscope, a quadrant, a case of mathematical instruments, a terrestrial or celestial globe, a tellurion, or any useful article which may best suit the taste of the successful candidate, might be given as a premium; and along with it a medal of copper, pewter, or brass, or an engraved card, with an appropriate inscription.

IV. *The Publications of the Society.*—A considerable time would probably elapse before such a society would have it in its power to communicate any new discoveries worthy of the attention of the scientific world. Yet this consideration ought not, perhaps, to deter the society from exhibiting some of its transactions to public view. In the progress of the institution, after the lapse of a few years, a selection might be made of the best essays that had previously been communicated, and published in a neat duodecimo volume, with an historical account of the progress of the institution since its commencement, and the manner in which its operations are conducted, together with an abstract of the general progress of science during the same period, which might be collected from certain scientific journals. It would also be useful to give a brief statement of what has hitherto been discovered in relation to the different sciences, with hints respecting the desiderata, or things which still remain to be discovered—which would tend to direct the attention of the rational inquirer to those particular investigations by which science might be advanced, and carried forward to perfection. Such a volume, though it might not embody any new deductions, or discoveries, might, notwithstanding, be of considerable utility in different respects. It might convey new and useful information to those who are just commencing the study of science, and who have no access to the more learned transactions of other societies; it might become a depository for inserting accounts of interesting facts, and of researches that may be made in that part of the country where the society is situated; it might tend to excite the rational part of mankind in other cities and towns to form similar establishments, and to cultivate a mutual correspondence; and, as it would probably obtain a considerable circulation in the surrounding districts (being printed in a cheap and economical form), it might diffuse new information in different quarters where more expensive volumes would never have found admittance.

V. *Correspondence and intercourse of the members of the different societies.*—It might be of considerable use for promoting the object of these institutions, that the societies, in their corporate capacity, and individual members, should correspond with each other, both personally and by literary communications—and that the members of one society, when occasionally residing in the locality of another, should be admitted gratis to all the privileges of that other society; such as, the use of the library, the inspection of the museum, and attendance on lectures. In order to designate the members of all such societies, and to prevent the necessity of a circumstantial proof of their belonging to similar institutions, every member might be furnished by his own society with an engraved card or ticket, or rather with a medal of brass or pewter, having the society's name and motto engraved on it, and to which the name of the person, at his admission, might also be appended. The advantages which would result from the possession of such a document are sufficiently obvious. It would form, as it were, a bond of union among all the lovers of science in different parts of the empire, and enable them with facility to recognize each other. Travelers, whether on business or for pleasure, when visiting the different towns in the line of their route, would thus obtain an easy access to the society of persons of congenial minds; useful hints would be reciprocally communicated, and an interesting correspondence occasionally formed,

which might be productive of many pleasing and important consequences, both to the individuals and to the respective societies. They would thus feel themselves more at home, devoid of that ennui which one so frequently feels in strange places, and have an opportunity of improving those hours which might otherwise be dissipated in listlessness, to rational and scientific purposes. In short, by this means, the idea suggested by the celebrated Lord Verulam, of uniting the learned world into one great republic, might be in some measure realized; every person of intelligence carrying along with him his badge of distinction, and thus indicating to all congenial minds, the grand association to which he belongs.

The present is an age in which scientific associations have rapidly increased. The principle of the division of labor seems now to be judiciously acted upon in scientific investigations, by the formation of societies which have chiefly one great object to promote, or one particular science which they propose to cultivate; and therefore we have reason to indulge the hope, that the different sciences will now make more rapid advances to perfection than in former times. Still, however, much remains to be accomplished in regard to the establishment of literary and rational associations. The discoveries hitherto made in the various departments of human knowledge are entirely unknown to by far the greatest proportion even of the civilized part of mankind. Institutions, therefore, still require to be formed, on an *extensive scale*, for communicating to the great mass of society at least the results of those researches which have hitherto been made, for eradicating those erroneous notions which so generally prevail, and for directing their attention to moral and intellectual pursuits. And should such societies be formed, we might indulge the hope that, ere long, they would be enabled to cooperate with those respectable societies which now exist, in making researches into those regions of science which are yet unexplored, and of promoting the moral improvement of all classes of the community.—They would likewise have a tendency to advance the interests of genuine religion. For, true science and the doctrines of revelation, so far from being at variance, perfectly harmonize, and reflect a mutual luster upon each other. Of course, the more general information persons acquire in relation to the system of nature and the economy of the material world, the more will they be qualified for studying the Scriptures in a rational manner; the light of sound philosophy will have a tendency to guard them from skepticism on the one hand, and from superstition and enthusiasm on the other, and to prevent them from imbibing those foolish and erroneous interpretations of Scripture, which have tended to bring discredit on the oracles of Heaven. If, therefore, the moral improvement and the intellectual illumination of mankind be an object at all desirable, it is to be hoped the intelligent public will duly appreciate its importance, and encourage every scheme which has a tendency to raise our species to that dignity which they ought to hold in the scale of existence, as rational and immortal beings.

Such is an abridged view of the communications on this subject, which were offered to the public above twenty years ago, long before any such society actually existed. Such institutions have now been established in most of the large towns of the British empire, and in various parts of the United States of America; but none of them with which I am acquainted comprehend in their plan all the objects above stated. In their

present state they appear defective in the following respects:—1. In these institutions being regarded as chiefly adapted to the instruction of artists and mechanics, for rendering them more intelligent and expert in their respective trades and professions; and hence the instructions communicated have been almost exclusively confined to mathematics and mechanical philosophy. It is highly requisite that mechanics should be instructed in the physical and mathematical sciences connected with their professions; but this, instead of being considered as an ultimate object, should be viewed as only one of the *subordinate* objects of such institutions. Their grand and ultimate objects ought to be, to induce a taste, among the great mass of society, for moral and intellectual improvement—and to diffuse, throughout all ranks, useful knowledge of every description, in order to raise the human mind from that state of degradation in which it has been so long immersed, and to direct its contemplations to objects worthy of the dignity of rational and immortal natures.

In order to accomplish such objects, it is essentially requisite that knowledge be presented to the understanding in *its most interesting and alluring forms*. In the first instance, all abstract disquisitions, and abstruse mathematical investigations, should be studiously avoided, or postponed to a future period; and those scenes and objects presented to view, which have a tendency to allure the imagination, to excite inquiry, and to produce rational delight. Such are the subjects of Natural History, which, considered in its most comprehensive sense, has for its object, to arrange and describe all the known facts in the material universe. *Facts* constitute the foundation of all the sciences—they are most easily acquired when properly described—their acquisition requires the least exertion of intellect—and, when presented to the view in sufficient number and variety, they will always produce pleasurable emotions, and a thirst for intellectual enjoyment. And, therefore, in the natural order of instruction, they ought to constitute the first portions of knowledge to be presented to the untutored mind in all colleges, academies, and mechanics' institutions. After the student has acquired a knowledge of such facts, the elements of the mathematical sciences might next occupy his attention, for enabling him to enter on the discussions of natural philosophy, astronomy, and the investigation of the causes of the phenomena of nature. A profound knowledge of the abstruse parts of mathematics, however, is not absolutely necessary for the acquisition of the more useful branches of general knowledge. An acquaintance with the demonstrations of the first book of Euclid, and of a few propositions in some of the other books—the elements of plane trigonometry and conic sections, along with practical geometry—is almost all that is requisite for understanding the more interesting departments of science, and may be acquired in a very short time, by a moderate application of the mental powers. The order I have now stated has, however, in most instances, been inverted. The abstractions of mathematical science have been presented to young and untutored

minds before they had any conceptions of their utility, or the investigations to which they are applied, and before they had acquired a *relish* for substantial knowledge; and the consequence has been, that many have abandoned the pursuit of knowledge, on account of the dry and uninteresting form in which it was presented to the mind. In conformity with this practice, the directors of some mechanics' institutions have selected lecturers chiefly on the ground of their being *expert mathematicians*, without any knowledge of their accomplishments as *popular* teachers of natural science; and the consequence has been, that both the superintendents and the members of the institution have been disappointed, and the society has fallen into disrepute. For, a profound mathematician is not *generally* the person best calculated to convey a knowledge of the facts of natural history and philosophy, *in the most simple and alluring manner*, to the untutored mind.

2. Another defect in these institutions, as presently conducted, is, that they are not rendered so subservient as they might be to the *moral improvement* of society. Knowledge of every description ought to be rendered subservient to the illustration of Divine truth—of the attributes and moral government of the Almighty—of the facts and evidences of revelation—and for counteracting evil passions, and promoting the advancement of the human race in true morality—and thus preparing them for the employments of that future and eternal world to which they are destined. Unless this object be kept in view, the advantages which society will derive from such institutions will be comparatively few and unimportant. For the mere acquisition of scientific knowledge will not of itself counteract the depravity and moral evils which exist in the world, nor raise mankind in the scale of moral excellence, unless it be blended with that celestial light which proceeds directly from the great Source of intelligence. Discussions on some of the leading subjects to which I allude can easily be conducted, without in the least interfering with *sectarian* views of religion; and I cannot account for the almost universal practice of setting aside such topics in philosophical discussions, without being inclined to suppose that there is a certain degree of antipathy entertained toward such subjects, notwithstanding their important bearings on the present comfort and the future happiness of mankind.

I shall only add further, that beside the communication of knowledge by public lectures in mechanics' institutions, the members of such societies might have occasional meetings for mutual instruction. At such meetings, a portion of some standard, scientific, or other work, might be read, and a conversation entered into respecting the subject it discusses. Every member should have an opportunity of proposing questions in reference to that subject, and of stating any objections or difficulties that may occur to his mind—not for the purpose of caviling or of formal disputation, but to increase his information, and to draw forth the remarks of his associates. In this way the leading branches of any particular system of science might be explained and elucidated in the course of a session.

PART II.

MISCELLANEOUS HINTS IN REFERENCE TO THE DIFFUSION OF KNOWLEDGE AND THE IMPROVEMENT OF SOCIETY.

ON the following subjects I originally intended to enter into some specific details and particular illustrations. But as this volume has already swelled to a considerable size, I can offer, in the meantime, only a few general hints.—If we would carry forward the social state of man to that “consummation” which is so “devoutly to be wished,” we would require, in the first place, to enter into *every department* of society, and detect the absurdities, abuses, and immoral principles connected with it, and expose them to view in all their naked deformities and unchristian tendencies. For there is scarcely a department of the social state, in Europe or Asia, whether civil, political, or ecclesiastical, but is based on selfishness, ambition, avarice, tyranny, or other anti-social and malignant principles. In the next place, it would be necessary, not only to investigate the remedies to be applied to such evils, but to introduce practices which have never yet prevailed, and to lay the foundation of institutions which have never yet been established. For, if ever we expect to behold a period when knowledge shall be universal, when “Righteousness shall run down our streets as a river,” and when “Holiness to the Lord” shall be inscribed on all the employments of human life—our existing institutions require to be new modeled, and many of them altogether overturned, and a new foundation laid for the advancement of society, and the future progress of the human mind. Notwithstanding the vague and violent declamations of certain politicians and divines about the necessity of “preserving unimpaired our national institutions,” it is evident that some of them are rotten to the very core, and stand as obstructions to the rights of mankind—to the progress of knowledge, and to moral improvement. There is a continual outcry among certain classes against everything which has the appearance of “*innovation*,” and which implies a want of confidence in “the wisdom of our ancestors;” as if laws and institutions, framed in an age comparatively barbarous and unenlightened, were so absolutely perfect that they require no further correction or improvement. Without *innovation* there can be no thorough *reformation*. Many existing institutions, laws, and usages, have been tried for centuries, and have been found of little avail to the renovation of the world; and he who insists that they shall be still supported in every *iota*, as they have hitherto been, virtually declares, that *the moral world ought to stand still*, and that no such period as the Scripture-Millennium will ever arrive to bless mankind. There is an utter inconsistency in maintaining that every practice and institution should continue in its present state, and at the same time admitting that the world is to be regenerated, and that “the knowledge of Jehovah shall cover the earth.” The one position appears incompatible with the other, and he who tenaciously adheres to the former must give up the latter; and hence we have sometimes found, that

those who are strenuous supporters of “things as they are,” do not hesitate to affirm, that “the world will never be much better than it has hitherto been, and that wars, and ignorance, and misery, will continue to the end of time.” But such a sentiment, as we have already shown, is inconsistent with the plainest declarations of the oracles of Heaven, and tends to throw a dismal gloom over all the future prospects of society; and I trust there is scarcely one enlightened Christian that would dare to vindicate an opinion so inconsistent with the future improvement of our species, and with the benevolent purposes and arrangements of the Governor of the world.—But to enter particularly into the subjects to which I allude would require a separate volume of no inconsiderable size. I shall therefore, in the meantime, offer only a few general hints, leaving every one to prosecute the subject more particularly by his own reflections.

I. ON IMPROVEMENTS IN REGARD TO PREACHING.

In the few remarks which I intend to make on this topic it is taken for granted that the fundamental facts and doctrines of Christianity are to be frequently illustrated, and always *recognized* in every discussion that has a reference to religion. But it is preposterous to dwell almost perpetually, as some preachers do, on what may be termed the alphabet, the rudiments, or first principles of Christianity, as if Christians were always to remain “babes in Christ.” “Leaving the first principles of the doctrine of Christ,” but neither forgetting them, nor dwelling exclusively upon them, they ought “to go on to perfection,” carrying forward and tracing these principles through all their important bearings and consequences in the Christian life, and expanding their minds with all the views of the Divine operations which the aids of Revelation, art and science, can furnish. This progress toward perfection, however, can never be attained, if Christians are always employed in “laying again the foundation,” and never attempting to rear the superstructure; and if Christian instructors are always exercised in attempting to prove and explain a few of the fundamental articles of the Christian system, and neglect to carry forward their readers and hearers through all the different departments of Christian action and contemplation. What should we think of the teacher of geometry who, after explaining the terms, axioms, and first principles of the science, stopped short, and left the student either to prosecute his path through the leading propositions and higher branches, or not, as he deemed proper? What should we think of the philosopher who spent his time merely in explaining the rules of philosophizing, and the general laws of motion, without ever applying them to the investigation and explanation of the phenomena of the visible world; and who is always defining first principles, without tracing them to their conso-

quencés, or pointing out the manner of their application? We could expect but poor geometers and philosophers, from such meager instructions. And can we expect that the Christian instructor, who seldom goes beyond the *axioms* of Christianity, shall render his hearers *enlightened* and *practical* Christians, and bold heroes in promoting the cause of reformation and religion? If such a plan of instruction be wise, then the apostles and prophets were fools in directing us so particularly in all the practical bearings of religion, and taking such expansive views of the works and the moral government of God. But, waiving such general observations, I proceed to offer two or three particular remarks.

The preacher should take a *more comprehensive range of subjects*, in his instructions, than that to which he is usually confined. The Scriptures contain references to a greater variety of objects than any other book—all of which must be considered as legitimate subjects for discussion in the pulpit. The works of creation, as displaying the Power, Wisdom, Benevolence, Grandeur, and superintending care of the Creator—the events recorded in sacred and civil history, as manifestations of the character and principles of his moral government—the history of nations and the revolutions to which they have been subjected, as illustrative of his faithfulness and retributive justice, and of the fulfillment of ancient predictions—the harmony which subsists between the system of nature and the system of Revelation, and the mutual light they reflect upon each other—the depravity of man, and the proofs and illustrations of it which are to be found in the constitution and operations of nature, and in the wars and devastations, and malignant principles which have prevailed in the world—the truth of Revelation, as displayed in its powerful and beneficent effects in the case of nations, families, and individuals, and in its transforming influence on the state of society and on the physical aspect of the world—the various active means by which society may be improved and regenerated, and the blessings of the Gospel diffused among all nations—the multifarious ways in which benevolence and general philanthropy may be made to operate in diffusing knowledge, counteracting misery, alleviating distress, and promoting happiness among all ranks—the rational grounds of those moral laws which God has promulgated in his word, which form the basis of the order and happiness of the moral universe,—these, and other topics connected with them, in conjunction with the leading doctrines of Christianity, and the views which the Scriptures unfold of the glories of the Millennial era, the resurrection of the dead, the new heavens and earth, and the employments and felicities of the future world—should be exhibited in a luminous and energetic manner, and illustrated with all the facts and scenes which the physical and moral world can supply. In particular, the duties of *practical Christianity*, the government of the temper, the dispositions and principles which should be displayed amidst the scenes and departments of human life, the duties incumbent on masters, servants, parents, children, teachers, scholars, merchants, judges, authors, publishers, neighbors, and other relations in society, should be specifically explained and illustrated. Graphical descriptions might be given of the scenes of human life and the practices which abound in society, delineating the selfish and malignant principles which pervade them, drawing them forth from their hiding-place, and portraying them before every eye, in all their contrariety

to the principles of the Gospel, and in all their repulsive features and abominations—at the same time showing *how* the spirit of Christianity ought to operate in every scene and department in the commercial, political, and religious world, and what delightful and harmonious effects would be produced, were the principles of our holy religion to be universally recognized in all the transactions of mankind.

Had we a preacher endowed with the graphical powers of a Sir Walter Scott, with a mind imbued with Christian principles, and ardently desirous to consecrate his faculties to the advancement of practical Christianity—he might, by his lively and picturesque descriptions of the scenes of sin and holiness, and their respective effects on the moral world, excite attention to such subjects almost to as high a pitch as that celebrated novelist did to his tales of warlike encounters, and of knights and ferocious chieftains whose names ought now to descend into oblivion. Such were some of the inspired preachers, whose orations are recorded in the book of God. Such was the prophet Isaiah, when he proclaimed to the tribes of Israel the counsels of the Most High. Let us conceive him standing in an elevated position in the court of the temple, at one of the solemn feasts, surrounded with thousands of worshippers,—describing the majesty of Him “who measur-eth the waters in the hollow of his hand, meteth out heaven with the span, and weigheth the mountains in scales and the hills in a balance”—contrasting the grandeur of Jehovah with the vanities of the heathen and the pitiful images of the idolater—portraying the destruction of Babylon, and its hideous and perpetual desolations—depicting the riches and splendor of Tyre, and the doom which awaited her proud inhabitants—foretelling the downfall of Egypt and the utter confusion and despair which would seize upon all ranks—denouncing the wickedness and abominations of the people of Judah—displaying the Messiah, in his character, humiliation, sufferings, and triumphs, and unfolding the future glories of his triumphant reign, when “the Gentiles shall come to his light, and kings to the brightness of his rising,” and “all the ends of the earth shall see the salvation of God,”—and we have a representation of a sacred orator, animated with the most sublime conceptions, and delivering his message in language calculated to arrest the attention of every hearer.*—The apostle Paul at Athens is another example.† Standing on the summit of Mars hill, under the open canopy of heaven, with the lofty Acropolis towering behind him, with islands, seas, mountains, and the peerless city of Athens, with the Porch, the Lyceum, and the Grove stretched out before him, and pointing to the splendid temples of idolatry, and to the altar erected “To THE UNKNOWN GOD”—he describes that incomprehensible Being “who dwelleth not in temples made with hands,” who is the Source of life to all beings, and who has “appointed the times of their existence and the boundaries of their habitations”—demonstrates the absurdity of idol-worship—proclaims the commencement of a new era, and the command of the Most High to “all men everywhere to repent”—and declares the certainty of a future state, a resurrection from the dead, and a day when “God will judge the world in righteousness” by the man Christ Jesus. There is no doubt that in this discourse, of which we have only a brief summary, the apostle would

* See Isaiah, Chapters xi, xlv, xlii, xliii, xiv, liii, lx, lxv, &c.

† Acts, xvii.

select all the surrounding objects, the facts of history, and the scenes of nature, which could be made to bear on the point of discussion, in order to illustrate the sublime topics of his address, and to produce an indelible impression on the minds of his audience.

We have another representation of what a Christian preacher ought to be, in the example of Messiah, the great "Teacher sent from God."—Seated on a mountain, with the vault of heaven above him for his sounding board, he expatiates on the happiness of the humble, the meek, the merciful, the pure in heart, the peace-makers, and they who are persecuted for the sake of righteousness, in opposition to all the false maxims which had prevailed in the world; and, in a long discourse, exposes the hypocritical and corrupt principles of the age, and enforces the true laws of moral action on every class of his hearers—a discourse which, if it were not recorded in the Bible as having been delivered by the highest authority, would be considered by some as a specimen of *legal preaching*. On other occasions he collected multitudes on the sea-shore, and addressed them from a ship, illustrating his heavenly doctrines from the sowing of seed, the tares among the wheat, the gradual progress of vegetation, the mustard-tree, the pearl of great price, and the net which gathered fishes of every kind. The objects both of the living and inanimate creation were presented to his hearers, as conveying sentiments of instruction and piety. He inculcated upon them confidence in the care of Providence, from the birds of the air and the flowers of the field. "Behold the fowls of the air," which are now flying around you, "they sow not, neither do they reap nor gather into barns, yet your heavenly father feedeth them;" "Consider the lilies of the field" growing on yonder meadow, "they toil not, neither do they spin, yet Solomon, in all his glory, was not arrayed like one of these."—Such were the subjects illustrated, and the mode of instruction adopted by those who were commissioned from heaven to make known the will of God to man. How very different, both in matter and manner, were those simple and sublime instructions, from some of the meager metaphysical discourses which are frequently read in our churches, in a dull monotonous tone, and which present scarcely one well-defined or animating idea to the majority of the hearers? And let the reason of every man, who acknowledges the Scriptures as a Divine Revelation, determine which of these modes of preaching is to be preferred—whether we ought to imitate the example of inspired teachers, or that of fallible and erring men!

Again, the subject of the *education of children*, and the proper means to be employed for training them in knowledge and Christian morality, should occasionally form the subject of preaching. Lectures might be delivered on this subject on Sabbath evenings, or on week-days, and the general principles and rules laid down, *particularly illustrating by examples taken from the existing scenes and practices of society*. With regard to *private or family education*, I know no book that would serve for a better model, as to the manner in which such instructions should be conveyed, than Mr. Abbott's "Mother at home," with all its appropriate facts and examples. Even the mere *reading* of such a book to a public audience, with occasional pauses, remarks, and familiar illustrations, might produce a more powerful practical effect than many elaborate sermons, whose object is merely to *prove* a doctrine which a single text

of Scripture is sufficient to establish. This is a subject of paramount importance, and which has been too much overlooked in the business of Christian instruction. Most of the evils which abound in society may be traced to the want of proper tuition in early life, under the domestic roof, and to the *ignorance* of parents and servants, as to the rational and moral principles on which instruction and family government ought to proceed. Discourses should likewise be occasionally preached on the *duty of Christians devoting a considerable portion of their wealth for the promotion of education and universal improvement in society*.—This is a duty which, in the present age, is scarcely understood or appreciated; and yet, upon the universal attention that is paid to it will depend the future progress of knowledge and religion, and all the bright scenes to which we look forward in the days of the Millennium. But it is needless to enlarge on this topic; after what has been stated in the preceding pages. (See p. 136, &c.)

2. The effect of preaching might be increased, *by illustrating the facts and reasonings, connected with religion*—in so far as they are susceptible of it—with *sensible representations*. In describing, for example, the Jewish tabernacle, and its utensils, models, or pictorial representations of such objects, on a large scale, might be exhibited. I have known persons who were considered as intelligent Christians and mighty in the Scriptures, who appeared to have no accurate conceptions of such objects, and who, when the relative positions of the altar of the burnt-offering, the sanctuary, and the Holy of the Holies, were represented on paper, along with the furniture and vessels in the respective apartments, acquired ideas on the subject which they never before entertained. When we consider the frequent allusions made to such objects in the writings of the prophets, in the Evangelical history, and particularly in the Epistle to the Hebrews, it cannot be a matter of mere indifference, that Christians should be altogether destitute of clear conceptions of the scenes and objects connected with the tabernacle in the wilderness, or the temple at Jerusalem; and there are comparatively few individuals who are able to form a distinct picture in their minds of such objects merely from reading the descriptions in the books of Moses. I have heard a preacher attempt to convey an idea to his hearers of the *Ark of the Covenant*, by telling them it was about the size of a *tent-bed*, and somewhat similar to it in form.—But it would certainly have conveyed a more precise and accurate idea, had a large drawing or engraving of it been exhibited to their view, and the different parts of it pointed out and explained.—Maps, on a large scale, of Palestine, Asia Minor, and the countries around Judea, where the Apostles traveled to propagate the Gospel, might likewise be exhibited, when the preacher is lecturing on the journeyings of Israel from Egypt, on the Evangelists, or the Acts of the Apostles, for the purpose of elucidating the narrations of the sacred historians, and showing the relations of the several towns and countries to which a reference or allusion is made; for the interest excited by these narratives, and some of the instructions to be derived from them, partly depend on our knowledge of the geographical positions and relations of the persons and places to which the history refers.—Similar exhibitions might likewise occasionally be made of various objects alluded to in Scripture connected with the agriculture, antiquities, arts and sciences of the Eastern nations,—on a knowledge of which a clear perception of the meaning

and references of many passages in the prophetic and historical writings in a great measure depends. The only point to be settled is, whether it be proper, in any case, to introduce such subjects into the pulpit. If this point be admitted, then the question is, whether we ought to convey a clear and distinct idea of the object, or an obscure and distorted conception, or no idea at all. For mere verbal descriptions can convey no distinct conceptions of the objects to which I allude.

Some worthy Christians, I am aware, would be apt to imagine, that such illustrations are altogether foreign to the business of religion, and that they would draw aside the mind from God and spiritual objects. But, I would ask, what do we know of religion except the notions we have acquired through the medium of the senses? What ideas have we of God but what we have derived from the history of his dispensations recorded in his word, and the contemplation of his visible works? Every fact contained in the Bible embodies in it a description and exhibition of *sensible* objects, without the intervention of which we could have no ideas of religion at all; and the material creation around us is an adumbration or sensible exhibition of the attributes of the invisible Divinity.—His omnipresence and agency is manifested in every object we behold. Every plant and flower, as it springs upward to maturity, indicates the presence and incessant operation of Him who formed it by his wisdom. Every ray of light descending from the solar orb, is an indication of the presence and glory of Him who is represented as dwelling “in light unapproachable.” Were we, in reality, “spiritually minded,” were our thoughts and affections properly directed, we would see God in every object and in every event—in the instruments of agriculture, by which the earth is cultivated—in the microscope, which discloses to our view the invisible worlds of life—in the Jewish tabernacle, with all its furniture and utensils—in the history of nations, and the revolutions through which they have passed—in the whirlwind, the tempest, and the refreshing breeze—in the verdure of summer, the storms of winter, the fruits of harvest, and in all the beauties and sublimities of earth and heaven;—and therefore, whatever artificial representations can assist our minds in forming distinct conceptions of such objects must have a tendency to convey instruction, and to inspire us with sentiments of piety and devotion.

3. In order to diversify the topics of preaching, and to render it more interesting and instructive, *the education of candidates for the ministry ought to embrace a more appropriate and extensive range of subjects than that to which it has been usually confined.* It is somewhat strange, that, in reference to preaching, the simile has been introduced into our language, “*as dull as a sermon.*” There is no class of orators that has such a multiplicity of sublime and interesting objects and motives at his command, and so extensive a range of illustration as the Christian preacher. He has the boundless field of the universe, in all its diversified relations, in which to expatiate—all the scenes of Providence which have been displayed in every age since time began—eternity, past and to come, with all its awful and glorious realities—the ruin and the recovery of the fallen world—the virtues, miracles, death, resurrection, ascension, and glory, of Him who is “the image of the invisible God”—the operations of the Divine government in reference both to man and to angels—the powers and agencies of superior intelligences—the perfections of the Deity, and the grandeur of his empire—the moral principles of the Christian system,

and the virtues which, if practiced, would reunite all the tribes and families of mankind—the hopes and fears of human beings both in regard to this world and to the life to come—the felicity and glory of the Millennial church—the scenes of the conflagration, the general resurrection, the last judgment, and the happiness and employments of men and angels throughout an endless duration,—these, with all the endlessly diversified objects connected with them, form so many legitimate topics and sources of illustration to every Christian preacher. And yet, a sermon is generally characterized as a dull and somniferous composition.—If this characteristic be true, the fault lies, not in the *subject*, and the narrow range of topics, but in the *preacher himself.*

It is not a little unaccountable, that the series of instruction through which students for the ministry usually pass, is everything but adapted to produce intelligent and eloquent preachers of the Gospel. Almost the one-half of the time devoted to what are called *philosophical* studies is employed in the study of Latin and mere classical literature, while they are never introduced to the knowledge of those more interesting and luminous subjects which have a far more direct bearing on theology and the objects of the Christian ministry. Even the subjects of natural history, natural theology, geography, popular philosophy, and pulpit oratory, are seldom discussed or illustrated in the seminaries where they are taught; and hence may be traced the limited views which are entertained respecting the range of illustration on subjects of divinity, and the little effort which has been made to excel in sacred eloquence. A preacher, in so far as is practicable, should be a man of almost *universal knowledge.* Without extensive information on all the subjects to which I have alluded, he cannot be supposed to enter with spirit and energy on the illustration of such topics, or to exhibit those graphical descriptions, and delineations of physical and moral scenery to which I lately adverted. The time employed in the study of Latin, and classical learning, might be sufficient for laying the foundation of knowledge in all those useful departments of science and religion, which, when thoroughly studied in after life, would “make the man of God complete, and thoroughly fitted for every good work.” It is little short of criminality to waste so much time in such studies, while subjects of infinitely greater importance are either overlooked, or altogether neglected. And, therefore, if we would render the Christian ministry fully efficient for all the great purposes it is intended to accomplish, we must introduce new arrangements into the plan of our academical instruction. In connection with Biblical criticism, and the study of Greek and Hebrew, in so far as necessary for reading the Scriptures in the original languages, all the branches of natural history, geology, geography, experimental philosophy, chemistry, physiology, natural theology; ancient and modern history, sacred, ecclesiastical, and civil; the progress of the arts; the physical, moral and political state of the nations—in short, all the facts which can be ascertained in reference to the operations of the Creator in the physical and moral universe, ought to be studied, in so far as is practicable; and no one should be sent forth as a preacher (unless in extraordinary cases) who has not a competent knowledge of such subjects.* Such knowledge would furnish inexhaustible sources of

* There appears no necessity for courses of *moral Philosophy* in Christian colleges and academies; as every one who takes Revelation for his guide, finds the purest, and most comprehensive system of moral science explained and illustrated by the sacred writers.

illustration on divine subjects, which would both arrest the attention, and increase the general knowledge of the hearers of the Gospel. I have always considered it as a characteristic of a good sermon, which the hearers would appreciate, *when an outline of the leading ideas contained in it could be sketched on paper or canvass.* We can paint the outlines of our Saviour's instructions, Paul's sermon at Athens, Moses' farewell address to the Israelites, the speech of the Almighty addressed to Job, and most of the orations of Isaiah, Jeremiah, Daniel, and the other prophets. But this can never be done, unless there be interwoven with the texture of the discourse *tangible* illustrations, borrowed from the subjects to which I have alluded. I may just add, that every candidate for the ministry should pay particular attention to the improvement of his voice and manner of delivery, so that he may be enabled to express his sentiments with a distinct articulation, and with *becoming energy and pathos*, suitable to the nature and solemnity of his subject,—and not, as is frequently the case, like a school-boy reading his lesson with a disgusting monotony. Where there is any natural or acquired defect in the organs of speech, the individual ought to be considered as unfit for the office of a Christian preacher.

4. Divine worship should be so conducted that *praise* offered to our Creator and Redeemer *should be appropriate, and according with the dictates of inspiration.* In order to this, all the subjects of praise should be taken *directly* from the sacred oracles, and the poetical version into which we throw them should embody, as nearly as possible, *the very language* of the inspired writers, and, in every instance, *the exact sentiments.*—The Scottish version of the Psalms of David—though containing many doggerel rhymes, and susceptible of considerable improvement—is, perhaps, the most accordant of any with the language and sentiments of the inspired penman. It is strictly coincident with the common version of the Bible, and where that version is incorrect, the poetical version is likewise deficient in precision and accuracy. But it does not appear to be incumbent upon us either to use the whole of the book of Psalms in our praises, or to confine ourselves to that selection of sacred poetry. The books of Moses, the book of Job, the prophesies of Isaiah, Jeremiah, Daniel, and Habakkuk, the Evangelists, the Epistles, and particularly the book of Revelation, can supply many appropriate passages to direct our meditations in the exercise of praise. But I would lay it down as a principle, that, in translating them into English verse, we should strictly adhere to the *sentiments* of the inspired writers, without interweaving our own paraphrases and comments. I hold it as an axiom, that the inspired writers are the best Judges of what is proper to be addressed to God in praise, and that our praises ought to contain nothing but the pure sentiments of inspiration. In opposition to this maxim, we find Independents, Methodists, Baptists, and others, using collections of what are termed *hymns* in public worship, and almost discarding the book of Psalms as if it were too antiquated a composition for directing Christian worship. Many of the compositions I allude to are vague, enthusiastic, too familiar in their language, when addressing the Creator and Redeemer—in many instances exhibit confused and distorted images of divine things, particularly when descanting on the joys of heaven; and their style and manner as well as some of their sentiments, altogether different from those of the prophets and apostles. To prefer such compositions in our addresses to God, to those of

inspired men, is little else than to “forsake the fountain of living waters, and to hew out broken cisterns that can hold no water.” I know not a more glaring piece of contradiction than in the pertinacious use of such hymns by the denominations alluded to, since they acknowledge no creed but the Scriptures; and when, in fact, there is a creed—in some instances not very consistent—embodied in the hymn book. The only question to be determined is, Are inspired writers the best judges of what we ought to address to God, and ought we to be directed by them in our devotions, or by the flimsy and erring compositions of fallible man? Private families and individuals may be left to their own feelings and discretion in this respect, but it is scarcely fair to *impose* such compositions on a public assembly.

There is another circumstance, in the exercise of praise, which deserves censure, and that is, *foolish and unmeaning repetitions.* Some tunes used in public worship require the last line of the verse or stanza to be two or three times repeated, whether it contains a complete sense or not; other tunes require *half a line* to be repeated three times although the pause should happen to be in the middle of a word; so that a worshipping assembly chiming in with such an absurd practice, appears “like children babbling nonsense in their sports.” Such a practice is highly indecorous; it is little short of mocking the Great Object of worship; and were an infidel entering an assembly when thus engaged, he might have some show of reason for declaiming on the absurdities of Christian worship. Those who abet such a practice would do well to consider the import of the Apostle's resolution, “I will sing with the spirit, and I will sing with the understanding also.”

II. *The Union of the Christian Church would have a tendency to promote universal improvement.*

The jealousies and mutual recriminations of contending sectaries constitute one of the many causes which have prevented the advancement of society. They have prevented the harmonious co-operation of all ranks and parties in establishing seminaries for the instruction of the young, and for promoting the knowledge of religion in our own country and in other lands; so that society, instead of moving forward as one great harmonious body in the path of improvement, has been shattered into a hundred different parties, each moving in its own direction, sometimes crossing the path of the others, sometimes advancing in an opposite direction, and sometimes clashing and engaging in mutual warfare. This is a state of Christian society which is much to be deplored, and which requires the most serious and solemn consideration of all denominations of the religious world, as to the means which ought to be employed, and the concessions which ought to be made, in order to produce a cordial union of all who appear to be imbued with the spirit of Christianity. Were this desirable object nearly effected, numerous obstructions to the general diffusion of knowledge would be removed, and a new impulse given to the cause of universal improvement. A broad and solid foundation might be laid for the universal instruction of all ranks in the leading truths of religion, and in every department of useful science, without interruption from those sectarian interests and contentions which have hitherto obstructed the rearing of the temple of knowledge and of Christianity. Liberality of views, and a spirit for introducing improvements into the social state, would be more extensively cherished. National reformation would be carried forward with more vigor and effect. Po-

litical parties in the State—which are frequently based on sectarian interests and opinions—would be gradually undermined, and all who are “right-hearted men” disposed to co-operate in every measure that has a tendency to promote the general good. The influence of such a state of society would be powerful in procuring the enactment of laws congenial to the spirit of philanthropy, and the dictates of revelation. Missionary enterprises to heathen countries would be carried forward on a much more extensive scale, and with far greater energy and effect, than can now be produced by the separate and insulated operations of sectarian missions. Unity of plan and operation would be introduced into all such expeditions, and a saving in the pecuniary means by which they are carried forward. Money, for all the purposes now stated, would be collected with less trouble and to a much greater amount; perhaps not only double or treble the amount now furnished, but even *tenfold* such sums might be collected, were the spirit of Christian union, and the liberal views which would accompany it, to pervade the whole range of the religious world.

III. *The knowledge of the Scriptures might be promoted by illustrating various portions of them with appropriate engravings.*

We have, indeed, Bibles and Commentaries of all sizes, from a 24mo to a folio, hawked through the country, “embellished” with engravings of different kinds, some of them not a little expensive. But these embellishments are, for the most part, only fit for the amusement of children, and, instead of elucidating the facts recorded in Sacred history, only tend to *distort* them. They consist almost wholly of pictures taken from fancy, in which the manners, costume, architecture, and rural scenery of the Eastern nations, are grossly misrepresented. Among these, we find views, connected with Jerusalem, and other cities in Judea, in which the houses are represented with sloping roofs and large arched windows in the modern style, and the streets crowded with *horses*, and horsemen, richly caparisoned, like knights-errant or modern dragoons, and holding halberds in their hands. The inhabitants of these countries are represented as wearing neither shoes, stockings, nor sandals, but quite bare from the soles of the feet to the knees. In a picture of the baptism of Christ, he is represented as standing quite naked beside a small rivulet, while John the Baptist is standing on the other side of it, holding a long cross in the one hand, and pouring water from a basin on the head of Christ with the other. In a picture of the *Temptation*, Christ is represented as sitting in something like an elbow-chair, with bare feet, a long robe like a surplice, and a glory round his head, while Satan appears addressing him in the attire of a modern female, standing upon cloven feet, and having wings attached to his shoulders. Such representations, which may be considered as specimens of most of our Scripture prints, instead of conveying ideas of the facts they are intended to represent, tend only to degrade and *caricature* them. Nothing can be more foolish and preposterous than most of the pictures representing the scenes of Scripture history, particularly in reference to the *anachronisms* they display. Burgoyne, in his *Travels*, notices a painting in Spain, where Abraham is preparing to shoot Isaac with a pistol, and an angel employed in providing that it shall miss fire! There is a painting, at Windsor, of Antonio Verrio, in which he has introduced himself to Sir Godfrey Kneller, and Captain May, surveyor of the works, as spectators of Christ's healing the sick. There

was in the Houghton Hall collection, Velvet Brughels' “Adoration of the Magi,” in which were a multitude of figures, all finished with the greatest Dutch exactness. The Ethiopian king is dressed in a *surplice*, with *boots and spurs*, and brings for a present, a *gold model of a modern ship*. Pousin's painting of Rebecca at the well, has the whole back-ground decorated with Grecian architecture. The same artist, in the picture of the *Deluge*, has painted *boats*, not then invented. Some of the Saxon painters put our Saviour, Noah, Abraham, and king Edgar, all in the same habit.

Many useful ideas respecting Scriptural facts may be communicated by means of engravings; but such representations as those to which I allude, should be forever discarded from our Commentaries and family Bibles. Instead of such absurd exhibitions, delineations of *real objects* should be introduced, as illustrative of some of the facts and descriptions of Sacred history. For example, the plan of the Jewish tabernacle and temple, the altar of incense and of burnt-offering, the ark of the covenant, the tables of showbread, the golden candlesticks, the brazen laver, and other utensils, as described by the sacred historians—the instruments of agriculture and of music, in so far as they are known, the manner of grinding corn, the plan and form of the Eastern buildings, the war-chariots and battering-rams of the ancients—views of modern Jerusalem, with plans of the relative positions of Mount Zion, Mount Calvary, Mount of Olives, the brook Kidron, &c.—views of Bethlehem, Nazareth, Joppa, the ruins of Tyre, Zidon, Babylon, and other cities mentioned in Scripture, as illustrative of the fulfillment of prophecy, which may be collected from the embellishments contained in the works of modern travelers—delineations illustrating the manners and customs of the Eastern nations—maps of Palestine, Egypt, Arabia, Assyria, Idumea, Babylonia, Persia, Greece, the islands of the Mediterranean, and the Roman empire, for illustrating the journeyings of Jesus Christ, the travels of the Apostles, the route of the Israelites through the wilderness, and the descriptions of the ancient prophets. Engravings might also be given of the more remarkable animals, trees and flowers, to which allusions are frequently made in the Sacred writings. Such views and delineations might be given at an expense much less than what is generally incurred in engraving the paltry and fictitious representations to which we have alluded; and they would certainly be much more congenial to the taste of intelligent readers of the Bible, and much more conducive to the illustration of the scenes described by the Sacred prophets and historians.

IV. *Knowledge and moral improvement might be promoted by abridging the hours of labor.*

One great objection to the prosecution of knowledge and general improvement is founded on the fact, that the bulk of mankind have not sufficient leisure from their daily avocations for such purposes. This is partly true in regard to merchants' clerks, haberdashers, grocers, apothecaries, and their apprentices and shopmen, and those employed in spinning-mills and several other manufactories. In these cases, shops are kept open, and persons employed from six in the morning until eight, and even until ten or eleven o'clock in the evening. But there is no necessity, in order to carry on the business of life, that such long hours of labor and attendance on shops should be imposed either on masters or servants. All the business usually carried on in shops and

manufactories could be transacted, without inconvenience to any party, between the hours of seven or eight in the morning, and six in the evening, if proper arrangements were made for that purpose. When once the public is aware that certain shops are shut up at a particular hour, every one would endeavor to supply himself with the articles he required from such shops before that hour arrived; and though they were to be kept open until twelve at midnight, or one in the morning, we know, from experience, that certain individuals would postpone their purchases, until these hours had nearly arrived. In order to prevent any inconvenience to society, by the shops, of bakers, grocers, apothecaries, or others, being closed at an early hour, an arrangement might be made to have one shop of every class kept open to a later hour, in every street or district of a town, so that, on any unforeseen emergency, articles of provisions, groceries, medicines, &c., might be procured. Every shopkeeper of this description would, of course, have his turn, in succession, of keeping open his shop during these extra hours, and of reaping, in rotation, the additional profits that might accrue, so that, in the course of a year or less, all would find themselves on an equal footing in regard to the quantity of business transacted, and the advantages gained, by keeping open in rotation their shops until later hours.

There is nothing to hinder the immediate adoption of such arrangements, but that spirit of jealousy which too much prevails among persons of the same profession, and which prevents a friendly intercourse among them for concerning measures for the good of the whole. A few obstinate and selfish characters, in the spirit of contradiction, would, doubtless, set themselves in opposition to such regulations; but as their sordid and avaricious views would be apparent to every one, they would soon be despised and deserted by the respectable portion of the community, and would suffer the natural consequences which almost invariably flow from selfishness and avarice. There is no man who, in such a case, sets himself in opposition to the general good of a community, that ought to be regarded as a Christian; as such conduct is directly opposed to the precept which enjoins us "to love our neighbor as ourselves," and "to look not merely on our own things, but also on the things of others." Such an arrangement, while it could be injurious to none, would be highly beneficial to all. It would afford leisure for public, private, and domestic intercourse—for attending philanthropic associations, or lectures on any branch of useful knowledge—for improving their minds in wisdom and virtue—for instructing their children, and enjoying the sweets of domestic intercourse—and for taking an active part in all those schemes which tend to promote the best interests of society. In particular, it would afford an opportunity to merchants' clerks, shopmen, apprentices, and others, of attending societies, lectures, schools, or other seminaries of instruction, for improving both their intellectual and moral powers—for want of which opportunities many young persons of this description rise up to manhood in comparative ignorance, and easily slide into the paths of folly and intemperance. But, before such an arrangement is effected, it would be previously requisite that seminaries, such as those formerly suggested, be established, for promoting the instruction of the classes to which I allude, so that their evening hours may not be spent in sloth or licentiousness. In regard to weavers, masons, tailors, carpenters,

mill-spinners, and common laborers, eight hours a day employed in labor; instead of ten or eleven, might be sufficient for all the purposes of society. Since the invention of modern machinery, a much greater quantity of labor than formerly can be effected in the same time. It appears to me, that the Governor of the world, in permitting such inventions for facilitating the process of manufactures, evidently intends thereby that the period of human labor should be abridged, in order to afford scope to all classes of society for mental, moral, and religious improvement, and in order to prepare the way for that period when "the knowledge of the Lord shall cover the earth." It ought, therefore, to be considered as a misapplication of machinery when it is employed chiefly for the purpose of enriching and aggrandizing a few individuals, while the mechanic and laborer are deprived both of the physical and moral advantages which it was intended to produce.

V. Knowledge might be promoted by a proper direction of public amusements.

There can be no impropriety, at certain intervals, of gratifying the mass of society with an exhibition of public amusements. But such amusements should always be blended, if possible, with moral and intellectual instruction—be congenial to the dignity and the high destination of man—and ought never to interfere with the purity of Christian morals. We have public amusements of various descriptions, such as stage-plays, balls, masquerades, horse-racing, cock-fighting, bull-baiting, equestrian feats and exhibitions, tricks of legerdemain, rope-dancing, &c. &c.; but most, if not all, of these, have an immoral tendency, and some of them are inconsistent with humanity, and degrading to the character of man. Instead of such trifling and demoralizing amusements, such exhibitions as the following might be adopted:—1. *Air Balloons*, of a pretty large size, which might be sent up into the atmosphere either with or without living beings, and might be rendered subservient for investigating atmospherical phenomena, the different currents and electrical states of the air, and other particulars. At the same time, descriptions and explanations might be given to the assembled multitude, of the nature of balloons, the principle on which they ascend, the mode of inflating them, the facts which have been ascertained by means of them in regard to the upper regions of the atmosphere, the nature and use of the parachute, and various details in relation to aerial navigation.—2. *Panoramas*, or perspective exhibitions, on a large scale, of ancient and modern buildings, cities, towns, ranges of mountains, sea-ports, volcanoes, grottoes, romantic rural scenery, and whatever is grand, beautiful, and interesting, in the scenes of Nature and Art. Such panoramic scenes, while they could not fail to gratify every spectator, would convey to the mind ideas which could not be derived from any other source, except the actual view of the objects represented.—3. *Camera obscuras*, on a large scale, constructed in the manner formerly described (p. 96). If these were constructed with large lenses of twenty or thirty feet focal distance, their magnifying power, on distant objects, would be equal to that of a telescope magnifying from thirty to about fifty times, which would show the distant scenery of a country with great minuteness, and people, sheep, and other animals, at the distance of many miles, while more than a score of persons at one time might contemplate such a scene. 4. *Telescopes*, constructed of a single convex lens, or a concave speculum of a long focal distance, for example,

from twenty-five to forty feet, might be fixed in certain positions, so that several individuals at the same time might perceive their effect on distant objects. Sir W. Herschel informs us that, by looking with his naked eye on the speculum of his forty feet telescope, without the interposition of any lens or mirror, he perceived distinctly

one of the satellites of Saturn; so that such an instrument would present a brilliant view either of the moon or of terrestrial objects. The manner of looking at objects with such an instrument is represented above, where A B represents a concave mirror or speculum of a long focal distance, C the focal point, a little within which several spectators might stand with their faces to the speculum, and view the distant objects behind them. Were A B a large convex lens of a similar focus, the spectators could stand in a similar position and view the objects *before* them.—

5. *Philosophical and Chemical experiments*, of various descriptions, on a large scale, might be exhibited—such as the explosion of a bladder full of oxygen and hydrogen gas, by means of an electric spark, which produces a tremendous sound—the breaking of a piece of glass or bladder, or a large square bottle, by the pressure of the atmosphere—the burning of charcoal or phosphorus in oxygen gas, which produces a most brilliant illumination—the ascent of turpentine, when tinged of a red color, through water in long glass tubes, which produces a beautiful effect—the burning of spirits of wine, after having been boiled, which produces an extensive and beautiful jet or spout of fire—the Chinese lights,* and an indefinite variety of similar striking experiments, all of which might, at the same time, be familiarly explained.

Such exhibitions might be made either in large halls, in squares, or in open areas in the neighbor-

* The *Chinese lights* are produced by the following composition:—Take twelve parts of niter, five and a half of sulphur, one-half of orpiment, one-half of indigo, one-half of gunpowder, all finely powdered and intimately mixed. When this composition is set fire to by a burning match, it produces a most splendid illumination. In the year 1814, when peace with France was proclaimed, a friend of mine, at the request of the magistrates of Paisley, got a large quantity of this composition prepared, which was ignited on the parapet which surrounded the spire of the High Church of that town, and which burned for more than half-an-hour, producing the most brilliant illumination over all the town, and was an object of curiosity at Glasgow, about eight miles distant. It would be visible from elevated situations, more than thirty miles distant. Such was the splendor of the light, that the birds rose from their nests, and flew around it, as if it had been the rising sun. At the same time, a balloon, made of the *allantois* of a calf, was sent up into the atmosphere, and a number of large bladders, filled with oxygen and hydrogen gas, were exploded, by being held in the Chinese lights, which produced sounds that were heard over all the town. The composition expended on this occasion, cost about ten pounds; but a quantity sufficient for a common experiment may be procured for two or three shillings.

hood of towns, according to the nature of the exhibition; and the best instrumental *music* might accompany them, and might occasionally be enlivened by the surrounding multitudes joining in unison with their voices. The expense of such exhibitions would be far less than the sums generally wasted in the encouragement of horse-racing, theatrical diversions, and similar amusements, and, while they tended to increase rational information, and to gratify the principle of curiosity, would be much more congenial to the taste of intelligent minds. There are certain towns in this country whose magistrates give, from the public funds, more than a hundred guineas annually for the encouragement of horse-races, beside the expenses connected with the various preparations and erections deemed necessary on such occasions. Such sums, along with a small contribution from each individual (for example, an English penny or two-pence), would, in general, be adequate to defray the expenses of such exhibitions.

VI. Knowledge and rational enjoyment might be increased by erecting observatories in every town and populous village.

These observatories might be furnished, not only with some of the best achromatic telescopes for viewing terrestrial and celestial objects, but likewise with several articles of philosophical apparatus, and specimens of natural history. In studying the science of the heavens, there is nothing more gratifying to those who have acquired a relish for this subject, than to view the telescopic objects described by astronomers, such as the moons and belts of Jupiter, the rings of Saturn, the crescent of Venus, the mountains and vales of the moon, the nebulae, the double stars, and other interesting celestial phenomena. Such views tend to produce a higher relish for astronomical studies and rational investigations; and no pictorial representations can serve as a substitute, or convey the same ideas as actual observations by good instruments. But the majority of rational inquirers and of the community at large are deprived of such views on account of the expense of such instruments. An establishment of this kind might be set on foot, either by a grant of money from a public fund, or by subscription. All the instruments requisite, in the first instance, would be, a large achromatic telescope for viewing celestial phenomena, and an equatorial telescope, for illustrating practical astronomy, and viewing the stars and planets in the day-time. These might be purchased for about forty guineas (see article Astronomy, pp. 88–89), and if an hundred and twenty individuals were to co-operate in such an undertaking, the subscription would be only seven shillings to each, and, if an additional subscription of about two shillings a-year were paid, in the course of a few years the apparatus might be considerably increased. One special advantage arising from the universal establishment of observatories would be, that the *true time* might always be accurately ascertained, and the public clocks regulated accordingly—on which circumstance depends, in certain cases, the determining of the altitude of certain atmospherical phenomena, such as a fiery meteor, or a luminous arch, when seen by different observers in places distant from each other.

VII. *The improvement of towns, villages, and roads*, is intimately connected with the advancement of society.

There are few circumstances in the state of society which exhibit the folly and depravity of man in a more striking point of view, than the

state of most of the cities and towns of Europe, and other parts of the world—not even excepting the British empire. In some of our cities we have palaces, churches, colleges, and public buildings of the most magnificent description, while the great mass of the population around are living in miserable habitations in narrow dirty lanes, which are seldom or never visited by the rays of the sun, or the refreshing breeze. In the High street of Edinburgh and its environs, which contain a greater number of human habitations than any other spot of the same extent on the surface of the globe, the inhabitants appear to be huddled together like so many rabbits in their cells. The houses are from five to eight and ten stories high, with numerous narrow lanes or *closes*, from four to six feet wide, branching from the street, and running down a great extent toward a hollow on each side. In these closes there is neither light nor pure air, but a continual gloom and noisome exhalations; and the physical filth and darkness which abound are generally emblems of the moral pollution and scenes of depravity which are too frequently exhibited in such habitations. Such abodes are incompatible, not only with physical comfort, but with any attempts at improvement in knowledge; and it is a kind of degradation to the nature of man, that any human beings should be doomed to spend their lives in such wretched habitations. It tends, not only to debase the moral character, but to prevent the expansion of the human intellect. Instead of an extensive landscape adorned with flowers and verdure, and the view of the expansive canopy of heaven—the inmates of such dwellings, for months and years, have nothing presented to the eye but a dead murky wall bespattered with filth, which confines the range of their vision within the compass of a few feet, and prevents them from becoming acquainted even with the common scenes of nature. What has been now stated will apply in a greater or less degree to almost all our cities and large towns, and even to some of our villages. Were we to inquire into the circumstances which led men thus to immerse themselves in gloomy holes and corners, like bats and owls, we should doubtless find that the abominable system of warfare has been one of the chief causes of the evil of which we complain. Man, living at enmity with his fellow-man, judged it expedient to surround his habitations with a huge wall for protection against the inroads of his hostile neighbors;—and the problem to be solved, in this case seems to have been, “In how small a space can we compress the greatest number of inhabitants, so that our wall and fortifications shall cost us the least trouble and expense?” Small towns and villages which were afterward built, and which required no fortifications, copied the plan and dimensions of their streets from fortified towns, and thus the whole of our cities, towns, and villages have been bungled and deranged.

Great cities, especially when ill-planned, may be considered as great evils. The Creator evidently intended that the population of the globe should be more equally distributed than it is at present. We are told that “He created it not in vain, but *formed it to be inhabited.*” But, how monstrous a disproportion is there in the distribution of its population, when we find a mass of human beings, as in London, compressed into a space of little more than 20 square miles, and a similar mass, in another part of the same island, spread over an extent of 20,000 square miles! There appears to be no reason, except in a very few cases, why any city should extend beyond a

population of a hundred thousand inhabitants; and a city containing such a population should occupy five times the area that it does at present. Towns distributed at nearly equal distances over the face of a country, would be of far more importance for the general improvement of society than a few crowded cities with an overgrown population, and more conducive to the health and morals of the inhabitants. There is one circumstance that characterizes almost all our cities, towns, and villages, except in some recent instances; and that is, *the extreme narrowness of the streets*, some of which do not exceed 15 or 20 feet in width. Even in the United States of America, where the towns have been more recently built, and formed on more expansive plans than in Europe, this evil is found to exist. The street *Broadway*, in New York, which is so much celebrated, and which is three miles in length, is only 80 feet broad, and most of the other streets are considerably narrower. Most of the streets in Philadelphia are little more than 50 feet broad, except *Broad street* and *Market street*, the latter being 100, and the former 113 feet in breadth. Most of the small towns, however, in the Northern States, such as New-Haven, Northampton, and others, are described by travelers as having broad streets and spacious squares, and remarkable for their cleanliness and beauty. In Great Britain, most of the streets, especially in seaport towns, are wretchedly narrow and dirty. In North-Shields, county of Northumberland, the main street is nearly a mile long, but so narrow that in many places two carriages cannot pass each other. The New Town of Edinburgh, which contains the most spacious and elegant streets of any city in Europe, is disgraced with two or three long narrow streets, not above one-fourth the breadth of the others, intended for the residence of the lower classes; as if they had no right to enjoy a free light, pure air, and a cheerful prospect, as well as their superiors.—The following hints are suggested in relation to the improvement of towns and villages; though I have no hope of living to see them realized in my native country.

1. Most of our crowded towns should be demolished, or at least their streets ought to be widened, at an average *three times* their present breadth. Extravagant as this proposal may appear, there is nothing that stands in the way of its accomplishment but *selfishness* and *avarice*. If the promotion of the comfort and happiness of our species were the great object of our ambition, all difficulties would soon vanish, and all obstructions would speedily be removed; and why call ourselves *Christians*, if this object is not kept in view?
- 2. No street in any town or village should be less than 80 feet wide. In large towns, where the houses are above two or three stories in height, the streets should not be less than 100 or 120 feet in breadth.
- 3. Narrow lanes and *closes*, of all descriptions, ought to be forever banished from all our towns and cities.
- 4. The practice of *sinking stories* below the level of a street, unless for cellars, should be laid aside. It has become an almost universal practice in Edinburgh, and other towns, especially in genteel houses, to have a *sunk* story for the kitchen and servant's rooms, as if they were unworthy of enjoying free light and pure air, and their health in no danger from the dampness of such apartments. There is something absurd and preposterous in being at the expense of digging a hole for the under story of a house, when a kitchen and laundry could be built behind the house, on the level of the street, which would be more convenient and salubrious

5. Houses might be built with *flat roofs*, with a parapet surrounding them, breast high, which would form a promenade for families in towns, where they would enjoy an airing and a prospect of surrounding objects, without removing from their own dwellings. It would also serve for drying clothes, contemplating the heavens, and various other purposes. In Eastern countries, where the houses are constructed with flat roofs, they form the sleeping places of the family during the summer months. The rain that falls upon them might be so conducted as to supply every family with water for washing and cooking victuals.—6. Squares, crescents, or octagonal spaces, should be appropriated in different parts of a town, for bazaars, or shops where all kinds of merchandise should be sold; each shop having an apartment or two connected with it, for the temporary accommodation of a family.—7. The streets more particularly appropriated for dwelling-houses, should have verandas or garden-plots in front of the houses on each side, diversified with shrubs, flowers, and evergreens, and, at certain regular distances, a few forest trees, so that the street, although 80 feet broad, would require only about 40 feet of pavement.—8. In every large city, open spaces, within the city, should be set apart for pleasure walks for the citizens, and diversified with trees, evergreens, shrubs, seats, and bowers for shelter from the heat or rain. In small towns, such rural walks should be formed to go quite round them.—9. A square plot of meadow ground, at each end of a town, might be set apart for public meetings, amusements, or exhibitions, which might also serve for grazing, bleaching, promenading, and other purposes.—10. Certain streets might be allotted for houses of one or two stories, for the accommodation of those who have it not in their power to occupy more stately mansions, so as to preserve uniformity in every street; but such streets should be equally broad, and adorned in the same manner as the other streets.—11. Between the different streets should be garden-plots for every family, and accommodation for washing and bleaching, as also for erecting workshops for smiths, carpenters, weavers, &c., wherever they are required.—12. Encouragement should be given in the neighborhood of large towns, and throughout the country at large, for building towns on such plans, and for transforming our present hamlets and villages into more convenient and pleasant places of residence. If mankind were united by the bonds of Christian affection, and if all were as anxious to promote the happiness of their fellow-men, as the greater part are to hoard up wealth and riches which they can never enjoy, all the improvements now suggested could easily be accomplished within the course of a few years, or, at furthest, within the limits of the next generation. But so long as avarice sways its scepter over the human breast, no extensive improvement, either in knowledge, religion, or physical comfort can be effected.

The following engraving exhibits a plan of a town of a moderate size, which, with a few modifications, according to circumstances, might be copied, in the formation of new towns and villages. In this plan all the streets cross one another in right angles, and are supposed to be at least 80 feet broad. In the center there is a circular space about 240 feet diameter, from which four streets diverge to each quarter of the town. The central part of this circle might be formed into a bowling green, diversified with shrubs and flowers; or a circular tower might be erected in the midst of it to overtop the surround-

ing buildings, on the top of which a large camera obscura and some telescopes might be placed, for the purpose of surveying the heavenly bodies, or the surrounding country. The four openings into this circular space might be about 40 feet wide, or half the breadth of the streets, which would afford the houses at each end of the four crescents a commanding view, not only of th

interior of the circle, but of the whole street in both directions. Instead of a circle, an *octagon*, if judged more convenient, might be adopted.—Directly opposite this central circle, on the north and south extremities of this town, are two squares, each of whose sides is about 170 feet long, and at the east and west extremities two crescents, about 360 feet diameter. In each of the squares, and in the middle part of the crescents, a church or other public building might be erected; and the entrance to these squares, &c., from the country, might be by a broad arch-way under one of the buildings. The principal shops might be placed, and the principal business of the town transacted, in the squares, crescents, and central circle. The spaces between the backs of the houses in the different streets might be set apart either for gardens, washing-houses, or workshops for the different mechanical professions. These spaces should be from 120 to 150 feet wide. A walk should be made to go round the whole town, decorated with trees, shrubs, and bowers; and on each side of the town should be a large common or bleaching-green. The extent of such a town would be about a mile and a quarter in circumference, but might be indefinitely extended according to circumstances. Such a town would undoubtedly be much more commodious, pleasant, and salubrious than most of the small towns and villages that now exist.

VIII. Knowledge might be diffused at a cheap rate by means of *itinerating libraries*.—Of late years small libraries have been established in most of our populous villages, and in connection with christian churches; but the want of sufficient funds prevents the purchase of such a variety of books as is sufficient to keep alive the attention for any number of years. In the year 1817, the plan of itinerating libraries was suggested by Mr.

Samuel Brown of Haddington, and, under his auspices, was commenced in East Lothian and the neighboring districts. The object is, "to furnish all the towns and villages of the country with libraries of useful books, and to plant them at such distances that no individual may be more remote from one than a mile and a half." "The books are formed into divisions of fifty volumes each. One of these divisions is stationed in a place for two years, and the books are issued to all persons above twelve years of age who will take proper care of them. After that period it is removed to another town or village, and a new division is sent in its room, which after other two years is again exchanged for another." By this means a perpetual succession of new books is introduced into each town and village, the principle of novelty is gratified, and the interest of the readers kept alive. The books are kept for a few years for the use of annual subscribers of five shillings. They are afterward formed into divisions of fifty volumes, and are lent the first year for one penny a volume (provided it is not kept longer than one month), and gratis the second.—One of the principal features of these libraries is their *cheapness*. A single library of fifty volumes, with book-case, catalogue, labels, advertisements, and issuing books may be procured for about £10 at an average, as they are purchased on the most economical plan. Were a British and Foreign Itinerating Library Society established in London, that could raise £10,000 annually, it is calculated that, in conjunction with the small sums furnished by the readers, there could be established, in the course of twenty years, a library for every 524 persons in Great Britain and Ireland, taking the population at twenty millions; and in twenty-five years, for every 294 persons, which would be a complete supply for the wants of the whole population. And what would such a sum be to the British government, which is extravagant enough to waste twenty times that sum every year in bestowing *pensions* on those who neither deserve them nor stand in need of them? The great object of these libraries is to promote the interests of religion, in connection with the study of history, biography, voyages and travels, and all the popular and useful branches of science. They have been supported and patronized by the most respectable persons in the country, and have met with almost unprecedented success. They have been introduced into several other counties in Scotland and Ireland, and in some of the West India islands, and even in South Africa. The number of volumes connected with the East Lothian itinerating libraries now amounts to nearly three thousand. In some of the divisions every volume has been issued about 120 times, and many of them much oftener. Mr. Brown, who has directed and superintended these libraries for eighteen years, deserves the thanks of his country for his benevolent and unremitting exertions.* In several cities and towns in America, such as Philadelphia and Albany, libraries have been established for the use of *apprentices*, both male and female. The Apprentices' Library in Philadelphia contains above 8000 volumes. Although well selected libraries are of immense importance for the diffusion of knowledge, yet

no person, who has it in his power to purchase a few good books occasionally, ought to *confine* his reading to the books of a public library; but in conjunction with the use of such books, should endeavor to furnish himself with selections of some of the best standard books in the language, which he may study at leisure, and to which he may immediately refer for any particular information of which he is desirous. Every general reader should, if possible, be furnished with an English Dictionary, a portable Encyclopedia, a summary of universal history, and some of the best systems of popular science.

IX. Knowledge might be promoted by *delineations and inscriptions on various articles of furniture*.

We have, for example, many kinds of bowls, drinking vessels, &c., made of porcelain or earthenware, on which many foolish inscriptions and devices are engraved. We have likewise carpets, bed-curtains, handkerchiefs, &c., on which groups of fantastic figures, and various distorted representations of natural and artificial objects are depicted, which serve no purpose but that of exhibiting a gaudy show. Now, if, instead of such paltry devices, moral sentiments and maxims, pithy sayings, and sentences descriptive of certain historical and scientific facts, such as those formerly specified (pp. 53, 159), were inscribed on the articles to which I allude, useful hints might be communicated and rendered familiar wherever we turned our eyes, and might occasionally suggest topics for useful conversation. In like manner, were *real objects* in nature and art depicted on china-ware, drinking vessels, printed cotton handkerchiefs, window-curtains, carpets, and similar articles, in place of the fantastical figures usually delineated, which have no prototypes in nature, a considerable fund of information might in this way be imparted. For pictures, when true to nature and correctly delineated, convey useful knowledge as well as books, and sometimes in a more pleasant and rapid manner; and there is no more difficulty in engraving *real objects* than in depicting the distorted and fantastic objects which are usually represented; and in course of time, every rational person would be induced to consider everything as *beautiful* which is really *useful*. In following out these suggestions, we might have paper hangings and carpets diversified with maps of the world and of particular countries—bed and window curtains adorned with public buildings, landscapes, views of caverns, grottos, volcanic mountains, cataracts, steam-carriages, air-pumps, telescopes, foreign trees, shrubs, and animals—our plates, tea-cups and saucers decorated with miniature pictures of similar objects, accompanied with wise sayings, immutable truths and short statements of important facts. In this way a fund of sententious wisdom, in connection with views of interesting scenery, might be introduced into every family; which would tend to excite inquiry, to lead to improving conversation, and to deter from the pursuit of vicious and criminal courses. A king was said to have been saved from being poisoned by his cup-bearer, by the following motto engraved on the cup which contained the poison, "Never *begin* any action of which thou hast not well considered the *end*."—It is evident, that the above hints might be reduced to practice with as much ease and cheapness, as silly and licentious inscriptions and clumsy castles in the air; and that almost every article of dress and furniture, every garden-bower, and every rural and architectural decoration, might in this way be rendered subservient to human

* Mr. S. Brown is a son of the Rev. John Brown, of Haddington, well known as the author of the "Self-Interpreting Bible," "Dictionary of the Bible," "System of Divinity," and many other works. His exertions, and the beneficial effects which have flowed from them, show how much even an individual engrossed in an extensive business has it in his power to perform, when his aims are directed to promote the good of mankind.

knowledge and improvement; provided society would give encouragement to such devices. But, hitherto, the foolish and depraved character of man has displayed itself in this as well as almost every other department of his actions.

X. The improvement of society requires *that changes and alterations be made in many of our established laws, regulations, and customs.*

The laws and practices to which I allude are so numerous, that I shall mention only two or three as a specimen. 1. *All taxes connected with the diffusion of knowledge should be wholly and forever abolished.* These include taxes on the materials and the manufacture of paper, which, beside directly adding to the price of this article, are found to be extremely vexatious to the manufacturer, and prevent him from getting his articles rapidly conveyed to the market—taxes on newspapers, engravings, pamphlets, periodical works, and advertisements of books and other articles of trade—and taxes, too, in the shape of entering books in “Stationers’ Hall,” depriving the author or publisher of thirteen copies of his work, however valuable and expensive, which in certain cases will amount to the sum of £200 or £300. Were these and all other taxes connected with literature abolished, and an economical mode of printing adopted, books might be purchased at little more than one-half of their present price. In this connection, too, it may be stated, that the charges demanded for the insertion of advertisements of books in newspapers, magazines, and other periodicals, are *extravagantly high*, and add, in no inconsiderable degree, to the price of literature. In consequence of the tax on newspapers there are only 30 millions of them circulated in Great Britain and Ireland, which is but the *one twenty-fifth* part of the number circulated in the United States of America, which contain little more than half the population of the British empire. In England there is only one newspaper to 46,000 inhabitants.—2. *The postage of letters should be greatly reduced.* The conveyance of letters is scarcely a fair subject of taxation, if we wish to facilitate the interchange of sentiment and friendship among mankind. It tends to prevent the poor man from corresponding with his friends and relatives at a distance—to prevent communications being sent to periodicals—and to abridge the correspondence of men of literature and science, some of whom have very little money to spare. I have known persons of this description taxed in this way, to the amount of three or four shillings, and even of half-a-guinea in one day, when such sums were imperatively required for procuring the necessaries of life.—It is likewise unfair and absolutely unjust, that the inhabitants of villages, who are generally poorer than those in towns, should pay more for letters and newspapers than others. While a person in a large town receives a daily newspaper from London *gratis*, the villager, only four miles farther distant, pays for the conveyance of the same paper, *twenty-six shillings a year*, beside paying an additional penny for all his letters.* The postage of letters should be so regulated that all may enjoy an equal benefit—that every facility may be afforded for transmitting them to foreign countries, whether belonging to the British dominions or not,—and the charge for letters and packages should be *no more than what is sufficient to defray all the expenses of the Post-office establishment*; as is the case in the United States of America. Under certain

regulations all *proof-sheets* of any work sent to the author for corrections *should be free of postage.* In these and many other respects our Post-office regulations require a thorough investigation and amendment.*—3. The names of ships and steam-vessels should be painted in large characters on the most conspicuous parts of these vehicles. If the names of ships are intended to distinguish them from each other, it appears preposterous and truly ridiculous, to have the name depicted on the lower part of the stern, which always stands in an oblique position, and which is seldom or never seen, when approaching another vessel or toward the shore. If the name of a vessel were painted in large characters on each side of the bow, it might be distinguished by a good telescope at the distance of four or five miles, whereas it is sometimes difficult to read the name of a vessel on the stern at the distance of a few yards. As it is interesting in many cases, not only to the owners of ships, but to those who have friends and relatives on board, to be able to distinguish any particular vessel, when it first makes its appearance, the hint now given cannot be deemed altogether unimportant.—4. The practice of paying waiters, chambermaids, boot-boys, and hostlers at inns, servant-maids, &c., at private houses, and guards and postillions in stage-coaches, should be universally discarded—as creating unnecessary trouble and expense to travelers, and fostering a spirit of meanness, impudence, and avarice, in the persons occupying such situations. It would be conducive both to the moral and pecuniary interests of all parties concerned, were such customs abolished. Mr. Stuart informs us, that no such custom prevails in the Northern States of America, and that it would be considered in almost every instance as an insult, to offer such persons a gratuity for performing their duty. This absurd and degrading practice has been handed down to us by the aristocracy, the servants of whom are always on the watch for gratuities from strangers and visitors. A literary gentleman, Dr. ———, who had frequently been invited to dine with Lord ———, was one day accosted by his lordship, and asked why he had not for a long time past complied with his invitation to dinner? “Why,” replied the doctor, “because I cannot afford it; I can dine at my own apartments for less than two shillings, but when I dine with your lordship it costs me at least *five shillings*—every one of your servants, at my departure, holding out his hand, and expecting a half-crown or a shilling at least to be given him.”—5. Another abominable custom which prevails at public meetings, and which should be discarded, is, *hissing* and groaning at certain speakers, or at the sentiments they express. A hiss or a groan may display the malignity of those who utter it, and their antipathy to the opinions expressed, but it never embodies a *reason* or an *argument* to confute the speaker, or convince the audience of the futility of his sentiments. In all deliberative assemblies, every speaker who conducts himself with decorum should be listened to without interruption, and *facts* and *arguments* brought forward to confute his positions, if they be untenable. To attempt to put down a speaker by hisses or groans is inconsistent with the dignity of an assembly of rational beings—is characteristic of a rabble, or a company of bores, rather than an assemblage of men of intelligence—and generally indicates the

* Here I allude to the *Penny posts* lately established in most of our villages.

* In America the postage for any distance under 300 miles, is 5 cents; over 300 miles, 10 cents.

weakness of the cause which such conduct is intended to support.—6. *Our civil and criminal codes require to be simplified and re-modeled, and formed on the principles of equity and natural justice.* Many of their enactments are repugnant to reason and religion, and inconsistent with the dictates of philanthropy and common sense, and with the spirit of an enlightened age. The expense of law processes, as presently conducted, amounts to a prohibition of a poor man's obtaining justice in any case where he has suffered an injury; and the multiplicity of statutes and precedents, the vagueness of their language, and the unintelligible jargon of terms and phrases connected with them, frequently lead to almost interminable litigations, until the whole value of the subject in dispute is more than expended, and the litigants reduced to poverty. Our civil code requires to be canceled, and reconstructed, *de novo*, on principles similar to the "Code Napoleon"—and our penal statutes require to be remodeled in such a manner, that punishments may be proportioned to crimes, and that they be of such a nature as to promote the *reformation* of the criminal.

The above are merely *specimens* of customs, laws, and usages, which require to be either modified or abolished, in order to promote the advancement of society.

XI. The diffusion of knowledge, and the improvement of mankind, are, in some measure, dependent on a *friendly intercourse being established among all civilized nations.*

Hitherto, nations, even those that are adjacent to each other, have acted toward other nations with a spirit of selfishness and jealousy, as if they were beings of a different species, and had no common relation as brethren, or as children of the same Benevolent and Almighty Parent. Harassing restrictions, duties, excise regulations, and every other impediment, are thrown in the way of travelers, when passing from one country to another, as if the interests of one class of human beings were set in opposition to those of another. When a traveler passes from England to France he must pay for a passport, and should he happen to lose it he is treated as a rogue or a spy. When he passes from Holland to Britain, and carries an old Dutch Bible along with him, before he can convey it from the shore he must pay a duty to the amount of far more than its value. When he is about to embark at Liverpool for America, his trunks and packages are searched, duties demanded, and a host of petty tyrants under the excise vex and harass him in all his arrangements; when he lands on the other side of the Atlantic, he is subjected to a similar ordeal; and when he returns to England with a few volumes of American literature, his luggage is again subjected to a strict scrutiny, and he must pay a shilling for every pound weight of knowledge he has imported.*

* The following instance, among many others, shows the harassing nature of custom-house restrictions.—A. Davidson, A. M., a celebrated lecturer on experimental philosophy and chemistry, after having returned from Ireland to Liverpool, had his packages, containing an extensive apparatus, thrown into the custom-house, which were not permitted to be removed until they should be minutely inspected. They consisted chiefly of glass cylinders, globes, receivers, &c., of all descriptions, which required several days and much exertion to get packed; and they could not be unpacked, in such a situation, without considerable expense and great loss of time, and the risk of having a great part of the apparatus broken and destroyed. He offered to unpack them in the presence of excise officers, in the apartments he had procured for the purpose; but this was refused. He called day after day at the custom-house about the matter, but to no purpose. One underling gave him a sealed

Beside the spirit of warfare, which has so frequently interrupted the correspondence of nations,—such harassing and vexatious restrictions have a tendency to foster a principle of antipathy, and to impede the progress of knowledge. They are founded on a principle of selfishness and malignity, and, like all such principles, they frustrate even the pecuniary object they were intended to promote; for, in point of fact, so far from increasing the wealth of a nation, they tend in many ways to diminish its resources. Were all such restrictions and exactions abolished, philanthropic travelers might make a tour through the nations without being annoyed—the manufactures and natural productions of every country could be afforded at a much cheaper rate than at present—and the hundred thousands of pounds and dollars annually expended in keeping up a numerous retinue of excise officers and underlings, would be saved for the purposes of national improvement. The most enlightened political economists now agree that Free Trade should be universally encouraged, and that extraordinary restrictions upon the importation of goods are injurious to the wealth and prosperity of nations.

XII. The improvement of society requires that particular attention be paid to the intellectual and religious instruction of *seamen.*

The British navy includes about 30,000 men; the British merchant service about 220,000, of whom about 100,000 are engaged in the coasting trade, and 120,000 in the foreign trade. The coast guard service includes 21,000 individuals; and there are of fishermen, watermen, and boatmen, probably not less than 50,000 persons, beside their families, amounting in all to above 320,000 individuals, exclusive of their wives and children. An immense number of this class of men is likewise connected with the United States of America, but I have no data on which to form an estimate of their amount. A great proportion of these persons have been brought up in debasing ignorance, both of general knowledge and of the truths of religion, and they are too frequently addicted to habits of profaneness and intemperance. They form, however, a most important and interesting class of our fellow-men—they are frequently distinguished for heroism, humanity, and a noble generosity; and, were they generally instructed in useful knowledge and Christian morals, they might be rendered useful agents in promoting the good of mankind both at home and abroad. The "British and Foreign Sailor's Society" was formed some time ago, "for promoting the moral and religious improvement of seamen." Of this society, Lord Mountsford is president; Alderman Pirie, and G. F. Angas, Esq., treasurers; the Rev. Dr. Cox, and the Rev. T. Timpson, secretaries—gentlemen distinguished for their activity in every department of philanthropic labor. The principal scene of their labor is the port of London, where the Gospel is preached, and prayer-meetings held on board ships, every evening, by

card, containing about two lines of writing, to carry to another underling, for which he charged half-a-crown; this last gave him a similar card to a third person, for which the same charge was made; this third person gave another *half-crown card*, to be handed to a fourth person who could give him the requisite information, but this fourth person could never be found; and thus he was banded about from one harpy to another, and fished out of four or five half-crowns. In this way, three weeks were wasted to no purpose, until by accident he met with a gentleman connected with the custom-house, with whom he was formerly acquainted, who got his packages released, after he had been subjected to much trouble, expense, and anxiety, and lost nearly a month, during which his lectures might have been nearly finished. Regulations which lead to such impositions and perplexities, require to be speedily abolished.

agents of the society, who distribute Bibles, religious books and tracts, and enter into conversation with the seamen on moral and religious subjects. They have already spent upward of £2000 in fitting up a chapel and other buildings, and have provided 140 "Loan Ship Libraries," comprising 4000 volumes, now abroad in many vessels; and 50 small libraries for the fishing smacks sailing from the Thames; beside the "Vestry Library,"⁵⁵ which contains upward of 3000 volumes, daily open to the sailors in the depot of the chapel;—but the want of adequate funds prevents them from enlarging the sphere of their operations. To complete such benevolent arrangements, it would be requisite, could funds be procured, to establish schools on a moral and intellectual principle, some of them adapted to the *children* of sailors, and others for the rational instruction of adults. Lectures on popular Science, accompanied with experiments, might likewise be occasionally delivered; and the religious books contained in the libraries blended with popular and interesting publications on geography, astronomy, history, voyages, travels and other departments of knowledge. Were sailors well instructed and moralized, they might improve their own minds by reading and conversation, during long voyages, and feel a superior degree of enjoyment to what they now experience; they might be the means of promoting both knowledge and religion in foreign lands—they might soon be accustomed to contemplate with intelligence the various scenes of nature which pass under their observation, and record them for the information of others—and thus become contributors to science, and benefactors to their species, instead of "increasing," as they often do, "the transgressors among men."

XIII. In order to carry into effect the hints suggested in the preceding pages, *societies might be formed for the promotion of education, and the general improvement of the social state.*

From the operations of Bible and Missionary Associations, it is evident how much may be achieved by the formation of societies for the accomplishment of a specific object. The societies to which I allude, including the Church Missionary, Scottish, London, Wesleyan, and several others, now raise nearly £300,000 annually. The general object I would propose to accomplish by a new association, is as important as any other which has yet engaged the public attention; for it lies at the foundation of all other philanthropic plans, and they can never be brought into *extensive* operation until it be accomplished. If all ranks were thoroughly instructed in knowledge and religion, and, consequently, led to appreciate the importance of Christianity, and the necessity of its universal propagation, the funds of our missionary institutions, and the energies with which they would be conducted, would be increased tenfold more than they now are, and few individuals would be found altogether indifferent to such noble enterprises. Such an association might be instrumental in calling the attention of the public to the subject—in diffusing information respecting it—in detailing plans for accomplishing the grand object intended—in illustrating the noble and beneficial effects which would flow from its accomplishment—and in exciting the more wealthy members of the community to contribute a portion of their substance for carrying forward the requisite arrangements. By such a society, with all the auxiliaries that might be formed throughout a nation, it would scarcely be too much to expect that a million of pounds might annually be procured, which would render society nearly independent

of the caprices and partialities of civil rulers, or of the grants of money which governments might either withhold or bestow.

XIV. Before any plan for the improvement of mankind can be brought extensively into effect, the principle of *avarice*, as it now operates in society, *must be counteracted and subdued.*

The great object of the majority of mankind appears to be, to acquire as much wealth as possible, not for the purpose of applying it to the service of God and the good of society, but to gratify a selfish principle, and an avaricious propensity—to make a splendid figure in life, to lay up portions for children, or merely to glory in the idea of having hundreds or thousands of guineas or bank-notes deposited in a chest, in the stocks, or other place of security. Every one seems to think that he may use his money just as he pleases, without being responsible to a higher Power; and even many of those who call themselves *Christians*, are glaringly guilty of that "covetousness which is idolatry," although they are pointedly admonished that "the love of money is the root of all evil," and, consequently, the prevention of much good; and that "it leads into many snares and temptations, and foolish and hurtful lusts, which drown men in destruction and perdition." Nothing can be more irrational and degrading than for an immortal being to hoard up treasures which he never applies to any useful purpose, and who only feasts his imagination with the idea that he has them, to a certain amount, in his possession. Yet thousands of such characters exist even in the Christian world. What should we think of the man who took it into his head to lay up, in a large shed or garret, which was carefully locked up from public view, 5,000 pair of boots, 10,000 tea-cups, 20,000 coffeepots, or 30,000 cork-screws, with no other view than to please his fancy, and to tell the world that he had such a number of articles in his possession? We should, doubtless, consider him as an arrant fool; or even as a downright madman. And what is the difference between hoarding thousands of guineas, dollars or bank-notes, which are never brought forth for the benefit of mankind, and accumulating fifty or a hundred thousand pair of boots, spurs, or knee-buckles? How ridiculous would it appear if all that could be said of a man when he died was, that the great object of his life was to lay up in store 25,000 tea-kettles, which were never intended for cooking, and 30,000 great-coats, which were never intended to be worn? Equally foolish and contemptible is it, to lay up thousands of pounds or dollars that are never consecrated to the glory of God or the good of man. I know individuals who are worth £1,000 a year, and whose annual expenditure does not amount to above £150; and I know others who are worth ten times that sum, who do not spend above two or three hundreds a year;—yet it is sometimes difficult to obtain from them a guinea, or even a few shillings, for a religious or philanthropic object; and, were you to call in question their Christianity, it would be considered as little short of an insult.*

It becomes Christian churches and ministers seriously to consider this subject, if they wish to see the principles of pure Christianity reduced to practice, and worldly maxims undermined, and if they would be instrumental in preparing the way for the universal propagation of the Gospel, and

* The late distinguished philanthropist, J. B. Wilson, Esq., of Clapham Common, was once heard to say of one who had been looked up to as a good man and Christian, "He died wickedly rich,"—evidently implying, that he thought such a man's Christianity was extremely doubtful.

the arrival of the predicted Millennium. Were it not for the prevalence of the debasing principle of avarice, we should, ere long, have seminaries of all descriptions established among us, for training both the young and the old in knowledge and virtue, and "to glory and immortality"—we should have our towns and cities cleared of every nuisance—our roads and footpaths improved—our deserts turned into fruitful fields—new towns and villages erected on spacious plans—intelligence speedily and cheaply conveyed—the physical aspect of the country beautified and adorned—and the whole frame of society transformed and remodeled, in conformity with the principles of reason and religion. Were I to enter into minute calculations on this subject, it might easily be shown, that the wealth presently possessed by civilized nations, were it properly distributed and applied, would be more than sufficient to introduce every improvement in society, physical, moral, and intellectual, of which the terrestrial state of man is susceptible—to raise the degraded mass of this world's population to intelligence and virtue—to bring into a state of cultivation almost every waste on the face of the globe—to intersect every country with canals and rail-roads—and to transform the whole earth into a paradise, scarcely inferior in beauty to that which appeared at the first creation. And those who expended their superfluous wealth in such noble achievements, so far from having any of their sensitive enjoyments diminished, would enjoy a happiness, both physical and mental, far surpassing anything which they formerly experienced.

RECAPITULATION AND CONCLUSION.

In the preceding pages I have endeavored to illustrate a variety of topics in reference to the education and general improvement of all classes of society—particularly the physical, moral, and intellectual instruction of infants—the advantages which would result from the universal establishment of infant schools—the seminaries which require to be erected for the instruction of youth from the age of six to the age of fifteen years—the plan and arrangement of school-rooms, and the objects and apparatus with which they should be furnished—the principles on which school-books should be constructed—the modes of teaching, by which substantial knowledge and moral principle may be communicated—the *branches of knowledge which should be taught to all classes of the community*—the *rational and intellectual processes* by which a knowledge of them is to be conveyed—the moral and religious instruction of the young—the manner in which Sabbath-schools should be conducted, and the qualifications requisite for every teacher, in such institutions—the seminaries which require to be established for young persons of both sexes from the age of fifteen to the age of twenty years or upward—the qualifications requisite for teachers of all descriptions, and the seminaries which ought to be established for their instruction—the *practicability* of establishing all such institutions—the *utility* of such improvements in education, in counteracting crime, raising the moral and intellectual character of man, and preparing the way for the approach of the Millennial era—the *principles* on which national systems of education should be established—mechanics' institutions, and the improvements of which they are susceptible—with a variety of *miscellaneous hints in reference to the diffusion of knowledge and the improvement of general society*.

Were such institutions once established through-

out every part of our country and of the world at large, thoroughly imbued with the spirit of Christianity, and conducted with activity and zeal—there can be little doubt that they would, ere long, be accompanied with the most interesting and beneficial results. We should soon behold ignorance, foolish prejudices, superstition, enthusiasm, bigotry, and intolerance, with all their accompanying evils, gradually vanishing from the world, as the shades of night before the rising sun. We should behold the human mind aroused from the slumber of ages, exerting its energies on objects worthy of its high dignity and destination, and conducive to the improvement and the happiness of the social state. We should behold science enlarging its boundaries, the useful and ornamental arts carried to perfection, and the universe more fully explored throughout all its departments. For we should then have a thousand experimenters, and a thousand intelligent observers of the phenomena of nature, for one that exists in the present state of intellectual debasement. New and interesting experiments would be instituted, new facts explored, new regions of the universe laid open to view, and a nobleness, a vigor, and a lofty spirit of independence, on every subject of thought, displayed by the human mind. We should behold avarice, pride, ambition, revenge, and other malignant passions, in a great measure extirpated; and a spirit of love, affection, liberality, and harmony, pervading every department of the moral world. We should behold the Christian world approaching to a harmonious union—the spirit of jealousy and dissension laid to rest—the demon of persecution chased out of the world—the truths of religion and its holy principles recognized in every department and arrangement in society—the great realities of the eternal world contemplated in their true light, and men of all ranks walking hand-in-hand, as brethren of the same family, to the same glorious and incorruptible inheritance.

In the progress of such institutions—when they shall have been brought into full operation—I behold, in the prospect of future ages, the most important transformations, and the most glorious results, in the improvement both of the *intellectual* and of the *physical* world. I behold the surface of the earth, at no distant period, adorned with vegetable and architectural beauties and embellishments—our deserts transformed into fruitful fields—our marshes drained—our moors and heath-clad mountains adorned with fruitful trees—our gardens producing the fruits of every clime—our highways broad and spacious, accompanied with cleanly footpaths, and at the distance of every half-mile furnished with seats and bowers for the shelter and refreshment of the passing traveler, and every bower furnished with Penny Magazines and other works for the instruction and amusement of every one who has leisure to peruse them—our abominable lanes and closes, the seats of physical and moral pollution, completely demolished and laid open to the light of heaven—our narrow streets expanding into spacious squares, cheered with the solar beams, and with rural prospects, and ventilated with the refreshing breeze—our densely crowded cities almost completely demolished, and new cities arising from their ruins, on noble and expansive plans, corresponding to the expansive state of the human mind.

I behold the *climates* of the earth meliorated by the hand of genius and industry—by the cutting down of forests, the draining of marshes, the im-

provement of sandy and rocky wastes, and the universal cultivation of the soil—the thunderbolts of heaven, wielded by the philosophic sage, and the forked lightnings, directed by the hand of art, to play in harmless coruscations in the regions of the clouds.—I behold *locomotive engines*, steam-carriages, and air balloons, brought to perfection, transporting multitudes of human beings from one city to another, from one nation to another, and from one continent to another, with a degree of velocity which has never yet been attempted.—I behold the savage restored to the dignity of his moral and intellectual nature, no longer roaming the desert wild and uncultivated like the beasts of prey throwing aside his warlike bows and his battle-axes, directing his faculties to the improvement of his species, and to the most sublime investigations.—I behold men of all nations and kindreds cultivating a harmonious and friendly intercourse;—the tribes of New Holland, Borneo, Sumatra, and Madagascar, visiting the British Isles with the productions of their respective climates, and holding literary and religious correspondence with the directors of our philosophical and missionary associations, on all the subjects of Christian and scientific investigation.

I behold *the scenery of the heavens* more fully explored, and new prospects opened into the distant regions of the universe—the geography of the *moon* brought to perfection, its mountains and vales thoroughly explored, and traces of the existence and operations of its inhabitants exhibited to view—the nature of comets ascertained—the causes of the various phenomena which appear on the *planets* explained—the construction of the *sun* and the nature of his spots determined—the sublime scenes connected with the *new and variable stars*, *double and treble stars*, and the many thousands of *nebula* dispersed through the regions of boundless space, more fully displayed—and the Divine character and perfections appearing with still greater luster and magnificence throughout the amplitudes of creation.

I behold the ministers of religion expatiating, amidst thousands of intelligent worshippers, on higher themes and more diversified topics than those to which they are now necessarily restricted—not confining their attention merely to first principles, and to a few fragments of the Christian system, but taking the whole of Divine Revelation as their text-book, and deriving their illustrations of it from the records of Providence, and from all the diversified scenes of the universe.—In fine, I behold the human soul, thus elevated and refined, and endowed with multifarious knowledge, dropping its earthly tabernacle in the dust, and, in another and a higher region of existence, contemplating the economy of other worlds, exploring the wonders of Divine Wisdom and Omnipotence throughout the immensity of creation, prying into the mysteries of human redemption, rising nearer and nearer to the Divinity, expatiating amidst objects of beauty and beneficence, and beholding new scenes of grandeur and felicity rising to view, in boundless perspective, while ages, numerous as the drops of the ocean, are rolling on.

Let none imagine that such views are either romantic or Utopian—they are the *necessary results* of what will undoubtedly take place, when knowledge and Christian principles are universally diffused. It is owing chiefly to *ignorance* and the prevalence of *malignant principles*, that science has been so slow in its progress, that contention and warfare have wasted and demoralized the nations, that the earth has been left bar-

ren and uncultivated, that savages have been permitted for ages to roam without arts and instruction, that religion has been neglected, and that so many evils, physical and moral, have been introduced into the social state. Remove the cause of existing evils, and opposite effects will be produced—effects surpassing, in benignity and grandeur, everything which has occurred since time began. In the present age, distinguished from all the periods of time which have hitherto elapsed, these effects are *beginning* to appear. All the movements now going forward in the moral, political, scientific, and religious world, have an evident bearing on the approach of a more auspicious and enlightened era. The rapid progress of scientific discoveries, and of improvements in the arts—the numerous and *cheap* publications, on all subjects of useful knowledge, now issuing from the press, in hundreds of thousands at a time, and read by all classes of the community—the erection of public seminaries on new and improved plans, throughout different countries both of Europe and America—the establishment of philosophical institutions, missionary associations, and reading societies, in every town, and almost in every parish—the extensive circulation of newspapers, magazines, and literary and religious journals, of all descriptions—the steam-boats and carriages which have been constructed, and the numerous canals and rail-roads which have been formed, for the speedy conveyance of passengers from one place to another, in order to facilitate the intercourse of human beings—the application of machinery to the different arts and manufactures, for increasing the productions of human labor—the desire excited among all ranks, even the lowest, for rational information, and for investigating every subject connected with the happiness of the social state—the abolition of *slavery*, with all its degrading accompaniments—the reforms going forward both in Church and State—the spirit of liberty bursting forth among the nations in both hemispheres of the globe—the conversion of savage tribes to Christianity, and their advancement in knowledge and civilization,—these, and many similar movements, viewed in connection with the Divine declarations, that “Wars shall cease to the ends of the world,” and that “*the earth shall be filled with the knowledge of Jehovah*”—plainly point to a period which is on the wing, when the light of truth shall irradiate the inhabitants of every region, and when improvements of every description shall be introduced into every department of the physical and moral world. It only remains, that, as agents under the Moral Governor of the world, we arouse ourselves from our present lethargy and devote all our powers, and wealth, and energies, to the accomplishment of such glorious designs, resting assured, that “*our labor*,” if conducted with wisdom and perseverance, “shall not be in vain in the Lord.”

In fine, if the world is ever to be enlightened and regenerated—if the predictions of ancient prophets are to be fulfilled—if the benevolent purposes of the Almighty, in relation to our world, are to be accomplished—if war is to cease its desolating ravages, and its instruments to be transformed into plowshares and pruning-hooks—if selfishness, avarice, injustice, oppression, slavery, and revenge, are to be extirpated from the earth—if the tribes of mankind are to be united in the bonds of affection, and righteousness and praise spring forth before all nations—if the various ranks of society are to be brought into harmonious association, and united in the bond of universal love—if the heathen world is to

be enlightened, and the Christian world cemented in one grand and harmonious union—if the landscape of the earth is to be adorned with new beauties, and the wilderness made to bud and blossom as the rose—if “the kingdoms of this world are to become the kingdoms of our Lord and his Messiah,” “the whole earth filled with his glory,” and his scepter sway over the nations throughout all succeeding ages—these long-expected events will, undoubtedly, be introduced by the universal instruction of all ranks, in everything that has a bearing on their present happiness, and their immortal destiny. If we, therefore, refuse to lend our helping hand to the accomplishment of this great object, we virtually attempt to frustrate the purposes of the Eternal, and to prevent the present and future happiness of mankind. And while we pray to the “Great Lord of all,” that he would “appear in his glory to men,” and hasten the time when “his name shall

be great from the rising to the setting sun,” we only offer an insult to the Majesty of Heaven, while we refuse to consecrate our wealth and influence to his service, and to engage in holy activity as “workers together with God.” We may legislate as we have hitherto done, for ages to come—we may make, unmake, and modify our civil laws, enforce hundreds of regulations and enactments for the punishment and prevention of crime—we may build thousands of churches and colleges, and academies without number—we may engage in profound discussions and investigations, and compass sea and land to make proselytes to our opinions; but unless the foundations of society be laid in the rational and religious education of all classes of the young, our most specious plans will prove abortive, and our superstructures gradually crumble into dust, and, “like the baseless fabric of a vision, leave scarce a wreck behind.”

APPENDIX.

INSANITY FROM EXCESSIVE STUDY.

THE following instance of the effects of excessive study, and the danger of neglecting the animal functions, is extracted from the “*American Annals of Education*” for September, 1833.

Mr. Joseph Frothingham, from Salem, State of Massachusetts, was a student of the Oneida Institute. In April, 1833, he was suddenly missed, and strong suspicions were entertained of his having been murdered. Nothing was heard of him, however, until a letter was recently received by his parents, dated “Atlantic Ocean, 12th May, 1833.—500 miles east of Newfoundland Banks.” The following extract from his letter will show to what account his abduction is to be charged:—“While at the Institute, having nothing else to do, and wishing to get ahead, I applied myself very closely to study (particularly the Latin grammar), leaving off only when absolutely necessary. You recollect I arrived during vacation, before the regular course of labor had commenced, and thinking I should have plenty of it in a few days, contented myself with taking very little exercise. The effects of this close application from sunrise until nine in the evening, I soon perceived, and several times was sensible that my thoughts for a moment or two were rather wandering. Yet I did not feel at all anxious or discouraged, reasoning with myself, that so sudden a change of pursuit must necessarily cause me at first to feel rather unwell, and that after a few days my mind would recover its wonted tone. After the 5th or 6th of April, the little momentary aberrations became more frequent, and how I spent much of the time intervening between that date and the 8th, I am wholly unable to say. Some things which I did I recollect distinctly, and others only as we recall the vagaries of a dream. But after the 8th, everything is wrapt in confusion,—‘shadows, clouds, and darkness rest upon it.’ I have a vague dim recollection of feeling something as if standing near a mountain, when a volcano bursts from the side. To escape the fiery deluge I traveled by sea and land, but onward it still seemed to move, and ever to rear itself a wall

of living fire. One only thing I can recollect clearly. Finding myself in a strange street, near a large stone building, I inquired of a soldier the name of the place, and he answered, ‘Montreal.’ For a moment I wondered what could have brought me there, but then came confusion over my mind again, and *not an idea or incident* can I recollect until yesterday, about 10 A.M., when I found myself in the steerage of a ship bound from Quebec to Liverpool. I immediately communicated everything to my fellow-passengers (a young man and wife), and from them learned the following particulars.”

It appears that he met them accidentally, and embarked with them, after making most of the necessary preparations; and, after passing through various difficulties in his way down the river, reached the ship. In consequence of the small sum of money which Mr. F. had, he was consigned to the steerage, but kindly supplied with necessaries by the captain. It was not until a week’s confinement with sea-sickness (which perhaps was the very remedy which a kind Providence saw necessary) that he recovered his recollection; and then, he observes, his “mind, in an instant, was as clear and as rational as ever.” The conclusion of his own letter will be more interesting than any abridgment. “The captain remarked, that he had sometimes suspected me to be a little deranged, and my fellow-passengers thought my appearance very odd at Quebec; but as I was frequently engaged, while on board, in reading their books, they concluded it was owing to ‘absence of mind, and a naturally eccentric character.’ They could hardly believe me, when I first made known to them my utter ignorance of every transaction since the time I met with them on the St. Lawrence. They told me I had been uniformly courteous and cheerful; and that, when we walked from the shore to a house during the storm, I carried her in my arms about half the way, she being too cold and weary to walk. They were well wrapped up in blankets, but I had nothing

but my cloak, and got two of my fingers frozen. You can better conceive than I can express, how strangely I felt when reason first told me I was in the cabin of a vessel; and when I knew, from the pitching and tossing, that that vessel was on the ocean. I am in hopes of meeting with some vessel bound homeward; and, if I cannot return in her, to send this letter. If we speak no vessel in which I can return, I shall probably take passage immediately after arriving in Liverpool. Until then, I leave all other incidents connected with this almost incredible loss of reason. I do not doubt that study was the cause, and thus are all my hopes of going through college blasted—for I should not dare to make a second attempt. But I think nothing of that. *I am lost in wonder* that such a journey should have been performed in safety in such a singular absence of mind; and to think too that I even went through all, without ever losing my money, is most strange. My preservation appears indeed miraculous—but I know not what to say. How thankful should I be to the Great Being who has guided and directed my wanderings—thankful! 'tis too tame a word. Words cannot express my feelings, and I leave all, for the contemplation almost overwhelms me."

Mr. Frothingham has since returned and confirms the whole account. "Would that his well-meant but mistaken zeal in study (says the editor) might be the means of saving many now in danger from a result not less fatal to future plans, and of preserving others from that partial mania—that predominance of the body over mind which we believe gives rise to not a few of the follies, and errors, and faults, of sedentary men. We will only add, as an example of a result more deadly, from a similar imprudence, that one of the most diligent and promising students of an institution returned to his room after a long tour on foot, in perfect health, and as he imagined, with a stock laid up on which he might draw. He sat down closely to study. The blood thus accumulated, which rushed to Mr. Frothingham's brain, in this case burst forth in a profuse discharge from the lungs;

and, after years spent in struggling, by the aid of a fine constitution, against the diseases and the effects of study, he fell, in the midst of the brightest prospects of usefulness, a victim to his hasty efforts to be a scholar. Would not a thorough knowledge of physiology preserve both sexes from incalculable evil?"

The very singular case of Mr. Frothingham, described above, suggests, both to the philosopher and the Divine, a variety of interesting reflections in reference to the action of mind on the corporeal functions, and to the goodness and care of a superintending Providence. He must have traveled more than two hundred miles by land and water, before he found himself in Montreal; and, as he could not be supposed to have taken the nearest road to that city, perhaps he may have traveled more than double that distance, and crossed several lakes and rivers which abound in the territory through which he passed. He must have inquired for lodgings, paid for victuals, found out the different ferries where he behooved to cross, and all, without being conscious where he was, or what was his object. With regard to the effect of study on the functions of the body and mind, I have every reason to believe, that those studies which are most abstruse, such as the ancient languages, metaphysics, and the higher branches of pure mathematics, when closely pursued, have the greatest tendency to injure the organic functions, and the mental powers; while natural and civil history, geography, astronomy, and the other physical sciences, being conversant about *sensible objects*, will seldom produce such effects, when prosecuted with judgment and moderation; so that those studies which are in reality most useful, will be found in few instances injurious either to the animal or mental powers. Mr. Frothingham was deeply absorbed in the study of Latin grammar when his mental aberration was induced. Were he to refrain from such abstract studies, and apply himself with moderation to the more interesting departments of natural science, I should have no fear of the return of his former insanity

THE HISTORY OF THE

REIGN OF KING CHARLES THE FIRST

BY JOHN BURNET

IN TWO VOLUMES

LONDON

P R E F A C E.

THE subject of the following Treatise, considered in all its aspects, is one which has an important bearing on the happiness and improvement both of Christian and Civil society. Impressed with a deep conviction of this truth, the author intended, some time ago, to address his fellow-men on the subject; but other engagements prevented him from entering on the consideration of the several topics connected with it, until about the month of August last, when a Prize, to be given for the best Essay on the subject, was announced in some of our religious periodicals. Being then engaged in conducting his work "On the Mental Illumination of Mankind," &c., through the press, and in various other avocations, he could not find leisure to finish the Essay within the time prescribed in the advertisement. It was, however, sent some time afterward, and returned, *unopened*, on the ground, "*that the carriage and portage of it were not paid;*" and had it not been for a particular circumstance, the package might have been lost, as there was no intimation on its exterior as to whom it should be addressed and returned. These circumstances the author was disposed to consider as little short of an exemplification of *Covetousness*—the very evil which the Essays advertised for were intended to counteract. For, although a hundred Essays had been sent, the carriage of which was two shillings each, the whole sum thus expended would not have amounted to above 10*l.*—which could only be a trivial sum to the individuals who offered the Prize. And equity required, that those who had been at the expense of paper and quills, and who had devoted a certain portion of their time to the subject, in compliance with the request of those gentlemen, should have been freed from the expense of carriage, especially when no intimation of this circumstance was contained in the announcement. But we too frequently find, that it is much easier to laud a virtue than to practice it, and to denounce a vicious principle than to act in opposition to it.

The Essay is now presented to the public by the Author, on his own responsibility, as he originally intended, in the hope that it may not be altogether inefficient, in counteracting the principle of *Covetousness*, and stimulating the Christian to those noble acts of *Beneficence* by which physical and moral evil may be prevented, religious society improved, and the world enlightened and regenerated. Having been composed in the course of four or five months, and in the midst of many interruptions and avocations, it is hoped, the critical reader will candidly overlook any slight inaccuracies it may contain.

Should any pecuniary emolument be derived from the sale of this volume, the greater portion of it will be devoted to the purpose of social and religious improvement.

BROUGHTY FERRY, NEAR DUNDEE.

CONTENTS.

	PAGE.
INTRODUCTION.—Remarks on the necessity of giving more particular attention to the duties of practical Christianity, &c. Plan of the Essay.....	9

CHAPTER I.

ON THE DISPOSITION OR PROPENSITY DESIGNATED BY COVETOUSNESS AND THE VARIOUS MODES IN WHICH IT HAS OPERATED IN THE WORLD, AND IN CHRISTIAN SOCIETY.	
General remarks—Description of covetousness.....	11

SECTION I.

ON THE OPERATIONS AND EFFECTS OF COVETOUSNESS AS DISPLAYED IN THE WORLD AT LARGE.	
Historical sketch of its operations and progress in ancient times. Modern examples—plunder of Mexico and Peru—Slave trade—Colonization—Piracy, &c.....	11

SECTION II.

ON THE EFFECTS OF COVETOUSNESS, AND THE MANNER IN WHICH IT HAS DISPLAYED ITSELF AMONG THOSE WHO ACKNOWLEDGE THE AUTHORITY OF CHRISTIANITY, AND PROFESS TO SUBMIT TO ITS DICTATES.	
Benevolent dispositions of the first Christians, &c. Progress of covetousness in the Christian Church—rapaciousness of the Popes and Bishops—sale of indulgences—vast quantity of wealth extorted from the people by the Romish Church, on the continent and in England—practices of the Pope's <i>Nephews</i> —extracts from the writings of an Italian Catholic, &c. Operations of covetousness in <i>Protestant</i> and <i>Evangelical churches</i> . Miscellaneous remarks. 1. Practice of <i>hoarding money</i> and acquiring houses and lands. Description of a miser. Various <i>examples</i> of avarice. 2. Gratifying a <i>desire for ostentatious display</i> . 3. Providing <i>portions for children</i> . 4. Covetousness in the <i>mercantile transactions</i> of mankind. 5. In cases of <i>bankruptcy</i> . 6. As it sometimes appears in the conduct of ministers of religion. Miscellaneous examples, in people professing evangelical religion. Covetousness of Great Britain in a <i>national</i> point of view. Various instances—Revenues derived from the support of idolatry in India—scenes of Juggernaut—description of his temple, &c.—Pilgrim hunters—General reflections.....	14

CHAPTER II.

ON THE ABSURDITY AND IRRATIONALITY OF COVETOUSNESS

Proof of the irrationality of covetousness—from the noble <i>intellectual faculties</i> with which man is endowed,—from the absolute <i>want of utility</i> , which characterizes avarice,—from its incapacity of affording rational enjoyment,—from the consideration of man's <i>immortal destination</i>	30
---	----

CHAPTER III.

ON THE INCONSISTENCY OF COVETOUSNESS WITH THE WORD OF GOD.

The <i>idolatry</i> and <i>atheism</i> of covetousness particularly illustrated. It forms an impassable barrier to the kingdom of heaven,—inconsistent with the idea of our being redeemed by the blood of Christ,—inconsistent with love to God,—its malignity demonstrated from the numerous <i>cautions and exhortations of Scripture</i> , in relation to this propensity. Selection of a variety of Scriptural declarations on this subject. General remarks and reflections.....	34
--	----

CHAPTER IV.

ON THE EVILS WHICH FLOW FROM COVETOUSNESS.

The covetous man a thief and robber. He robs his Maker,—he robs the poor and distressed,—he robs his family and himself,—he robs society. Covetousness leads to *falsehood* and *injustice*,—destroys *natural feeling* and tenderness of *conscience*,—leads to the indulgence of murderous wishes, and to murder itself,—prevents the administration of the law, and the ends of public justice (illustrated with examples),—transforms many of the ministers of religion into hunters after places and pensions,—leads to presumption and a virtual denial of Providence,—has produced all the public evils, wars, &c., which have prevailed in the world,—prevents the extension of the Christian church and the improvement of society. What would be the consequences were it *universally* to prevail,—it infallibly leads to misery in the life to come. 44

CHAPTER V.

ON THE PRINCIPLES BY WHICH CHRISTIANS SHOULD BE DIRECTED IN THE APPLICATION OF THEIR WEALTH. 55

Preliminary remarks—general observations connected with this topic—God the original source of wealth. Riches a trust to be employed in his service. Christians bound to such appropriation, from a consideration of *the love of Christ*. A particular inquiry into *the proportion* of wealth which should be directly consecrated to the service of God. General remarks and maxims on this point—considerations to direct us in this particular.—1. Proportion of wealth dedicated to God, under the Jewish economy. Proportion of wealth which might be raised in Great Britain for religious and philanthropic purposes. 2. Voluntary contributions made at different times under the O. T. dispensation. Offerings at the erection and dedication of the tabernacle,—at the dedication of the temple, offerings by Josiah, Hezekiah, David, &c. 3. Predictions of the prophets in reference to the liberality to be displayed by the Christian Church. Remarks on these predictions. Amount of what might be raised in our country. Appeal to Christians 55

CHAPTER VI.

ON THE BENEFITS WHICH WOULD FLOW TO THE WORLD, WERE COVETOUSNESS UNDERMINED, AND AN OPPOSITE PRINCIPLE PREVAILING IN CHRISTIAN SOCIETY. 63

General remarks. Provision for the external comfort of the poor and destitute. State of the poor in Ireland, in Italy, &c. Method of promoting the best interests of the poor. Improvement of general society—removal of physical evils. Original and present state of the globe—evils which require to be removed, and scriptural predictions in relation to this subject. Universal education would be promoted. Utility of, in reference to the spread of the gospel. Defects in this respect, in the present state of society. Expense of establishing universal instruction. Promotion of science and art. Connection of science and art with the objects of religion. The progress of Christianity would be promoted,—exertions requisite for this end, and the extent of the object to be accomplished,—reflections on this subject, and appeal to Christians. Preparations might soon be made for the *speedy arrival of the millennium*. Predictions in relation to this period—by what means it will be introduced—arrangements requisite for preparing the way for its arrival—addresses to professing Christians on this subject 63

CHAPTER VII.

ON THE MEANS TO BE EMPLOYED FOR THE COUNTERACTING OF COVETOUSNESS

Introductory remarks—frequent preaching and public discussions on this subject. Duty of Christian churches in relation to their members. More particular care requisite than hitherto, for detecting the latent principle of avarice, and for exciting to liberality. Acts which display the covetous principle—various examples illustrative of this subject. The churches of Christ should now begin to distinguish themselves by a spirit of liberality. Examples of liberality, in Britain and America, calculated to stimulate Christians to this duty. Various remarks on this subject. *Associations* might be formed for encouraging liberality and counteracting avarice. 76

CHAPTER VIII.

CONSIDERATIONS ADDRESSED TO PROFESSING CHRISTIANS, AND OTHERS, AS TO THEIR AFFECTIONS AND CONDUCT IN RELATION TO COVETOUSNESS.	83
I. To professing Christians in general. 1. God claims the supreme affection of the heart, which is incompatible with the indulgence of covetousness. Hints for self-examination on this point. 2. Considerations founded on our redemption by Christ. 3. On the <i>privileges</i> and <i>prospects</i> of Christians.....	83
II. Considerations addressed to the <i>Covetous</i> . Wealth cannot secure from misery and calamity. Riches uncertain, as to their enjoyment. Folly and unreasonableness of covetous affections—illustrated from facts, and various considerations. Light in which wealth will be viewed at the hour of death. Difficulty of subduing the covetous propensity. Covetous affections necessarily unfit men for the enjoyment of celestial bliss. Appeals on this subject.....	85
III. Considerations addressed to <i>Christians</i> on whom God has bestowed wealth and influence. Expostulations with such, on the proportion of wealth they ought to allot for the promotion of religion, &c. Necessity of extraordinary exertions being made for the renovation of society. Inconsistency of professors of religion, in not bequeathing, at their decease, a portion of their wealth for religious purposes. Illustration of the spirit and import of our Saviour's maxim, "It is more blessed to <i>give</i> than to <i>receive</i> ." Considerations founded on the fleeting nature of earthly things,—on the promises and declarations of God—selection of Scripture passages calculated to inspire the Christian with contentment and dependence on God for his temporal support. Sentiments on this subject, and anecdote from Dr. Witherspoon	89

ESSAY

ON

COVETOUSNESS, OR THE LOVE OF MONEY.

INTRODUCTION.

CHRISTIANITY has now subsisted in the world throughout the lapse of eighteen hundred years. During the first periods of its existence, when its facts and doctrines were propagated in their native purity and simplicity, uncontaminated with Pagan ceremonies and worldly maxims; its progress was rapid, and was accompanied with many astonishing and auspicious results. The empire of the Prince of Darkness was shaken to its center, the altars of Paganism were overturned, its oracles struck dumb, its worship forsaken, and its temples leveled with the ground. "The word of the Lord had free course and was glorified," and multitudes both of men and women, of the higher and the lower ranks of society, formerly immersed in all the vices and abominations of heathenism, were "turned from darkness to light, and from the worship of dumb idols to the service of the living God." By the unwearied labors of the Apostles and their successors, the knowledge of the true God was communicated to the inhabitants of the Grecian Islands, Asia Minor, the Northern coasts of Africa, the Southern shores of Europe, and throughout the greater part of the widely extended Roman Empire, where the abominations of Pagan Idolatry had, for ages, debased and demoralized the minds of men. The darkness of heathenism began gradually to vanish before the light of the "Sun of Righteousness," and a new and happier era appeared to dawn upon the world. The influence of Christian principle was felt in all its force; love knit together, in "the bond of perfection," the various members of the Church; a spirit of holy fortitude, and of non-conformity to the world, pervaded the minds of the disciples of Jesus, and the "lust of the eye, the lust of the flesh, and the pride of life," were considered as unworthy the pursuit of those who accounted themselves "strangers and pilgrims upon earth," and travelers to a blessed immortality.

Little more than two centuries, however, had elapsed, before a worldly spirit, and a "love of pre-eminence," began to appear, and to diffuse their malign influence throughout every department of the visible church,—which prepared the way for the unhappy dissensions which afterward arose, and for the long reign of Antichrist over the nations. During the period of more than a thousand years "darkness" again "covered the earth, and gross darkness the people." Pagan maxims and ceremonies began to be blended with the pure precepts and sublime doctrines of the Gospel; vain speculations were indulged on questions which the limited faculties of man are unable to resolve; a multitude of unmeaning rites

were substituted in the room of love to God and man; pride, and a desire of domination, usurped the place of meekness and humility; the power of the clergy was augmented; the bishops aspired after wealth, magnificence, and splendor; and their *avarice*, extortion, and licentiousness, at length became notorious, even to a proverb. Errors in religion, whether real or supposed, were punished by civil penalties and bodily tortures; and the select few who adhered to the cause and "testimony of Jesus," and lifted up their voice against such abominations, were reproached and persecuted, and obliged to seek for shelter in deserts and mountains, and in dens and caves of the earth. Hence it happened, that the spirit of genuine religion was almost evaporated; carnal maxims and policy were introduced; the love of riches and aggrandizement began to gain the ascendancy; and thus a barrier was interposed to the propagation of the pure gospel of Jesus Christ, and to the renovation of the world. Even since the Reformation from Popery, it is amazing how little practical influence Christianity has obtained over the nations who profess to have submitted to its authority. While its leading principles and precepts are not called in question, as matters of *mere opinion*, the great majority of professing Christians seem to act as if they were to be left entirely out of view in their ordinary deportment, or as if there were no specific difference between Christian principles and the corrupt maxims of the world.

It is a fact which cannot be denied, that, considering the long period which has intervened since its first promulgation, Christianity has never yet produced all the practical and beneficent effects which might have been expected from a religion introduced by the authority of heaven, and confirmed by a series of the most august and striking miracles,—nor has its empire been extended throughout the nations in any degree proportionable to the zeal of its first propagators, and to the rapidity and the extent of its progress after it was first announced to the world. This is a fact which has filled its sincere friends with deep regret, and which has been held up by its adversaries as a presumptive proof that its claims to a Divine origin are unfounded. Although there are, doubtless, to be found, in the principles of the Divine government, reasons inscrutable by us, why Christianity has been so slow in its progress and so limited in its effects; yet, I presume, that one grand reason is to be found in the fact, that the great majority of its professors have paid more attention to its *theory* than to its *practical requisitions*—that its *original record* has been too much

neglected, and human systems substituted in its place, and that contentions about matters of "doubtful disputation" have occupied the room of fervent piety and practical godliness. No nation under heaven has yet recognized its principles and maxims, in all their extent, in its civil and criminal code, in its legislative enactments, in its colonial transactions, and in its intercourse with other nations. No Christian church has yet been formed on the principle of *a full and unreserved* recognition of its precepts and laws, in all their bearings and practical applications; and even the most exemplary Christians, in their general deportment, and particularly in the application of their wealth, fall far short of what the religion of the Bible inculcates.

It is now high time that Christianity were recognized in all its holy principles and preceptive requirements, and that its votaries show to the world that they have imbibed its heavenly spirit, and are determined to rise superior to the groveling affections and the carnal policy of worldly men, and to follow the footsteps of their divine leader, and of his holy prophets and apostles. If we expect to behold the moral world regenerated, and Zion appear "beautiful and glorious in the eyes of the nations," we must exhibit our religion, not merely in theory, but in its *renovating and beneficent effects*. If we ask surrounding nations to embrace its doctrines, and introduce among their people its divine institutions; if we entreat the tribes of the heathen world to listen to its stupendous facts and to receive its ordinances and laws; or if we urge the infidel to examine with attention the evidences of its divine original, they have a right to demand from us proofs and examples of its benignant tendency and of its harmonious and beneficent effects. If we could show, that, wherever it is professed, it uniformly produces love, brotherly affection, forgiveness of injuries, peace and harmony, philanthropy, temperance, charity, and a spirit of noble generosity; if we could say with Lactantius, one of the early Apologists, "give me a man that is wrathful, malicious, revengeful, and, with a few words of God, I will make him calm as a lamb; give me one that is a covetous, niggardly miser, and I will give you him again liberal, bountiful, and dealing out of his money by handsful; give me one that is fearful of pain and death, and immediately he shall despise racks and crosses, and the most dreadful punishments you can invent;"—could we, with truth and sincerity, propose to the world such arguments and examples in behalf of our holy religion,—could we show that in every case where a Christian or a Christian society is to be found, such virtues are uniformly displayed; the progress of Christianity over the globe would soon be accelerated, and "righteousness and praise would" ere long, "spring forth before all the nations." And, I verily believe, that, until we can exhibit our religion in all its amiable and beneficent effects, its progress will be comparatively feeble, and its enemies numerous and powerful. We have been long engaged in controversies about *theological opinions*; and, in such contentions, have too frequently overlooked the grand practical

objects which it is the design of Christianity to accomplish. The government of the temper, the regulation of the affections, and the mortification of the principle of sin and corruption, have been, in a great measure lost sight of, amidst the fiery zeal which has sometimes been displayed in the propagation of dogmas and opinions, which do not enter into the essence of our holy religion. While we have endeavored to display our bravery as champions in the cause of orthodoxy, we have too frequently given vent to unhallowed passions, and aspired after worldly emolument and applause, instead of "the honor which cometh from God alone."

Of all the practical requisitions of Christianity, there is none which seems to be so much overlooked as the duty of contributing, with *liberality*, for the extension of the Gospel, the diffusion of knowledge, and the general improvement of mankind. This has been owing to the prevalence of that most vile and unchristian propensity, designated in Scripture by "*COVETOUSNESS*, which is *IDOLATRY*"—a propensity which has affected all ranks of men, from the highest to the lowest, and which is characteristic of multitudes who make a glaring profession of evangelical religion. Were this single affection either undermined or extirpated, a deluge of miseries would soon be swept away from our suffering world—philanthropy would distribute its thousand blessings among all ranks; universal education would be established in every land; Zion would be built up even in troublous times; "God would appear in his glory" to men; the benighted heathen would, ere long, be enlightened with the "day-spring from on high," and the way prepared for the ushering in of that glorious period when "the knowledge of Jehovah shall cover the earth, and the kingdoms of this world become the kingdoms of our Lord, and of his Messiah."

In the illustration of this subject the following plan may be adopted:

I. I shall describe the disposition or propensity designated by "*Covetousness*," as it has operated, and still operates, in Christian and civil society.

II. Demonstrate its *absurdity* and *irrationality*.

III. Show its inconsistency with Christian principle, and the general tenor of the Word of God.

IV. Illustrate some of the *Evils* which flow from the indulgence of Covetousness.

V. Investigate the *Principles* by which Christians should be directed in the application of their wealth.

VI. Illustrate some of the *Benefits* which would result to Christians and general society, were Covetousness undermined, and an opposite principle universally cultivated.

VII. State some of the *means* to be used, in order to counteract the influence of Covetousness, and to promote a spirit of Scriptural liberality among Christians.

VIII. Offer a few solemn considerations to different classes of individuals in relation to this subject.

CHAPTER I.

ON THE DISPOSITION, OR PROPENSITY DESIGNATED BY COVETOUSNESS, AND THE VARIOUS MODES IN WHICH IT HAS OPERATED IN THE WORLD, AND IN CHRISTIAN SOCIETY.

COVETOUSNESS consists in an *inordinate* desire of any worldly enjoyment, particularly *riches*, for the purpose of gratifying ambition, avarice, or sensual desires. It is the opposite of generosity, or that liberality and *contentment* which the word of God inculcates.

The Creator has furnished the material world with an immense variety of objects, and has endowed us with sensitive organs, through the medium of which these objects may be perceived and enjoyed. He has also implanted in us desires and affections which, in subordination to higher aims, were intended to be directed to the objects of the visible world, and the enjoyment of the good things of this life. We may lawfully desire water to quench our thirst, food to nourish our bodies, clothes to cover us, and comfortable shelter and accommodation—if such desires be regulated by scripture and reason, and confined within their proper bounds. We may even desire the possessions of others when they are willing to relinquish them, and when we are able and willing to offer them a fair and equitable compensation. We may lawfully labor by the exertion either of our bodily or mental powers, to acquire a more comfortable house or garden than we now possess, and to enjoy a little more of the external bounties of Providence, when proper motives regulate our exertions and our aims. For, the Creator has exhibited, in his creation around us, an immense variety of beauties and sublimities to gratify the eye and the imagination, and has furnished the world in which we live with a multiplicity of delicious fruits, flowers, herbs and roots, to gratify every taste, as well as to afford nourishment to our animal system. It is, therefore, evident, that he intends his creatures should participate the sweets of sensitive enjoyment. "For every creation of God is good, and nothing to be refused, if it be received with thanksgiving." "I know," says Solomon, "that it is good for a man to rejoice and to do good in his life, and also that every man should eat and drink, and enjoy the good of all his labor, for it is the gift of God." Everything in the system of nature is so arranged as to produce pleasure and sensitive enjoyment, when used with moderation, and according to the design intended by the Creator. To condemn the moderate use of sensitive enjoyments, or to inculcate the austerities of an ascetic life, is, therefore, repugnant to the dictates both of reason and revelation, and tends to frustrate the beneficent designs of Him whose goodness and "tender mercies are over all his works."

It is not, therefore, in the *simple* desire of worldly good that *covetousness* consists, but in an *inordinate* desire of sensitive objects and enjoyments—a desire which is inconsistent with the rational nature of man, and with our duty to our Creator and our fellow-men. Covetousness assumes a variety of forms, and manifests itself in

many different modes. 1. It appears in its most degrading form in *hoarding money*, and *acquiring houses and lands*, for the mere purpose of *accumulation*, when there is no intention of enjoying such wealth, or bringing it forth for the good of society. This is the characteristic of the man who is denominated a *miser*—a word which originally signifies *wretched*, or *miserable*, as all such persons necessarily are. 2. It appears under the pretense of *making provision for children*—a pretense which is generally nothing more than a cloak to cover the principle of avarice which is fixed in the mind. 3. It operates most frequently for the purpose of gratifying sensual propensities—displaying elegance in dress and furniture, and giving scope to a spirit of pride and ambition. In these, and many other ways, this vile affection manifests itself, robbing man of the true glory of his nature, degrading him in some respects below the level of the brutes, undermining every principle of religion, counteracting human happiness, preventing the renovation of the world, and reducing the soul to the level of a groveling idolater who "worships and serves the creature more than the Creator, who is blessed forever."

This inordinate desire of wealth has been productive of more mischief and misery in the world than almost any other unhallowed affection of the human heart. It has been the malignant source of almost all the evils which have been introduced into the social state, and of all the sorrows and sufferings to which the inhabitants of the earth in every age have been subjected. In order that we may clearly perceive the *maliginity* of this affection, it may not be improper to take a cursory view of the *effects* it has produced, and of the *manner* in which it has operated, both in the world at large and in Christian society.

SECTION I.

ON THE OPERATIONS AND EFFECTS OF COVETOUSNESS AS DISPLAYED IN THE WORLD AT LARGE.

THIS vile affection may be considered as the *first display* which was made in our world of *sin* or rebellion against God. Our first parents commenced their apostasy from their Maker by coveting the fruit of "the tree of knowledge," which he had expressly interdicted under the highest penalty. Though they were surrounded by the *munificence* of the Deity, though they were permitted to eat of every other tree in the garden of Eden, and possessed everything that was pleasant to the eye and delicious to the taste—yet they dared to put forth their hands to the forbidden fruit, from the covetous propensity of enjoying what was not their own, and the *ambitious* desire of being "like the gods, and knowing good and

evil." This covetous and ambitious act "brought death into the world and all our woe," and was the prelude and forerunner of all those devastations and miseries which avarice and ambition have entailed on the inhabitants of the world. We have reason to believe, that this woeful propensity, in conjunction with ambition, with which it is inseparably connected, in one shape or another, was the principal cause of the wickedness which abounded in the world before the flood, and of the overwhelming deluge which swept away its inhabitants. For we are told, that "the earth was filled with violence"—plainly intimating, that wars and devastations were everywhere carried on—that a system of rapine and plunder universally prevailed—that the strong and powerful forcibly seized the possessions of the weak—that the poor and needy were robbed and oppressed—that cities were demolished, fields and vineyards laid waste, and the plowshare of destruction driven through every land.

The whole history of the world, since that period, may be considered as little else than a revolting detail of the operations of covetousness and ambition, and of the direful effects they have produced on the destinies of mankind. The oppressions which Babylon and Assyria exercised over the Jews and neighboring nations, the plundering of the sacred vessels which belonged to the temple of Jehovah; the mad expedition of Xerxes against the Grecians, with his numerous fleets and armies, and the slaughters and devastations they produced; the boundless ambition of *Alexander*, his cruelties and injustice, his burning of cities, plundering of palaces and temples, and the destruction of thousands and millions by his conquering armies, while engaged in the mad pursuit of universal empire; the atrocities and murders committed by his successors, and the commotions and revolutions which followed in their train; the plunder, butchery and devastation of the Roman legions, and the terror they inspired throughout surrounding nations; the dreadful contests between Rome and Carthage, known by the name of the *Punic Wars*, which lasted for more than forty-five years, and in which millions of human beings were sacrificed to the demon of war; the slaughter and ravages produced by the jealousy and ambition of *Cæsar* and *Pompey*; the terrible desolations and carnage produced throughout Asia and Africa by *Mahomet* and his ferocious disciples, while they were laying waste cities without number, and cutting in pieces all the enemies of Islamism; the commotions, assassinations, murders, and contests which happened during the reign of the Roman Emperors; the pillage of Rome by the barbarous *Alaric*, when the streets and houses were deluged with blood, the buildings enveloped in flames, the monuments of ancient grandeur overturned, and the soldiery raged and ravaged with all the ferocity of infernal demons; the irruption of the Goths and Vandals, who rushed like a torrent into the Roman Empire, who respected neither rank, age nor sex, who covered the earth with carnage, and whose route was uniformly marked with desolation and with blood; the incursions of the Scythians, who rushed with irresistible impulse on western Europe, exterminating the inhabitants wherever they came, and threatening almost total destruction to the human race; the ravages of *Jenghis Khan*, the most bloody conqueror that ever existed, who, in twenty-two years, destroyed fifteen millions of human beings, and transformed their countries into hideous deserts; the mad expeditions of the Crusaders, who went forth by millions along the

eastern parts of Europe, breathing out threatenings and slaughter against the inhabitants of Asia; the ferocious and fiendlike wars of the Turks against Christian nations—these, and thousands of similar scenes of atrocity and plunder which have entailed misery and destruction on hundreds of millions of the human race, are to be attributed to the insatiable lust of covetousness, when pandering to the purposes of ambition and worldly aggrandizement.

In the wars of modern times, and in the numerous expeditions which have been undertaken for the discovery and colonization of new countries, the same avaricious principles have been almost uniformly displayed. No sooner had *Columbus* discovered a portion of the Western World, than the cursed love of gold began to absorb the whole attention of his followers. No desire to confer benefits on the natives, who almost adored them, seems ever to have entered their breasts; but, on the other hand, they displayed every species of perfidy, inhumanity, and injustice; and inflicted every kind of cruelty on the Indians, if they could but extort from them the golden treasures they possessed. As if the acquisition of gold had been the great end of human existence, their whole faculties and exertions were directed to this object. They went from one part of the island on which they had landed to another; they sailed eastward and westward, and from one island to another; and wherever they went, their sole inquiry was for the mountains and vales where gold was to be obtained. The island *Hispaniola* was the earliest settlement of the Spaniards in the New World, on account of the quantity of gold it supplied. They forced its inhabitants, as so many slaves, to dig this object of their avarice out of the bowels of the earth, and when the source of it was dried up, they exterminated the natives by a series of barbarities more shocking than ever before disgraced the history of man. Of two millions of inhabitants which the island contained when discovered by *Columbus* in 1492, scarcely 150 were alive in 1545, only about fifty years afterward. The conquest of Mexico by *Cortez* and his followers, impelled by an insatiable lust for gold, was accompanied with horrors, atrocities and slaughters more dreadful and revolting than almost any other scenes recorded in the annals of our race. To prepare the way for enjoying the plunder they had in view, the unoffending Indians were butchered by thousands, and their towns laid in ruins. Throughout the whole of their progress, their route was marked with perfidy, injustice, carnage, and deeds of atrocious cruelty. On one occasion, 60 Caciques or leaders of the Mexican empire, and 400 nobles, were burned alive with the utmost coolness and deliberation, and, to complete the horrors of the scene, the children and relations of the wretched victims were assembled and compelled to be spectators of their dying agonies. On another occasion, when the inhabitants of the city of Mexico were celebrating a festival, and all the people, particularly the nobles, were dressed in their richest decorations,—under the pretense of an intended conspiracy, the Spaniards, in order to glut their avarice, fell upon the unthinking Mexicans, slaughtered 2000 of the nobles, and stripped their dead bodies of all their valuable ornaments. Every right was violated which is generally held sacred even by hostile nations. On every trivial occasion the Indians were massacred in great numbers, their lands apportioned among the Spaniards, the inhabitants reduced to slaves, and forced to work without payment at all their public works, while

the officers distributed into different provinces, faithfully imitated their avaricious commander in all his excesses and barbarities. In the siege of Mexico alone, no less than a hundred thousand of the natives fell by the sword, beside those who perished by famine and other causes connected with warfare. And all these revolting scenes were produced in violation of every moral principle, merely to gratify the unbounded desires of sordid minds for the unsatisfying treasures of gold and silver. And while they had the effrontery and impiety to elevate the standard of the *Cross*, and to implore the God of armies to assist them in their conquests, no means were ever used to meliorate either the physical or moral condition of those whom they had so cruelly plundered. But God, whose laws they had so wantonly violated, caused them to suffer a just retribution, as a punishment for their enormities and their avaricious desires. For numbers of them were butchered by the enraged Mexicans in their retreat from the capital, and those who were taken alive were carried off in triumph to the temples and sacrificed with all the cruelties which revenge could invent, to the god of war,—while their companions, at a distance, heard their dismal screams and piteous lamentations. Many of them so overloaded themselves with bars of gold as retarded their flight, so that they fled ignominiously, the victims of their abominable avarice, and a great part of the gold and treasures they expected from their conquests, was commanded by their enemies to be thrown into the lake. Such are the effects of the operation of that detestable passion which has so long degraded the character of man, and which tramples under foot every principle of virtue, and every dictate of justice and humanity.

The same atrocities were committed, and the same execrable propensities displayed in the expedition of Pizarro and his followers for the conquest of Peru. In order to glut their avarice for plundering the golden treasures of this country, the basest treachery, and the most cold-blooded cruelties, were exercised. Under profession of amity, they seized upon the *Inca* or emperor of the country, who had received them in a friendly manner, and had commanded his attendants to offer the strangers no injury; and butchered, with deliberate and unrelenting fury, above 4000 of his attendants, who never offered the least resistance; after which they passed the night in the most extravagant exultation, at the greatness of the plunder they had acquired from the bodies of the slain. The *Inca*, in order to regain his liberty, promised them as many vessels of gold as would fill an apartment twenty-two feet long, sixteen wide, and eight high; and after having dispatched messengers throughout his kingdom to collect the promised treasures, he had fulfilled his engagement—they not long after, under the most ridiculous pretences, condemned him to be burned alive. The booty they obtained by such atrocious deeds, amounted to more than two millions of pounds sterling. The day appointed for the partition of this enormous sum was the festival of St. James, the patron saint of Spain; and although assembled to divide the spoils of an innocent people, procured by deceit, extortion, and cruelty, they had the impiety and audacity to commence the transaction with a solemn invocation of the name of God, as if they had expected the benediction of Heaven in distributing those wages of iniquity. Such was the commencement, and such the progress of the expedition by which the empire of Peru was subjugated to the dominion

of Spain. A *curse* has rested upon the wealth which was thus procured; and the nation that sanctioned such injustice and atrocities, has, in the just providence of God, suffered the punishment due to its cruelties and avarice. Instead of being enriched by such treasures, it has been impoverished. That very wealth which its inhabitants so ardently desired, and for the acquisition of which they violated every principle of religion and morality, laid the foundation of Spanish indolence, checked the increase of population, prevented the exertions of industry in the improvement of agriculture, manufactures, and commerce, which are the only true sources of wealth, and has reduced their country from one of the most powerful and wealthy of European kingdoms, to a state of comparative poverty. The wars which have, of late years, been carried on in that country, and in its former colonies, and the commotions and massacres which are at this moment taking place, may be considered as part of the punishment for national offenses, inflicted by Him who “visits the iniquities of the fathers upon the children to the third and fourth generation”—thus by a kind of retributive justice, avenging the many innocent nations which were ravaged by their forefathers on the continent of America.

Another mode in which Covetousness has displayed its malignity is, *the traffic in slaves*. Among the circumstances connected with this trade, are found whatever is dark in treachery, odious in cruelty, or horrible in war,—whatever afflicts the body or degrades and tortures the soul. It is a traffic which has suffocated thousands of human beings in the cells of a floating dungeon, plunged ten thousands into a watery grave, and doomed the survivors to long years of captivity and sorrow, under the lash of relentless task-masters—a traffic which has produced wars and massacres of every description, torn asunder the most endearing ties, trampled under foot every dictate of justice and humanity, transformed civilized men into infernal fiends, and embodied in it whatever has been feared or imagined in the cup of human woe. Yet this infernal traffic has been encouraged and carried on by men who make high pretensions of their improvement in science and civilization; by *States* that, with the most glaring inconsistency, boast of the liberties they have acquired above all other nations; by Roman Pontiffs who pretend to be Christ's vicegerents on earth; by thousands who profess the greatest zeal for the interests of Religion, and who would consider themselves as scandalized and insulted, were we to refuse them the name of *Christians*—and all for the purpose of glutting their insatiable lust of avarice, at the expense of the blood and sufferings of their fellow men. Early in the 15th century, the Portuguese, under the authority of the *Pope*, explored the African coast, planted colonies, and reduced the Africans to slavery. The decrees of five successive Roman Pontiffs “granted, conveyed, and confirmed to the most faithful king [of Portugal], a right to appropriate the kingdoms, goods, and possessions of all infidels, wherever to be found, to reduce these persons to perpetual slavery, or destroy them from the earth,” for the declared purpose “of bringing the Lord's sheep into one Dominican fold under one Universal Pastor.” By whom, then, was this atrocious commerce opened, and by whom has it been so long and ardently pursued? By the subjects of their *Most Faithful, most Catholic, and most Christian Majesties, Defenders of the Faith; by British subjects*, who have only lately been forced to abandon it, and by the citizens of the *Most Republican*

States, with the sanction of his holiness the Pope. It has been calculated that, in this accursed traffic, eight millions of slaves have been shipped in Africa for the West India Islands and the United States, ten millions for South America, and two millions have been taken and held in slavery in Africa; in all, about twenty millions of negroes, who have been consigned either to bondage or to death.* Reckoning the value of each slave at £40 sterling, this horrid trade has accumulated for its unprincipled abettors, the enormous sum of £800,000,000, a sum which would be nearly sufficient for effecting the physical and moral renovation of our world; but the greater part of which, we have too much reason to believe, has been wasted in luxury and debauchery.

I have stated these more atrocious acts of avarice, for the purpose of showing to what a pitch of wickedness and barbarity the principle of covetousness will lead its votaries when no human laws or prudential considerations interfere to obstruct its progress. Men are apt to imagine, that the occasional indulgence in covetousness, in respect to little things, can produce no great harm, when actions directly criminal are not resorted to for its gratification,—that to take a quarter of an ounce from a pound of sugar, an inch from a yard of print, a “remnant” from a suit of clothes,—to ask more than the fair value for an article of merchandise, to withhold a few pence or shillings from a philanthropic institution, or to desire the wealth of others which we cannot by fair means obtain, must be faults of trivial consideration, and can produce little injury to general society. But such persons ought to consider, that the *very same principle* which operates in such cases, *if left to its own native energies*, and to operate without control from the force of human laws, would lead to all the atrocities and scenes of horror to which we have now alluded, and would, ere long, transform the world into a field of plunder, an immense charnel house, and a habitation of demons. Were its influence *universal*, it would destroy the happiness of rational beings, subvert the moral order of intelligent agents, both in heaven and on earth, and even sap the foundations of the throne of the Eternal. Hence, it is described in Scripture as “THE ROOT OF ALL EVIL,” and designated by the term IDOLATRY; a crime which, above all others, has a tendency to *degrade* the character of man, and to subvert the relations in which he stands to his fellow creatures, and to his *Creator*—which includes in it a comprehensive summary of wickedness, pride, falsehood, malignity, rebellion, hatred of moral excellence, and the basest ingratitude toward him “in whom we live, and move, and have our being.”

Beside the more barbarous acts of plunder to which I have adverted, there are innumerable other acts in the conduct of nations and societies, flowing from the same principle, which are every day committed without a blush at their enormity and injustice. Almost the whole of our colonization system has been commenced and carried on from a principle of avarice; when the rights of independent tribes have been invaded, and their territories wrested from them without an adequate compensation. Whether we go to America or Africa, the West Indies or Hindostan, or wherever colonies have been established by European nations, we shall find numerous exemplifications of the truth of this position. Instead of rendering our geographical discoveries subservient to the

happiness and improvement of unenlightened tribes; we have sent out expeditions to deprive them of the property which God and nature had given them, to massacre and to hunt them as wild beasts from the face of the earth, for the purpose of acquiring plunder, and gratifying our avaricious desires. And when we have thus laid the foundation of our colonies in avarice and injustice, we have next oppressed their inhabitants by arbitrary enactments and exorbitant taxes, which have frequently led to protracted and expensive wars, in which our treasures, acquired by injustice and oppression, have been wasted, our previous riches and prosperity diminished, and our finances sometimes brought to the verge of ruin. It is thus that the Governor of the world frequently punishes the crime of avarice, by forcing it again to disgorge those riches which were unjustly acquired, and to make nations perceive, if they have any moral perceptions, their sin in their punishment. Hence when the British roused the indignation of their American Colonists, by their despotic enactments and oppressive taxations, a desolating and unnatural war ensued, which cost Britain not only many thousands of valuable lives (about two hundred thousand in all), but no less than £139,000,000; a sum far greater than had ever been acquired from the possession of these colonies, and which might have sufficed to transform Britain into a terrestrial paradise, and to establish churches and seminaries to the utmost extent, for the diffusion of knowledge and religion among all classes of the inhabitants.

There would be no end to the illustrations of the operation of covetousness, as displayed on the general theater of the world, were we to enter into particulars. The barbarous practices connected with *piracy*, or the plundering of vessels at sea, and the deeds of violence and atrocity which pirates have committed; the robberies and depredations which have been perpetrated by land, and the horrid murders which have been committed by lawless banditti in pursuit of spoil; the cruelties exercised by Turkish Bashaws and Moorish Emperors, in squeezing from their subjects exorbitant taxes; the plundering of caravans in the desert by wandering Arabs; the savage practices of a set of men denominated *wreckers*; the perfidy and perjuries of spies and informers, in convicting the innocent of crimes in the hope of reward; the trepanning of soldiers and the impressment of seamen; the secret murders committed on friends and relatives in hopes of obtaining an inheritance; the treachery of executors and lawyers in betraying their trusts, in order to fill their coffers; the frauds of public officers in conducting the affairs of government, the embezzling of public money by close corporations for the purpose of selfishness and sensuality; the oppressions which, in almost every nation, have been exercised by unprincipled and avaricious men, on the poor and destitute, the widow and the orphan; these, and hundreds of similar modes in which avarice is displayed, would require volumes to describe and record the revolting details.

SECTION II.

ON THE EFFECTS OF COVETOUSNESS, AND THE MANNER IN WHICH IT HAS DISPLAYED ITSELF AMONG THOSE WHO ACKNOWLEDGE THE AUTHORITY OF CHRISTIANITY, AND PROFESS TO SUBMIT TO ITS DICTATES.

WHEN the leading facts and doctrines of Christianity were first publicly proclaimed on the day

* See Gurley's “Life of Ashmun,” page 101. Printed at Washington, in 1805.

of Pentecost, those who were converted to the faith imbibed its heavenly spirit, and acted according to its holy requisitions. This was particularly manifested in their noble indifference to earthly possessions, and their anxious desire to consecrate the wealth which God had given them to purposes of Christian beneficence. So great was their admiration of the love of God, and the riches of his grace, and so elevated their hopes of heavenly felicity, that they looked down with a becoming contempt on worldly treasures, except in so far as they were subservient to the purposes of benevolence, and to the promoting of the interests of the Redeemer's kingdom. For, we are told, that "all that believed," being inspired with mutual love and affection for each other,—“had all things common.” Nay, to such an extent did this generous principle prevail, that they who had estates or other valuable effects, “sold their possessions and goods, and parted them to all men as every one had need.” This Christian liberality and heroic indifference to the world continued to distinguish the followers of Jesus, in a greater or less degree, during the first two centuries of the Christian era. For the sake of Him who had “redeemed them with his blood,” and brought them “from darkness to marvelous light,” they cheerfully parted with houses and lands, and brethren and sisters, and subjected themselves to the severest persecutions, that they might obtain “a better resurrection,” and an “incorruptible inheritance.” They were admonished beforehand that they were to be “betrayed by friends and brethren and kinsfolk, accused before rulers and kings, and hated of all men for his name's sake.” And these premonitions were fully realized in the experience of all who professed an adherence to “the testimony of Jesus.” At the instigation of the heathen priests and emperors, every species of contumely and cruelty was inflicted which the wicked ingenuity of our fallen nature could invent. Some were slain by the sword, some were whipped and scourged, after the cruel manner of the Romans, and others were roasted in the flames. Some were stabbed with forks of iron, some nailed to a cross, some torn by wild beasts, and others drowned in the sea, or stoned to death; some starved with hunger or killed with cold; some had their hands and tongues dis severed from their bodies, and others were wrapped in combustible garments, and fire set to them when evening came on, that they might serve like torches to dispel the darkness of the night. Hierome, in his epistle to Cromatius, observes,—“There is no day in the whole year to which the number of five thousand martyrs cannot be ascribed, except only the first day of January.” So that every year no less than *one million eight hundred and twenty thousand* Christians must have perished from the earth by the infliction of such demoniacal punishments,—and all to glut the avarice and revenge of Pagan priests and rulers. Yet the number of those men “of whom the world was not worthy,” still continued to increase throughout every province of the Roman empire. They magnanimously looked down on all the wealth and splendor of this passing scene as unworthy to be compared with the glory which was about to be revealed. “They counted all things as dung in comparison of the excellent knowledge of Christ,” for whom they had suffered the loss of all things; they knew in whom they had believed,” and “chose rather to suffer affliction with the people of God than to enjoy the pleasures of sin for a season, esteeming the reproach of Christ greater riches than the

treasures of earth, and having respect to the recompense of reward.” How many members of the Christian church should we have in modern times, were they all exposed to such persecutions and tribulations! Were all professing Christians animated with such heavenly principles and affections as distinguished the primitive saints and martyrs, there would be little need to write an Essay on the evils of Covetousness, or to enforce the duty of a noble and disinterested liberality on the members of the visible church. But, alas! the gold has become dim, and the most fine gold has changed! The great majority of those called *Christians*, in our time, can scarcely be distinguished, in their dispositions and conduct, from civilized Pagans, and the professed men of the world, “whose god is their belly,” who glory in their wealth, and “who mind earthly things.”

When the Christian church began to enjoy the favor of worldly men, it was not long before many of its members began to imbibe a worldly spirit. As the wealth and honors conferred on the church increased, the heavenly zeal of its votaries diminished, and a spirit of *Covetousness*, and a desire for worldly honors and distinctions, began to prevail throughout all the official departments connected with Christian worship and instruction. Even so early as the third century, this melancholy change began to appear, particularly in the contests of the Bishops for power and pre-eminence, and for worldly splendor and magnificence. Though a considerable number of them continued to exhibit to the world illustrious examples of primitive piety and virtue, yet “many of them were sunk in luxury and voluptuousness, puffed up with vanity, arrogance, and ambition, possessed with a spirit of contention and discord, and addicted to many other vices, that cast an undeserved reproach upon the holy religion of which they were the unworthy ministers.”* The Bishops assumed, in many places, a princely authority, particularly those who had the greatest number of churches under their inspection, and who presided over the most opulent assemblies. “They appropriated to their evangelical function, the splendid ensigns of temporal majesty. A throne, surrounded with ministers, exalted above his equals the servant of the meek and humble Jesus, and sumptuous garments dazzled the eyes and the minds of the multitude into an ignorant veneration for their arrogated authority. The example of the bishops was ambitiously imitated by the presbyters, who, neglecting the sacred duties of their station, abandoned themselves to the indolence and delicacy of an effeminate and luxurious life. The deacons, beholding the presbyters thus deserting their functions, boldly usurped their rights and privileges, and began to despise those lower functions and employments which they had hitherto exercised with so much humility and zeal, and the effects of a corrupt ambition were spread through every rank of the sacred order.”†

Wherever luxury, ambition, and a desire for worldly splendor, gain ascendancy over the mind, *Avarice* follows in the train as an *inseparable* concomitant. In the progress of the corruptions which were afterward introduced into the church, this degrading passion was displayed, with shameless effrontery, in all its impious and demoralizing effects. The rapaciousness of the bishops and popes, and of almost every order of ecclesiastics,

* Mosheim's Eccles. Hist., Century third.

† Mosheim.

became excessive, and even proverbial; and they did not hesitate to employ the most insidious and sacrilegious means to gratify their covetous propensities. The possessions of the church were sold to the highest bidders, or turned into a patrimony for the bastards of the incumbents. Frauds and abuses of every description were practiced; legends were forged, lying wonders invented, and all the resources of fable and forgery exhausted, to celebrate exploits which had never been performed. Skulls and jaw-bones, legs and arms, were collected under pretense of being the relics of the primitive martyrs, and deposited in churches in order to procure the rich presents of wealthy supplicants, who flocked to them for deliverance under affliction and dangers. Marriages, wills, contracts, the interests of families and of courts, the circumstances connected with the living and the dead, were all converted into instruments and occasions for increasing the power and riches of the church. The ignorance and superstition which the corruptions of Christianity had introduced, were dextrously improved by the ecclesiastical rulers to fill their coffers, and to drain the purses of the deluded multitude. All the various ranks and orders of the clergy had each their peculiar method of fleecing the people, and increasing their revenues. "The bishops, when they wanted money for their private pleasures, granted to their flock the power of purchasing the remission of the penalties imposed upon transgressors, by a sum of money which was to be applied to certain religious purposes, or, in other words, they published *Indulgences*, which became an inexhaustible source of opulence to the Episcopal orders, and enabled them to form and execute the most difficult schemes for the enlargement of their authority, and to erect a multitude of sacred edifices which augmented the external pomp and splendor of the church. The abbots and monks, equally covetous and ambitious, had recourse to other methods of enriching their convents. They carried about the country the carcasses and relics of the saints, in solemn procession, and permitted the multitude to behold, touch, and embrace those sacred and lucrative remains, at certain fixed prices. By this raree-show, the monastic orders often gained as much as the bishops did by their indulgences."* At length the Roman Pontiffs assumed the chief power over this profitable traffic, and "when the wants of the church or the demon of avarice prompted them to look out for new subsidies, published not only a universal, but a *plenary* remission of all the temporal pains and penalties which the church had annexed to certain transgressions." "They even audaciously usurped the authority which belongs to God alone, and impiously pretended to abolish even the punishments which are reserved in a future state for the workers of iniquity, a step which the bishops, with all their avarice and presumption, had never once ventured to take."†

It was by the sale of such indulgences that Pope Leo X. carried forward the magnificent structure of St. Peter's church at Rome. He published a system of indulgences suited to all ranks and characters of men, and promised a plenary remission to all who should contribute their money to the furtherance of this and other ambitious projects. So that the foundations of this edifice, which has been so much extolled, were laid, and its superstructure reared, by means the most impious and diabolical, by a display of reckless perfidy and insatiable avarice, and at the expense

of undermining the whole fabric of Christianity, and usurping the prerogatives of the King of heaven. To such a pitch was this daring impiety carried, that indulgences were farmed out to the highest bidders, who, to make the best of their bargains, procured the ablest and most eloquent preachers to extol the efficacy, and enhance the value of such wares. A price, on a graduated scale, was set upon the remission of sins of every description, not even excepting the most horrid crimes, such as the murder of the father, mother, or wife; so that for ninety livres, or a few ducats, or even for half a guinea of English money, a pardon might be procured from the "Apostolic Chancery," for crimes which all civilized nations punish with death. The raging thirst of dominion which consumed the Roman Pontiffs, prior to the Reformation, and their arrogant endeavors to oppress all that came within the reach of their power, were accompanied with the most impudent and insatiable extortion. "All the provinces of Europe were in a manner drained to enrich these ghostly tyrants, who were perpetually gaping after new accessions of wealth, in order to augment the number of their friends, and the stability of their dominions; and every stratagem was used to rob the subject without shocking the sovereign, and to levy taxes under the specious mark of religion."* Such was the shameless rapacity which then prevailed, that even in that age of superstition and servility, the eyes of all ranks began to open and to perceive the vileness and impiety of the pretensions of the ecclesiastical orders. Not only private persons, but also the most powerful princes and sovereign states exclaimed loudly against the despotic dominion of the Pontiffs, the fraud, avarice and injustice that prevailed in their councils, the arrogance and extortion of their legates, and the unbridled licentiousness and rapacity of the clergy and monks of all denominations, until at length the Reformation dawned and brought to light a scene of extortion and profligacy produced by the lust of covetousness, which had never before been exhibited with such effrontery in any country under heaven. In such a state of things it was no wonder that ignorance prevailed, that morality was undermined, and the peculiar doctrines of Christianity thrown into the shade and entirely overlooked. The public worship of the Deity was little more than a pompous round of external ceremonies, more adapted to dazzle the eye than to enlighten the understanding or to affect the heart. The discourses of the clergy were little else than fictitious reports of miracles and prodigies, insipid fables, wretched quibbles and illiterate jargon, which deceived the multitude instead of instructing them. The authority of the holy mother church, the obligation of obedience to her decisions, the virtues and merits of the saints, the dignity and glory of the blessed virgin, the efficacy of relics, the adorning of churches, the endowing of monasteries, the utility of indulgences, and the burnings of purgatory, were the principal subjects on which the clergy desecrated, and which employed the pens of eminent doctors of divinity, because they tended to fill the coffers of the mother church to gratify her ambition, and to advance her temporal interests.

It is impossible to ascertain with any degree of accuracy, the vast sums of money and the immense property which for ages were extorted from the people of Christendom for such unhallowed and sacrilegious devices. But it must have

* Mosheim, Cent. 12.

† Ibid.

* Mosheim, Cent. 12.

amounted to many thousands of millions of pounds, the greater part of which was employed for the purposes of devastation and carnage, of luxury and debauchery, and for tyrannizing over the people, whom the clergy had reduced to poverty and ignorance, by their shameful licentiousness and unbounded rapacity. The one-fifth of the wealth thus acquired, had it been spent for the good of the church, as was impiously pretended, might have been sufficient to have diffused the knowledge of the gospel of Christ over every region of the globe, and to have evangelized every portion of the Pagan world. But, alas! it was wasted in promoting schemes directly opposed to the principles and interests of genuine Christianity, forming one striking instance, among many, of the incalculable good which has been prevented, and the numerous evils which have been entailed on the world by the indulgence of Covetousness. The Pope's present revenues as a temporal prince, have been calculated to amount to at least £1,000,000 sterling, per annum, arising chiefly from the monopoly of corn, the duties on wine and other provisions. Over and above these, vast sums are continually flowing into the Papal treasury from all the Roman Catholic countries, for dispensations, indulgences, canonizations, annats, the pallia, the investitures of bishops and archbishops, and other resources. It is computed, that the monks and regular clergy, who are absolutely at the Pope's devotion, do not amount to less than 2,000,000 of persons, dispersed through all the Roman Catholic countries to assert his supremacy over princes, and to promote the interest of that church. The revenues of these monks do not fall short of £200,000,000 sterling, beside the casual profits arising from offerings, and the people's bounty to the church, who are taught that their salvation depends upon this kind of benevolence. In Spain alone, the number of ecclesiastics, including the parochial clergy, monks, nuns, syndics, inquisitors, &c., amounts to 188,625. The number of archbishops is eight, and of bishoprics, forty-six. The archbishop of Toledo alone has a revenue which, according to the most moderate calculation, amounts to £90,000 annually. In Portugal, in 1732, there were reckoned above 300,000 ecclesiastics out of a population of less than two millions. The patriarch of Lisbon has an annual revenue of £30,000, and the Revenue of the Patriarchal Church, above £114,000 sterling per annum. It is stated by Mr. Locke, in a Diary of his travels when on the Continent, inserted in Lord King's late biography of that illustrious philosopher, that the expense of the ecclesiastical establishment of France, at the period in which he resided in that country, amounted to above twenty-four millions of pounds sterling. What, then, must have been the immense treasures of wealth collected by the extortions of the Roman pontiffs and bishops prior to the Reformation, when the whole of the European nations lay prostrate at their feet, and were subservient to their interests,—and when the newly discovered countries in America were plundered to augment their revenues, and to gratify their unbounded rapacity! The wealth thus amassed, might have been almost sufficient to have cultivated every region, and to have transformed every portion of the globe into an earthly paradise.

Even in England, during the reign of Papal tyranny, the avarice of the clergy seems to have risen to an enormous height. Mr. Hume, in his history of the reign of Henry III. of England, gives the following description:—"Everything was become venal in the Romish tribunals; simony

was openly practiced; no favors, and even no justice could be obtained without a bribe; the highest bidder was sure to have the preference, without regard either to the merits of the person or of the cause; and beside the usual perversions of rights and the decision of controversies, the Pope openly assumed an absolute and uncontrolled authority of setting aside, by the plenitude of his Apostolic power, all particular rules and all privileges of patrons, churches, and convents. On pretense of remedying these abuses, Pope Honorius, in 1226, complaining of the poverty of his see as the source of all grievances, demanded from every cathedral two of the best prebends, and from every convent two monks' portions, to be set apart as a perpetual and settled revenue of the papal crown; but all men being sensible that the revenue would continue forever, his demand was unanimously rejected. About three years after, the Pope demanded and obtained the tenth of all ecclesiastical revenues, which he levied in a very oppressive manner, requiring payment before the clergy had drawn their rents or tithes, and sending about usurers who advanced them the money at exorbitant interest. In the year 1240, Otho the legate, having in vain attempted the clergy in a body, obtained separately, by intrigues and menaces, large sums from the prelates and convents, and on his departure, is said to have carried more money out of the kingdom than he left in it. This experiment was renewed after four years, with success, by Martin, the nuncio, who brought from Rome powers of suspending and excommunicating all clergymen that refused to comply with his demands. Meanwhile all the chief benefices of the kingdom were bestowed on Italians; non-residence and pluralities were carried to an enormous height; Mansel, the king's chaplain, is computed to have held at once seven hundred ecclesiastical livings, and the abuses became so evident as to be palpable to the blindness of superstition itself." "The benefices of the Italian clergy, in England, were estimated at the amount of 60,000 marks a year, a sum which exceeded the annual revenue of the Crown itself." "Pope Innocent exacted the revenues of all vacant benefices, the twentieth of all ecclesiastical revenues without exception, the third of such as exceeded 100 marks a year, and the half of such as were possessed by non-residents. He claimed the goods of all intestate clergymen; he pretended a right to inherit all money gotten by usury; he levied benevolences upon the people; and when the king prohibited these exactions, he threatened to pronounce against him the sentence of excommunication." Such was the boundless rapacity of the Popes, the extravagant exactions they enforced, and the power they wielded to gratify their avaricious desires. There is, perhaps, not a similar instance to be found in the history of man, in any nation on the face of the globe, of Covetousness, under the mask of religion, so impudent, unbounded, and extravagant.

There is a certain class of persons connected with the Romish Church, who have been more arrogant and rapacious, than almost any other class, except the pontiffs, namely, those individuals commonly designated by the title of "The Pope's Nephews." An Italian writer of the 17th century, who appears to have been a moderate Catholic, when sketching the characters of the existing cardinals, and the Pope's Nephews, relates, among other curious and melancholy pieces of history, the following circumstance: "A friend of mine had the curiosity to calculate the money that has been given to the Nephews, and he began

at the year 1500, and, after a great deal of pains, he found issuing from the treasury of the church above *seventy millions of double ducats*,* all delivered into the hands of their kindred: And this is to be understood of *visible* moneys; for of private and invisible sums, there may perhaps be twenty millions more. And those *Romans* that are within the town, and have more time to cast up what has been extorted from them, if they would take the pains to examine it more strictly, I am satisfied, would find it much more." The author, like a good and zealous Catholic, makes the following reflection on this fact: "If these seventy millions of double ducats had been spent in persecuting heretics, or in making war upon infidels, where would any infidels be? where would any heretics be? Those seventy millions would have been enough to have overrun all Asia. And (which is of importance too) the princes would have contributed as much more, had they seen the Popes more tenacious against their kindred, and more free to the soldiers who were fighting for Christ." The same author states, that "Innocent the tenth, to satisfy the fancy of a *kinswoman*, spent a *hundred thousand crowns* upon a fountain; yet with great difficulty could scarce find forty thousand to supply the Emperor in his wars with the Protestants," and "This good Pope would nevertheless leave to his cousin, to the house of *Pamphilia*, and other houses allied to that, above *eight millions of crowns*, with which sum they flourish in Rome to this very day." Again, "The *Barbarini* were in Rome at the same time, and enjoyed a rent of *four hundred thousand crowns*; and yet in a war of so much importance to the Catholic religion, they could not find forty thousand. But, oh God! (I speak it with tears in my eyes) against the most Catholic princes of Italy, *whole millions* were nothing; they could turn the cross into a sword to revenge their particular injuries; but in the relief of the Emperor, who was vindicating the Christian faith, they could not find so much as a few hundreds." On such circumstances he makes the following remarks: "The infidels laugh, and the heretics rejoice to see the wealth of the Church so irreligiously devoured, while the poor Christian weeps at their meriment." "The heat and passion which the Popes show hourly for their Nephews—to gain Principalities for them, to bestow pension upon pension upon them, to build palace upon palace for them, and to fill their coffers with treasure to the brim, is that which cools the resolution of the zealous prince, and exasperates the infidels in their wicked designs. A great shame it is, indeed, that the heretics should have more ground to accuse the Catholics, than the Catholic has to impeach the heretic." I shall only extract farther the following apostrophe of the author, in reference to this subject: "Oh God! to what purpose will they keep so many jewels at *Loretta*, so much consecrated plate at *Rome*, so many abbeyes for their Nephews, so much wealth for the Popes, if abandoning their commonwealth, and refusing it that humane supply that is necessary for the celestial glory, it be constrained to submit to the *Ottoman* power which threatens it now with the greatest effect? If the wealth of the Popes be devoured, the benefices of the cardinals given to the priest of *Mahomet*, the abbeyes of the Nephews usurped by the Turks, the sacred vessels at Rome

profaned by these Infidels, and the seraglio adorned with the gems of *Loretta*; God grant my eyes may never see that spectacle!"*

Thus it appears, even from the testimony of Roman Catholic writers, that immense sums were wrested from the "Christian people," by every species of fraud and extortion; that these sums, instead of being applied to the maintenance and defense of the Church, as was pretended, were wasted in luxury and extravagance, in selfish gratifications, in riot and debauchery, in accumulating wealth on the heads of their relatives and favorites,—most of whom were infidels and debauchees, in gratifying the pride and avarice of courtesans, and in the most romantic and ambitious projects. The single structure of St. Peter's at Rome, cost the enormous sum of *twelve millions* of pounds; and, in our age and country, would have cost at least thirty-six millions of pounds sterling. What, then, must have been the immense sums expended on similar objects, intended merely for worldly ostentation throughout the whole of Christendom, beside the millions wasted in the pursuits of tyranny, sensuality and debauchery! The mind of a reflecting Christian is almost overwhelmed at the thought that such sacrilegious enormities should have been so long permitted to continue under the moral government of God; and that such treasures should have been consecrated, for so many ages, to the support of the kingdom of darkness, while the true Church of Christ was obliged to pine away in poverty, and hide its head in dens and caves of the earth. But such are the deplorable and overwhelming effects of *Covetousness*, when it gains an ascendancy in the minds of individuals, communities, or nations. To accomplish its objects, every dictate of prudence is discarded, every law, human and divine, trampled under foot, every ordinance of religion violated and profaned, every threatening of future punishment set at naught, the happiness or misery of fellow-creatures entirely disregarded, atrocious murders perpetrated without remorse, and, in its boundless projects, the whole earth appears too narrow a field for the scene of its devastations.

Let us now attend to the operations of Covetousness as it appears in *individuals and societies connected with Protestant and Evangelical Churches*.

The operation of this affection among professing Christians in general, is apparent, from the *eagerness and restless activity with which the acquisition of wealth is prosecuted*. Diligence and activity in business is the duty of every man; and he who, in this way, "provides not for his household, hath denied the faith, and is worse than an infidel." But the keenness and unwearied exertion so frequently displayed in the accumulation of wealth, are very different, and ought to be distinguished from that dutiful attention which every man ought to exercise in procuring the means of comfortable subsistence. When we look around us on the world, and even on the conduct of many Christians, one would be almost apt to conclude, that the acquisition of riches and honors is the great object of pursuit, and the ultimate end of human existence. For men will make sacrifices, and expose themselves to inconvenience, privations, and dangers, to acquire money, which they would refuse to do, in order to supply the

* A ducat is about 4s. 6d. or 5s. in value, when of silver, and twice as much when of gold. The double ducats of Venice, Florence, Genoa, &c., weigh five pennyweights, seventeen grains of gold, and consequently are about the value of an English guinea, so that the above sum may be considered as equivalent to £73,500,000 sterling, which is equivalent to more than 200 millions of pounds at the present time.

* See a folio volume of 330 pages, entitled "*Il Cardinalismo di sancta Chiesa*;" or the History of the Cardinals of the Romish Church, from the time of their first creation to the election of Pope Clement the ninth. Written in Italian, by the author of *Nepotismo di Roma*. London, 1670.

wants of a poor and afflicted family, or to promote the best interest of an immortal soul, even when there is no necessity for accumulating wealth in order to family comfort. This disposition likewise appears, in *being unsatisfied with the wealth already acquired, even when every sensitive comfort consistent with reason and religion is already enjoyed*. There is too much aiming at what is called *independence*—a want of *contentment* under the present allotments of Providence, and a *distrust of the care and the promises of Him* who has said, "Thy bread shall be given thee, and thy water shall be sure," and "I will never leave thee nor forsake thee." How few are there to be found, even among evangelical Christians, whose language and conduct declare,—*"We are perfectly contented with the arrangements of the Almighty, and with that portion of earthly good which he has bestowed upon us, and we confidently trust that in the use of all proper means, he will cause goodness and mercy to follow us all the days of our lives; for all his allotments are determined by Infinite wisdom and rectitude!"* The same disposition appears in *refusing to contribute to philanthropic objects, or in contributing the smallest and most trifling sums*. While large sums are unnecessarily expended in expensive articles of dress and furniture, the most pitiful and niggardly sums are sometimes reluctantly given for the promotion of objects which have for their ultimate end the alleviation of human misery, the diffusion of divine knowledge, and the renovation of the world. But, leaving such general observations, it may be expedient to descend into particulars, and fix our attention for a little, on some of the more prominent modes by which covetous affections are manifested by professing Christians.

Covetousness assumes an immense variety of different shapes, and manifests itself in such a multiplicity of modes, that it would require volumes of description, were we to trace it in all its turnings and windings, and the diversity of phases in which it appears in different individuals, and throughout the ramifications of Christian society; and therefore I shall confine myself to some of its more general or leading aspects.

1. It appears in its most abject and degrading form in the practice of *hoarding money and acquiring houses and lands* for the mere purpose of *accumulation*, when there is no intention of enjoying such wealth, or bringing it forward for the good of society. A man who is under the influence of this vile propensity will sometimes exhibit an apparent decency and respectability of conduct to general society. He will seldom be distinguished for gluttony, drunkenness, or debauchery; for such indulgences run counter to his love of gain and his hoarding propensities. He will even attend with punctuality on the public ordinances of religion, and, for the sake of character, will give his half-penny or his penny to the collections for the poor, and will likewise keep up a routine of family worship in private, because it costs him nothing. Among his neighbors he may enjoy the reputation of being a sober, industrious and frugal character, and be set in contrast with the profligate and the profane. But all the while his heart is set upon his covetousness. To acquire money by every mean that will not subject him to the criminal laws, and to place it in security, are the great and ultimate objects of his pursuits; his whole affections are absorbed in the accumulation of wealth; mammon is the great idol which he adores; and whatever semblance of religion he may assume, he worships and serves the *creature* more than the

Creator. He is hard and griping in every bargain he makes; he grinds the faces of the poor, and refuses to relieve the wants of the needy; his weights and measures are frequently found deficient, and he cheats without remorse, if he can pass without detection. He envies the man who is richer or more prosperous than himself, and he casts his eyes around him on the possessions of the poor, if perchance, by cunning and deceit, he may acquire them at half their value. However fast his wealth may increase, "though he heap up silver as the dust," and "the gold of Ophir as the stones of the brooks," his wishes are never satisfied, and his accumulated wealth always lags behind his avaricious desires. He thinks he has a right to be rich, and he murmurs against the dispensations of Providence, when they frustrate his schemes and disappoint his expectations. He is unhappy, because he is unsatisfied with what he has acquired, and because his plans for accumulating gain are so frequently disconcerted. Gratitude to God and reliance on his providential care, tenderness, sympathy, and kindness, domestic affection, and expansive beneficence, are virtues which can never find an entrance to his heart; for all the avenues to true enjoyment are interrupted, and closely shut up by the cold hand of avarice. He denies himself those sensitive comforts which Providence has put within his reach, and almost starves himself in the midst of riches and plenty. He stints the comforts of his family and dependents, imparting to them the necessities of life in shreds and crumbs, and stooping to the meanest and most debasing expedients, in order to save a shilling or to increase his store—days and years roll on and carry him near to the verge of time. As he approaches nearer the grave, into which his riches cannot descend, his desires after them still increase, and he clings to them with a more eager grasp. His last sickness seizes him while he is counting his gold, arranging his bills, collecting his rents, or prosecuting the poor debtors who have come under his grasp. He is determined to hold fast his treasures until the last moment; even the near prospect of dissolution is insufficient to make his heart relent over a poor family whom he is hurrying into ruin, and in the very article of death, his heart is glued to earthly treasures, in spite of every remonstrance; sometimes grasping the keys of his coffers with a desperate resolution, until, at length, his soul takes its downward flight to that world for which it is prepared.

Such is a faint picture of the covetous man who "lays up treasures for himself, and is not rich toward God." Such is the character, more or less deeply marked, of not a few who pass under the Christian name, and have a place in the Christian church. When they are dextrous in the exercise of cunning and deceit, and their conduct is unmarked with any *flagrant* vice, they may long continue their course without much reprobation from general and even Christian society, especially if they have acquired the habit of dissimulation and hypocritical canting. But the principle which pervades the souls of such persons, if permitted to operate without control, would display itself in a still more glaring and disgusting manner,—of which we have many examples recorded in biography and history. In order to exhibit covetousness in its real light, and to impress the mind with the baseness and revolting nature of this passion, it may not be improper to select two or three examples.

Edward Nokes was by trade a tinker, at Hornchurch in Essex. His apartments portrayed symp-

toms of the most abject poverty, though, at his death, he was found to be possessed of between five and six thousand pounds. He had a wife and several children whom he brought up in the most parsimonious manner, often feeding them on grains and offals of meat which he purchased at reduced prices. In order to save the expense of shaving, he would encourage the dirt to gather on his face, to hide in some measure this defect. He never suffered his shirt to be washed in water, but after wearing it until it became intolerably black, he used to wash it in wine to save the expense of soap. His coat, which time had transformed into a jacket, would have puzzled the most accomplished chemist to determine its original color, so covered was it with shreds and patches of different colors, and those so diversified as to resemble the trophies of the different nations of Europe. The interest of his money, together with all he could heap up, he used to deposit in a bag, which bag was covered up in a tin pot, and then conveyed to a brick kitchen where one of the bricks was taken up, and a hole made just large enough to hold the pot; the brick was then carefully marked, and a tally kept behind the door, of the sum deposited. One day his wife discovered the hoard, and took from the pot one of 16 guineas that were placed therein; but when her husband came to count his money, on finding it not to agree with the tally, behind the door, which his wife did not know of, he taxed her with the theft, and to the day of his death—even on *his death bed*, he never spoke to her, without adding the epithet "*thief*" to every expression. A short time before his death he gave strict charge that his coffin should not have a nail in it, which was actually the case, the lid being fastened with hinges made of cords. His shroud was made of a pound of wool, the coffin was covered with a sheet instead of a pall, and was carried by six men, to each of whom he left half a crown. At his particular desire, no one who followed him to the grave wore mourning; even the undertaker was habited in a blue coat and scarlet waistcoat. He died in 1802, a wretched example of the degrading effects of avarice.

In November, 1821, a person of the name of Harrison died in Bennet street, Rathbone Place, Oxford road, London, where he had lodged 20 years. The furniture in his room consisted of one old chair, a table, an old stump bedstead, and a bed of straw; in one corner was a heap of ashes; and the cupboard, the day after his decease, contained a few potato peelings and a stale roll. His body presented a picture of extreme misery and starvation, though he had no family, and had property in the funds to the amount of £1500. A female friend who was in the habit of visiting him, deposed before the coroner, that he would let no person but her enter his room, which he always kept padlocked on the inside, for fear of being robbed. He lay on his bed in the day time, and sat up at night without any fire, always burning a lamp. A few evenings before his death, he told her, that many persons wanted to finger his cash, but they should not. He then desired her to lock him in, and take the key with her, which she did; but on going again next day, she found him lying on his bed, with his clothes on, quite dead. He was in the practice of carrying large sums of money, and sewing them up in different parts of his clothes, for which reason he never pulled them off. Upward of £100 was found upon him at the time of his death;—on the night previous to which he sent for one oyster, half a pint of beer, and a pennyworth of figs, which he ate.

Such is the wretchedness and degradation to which covetousness reduces those miserable beings who live under its influence. Such examples form a striking commentary on the words of Solomon:—"There is a sore evil, which I have seen under the sun; riches kept by the owners thereof to their hurt, and those riches perish by evil travail. As he came forth of his mother's womb, naked shall he return, to go as he came, and shall take nothing of his labor which he may carry away in his hand. All his days also he eateth in darkness, 'or wretchedness,' and hath much sorrow and wrath with his sickness," under the curse and displeasure of God.

Numerous examples of this kind might be brought forward; but I shall adduce only the following well authenticated instance, in relation to John Elwes, Esq., who was for some time a member of parliament for Berkshire.

The father of this gentleman was a brewer of great eminence, but his mother, though she was left nearly £100,000 by her husband, literally starved herself to death. About the age of 40, Mr. Elwes succeeded to the property of his uncle, which amounted to no less than £250,000. Yet this wretched man, notwithstanding his immense wealth, denied himself of almost every comfort, in order to increase his store. He would walk home in the rain in London, rather than pay a shilling for a coach; he would sit in wet clothes sooner than have fire to dry them; he would eat his provisions in the last stage of putrefaction, sooner than have a fresh joint from the butchers; and he wore a wig for a certain time, which his biographer saw him pick up out of a rut in a lane where they were riding; which had all the appearance of the cast-off wig of some beggar. When setting out on a journey, his first care was to put two or three eggs, boiled hard, into his great-coat pocket, or any scraps of bread which he found; then mounting his horse, his next attention was to get out of London into that road where turnpikes were the fewest; then stopping under any hedge whose grass presented stuff for his horse, and a little water for himself, he would sit down and refresh himself and his horse together, without ever once stopping on the road at any house. Two of his residences he chiefly visited were, Marcham in Suffolk, and another in Berkshire. Marcham was the place he most frequently visited as he advanced in life; for this reason, that the journey into Suffolk cost him only two pence halfpenny, while that into Berkshire amounted to *four pence*. To save fire he would walk about the remains of an old green-house, or sit with a servant in the kitchen. During the harvest, he would go into the fields to glean the corn on the grounds of his own tenants, and they used to leave a little more than common, to please the old gentleman, who was as eager after it as any pauper in the parish. In the advance of the season, his morning employment was to pick up any stray chips, bones, or other things, to carry to the fire in his pocket; and he was one day surprised by a neighboring gentleman, in the act of pulling down, with some difficulty, a crow's nest for this purpose. On the gentleman wondering why he would give himself this trouble, "Oh! sir," he replied, "it is really a shame that these creatures should do so. Do but see what a waste they make—they don't care how extravagant they are."

As he approached to the close of life, his avaricious disposition increased, and his penurious habits became still more inveterate. He used still to ride about the country, on one of his mares, but he rode her on the soft turf, adjoining the

road, to save the expense of shoes, as he observed, "the turf is very pleasant for a horse's foot."—When any gentleman called to pay him a visit, and the stable boy was profuse enough to put a little hay before the horse, old Elwes would slyly steal back into the stable, and take the hay very carefully away. He would continue to eat game in the last state of putrefaction, and meat that *walked about his plate*, rather than have new things killed before the old provision was finished—a species of provisions not altogether unsuitable to so degraded a mind. During this period, he one day dined upon the remaining part of a moor-hen, which had been brought out of the river by a rat; and soon after ate an undigested part of a pike, which a larger one had swallowed, but had not finished, and which were taken in this state in a net—remarking to a friend with a kind of satisfaction, "Ay! this is killing two birds with one stone." It is supposed that if his manors and some grounds in his own hands had not furnished a subsistence, where he had not anything *actually* to buy, he would have suffered himself to have starved rather than have *bought anything with money*. His dress was in unison with his mode of living. He would walk about in a tattered brown-colored hat, and sometimes in a red and white colored cap, like a prisoner confined for debt. His shoes he would never suffer to be cleaned, lest they should be worn out the sooner; but still, with all this *self-denial*, he thought he was too profuse, and would frequently say, "he must be a little more careful of his property."—His disquietude on the subject of money was now continual. When he went to bed, he would put five or six guineas into a bureau, and then feel of his money, after he had retired to rest, and sometimes in the middle of the night he would come down to see if it was there. Money was now his only thought; he rose upon money—upon money lay down to rest. He would carefully wrap up a few guineas, in various papers, and deposit them in different corners, and then run from one to the other, to see whether they were all safe; then forgetting where he had concealed some of them, he would become as seriously afflicted as a man might be who had lost all his property. During the last winter of his life, he would frequently be heard at midnight, as if struggling with some one in his chamber, and crying out, "I will keep my money; I will: nobody shall rob me of my property." At length, on the 26th November, 1789, expired this miserably rich man, while absorbed in his avaricious propensities, leaving to the world a most striking and melancholy example of the miserable and debasing effects of covetousness. At his death, his property amounted to above *eight hundred thousand pounds*, which were soon dispersed throughout all parts of England.*

Such examples may be considered as intended by Divine Providence to show us the wretched and degraded condition to which avarice reduces the soul of man, and to serve as beacons to guard us against the influence of this debasing and soul-ruining propensity. For it is impossible for a soul thus absorbed in the accumulation of money to love its Creator or its fellow-creatures, or to submit to the requisitions of the gospel; and consequently it must be altogether unfit for engaging in the sublime exercises of the heavenly world, and for relishing the enjoyments of that "inheritance which is incorruptible and that fadeth not

away." The service of God and mammon are absolutely irreconcilable; and the man who devotes himself to the latter, by his own act renders himself *unfit* for being a partaker of the inheritance of the saints in light. Than such a man there can scarcely be presented a more pitiable picture of human depravity and degradation. An immortal mind groveling in the dust, and having for its highest aim to heap up treasures which are never to be enjoyed! and despising those incorruptible riches which shall endure forever! what folly can be compared to the conduct of such an infatuated mortal?

"Oh, cursed lust of Gold! when for thy sake
The fool throws up his interest in both worlds;
First starved in this, then damned in that to come."

Who that ever tasted the pleasures of knowledge, or felt the sweets of beneficence, or the comforts of religion, can but pity the poor wretch whose soul is chained to earthly treasures, and tortured on the rack of avarice? And, let it be remembered, that although the examples related above are extreme cases, yet the principle of covetousness is the same in every individual in whose heart it predominates, and it is owing only to certain restraining circumstances, that it does not carry them to the same stage of misery and degradation, as in the instances I have now related. Let this depraved principle be let loose to operate without control, and it is impossible to depict the miseries and degradations of human character that would follow in its train. The world would soon become an immense *aceldama*, and its inhabitants a society of fiends, fit only to be the companions of the prince of darkness, and his infernal legions.

2. Another way in which Covetousness operates, even among professed Christians, is, in *gratifying a desire for ostentatious display, and a spirit of pride and ambition*.

The Creator evidently intended that his creatures should be suitably clothed and accommodated with comfortable habitations; for he has replenished the earth with everything requisite for those purposes; and were proper arrangements made in the social state, and benevolence as frequently displayed as the principle of avarice—all the ranks of mankind would be comfortably clothed, and conveniently accommodated. A spirit of covetousness is not necessarily connected with a desire after decent apparel and comfortable dwellings, nor with those exertions which are requisite to procure them. But when I behold a professed Christian decking himself and family with gaudy attire, replenishing his dwelling with the most expensive furniture, erecting a huge mansion, superior to those of all his neighbors, and sufficient to accommodate three or four families—contenting himself at the same time with subscribing half a guinea a year for a religious or philanthropic institution, and so eagerly engaged in the pursuit of wealth, that time is scarcely left for mental improvement or family religion—I cannot help drawing the conclusion, that covetousness is a principle which rules in such a mind for the purpose of fostering a spirit of vanity and pride, and a desire for worldly ostentation and parade. I have seen in the house of a professor of religion, whose income did not exceed £150 a year, an article of furniture, of no great utility, which cost twenty or thirty guineas, while a sixth part of this sum would have been sufficient to have procured a neat article to have answered every purpose for which it was intended. Yet if the individual had been urged to subscribe a guinea for a

* Selected from Topham's "Life of John Elwes, Esq."

enjoyments suitable to his station—is it *rational*, is it *useful*, either to himself or others, that he should waste £2200 in vain or profligate pursuits, in balls, masquerades, gambling, hounding, horse racing, expensive attire, and splendid equipages—when there are so many poor to be relieved, so many ignorant to be instructed, so many improvements requisite for the comfort of general society, so many sciences to cultivate, so many arts to patronize, and so many arduous exertions required for promoting the general renovation of the world—and scarcely a single guinea devoted to either of these objects? Such conduct is no less irrational and degrading, in a moral and accountable agent, than that of the groveling wretch who hoards his money in a bag which is never opened but with jealous care when he has a few more guineas or dollars to put into it. In both cases, wealth is turned aside from its legitimate channel, and perverted to purposes directly opposite to the will of the Creator, and the true happiness of mankind.

3. The folly of Avarice will appear, if we consider it in relation to rational enjoyment.

The rational enjoyment of life consists, among other things, in the moderate use of the bounties of Providence which God has provided for all his creatures—in the exercise of our physical and mental powers on those objects which are calculated to afford satisfaction and delight—in the emotions of contentment and gratitude toward our Creator—in the sweets of an approving conscience—in the acquisition of knowledge—in the flow of the benevolent affections, in affectionate social intercourse with our fellow men, in the exercise of tenderness, sympathy, and good will toward others, and in that calmness or equanimity which remains unruffled amidst the changes of fortune, and the untoward incidents of human life. Now, in none of these respects can the covetous man experience the sweets of true enjoyment. He has it in his power to enjoy all the sensitive pleasures in which a rational being ought to indulge, yet he stints himself even of necessary comforts, and lives upon *husks* when he might feast himself on the choicest dainties, because it might prevent him from adding new stores to his secret treasures. He will shiver amidst the colds of winter, under a tattered coat, or a thread-bare covering, and sit benumbed in his apartment without a fire to cheer him, because the purchase of requisite comforts would diminish the number of his pounds, shillings, and pence. He will lie on a bed of straw, during the dark evenings of winter, like a mere animal existence, rather than furnish oil for a lamp, and will wallow like a sow amidst mire and filth, rather than give the smallest trifle to a person to clean his apartment. Of *mental* pleasures he can scarcely be said to enjoy the smallest share, except in so far as the *ideas* of accumulated gold and silver are concerned. He is necessarily oppressed with *restless anxiety*. The objects of his covetousness are, in most instances, necessarily uncertain. He strives to obtain them, but is doubtful of success; his mind hangs between hope and fear; his desires are, however, continually exerted; he is on the rack as it were, until he sees the issue of his adventure, and in numerous cases, his hopes are blasted, and his schemes disconcerted; and when the plans of gain he had laid are frustrated, or a portion of his wealth destroyed by an unexpected accident, he feels all the pains and agonies of a man verging toward poverty and ruin. While a contented man may become rich, to every desirable degree, amidst the full possession of serenity of mind, and self-appro-

bation, the anxiety of the covetous is necessarily great and *distressing*; and that is one part of the punishment he inevitably suffers under the righteous government of God, on account of his infringement of the natural and moral laws of the universe. To the misery of perpetual anxiety are added incessant *labor*, and an endless and wearisome train of exertion to augment his gains and secure himself from losses. Like a slave or a mill-horse, he drudges on in a state of travail, and in an unceasing whirl of toil and effort, which leave no intervals for rational reflection and enjoyment; and, after all, his desires are still craving and still unsatisfied.

In the midst of such labor and mental efforts and perplexities, he meets with frequent disappointments. His deeds or obligations are found to be defective; his bills are refused to be discounted; his agents prove cheats and deceivers; storms will blow in spite of him, and sink his ships in the mighty waters; floods and inundations will sweep away the produce of his fields; his crops will fail; his cattle die; his debtors abscond or become bankrupts, and the devouring flames will seize upon his houses and barns, or his shops and warehouses, and consume them to ashes. In all such cases, where a contented mind will endeavor to submit with calmness to the allotments of Providence, the mind of the covetous impugns the rectitude of the Divine dispensation, and heaves with unutterable throes of agony and despair. In the language of inspiration “he is pierced through,” or, compassed on every side “*with many sorrows*,” and the inward language of his heart is—and it is awfully appropriate, “Ye have taken away my gods; and what have I more?” Amidst such misfortunes and mental pangs, he is frequently left without friends, without pity, or sympathy, or commiseration—pointed at with the finger of scorn, stung by the keen sarcasms of his neighbors, and considered as a fit mark for the shafts of contempt and derision, while the lashes of his own conscience add a keenness to his anguish. It is almost needless to add, that he derives no enjoyment from the exercise of kindness and benignity, from the pursuits of knowledge, the contemplation of nature, the affectionate association of his fellow-men, or the satisfaction which arises from deeds of beneficence, for his degrading pursuits leave him neither leisure nor relish for such refined gratifications. Who, then, that has any regard to rational enjoyment, would desire the state of mind, and the condition of such a wretched mortal, even although his bags were full of gold, and his barns filled with plenty!

Nor are the enjoyments much superior, of the man who covets riches merely for the purpose of living in splendor and fashionable dissipation. To a rational mind conscious of its dignity, and of the noble powers with which it is furnished, how poor a gratification would it receive from all the pleasures and gewgaws that fascinate the worldly minded and the gay? Are the pleasures derived from rich viands, delicious wines, costly apparel, stately mansions, splendid equipages, fashionable parties and diversions, an enjoyment adequate to the sublime faculties, and the boundless desires of an immortal mind? How many of those who make such pleasures the grand object of their pursuit, are found the slaves of the most abject passions, with hearts overflowing with pride, ranking with envy, fired with resentment at every trivial affront, revengeful of injuries, and hurried along, by the lust of ambition, into every folly and extravagance? Where such passions are

continually operating, along with all their kindred emotions, and where benevolence is seldom exercised, it is impossible that true happiness can ever be enjoyed. And hence, we find, among persons of this description, more instances of suicide, and more numerous examples of family feuds, contentions, and separations, than among any other class of general society. So that there is no reason to desire the enjoyments of covetousness in whatever channel it may run, or whatever shape it may assume.

4. The folly and irrationality of Covetousness appears, when we consider the immortal destination of man.

There are thousands of misers and other worldlings who are governed by the lust of ambition and covetousness, who admit the doctrine of a future state of punishments and rewards. Independently of those arguments which may be drawn from the nature of the human soul, its desires of knowledge and capacious intellectual powers, the unlimited range of view which is opened to these faculties, throughout the immensity of space and duration, the moral attributes of God, the unequal distribution of rewards and punishments in the present state, and other considerations,—there is a *premonition* and a powerful impression in almost every human mind, that the range of its existence is not confined to the present life, but that a world of bliss or woe awaits it beyond the grave. And, as vast multitudes of worldly and avaricious characters are to be found connected with the visible church, or frequenting its services; by this very circumstance, they formally admit, that there is another scene of existence into which they enter at the hour of dissolution.

Now, how irrational and inconsistent is it for a man to admit, that there is a world beyond the present which is to be the scene of his *everlasting* abode, and yet continue to have his whole thoughts and affections *absorbed* in pursuing the riches and transitory gratifications of the present life, without casting a serious glance on the realities of the invisible state, or preparing to meet them? If we had just views of all the momentous realities, and the scenes of glory, and of terror, connected with the idea of an eternal world, and could contrast them with the vain and fleeting enjoyments of this mortal scene, we should perceive a *folly* and even a species of *madness* in such conduct, more astonishing than what is seen in any other course of action pursued by human beings. If a man have an estate in a distant country, on the proceeds of which a considerable portion of his income depends, he will not forget that he has an interest in that country; he will correspond with it, and will be anxious to learn intelligence respecting its affairs from periodical journals and other sources of information. If a person, on the expiration of ten years, has the prospect of entering on the possession of a rich inheritance, he will look forward to it, with longing expectations, and will employ his thoughts in making arrangements for enjoying it, though perhaps he may not live to take possession. Nay, we shall find many individuals spending weeks and months in melancholy and chagrin for the loss of a few guineas or dollars, and, at other times, deriving their chief pleasure from the prospect of a paltry gain. Yet strange to tell, many such persons remain altogether insensible to the joys and sorrows of a future world, and never make the least arrangement in reference to that state; although there is an absolute *certainty* that it awaits them, and that it is possible they may be ushered into it before tomorrow's dawn. Can any species of folly with

which men are chargeable, be compared with such apathy and indifference about *everlasting* things, when such things are admitted to have a real existence?

It is a dictate of wisdom, and even of common sense, that when a person has a prospect of occupying any office or condition in life, he ought to engage in that course of preparation which will qualify him for performing its duties and enjoying its comforts. But what preparation does the covetous man make for enabling him to *relish* the enjoyments, and to engage in the exercises of the eternal world? Will heaping up silver as the dust, and filling his bags with sovereigns and dollars, and *concentrating* his thoughts and affections on such objects, *prepare* him for the sublime contemplations of the spirits of just men made perfect, and the hallelujahs of the heavenly host? Will his hard griping disposition, which never permitted him to drop the tear of sympathy, or to relieve the widow and the orphan, render him meet for associating with the inhabitants of that world, where *love* and the purest affections, in all their varied ramifications, forever prevail? Will his anxious desires and his incessant toils from morning to night, to add to the number of his guineas, and the extent of his property, qualify him for surveying the wonderful works of God, and contemplating the glory of Him “who was slain and hath redeemed us to God by his blood?” Can any man, who has the least spark of rationality within him, imagine that such conduct and such dispositions, are at all compatible with preparation for the felicities of the heavenly state? Or, does the poor degraded miser really believe that heaven is filled with bags of gold and silver, and that there is no employment there but “buying and selling, and getting gain?” If the mansions of heaven, and the exercises of its inhabitants, be such as the Scriptures delineate, then, there is an utter incompatibility between the employments of the celestial state, and the train of action, and the temper of mind, of the covetous man, which renders him altogether *unqualified* for its enjoyments. And, if he be unprepared for the joys and the services of the heavenly state, he cannot, in consistency with the constitution of the moral world, be admitted into its mansions, but must necessarily sink into “the blackness of darkness forever.”

Nor are the pursuits of the worldling, who spends his wealth in vanity and luxury, more compatible with the joys of the celestial world. This will appear, if we consider some of the ingredients which enter into the essence of heavenly felicity. From the representations of this state given in the Scriptures, we learn, that it is a state of perfect purity and holiness; that the minds of its inhabitants are irradiated with divine knowledge, and adorned with every divine virtue; that *love* pervades and unites the hearts of the whole of that vast assembly; that *humility* is one of their distinguishing characteristics; that they are forever engaged in *beneficent* services; that the contemplation of the works and ways of God forms a part of their employment; and that they are unceasingly engaged in sublime adorations of the Creator of the universe, in contemplating the glory and celebrating the praises of Him “who hath loved us, and washed us from our sins in his own blood.” But what resemblance is there between such a state and such employments, and the pursuits of the gay worldling whose heart is set upon his riches as the chief object of his affections? Would the man who spends his wealth in hounding, horse-racing, cock-fighting, and gam-

in smuggling spirituous liquors, paper, teas, and other commodities, who have even forged excise stamps, and who seemed to consider such practices as nowise inconsistent with the principles of Christianity. I have known such whose weights and measures were deficient, whose quarter loaves were from five to ten ounces below the just standard, and whose butter, when exposed to sale in the public market, has been frequently seized by police officers, on account of its deficiency in weight. I have seen the confidence of their brethren in this way grossly abused by their assumed character of piety and rectitude, and have been sometimes tempted to suspect the honor and honesty of every one who made high pretensions to sanctity and evangelical religion. Yet many such nefarious practices are overlooked in Christian churches, as scarcely worthy of censure, especially if the guilty individuals have a large share of wealth, and regularly attend the public ordinances of religion. Were it expedient in the present case, numerous examples of the above description might be brought forward.

Another way in which merchants display their covetous disposition is, *by toiling their apprentices and servants, and confining them for so many long hours, that their health is injured, and their intellectual and religious improvement prevented.* I have known apprentices not above thirteen years of age, confined in shops from seven in the morning until twelve at midnight, and sometimes to an early hour in the morning, and having scarcely two hours out of the twenty-four allotted them for meals; and that too, by merchants who made a splendid profession of piety, and were considered as pillars of Dissenting churches. By such conduct young persons are not only deprived of that recreation which is necessary to the vigor of their animal system, but prevented from attending the means of moral and religious instruction, and from storing their minds with that knowledge which they ought to possess as rational and immortal beings. If, in the present state of things, merchants and others require so long continued drudgery from their servants, other arrangements ought to be made, and additional servants or apprentices procured, so that a moderate and reasonable service only should be required from them. But such arrangements would run counter to the principle of avarice. Similar practices have long been complained of in regard to many of our spinning-mills, and other public manufactories, and yet they have been defended by *Christian* men, as if the laboring classes were to be considered in no other light than as mere animal machines, or as beasts of burden. Covetousness likewise displays itself in keeping open shops to late hours, and thus preventing families, servants, shopmen, and apprentices from domestic enjoyment, and from the means of rational improvement; and, when measures have been concerted to put a stop to this evil, I have known two or three professed Christians, by their obstinacy and avaricious dispositions, disconcert every plan which had been formed for this purpose.

5. The covetous principle, conjoined with glaring acts of inhumanity and injustice, is frequently displayed in *cases of BANKRUPTCY.*

How frequently do we find persons establishing an extensive business on credit, when they have no funds of their own; using wind-bills and sometimes forgeries; furnishing elegant houses with money which is not their own; living in luxury and splendor; dashing along in gigs and landaus; entertaining friends with sumptuous dinners, and indulging in all the fashionable follies

of life, until, in the course of two or three years, they are run aground and declared to be *Bankrupts*, who can scarcely pay a dividend of three shillings a pound. Previous to such bankruptcies, many cases of fraud and injustice very frequently occur. I have known office-bearers in Christian churches, distinguished for their high pretensions to religion and piety, who, only a few days previous to their failure in business, have borrowed pretty large sums of money, and that, too, even from an industrious mechanic, who was induced, by deceitful words, to lend the whole of what he had accumulated by industry and economy, during a course of many years,—scarcely a fraction of which was ever recovered. In such cases, we not unfrequently behold selfishness assuming a vast variety of forms; practicing low cunning and dishonesty, resorting to all possible shifts of duplicity, to prolong the credit of a tottering establishment; concealing property which belonged to others, or secretly disposing of it at half its value; dealing in contraband articles, defrauding government of its revenues, deceiving the unwary, weaving a web of entanglement throughout every department of the mercantile concern, gathering up payments of money and merchandise against the crisis which is approaching, and implicating friends and acquaintances, and even the poor industrious laborer in their concerns, and involving them in the impending ruin. If such were the practices merely of professed worldly men, we might cease to wonder. But, alas! such wiles and shufflings and dishonesties, are too frequently displayed by those who profess to be seeking after an incorruptible inheritance.

But the exhibition of covetousness and dishonesty does not end at the period of bankruptcy. After a legal settlement has been obtained, and business resumed, similar exhibitions are repeated. I have known many individuals, belonging both to the established church and to dissenters, men whose professions of religion were ostentatious and glaring; who, after having become bankrupts, lived as luxuriously, dressed as gaily, gave their children as *fashionable* an education, and set them up in as lucrative professions, as if no such event had taken place. I have known others who, after having paid six or seven shillings on the pound, and been permitted to resume trade, have, in the course of a few years, purchased heritable property to a considerable amount, without ever thinking of restoring to their creditors a single shilling of what they had lost by their bankruptcy. Because they obtained a *settlement* from their creditors, and therefore are not *legally* bound to refund their loss, *therefore*, they imagine that they are under no *moral* obligation to perform such an act of *natural* justice. The cases of this kind which daily occur, are so numerous and striking, that it would be needless to condescend to particular instances. It is little short of a libel on the moral perceptions of general society, and particularly on the Christian world, that a man voluntarily coming forward and settling with his creditors, when he is not legally bound to do so, should be considered as a kind of *phenomenon* in the commercial world, and worthy of being published in every newspaper, when it is nothing more than what a sense of natural justice would, in all cases, obviously dictate. It is true, indeed, that the men of the world seldom consider such cases as I have alluded to, as of a criminal nature; but it is amazing that Christian churches should almost entirely overlook such displays of covetousness and injustice, and inflict no censure on the offenders, not-

withstanding the malignant and anti-christian dispositions and practices with which they are associated.

6. There is too frequently a striking display of covetousness in the case of many of the ministers of religion.

Not to mention the buying and selling of benefices and other Simoniacal practices, which have long abounded, and which have tended to throw disgrace on the sacred office; there are many other ways in which worldly-mindedness is manifested by not a few in this class of Christian society. Although I wish to speak with the greatest respect of the ministers of the church, on account of the sanctity and importance of the sacred office, for which no one entertains a higher veneration; yet I cannot shut my eyes to the many examples around me, which prove, that not a few Christian ministers are too much actuated and directed in their movements, by a worldly-minded and avaricious disposition. This propensity is displayed in aspirings, with the utmost keenness, after ecclesiastical dignities and preferments—not for the sake of the duties connected with such situations, nor with a view of occupying a field of more extensive usefulness; but for increasing their revenues, and living in opulence and splendor. The general conduct of many to whom I allude, their neglect of the flock over which they have been made overseers, and their indulgence in the fashionable pursuits and amusements of the world, too plainly evince the ruling disposition of their hearts. Would to God that such persons would consider what views they will have of such things, when stretched upon that bed from which they are to rise no more, and about to enter the confines of the eternal world! The pious Mr. Hervey, about four days before his death, when Dr. Stonehouse paid him a visit, and was discoursing on the emptiness of worldly honors to an immortal, and on the unprofitableness of riches to the irreligious, replied, “True, Doctor, true, the only valuable riches are in heaven. What would it avail me now, to be the Archbishop of Canterbury? Disease would show no respect to my miter. That prelate is not only very great, but I am told, he has religion really at heart. Yet it is godliness, and not grandeur, that will avail him hereafter. The gospel is offered to me, a poor country parson, the same as to his Grace. Oh! why then do ministers thus neglect the charge of so kind a Saviour, fawn upon the great, and hunt after worldly preferments with so much eagerness, to the disgrace of our order? These are the things which render the clergy so justly contemptible to the worldlings. No wonder the service of our church has become such a formal, lifeless thing, since it is, alas! too generally executed by persons dead to godliness in all their conversation; whose indifference to religion, and worldly-minded behavior, proclaim the little regard they pay to the doctrines of the Lord, who bought them.”

The same covetous propensity is indicated, when a minister leaves an affectionate people, among whom he has a competent support, for a larger and more opulent congregation, where his income will be considerably increased. I have seldom known an instance in which a minister voluntarily left his charge, unless when he had the prospect of a larger stipend. There are, doubtless, valid reasons why a minister of the gospel may, with propriety, leave his charge; but if he has previously been in moderately comfortable circumstances, and if the increase of income be the chief or only motive for the change, there

is too much reason to suspect, that a covetous disposition has lurked in the breast, and has influenced his decision. Not long ago, a dissenting pastor received a call from a congregation in a large town, where he was offered a larger stipend than he had previously received. He was generally beloved by his people, he had received from them handsome presents, as testimonials of their gratitude and affection; he received from them an income adequate to his station, and to the supply of every reasonable want; they pressed him to remain, and promised to do everything that might promote his comfort. But, for no other reason, apparently, than the prospect of about £50 more being added to his income, he parted with them almost abruptly, and left them to draw the inference (which they did not hesitate to do), that he had more regard to his worldly interests than to superintend the spiritual interests of an affectionate people. I am much mistaken if even the temporal happiness of such a person shall be augmented by such conduct; and if God, in the course of his Providence, does not try him with unexpected difficulties, and make him behold his sin in his punishment.

This covetous disposition is likewise displayed by ministers of the gospel when they take large farms and engage with keenness in the pursuits of agriculture, and when they embark in extensive mercantile concerns and speculations, for the purpose of increasing their fortunes, and enabling them to live in splendor and affluence. It is not long since a dissenting minister was advertised in the newspapers, among the list of bankrupts, as “the Rev. Mr. H——, Banker and Builder.” And, even a Doctor of Divinity, who enjoyed a handsome stipend, and was distinguished as a popular preacher, has been known to have embarked with eagerness in mercantile speculations, connected with shipping affairs, spinning mills, banking, building, and other departments, for the purpose of gratifying a worldly disposition, and enabling him to leave, at his death, several thousands of pounds to each member of his family. Another of the same description has been known to engage in extensive agricultural operations, in surveying and superintending roads and acting as factor for neighboring Squires, in order to hoard up worldly treasures, although his stipend was one of the largest in the country around. Indeed, instances of this description are so far from being uncommon, that they are scarcely considered as inconsistent with the sacred office; and a man, under the influence of such principles, will pass through life with a certain degree of respect from the church and the world, as if he had acted in no way inconsistent with the character of a Christian. In the case of such, the duties of their office generally form only a subordinate object of attention. Another way in which covetousness sometimes manifests itself, especially in the case of dissenting ministers, is—their concealing certain important truths in their public ministrations, and neglecting to apply the principles and precepts of Christianity to the particular cases of every class of gospel-hearers without respect of persons, for fear of offending certain leading individuals of the church, and risking the loss of a portion of emolument. It is likewise manifested in winking at the delinquencies of men of wealth and influence, in cringing to such characters, and attempting to screen them from censure, when their conduct demands it. In all such cases as those to which I allude, the conduct of a Christian pastor requires to be guided by wisdom and prudence. But when he clearly perceives the

path of truth and duty, he ought at once, without fear of consequences, to act on the principle "*Fiat Justitia ruat cælum.*" Let what is accordant with eternal truth and righteousness be performed, although the mighty should rage, the heavens fall, and the elements rush into confusion.

But, in general, it will be found, that he who prudently discharges his duty, trusting for support in the Providence of God, will seldom be left to sink under his difficulties, or to want the means of comfortable support. The conduct of the apostles, in such cases, should be imitated by every Christian minister. When Peter was brought before the Jewish rulers to account for his conduct in healing the impotent man, and preaching the resurrection of Jesus, he boldly declared, "Be it known to you all, that by the name of Jesus Christ of Nazareth, whom ye crucified, whom God raised from the dead, even by him doth this man stand before you whole. This is the stone that was set at naught of you builders, which is become the head of the corner." And when he was commanded to teach no more in the name of Jesus, he replied, with the same fearlessness of consequences, "Whether it be right in the sight of God to hearken unto you more than unto God, judge ye. For I cannot but speak the things which I have seen and heard." And Paul, when he was about to leave the church of Ephesus, could declare, "I have kept back nothing that was profitable unto you; I have not shunned to declare to you all the counsel of God: I have coveted no man's gold, nor silver, nor apparel, for these hands have ministered to my necessities. I have showed you all things, how that so laboring ye ought to support the weak, and to remember the words of the Lord Jesus, how he said, It is more blessed to give than to receive." Were all Christian ministers animated by the spirit which actuated these holy apostles, we should seldom find pastors shrinking from their duty, from the fear of man, or from worldly motives, "shunning to declare the whole counsel of God." Much less should we ever behold men more careful to fleece their flocks than to feed them with knowledge—and who have the effrontery to receive many hundreds, and even thousands of pounds a year, as Christian ministers appointed to the charge of souls, while yet they spend their incomes in fashionable dissipation in foreign lands, regardless of the spiritual interests of those precious souls which were committed to their care. It is by such conduct in the clerical order, that religion and its ordinances are despised and treated with contempt, more than by all the efforts of avowed and unblushing infidelity; and it becomes all such seriously to consider how far they are responsible for the demoralization of society, the prevalence of irreligion, and the ruin of immortal souls; and what account they will one day be called to give of the manner in which they discharged the important office committed to their trust.

I shall now adduce a few miscellaneous examples, illustrative of the ascendancy of the covetous principle in those who made, or who still make a flaming profession of religion.

A certain member of a dissenting church, who had long been a zealous supporter of its peculiar modes and tenets, had, in the course of his business as a carpenter, and by penurious habits, amassed a considerable portion of property, but was remarked to be of a hard and griping disposition, and could seldom be induced to contribute to any religious object. He had a brother, a man of good character, and a member of the same church, who, by family and personal distress, had been

reduced to extreme poverty. Some of his Christian brethren represented to him the case of this distressed brother, and urged him to afford the family a little pecuniary relief. He replied, "My brother little knows how difficult it is for me to get money; I have nothing that I can spare. Does he know that I have lately bought a house, and have the price of it to pay in a few days?"—and he peremptorily refused to bestow a single shilling upon his distressed relative. Yet no public notice was taken of such conduct by the religious society with which he was connected, for, unfortunately, such cases are not generally considered as *scandals*, or tests of the want of Christian principle. His wife, who survived him, and who was of a similar disposition, while lying on her death-bed, kept the keys of her trunks and drawers constantly in her hands, and would, on no account, part with them to any individual, unless when she was in a position to perceive exactly everything that was transacted while the keys were used, and appeared to be restless and uneasy until they were returned. The idea of losing a single sixpence, or the least article, seemed to go like a dagger to her heart. After she had breathed her last, a bag, containing bank-notes, bills, and other documents, was found in her hand, which she had carefully concealed from her attendants, as if she had expected to carry it along with her to the world of spirits. Such are the degrading and awful effects of covetousness, when suffered to gain the ascendancy over the heart. Can such a spirit be supposed to be prepared for the mansions of the just, and for entering into that inheritance which is incorruptible, and that fadeeth not away?

The following is another example, relating to a lady in comfortable circumstances, who died three or four years ago. This lady was married to a gentleman who was generally respected as a worthy man and a zealous Christian. His habits were somewhat penurious; and from a low situation, he rose by various means, some of which were scarcely honorable, to a state of wealth and independence, so that, about 12 years before his death, he was enabled to retire from the duties of his office, to live in a state of respectability. His wife was likewise a professed religious character; she had no children, and her great anxiety was to preserve, if possible, any portion of her husband's property from passing into the hands of his relations. When any of her husband's relatives happened to live with them for the sake of sociality or for affording them assistance in their old age, she denied them almost every comfort, and grumbled at the least article they received, as if it had been a portion of flesh torn from her body—until, one by one, all such relatives forsook her. After her husband's death, the same penurious habits remained, and, as is usually the case, grew stronger and more inveterate. After her death, a purse was found concealed under her pillow, containing above £300 in cash and bank-notes, to which, it appears, her heart had been more firmly wedded than to "the treasure in the heavens that faileth not," and "the glory which fadeeth not away." Yet this sordid mortal passed among Christian society as a follower of Jesus. Another old woman died lately, who was a professed zealot for the truth, for "a covenanted work of reformation," and for testifying against abounding errors and immoralities in the church. She was noted among her neighbors for telling fibs, and giving false representations of her own circumstances and those of others. She represented herself as destitute of money, and almost of daily bread—

that she could scarcely attain the enjoyment of the coarsest morsel—and, of course, she was favored with a small alimnt from a charitable fund. She was also distinguished as a busy-body and tale-bearer, and was frequently caught secretly listening to the conversation of her immediate neighbors, and had burrowed a hole below the partition which separated her apartment from that of another family, in order that she might indulge in this mean and unchristian practice. In a short time after she had represented herself as a destitute pauper, she died, and, after her death, when her store was inspected, it was found to contain a considerable quantity of confectionaries of different kinds, spirits, wines, and not a small portion of money and other articles, some of which had been accumulating for years. Yet no one was more zealous than Margaret for the truth, and for testifying against the “defections” of the established church, and the sins and immoralities of the age. Such examples as those now stated, are to be found throughout almost every portion of the visible church, and might be multiplied to an indefinite extent.

There is not a more common case of covetousness that occurs in Christian society, than that of *taking advantage of the civil law, in opposition to natural justice*, in order to gratify an avaricious affection. A father dies suddenly without a will; certain relations, perhaps the son of the first marriage, seize upon the father's property, while the widow and her infant children are turned adrift from their accustomed dwelling, either with nothing, or with a pittance so small as to be insufficient to procure the coarsest necessities of life. Or, perhaps a will has been drawn up, specifying the intention of the father in regard to the inheritance of his property, but he dies before he has had an opportunity of subscribing the document. Though the will of the father was clearly made known to all concerned, yet a person called the *heir at law*, will immediately step in and claim the whole property which the parent intended to bequeath, without any regard to the *natural* rights of others. The death of parents and relatives frequently produces a scene of rapacity and avarice which is truly lamentable to a pious mind, and which no one could previously have expected. The death of friends, which should naturally lead us to reflections on the vanity of worldly treasures, and the reality of a future state, not unfrequently steels the heart against every generous feeling, and opens all the avenues of ambition and avarice. As a certain writer has observed, “The voice from the tomb leads us back to the world, and from the very ashes of the dead there comes a fire which enkindles our earthly desires.” The instances of this kind are so numerous, that volumes might be filled with the details. In opposition to every Christian principle, and to the dictates of natural justice, professed religionists will grasp at wealth wrong from the widow and the orphan, because the civil law does not interpose to prevent such barefaced robberies; and yet they will dare to hold up their faces, without a blush, in Christian society—while one who had committed a far less extensive robbery, *in another form*, would be held up to execration, and doomed to the gibbet. I know no practical use of Christian principle, unless it leads a man in such cases to perform an act of natural justice, altogether independent of the compulsions or regulations of civil codes. “The law,” says Paul, “was not made for a righteous man, but for the lawless and disobedient, the ungodly and the profane;” and he who, in cases which natural justice should determine,

takes shelter under the protection of law, in committing an act of oppression, ought to be excluded from the society of the faithful, and regarded as a “heathen man and a publican.” That such characters are so frequently found in the visible church, is a plain evidence that the laws of Christ's kingdom are not yet strictly and impartially administered.

The forms of our civil laws are a striking proof of the extensive range of the operations of the covetous principle, and a kind of libel on the character of mankind, however much refined by civilization and Christianity. “It is impossible,” says a periodical writer, “to see the long scrolls in which every contract is included, with all the appendages of seals and attestation, without wondering at the depravity of those beings who must be restrained from violation of promises by such formal and public evidences, and precluded from equivocation and subterfuge by such punctilious minuteness. Among all the satires to which folly and wickedness have given occasion, none is equally severe with a bond or a settlement.” And is it not a satire upon Christianity, that its professed votaries require such legal obligations, and punctilious forms and specifications, to prevent the inroads of avarice? and that no one can safely trust money or property to any one on the faith of a Christian, or depending purely on his sense of equity and justice?

Before proceeding to the next department of our subject, it may not be improper to advert to our covetousness and idolatry, considered as a *nation*.

Great Britain has long been designated by the title of a *Christian nation*. But, if proud ambition and an inordinate love of riches and power be inconsistent with the religion of Jesus, we have, in many instances, forfeited our right to that appellation. Without adverting to the immense load of taxation which has long been levied from the mass of the people, and the extravagance with which many portions of it have been expended—the heavy imposts on foreign produce, and the harassing regulations of the excise, which prevent a free intercourse with foreign nations—the keenness of our merchants and manufacturers in accumulating wealth and amassing immense fortunes for the purposes of luxury—the eagerness with which our Landholders endeavor to keep up the price of grain, although the poor should thus be deprived of many of their comforts—the poverty of one class of our clergy and the extravagant incomes enjoyed by others—passing the consideration of these and similar characteristics, I shall only mention one circumstance which appears altogether inconsistent with our character as a Christian nation, and that is, the *revenues derived from the support of IDOLATRY in India*, and the encouragement thus given to the cruelties and abominations of Pagan worship.

In another age, it will perhaps scarcely be believed, that Britain, distinguished for her zeal in propagating the gospel throughout the heathen world, has, for many years past, derived a *revenue* from the worshipers of the idol *Juggernaut*, and other idols of a similar description at Gya, Allahabad, Tripetty, and other places in Hindostan. From the year 1813 to 1825, there was collected, by order of the British government, from the pilgrims of Juggernaut alone, about 1,360,000 rupees, or £170,000; a great part of which was devoted to the support of the idol, and the priests who officiated in conducting the ceremonies of this abominable worship. Dr. Buchanan, in his “*Christian Researches*,” states, from official ac-

counts, that the annual expense of the idol Juggernaut presented to the English government is as follows:

	Rupees.	£.
Expenses of the Table of the Idol,	36,115	or 4,514
Do. of his dress, or wearing apparel,	2,712	339
Do. wages of his servants,	10,057	1,259
Do. contingent expenses at the different seasons of pilgrimage,	10,989	1,373
Do. of his elephants and horses,	3,030	378
Do. of his annual state carriage, or the car and tower of the idol,	6,713	839
	Rupees, 69,616	£8,702

In the item "wages of servants," are included the wages of the *courtesans*, or strumpets who are kept for the service of the temple. Mr. Hunter, the collector of the pilgrim tax for the year 1806, told Mr. Buchanan that three state carriages were decorated that year, with upward of £200 sterling of English broadcloth and baize.

The following items show the gain of this unnatural association with idolatry at some of the principal stations appropriated for idol worship.

	Rupees.
Net receipts of pilgrim tax at Juggernaut for 1815,	135,667
Do. at Gya for 1816, - - - - -	182,876
Do. at Allahabad, for 1816, - - - - -	73,053
Do. at Kashee-poor, Surkuree, Sumbal and Kawa, for 1816, - - - - -	5,683
Do. at Tripetty, near Madras, for 1811, -	152,000
	Rupees, * 549,279

Mr. Hamilton, in his "Description of Hindostan," as quoted by Mr. Peggs, in his "Pilgrim tax in India," states, with respect to the district of Tanjore, that "in almost every village, there is a temple with a lofty gateway of massive architecture, where a great many Brahmins are maintained, partly by an allowance from government. The Brahmins are here extremely loyal, on account of the protection they receive, and also for an allowance granted them by the British government of 45,000 pagodas or £18,000 annually, which is distributed for the support of the poorer temples,"—a sum which would purchase one hundred and eighty thousand Bibles at two shillings each! Can anything be more inconsistent than the conduct of a professed Christian nation in thus supporting a system of idolatry, the most revolting, cruel, lascivious, and profane? Yet a member of the parliament, C. Buller, Esq., in his letter to the Court of Directors, relative to Juggernaut, in 1813, says, "I cannot see what possible objection there is to the continuance of an established tax, particularly when it is taken into consideration what large possessions in land and money are allowed by our government, in all parts of the country, for keeping up the religious institutions of the Hindoos and the Mussulmans."

The scenes of Juggernaut and other idol-temples are so well known to the British public, that I need not dwell on the abominations and the spectacles of misery presented in these habitations of cruelty. I shall only remark that, from all parts of India, numerous bodies of idol-worshippers or pilgrims travel many hundreds of miles to pay homage to the different idols to which I have alluded. A tax is imposed by the British government on these pilgrims, graduated according to the rank or circumstances of the pilgrim, and amounting from one to twenty or thirty rupees—which, according to the estimate

stated in the preceding note, will be equivalent to one pound sterling to the poorest class of pilgrims. Those journeying to Allahabad, for example, are taxed at the following rates. On every pilgrim on foot, one rupee. On every pilgrim with a horse or palanquin, two rupees. On every pilgrim with an elephant, twenty rupees, &c. Vast numbers of deluded creatures flock every year to these temples. In 1825, the number that arrived at Juggernaut was estimated at two hundred and twenty-five thousand, and in some cases they have been calculated to amount to more than a million. The deprivations and miseries suffered by many of these wretched beings are almost incredible. Dr. Buchanan, who visited Juggernaut temple in June, 1806, gives the following statement. "Numbers of pilgrims die on the road, and their bodies generally remain unburied. On a plain near the pilgrim caravansera, 100 miles from Juggernaut, I saw more than 100 skulls; the dogs, jackals, and vultures, seem to live here on human prey. Wherever I turn my eyes, I meet death in one shape or other. From the place where I now stand, I have a view of a host of people, like an army encamped at the outer gate of the town of Juggernaut, where a guard of soldiers is posted, to prevent them from entering the town until they have paid the tax. A pilgrim announced that he was ready to offer himself a sacrifice to the idol. He laid himself down on the road before the car as it was moving along, on his face, with his arms stretched forward. The multitude passed him, leaving the space clear, and he was crushed to death by the wheels. How much I wished that the proprietors of India stock would have attended the wheels of Juggernaut, and seen this peculiar source of their revenue! I beheld a distressing scene this morning in the place of skulls; a poor woman lying dead, or nearly so, and her two children by her, looking at the dogs and vultures which were near. The people passed by without noticing the children! I asked them where was their home? They said they had no home but where their mother was. O there is no pity at Juggernaut! Those who support his kingdom, err, I trust, from ignorance; they know not what they do."

"The loss of life," says Colonel Phipps, who witnessed this festival in 1822, "by this deplorable superstition, probably exceeds that of any other. The aged, the weak, the sick, are persuaded to attempt this pilgrimage as a remedy for all evils. The number of women and children is also very great, and they leave their families and their occupations to travel an immense distance, with the delusive hope of obtaining eternal bliss. Their means of subsistence on the road are scanty, and their light clothing and little bodily strength, are ill calculated to encounter the inclemency of the weather. When they approach the temple, they find scarcely enough left to pay the tax to government, and to satisfy the rapacious brahmins; and, on leaving Juggernaut, with a long journey before them, their means of support are often quite exhausted. The work of death then becomes rapid, and the route of the pilgrims may be traced by the bones left by jackals and vultures, and the dead bodies may be seen in every direction."

The Rev. W. Bampton, in an account of this festival, in July, 1823, states, "in the front of one of the cars lay the body of a dead man; one arm and one leg were eaten; and two dogs were then eating him; many people were near, both moving and stationary, but they did not seem to take any notice of the circumstance. I went to

* A Rupee, though generally considered to be only the value of half a crown, yet is reckoned in the case of the pilgrims of India, to be equivalent to the value of one pound sterling to an inhabitant of Britain, so that, in this point of view, rupees may be considered as equivalent to pounds.

see the pilgrims, who, because they could not pay the tax, were kept without one of the gates. In the course of the morning, I saw, within a mile of the gate, six more dead, and the dogs and birds were eating three of them. Five or six lay dead within a mile of the gate. A military officer pointed out a piece of ground, scarcely an acre, on which he had, last year, counted *twenty-five dead bodies*.* Mr. Lacey, a missionary, who was at the festival in June, 1825, states, "On the evening of the 19th, I counted upward of sixty dead and dying, from the temple, to about half a mile below—leaving out the sick that had not much life. In every street, corner, and open space—in fact, wherever you turned your eyes, the dead and the dying met your sight. I visited one of the Golgothas between the town and the principal entrance, and I saw sights which I never shall forget. The small river there was quite glutted with the dead bodies. The wind had drifted them all together, and they were a complete mass of putrefying flesh. They also lay upon the ground in heaps, and the dogs and birds were able to do but little toward devouring them." Such horrid details could be multiplied without number; every one who has visited such scenes of misery and depravity, gives similar relations, some of which are still more horrible and revolting. With regard to the number that perish on such occasions, the Rev. Mr. Ward estimates that 4000 pilgrims perish every year, on the roads to, and at holy places—an estimate which is considered by others as far below the truth. Captain F—— estimates those who died at Cuttack and Pooree, and between the two stations, at 5000. How many of these miserable people must have died before they reached their homes! many of them coming three, six, or nine hundred miles. Mr. M——, the European collector of the tax at Pooree, estimated the mortality at 20,000!

Juggernaut is one of the most celebrated stations of idolatry in India. All the land within twenty miles is considered holy; but the most sacred spot is inclosed within a stone wall twenty-one feet high, forming a square of about 656 feet. Within this area are about fifty temples; but the most conspicuous building consists of one lofty stone tower, 184 feet high, and twenty-eight and a half feet square inside. The idol Juggernaut, his brother Bulbudra, and his sister Subadra, occupy the tower. The roofs are ornamented with representations of monsters; the walls of the temple are covered with statues of stone, representing Hindoo gods, with their wives, in attitudes grossly indecent. The three celebrated idols alluded to, are wooden busts six feet high, having a rude resemblance of the human head, and are painted white, yellow, and black, with frightfully grim and distorted countenances. They are covered with spangled broadcloth, furnished from the export warehouse of the British government. The car on which the idol is drawn, measures forty-three and a half feet high, has sixteen wheels, of six and a half feet diameter, and a platform thirty-four and a half feet square. The ceremonies connected with this idolatrous worship, are, in many instances, exceedingly revolting and obscene. At Ranibut, in the province of Gurwal, is a temple sacred to *Rajih Ishwara*, which is principally inhabited by *dancing women*. The initiation into this society is performed by anointing the head with oil taken from the lamp placed before the altar, by which act they make a formal abjuration of their parents and kindred, *devoting their future lives to prostitution*; and the British government, by giving annually 512 ru-

pees to the religious mendicants who frequent this temple, directly sanction this system of obscenity and pollution. Many temples of impurity exist in other places of Hindostan. Tavernier mentions a village where there is a pagoda to which all the Indian *courtesans* come to make their offerings. This pagoda is full of a great number of *naked images*. Girls of eleven or twelve years old, who have been bought and educated for the purpose, are sent by their mistresses to this pagoda, to offer and surrender themselves up to this idol.

In order to induce ignorant devotees to forsake their homes, and commence pilgrimages to these temples of impurity and idolatry, a set of avaricious villains, termed *Pilgrim hunters*, are employed to traverse the country, and by all manner of falsehoods, to proclaim the greatness of Juggernaut and other idols. They declare, for example, that this idol has now so fully convinced his conquerors [that is, the British] of his divinity, that they have taken his temple under their own superintendency, and that they expend 60,000 rupees from year to year to provide him with an attendance worthy of his dignity. These pilgrim hunters are paid by the British government. If one of them can march out a thousand persons and persuade them to undertake the journey, he receives 1500 rupees, if they be of the lower class; and 3000 rupees, if they be persons belonging to the highest class. But, what is worst of all—the conduct of the British government in relation to this system, has led many of the natives to believe that the *British nation approves of the idolatrous worship established in India*. A Hindoo inquired of a missionary in India, "If Juggernaut be nothing, why does the Company take so much money from those who come to see him?" Mr. Lacey, a missionary, who went to relieve the destitute on the road to Cuttack, during one of the festivals, relates the following incident:—"You would have felt your heart moved, to hear, as I did, the natives say—*Your preaching is a lie;—for, if your Saviour and your religion are thus merciful, how do you then take away the money of the poor and suffer him to starve?*" It is indeed no wonder that when the natives see a poor creature lying dying for want, they should reflect, that the two rupees he paid as a tax, would have kept him alive. Nor is it indeed a pleasing reflection to a European mind, that these two rupees form precisely the difference between life and death to many who have perished for want on their road home. Another missionary relates, "Passing one evening a large temple, I caught a sight of one of the idols, and exclaimed, sinful, sinful. The native who was with me asked, 'Sir, is that sinful for which the Company gives thousands?' A man said to me a few days ago, 'If the government does not forsake Juggernaut, how can you expect that we should?'" In this way the efforts of Christian missionaries to turn the Hindoo from idolatry, are, in many instances, completely paralyzed.*

Such is the worship which the British government supports, and from which it derives an annual revenue: Such is the *covetousness* literally and directly connected with "*idolatry*," manifested by those who give their sanction and support to a system of idol-worship, distinguished for rapacity, cruelty, obscenity, and everything shocking to the feelings of humanity! If we are com-

* Most of the facts above stated have been selected and abridged from Mr. Pegg's "*Pilgrim tax in India*."

manded to "flee from idolatry," "to abstain from meats offered to idols," and to "hate even the garment spotted by the flesh," what shall we think of the practice of receiving hundreds of thousands of rupees annually, for permitting blinded idolaters to worship the most despicable idols—of clothing those idols, repairing their temples, and paying the rapacious and unfeeling priests that minister at their altars? What shall we think of the practice of Christian Britons sending forth a body of idol-missionaries, far exceeding in number all the Christian missionaries, perhaps, throughout the world, who, from year to year, propagate delusion, and proclaim, for the sake of gain—the transcendent efficacy of beholding "*a log of wood!*" "Be astonished, O ye heavens, at this." No wonder if *Christian* missionaries have the most formidable opposition to en-

counter, when the very nation that sent them forth to undermine the fabric of Pagan superstition, gives *direct* countenance and support to everything that is abhorrent and debasing in the system of idolatry.

How appropriate the wish expressed by Dr. Buchanan, "that the proprietors of India stock, could have attended the wheels of Juggernaut, and seen this peculiar source of their revenue!" I would live on "a dinner of herbs," or even on the grass of the fields, before I would handle a sum of money procured in this way, to supply the most delicious fare. From whatever motives support is given to this system of Idolatry, it will remain an indelible stain on the British nation, to generations yet unborn, and its miserable and demoralizing effects will only be fully known in the eternal world.

CHAPTER II.

ON THE ABSURDITY AND IRRATIONALITY OF COVETOUSNESS.

THE Creator has endowed man with mental faculties which, if properly directed and employed, would be sufficient, in many cases, to point out the path of virtue, and to show the folly and unreasonableness of vice. All the laws of God, when properly investigated as to their tendency and effects, will be found accordant with the dictates of enlightened reason, and calculated to produce the greatest sum of human happiness; and the dispositions and vices which these laws denounce will uniformly be found to have a tendency to produce discomfort and misery, and to subvert the moral order and happiness of the intelligent system. On these and similar grounds, it may not be inexpedient to offer a few remarks on the folly and irrationality of the vice to which our attention is directed.

In the first place, *the irrationality of Covetousness*, will appear, if we consider *the noble intellectual faculties with which man is endowed*.

Man is furnished not only with sensitive powers to perceive and enjoy the various objects with which his terrestrial habitation is replenished, but also with the powers of memory, imagination, judgment, reasoning, and the moral faculty. By these powers he can retrace and contemplate the most remarkable events which have happened in every period of the world, since time began; survey the magnificent scenery of nature in all its variety and extent; dive into the depths of the ocean; ascend into the regions of the atmosphere; pry into the invisible regions of creation, and behold the myriads of animated beings that people the drops of water; determine the courses of the celestial orbs; measure the distances and magnitudes of the planets; predict the returns of comets and eclipses; convey himself along mighty rivers, and across the expansive ocean; render the most stubborn elements of nature subservient to his designs and obedient to his commands; and, in short, can penetrate beyond all that is visible to common eyes, to those regions of space where suns unnumbered shine, and mighty worlds are running their solemn rounds; and perceive the agency of Infinite Power displaying itself throughout the unlimited regions of the universe. By these powers he can trace the existence and the attributes

of an Invisible and Almighty Being operating in the sun, the moon, and the starry orbs, in the revolutions of the seasons, the agency of the elements, the process of vegetation, the functions of animals, and the moral relations which subsist among intelligent beings; and in such studies and contemplations he can enjoy a happiness infinitely superior to all the delights of mere animal sensation. How *unreasonable* then, is it, for a being who possesses such sublime faculties, to have his whole soul absorbed in raking together a few paltry pounds or dollars, which he either applies to no useful object, or employs merely for purposes of pride and ostentation! We are apt to smile at a little boy hoarding up heaps of cherry stones, small pebbles, or sea shells; but he acts a more rational part than the covetous man whose desires are concentrated in "heaping up gold as the dust, and silver as the stones of the brook;" for the boy has not arrived at the full exercise of his rational powers, and is incapable of forming a comprehensive judgment of those pursuits which ought to be the great end of his existence. The aims and pursuits of every intelligence, ought to correspond with the faculties he possesses. But does the hoarding of one shilling after another, day by day, and the absorption of the faculties in this degrading object, while almost every higher aim is set aside,—correspond to the noble powers with which man is invested, and the variety and sublimity of those objects which solicit their attention? Is there, indeed, any comparison between acquiring riches and wealth as an ultimate object, and the cultivation of the intellectual faculties, and the noble pursuit of knowledge and moral improvement? If man had been intended to live the life of a miser, he would rather have been formed into the shape of an *ant* or a *pismire*, to dig among mud and sand and putrefaction, to burrow in holes and crevices of the earth, and to heap up seeds and grains against the storms of winter; in which state he would live according to the order of nature, and be incapable of degrading his mental and moral powers.

There cannot be a more absurd and preposterous exhibition, than that of a man furnished with powers capable of arresting the elements of na-

ture, of directing the lightnings in their course, of penetrating to the distant regions of creation, of weighing the masses of surrounding worlds, of holding a sublime intercourse with his Almighty Maker, and of perpetual progression in knowledge and felicity, throughout an interminable round of existence; yet prostrating these noble powers by concentrating them on the one sole object of amassing a number of guineas and banknotes, which are never intended to be applied to any rational or benevolent purpose; as if man were raised no higher in the scale of intellect, than the worms of the dust! Even some of the lower animals, as the dog and the horse, display more noble and generous feelings, than the earth-worm, from whose grasp you cannot wrench a single shilling for any beneficial object. And shall man, who was formed after the image of his Maker, and invested with dominion over all the inferior tribes of animated nature, thus reduce himself by his groveling affections below the rank of the beasts of the forest and the fowls of heaven? Nothing can afford a plainer proof of man's depravity, and that he has fallen from his high estate of primeval innocence and rectitude; and there cannot be a greater libel on Christianity and on Christian churches, than that such characters should assume the Christian profession, and have their names enrolled among the society of the faithful.

2. The folly of Covetousness appears in the absolute want of utility which characterizes the conduct of the avaricious man.

True wisdom consists in proportioning means to ends, and in proposing a good and worthy end as the object of our pursuit. He would be accounted a fool, who should attempt to build a ship of war on one of the highest peaks of the Alps or the Andes, or who should spend a large fortune in constructing a huge machine which was of no use to mankind, but merely that they might look at the motion of its wheels and pinions; or who should attempt to pile up a mountain of sand within the limits of the sea, which the foaming billows, at every returning tide, would sweep away into the bosom of the deep. But the man "who lays up treasures for himself and is not rich toward God," acts with no less unreasonableness and folly. He hoards riches which he never intends to use; he vexes and torments himself in acquiring them; he stints himself of even lawful sensitive comforts; and his sole enjoyment seems to be that of brooding over in his mind an *arithmetical idea* connected with hundreds or thousands of circular pieces of gold, or square slips of paper. The poor are never to be warmed, or fed, or clothed, the oppressed relieved, the widow's heart made to leap for joy, the ignorant instructed, the ordinances of religion supported, or the gospel promoted in heathen lands, by means of any of the treasures which he accumulates. He "spends his money for that which is not bread, and his labor for that which satisfieth not;" and neither himself, his family, his friends, his country, or the world, is benefited by his wealth. I have read of a Reverend Mr. Hagamore, of Catshore, Leicestershire, on whose death, in January, 1776, it was found that he had accumulated thirty gowns and cassocks, one hundred pair of breeches, one hundred pair of boots, four hundred pairs of shoes, eighty wigs, *yet always wore his own hair*, fifty-eight dogs, eighty wagons and carts, eighty plows, and *used none*, fifty saddles, and furniture for the menage, thirty wheelbarrows, sixty horses and mares, seventy-four ladders, two hundred pick-axes, two hundred spades and shovels, two hun-

dred and forty-nine razors, and so many walking-sticks, that a toysman in Leicesterfields, offered eight pounds sterling to procure them.* Every one will at once perceive that this man, although he had the title of "Reverend" affixed to his name, must have been nothing else but a Reverend fool, or something approaching to a maniac; for, to accumulate such a number of useful articles, merely for the purpose of looking at them, or brooding over the idea that they were in one's possession, without any higher object in view, is surely the characteristic of folly and irrationality, if anything ought to designate a person a fool or a madman.

Now, let us suppose for a moment, instead of money, a man were to hoard in a garret or a warehouse appropriated for the purpose—10,000 pots or caldrons that were never to be used in cooking victuals, or for any other process,—15,000 teakettles, 20,000 coffee-pots, 25,000 pairs of boots, 30,000 knee-buckles, 32,000 great coats, and 40,000 pairs of trowsers—suppose that none of these articles were intended to be sold or appropriated to such uses as they are generally intended to serve, but merely to be gazed at from day to day, or contemplated in the *ideas* of them that float before the imagination—what should we think of the man who spent his whole life, and concentrated all the energies of his soul in such romantic pursuits and acquisitions? We should at once decide, that he was unqualified for associating with rational beings, and fit only for a place within the precincts of bedlam. But what is the great difference between accumulating twenty thousand cork-screws, or thirty thousand shoe-brushes, and hoarding as many thousands of shillings, dollars or pieces of paper called banknotes, which are never intended to be brought forth for the benefit of mankind? The cases are almost exactly parallel; and he who is considered as a fool or maniac, in the one case, deserves to be branded with the same epithets, in the other. Were a man to employ the greater part of his life in laying up millions of cherry-stones or pin-heads, and find his chief delight in contemplating his heaps, and continually adding to their number, he would be considered as below the scale of a rational being, and unfit for general society. But there is no *essential difference* between such a fool, and the man whose great and ultimate aim is to accumulate thousands of dollars or of guineas. Both classes of persons are in reality *maniacs*—with this difference, that the first class would be considered as laboring under a serious *mental derangement*, and therefore objects of sympathy and pity; while the other are considered as in the full exercise of their intellectual powers, although they are prostrating them in the pursuit of objects as degrading and irrational, as those which engross the imagination of the inmates of bedlam.

But, suppose that riches are coveted, not for the purpose of being hoarded, but for the purpose of being expended in selfish gratifications, there is almost as much folly and irrationality in the latter case as in the former. Suppose a man to have an income of £3000 a year, and that £800 are sufficient to procure him all the sensitive

* This singular clergyman, when he died, was worth £700 per annum, and £1000 in money, which fell to a ticket porter in London. He kept one servant of each sex, whom he locked up every night. His last employment on an evening, was to go round his premises, let loose his dogs, and fire his gun. He lost his life as follows: going one morning to let out his servants, the dogs fawned upon him suddenly, and threw him into a pond, where he was found dead. His servants heard his calls for assistance, but, being locked up, they could not lend him any help.

enjoyments suitable to his station—is it *rational*, is it *useful*, either to himself or others, that he should waste £2200 in vain or profligate pursuits, in balls, masquerades, gambling, hounding, horse racing, expensive attire, and splendid equipages—when there are so many poor to be relieved, so many ignorant to be instructed, so many improvements requisite for the comfort of general society, so many sciences to cultivate, so many arts to patronize, and so many arduous exertions required for promoting the general renovation of the world—and scarcely a single guinea devoted to either of these objects? Such conduct is no less irrational and degrading, in a moral and accountable agent, than that of the groveling wretch who hoards his money in a bag which is never opened but with jealous care when he has a few more guineas or dollars to put into it. In both cases, wealth is turned aside from its legitimate channel, and perverted to purposes directly opposite to the will of the Creator, and the true happiness of mankind.

3. The folly of Avarice will appear, *if we consider it in relation to rational enjoyment.*

The rational enjoyment of life consists, among other things, in the moderate use of the bounties of Providence which God has provided for all his creatures—in the exercise of our physical and mental powers on those objects which are calculated to afford satisfaction and delight—in the emotions of contentment and gratitude toward our Creator—in the sweets of an approving conscience—in the acquisition of knowledge—in the flow of the benevolent affections, in affectionate social intercourse with our fellow men, in the exercise of tenderness, sympathy, and good will toward others, and in that calmness or equanimity which remains unruffled amidst the changes of fortune, and the untoward incidents of human life. Now, in none of these respects can the covetous man experience the sweets of true enjoyment. He has it in his power to enjoy all the sensitive pleasures in which a rational being ought to indulge, yet he stints himself even of necessary comforts, and lives upon *husks* when he might feast himself on the choicest dainties, because it might prevent him from adding new stores to his secret treasures. He will shiver amidst the colds of winter, under a tattered coat, or a thread-bare covering, and sit bentumbed in his apartment without a fire to cheer him, because the purchase of requisite comforts would diminish the number of his pounds, shillings, and pence. He will lie on a bed of straw, during the dark evenings of winter, like a mere animal existence, rather than furnish oil for a lamp, and will wallow like a sow amidst mire and filth, rather than give the smallest trifle to a person to clean his apartment. Of *mental* pleasures he can scarcely be said to enjoy the smallest share, except in so far as the *ideas* of accumulated gold and silver are concerned. He is necessarily oppressed with *restless anxiety*. The objects of his covetousness are, in most instances, necessarily uncertain. He strives to obtain them, but is doubtful of success; his mind hangs between hope and fear; his desires are, however, continually exerted; he is on the rack as it were, until he sees the issue of his adventure, and in numerous cases, his hopes are blasted, and his schemes disconcerted; and when the plans of gain he had laid are frustrated, or a portion of his wealth destroyed by an unexpected accident, he feels all the pains and agonies of a man verging toward poverty and ruin. While a contented man may become rich, to every desirable degree, amidst the full possession of serenity of mind, and self-appro-

bation, the anxiety of the covetous is necessarily great and *distressing*; and that is one part of the punishment he inevitably suffers under the righteous government of God, on account of his infringement of the natural and moral laws of the universe. To the misery of perpetual anxiety are added incessant *labor*, and an endless and wearisome train of exertion to augment his gains and secure himself from losses. Like a slave or a mill-horse, he drudges on in a state of travail, and in an unceasing whirl of toil and effort, which leave no intervals for rational reflection and enjoyment; and, after all, his desires are still craving and still unsatisfied.

In the midst of such labor and mental efforts and perplexities, he meets with frequent disappointments. His deeds or obligations are found to be defective; his bills are refused to be discounted; his agents prove cheats and deceivers; storms will blow in spite of him, and sink his ships in the mighty waters; floods and inundations will sweep away the produce of his fields; his crops will fail; his cattle die; his debtors abscond or become bankrupts, and the devouring flames will seize upon his houses and barns, or his shops and warehouses, and consume them to ashes. In all such cases, where a contented mind will endeavor to submit with calmness to the allotments of Providence, the mind of the covetous impugns the rectitude of the Divine dispensation, and heaves with unutterable throes of agony and despair. In the language of inspiration “he is pierced through,” or, compassed on every side “*with many sorrows*,” and the inward language of his heart is—and it is awfully appropriate, “Ye have taken away my gods; and what have I more?” Amidst such misfortunes and mental pangs, he is frequently left without friends, without pity, or sympathy, or commiseration—pointed at with the finger of scorn, stung by the keen sarcasms of his neighbors, and considered as a fit mark for the shafts of contempt and derision, while the lashes of his own conscience add a keenness to his anguish. It is almost needless to add, that he derives no enjoyment from the exercise of kindness and benignity, from the pursuits of knowledge, the contemplation of nature, the affectionate association of his fellow-men, or the satisfaction which arises from deeds of beneficence, for his degrading pursuits leave him neither leisure nor relish for such refined gratifications. Who, then, that has any regard to rational enjoyment, would desire the state of mind, and the condition of such a wretched mortal, even although his bags were full of gold, and his barns filled with plenty!

Nor are the enjoyments much superior, of the man who covets riches merely for the purpose of living in splendor and fashionable dissipation. To a rational mind conscious of its dignity, and of the noble powers with which it is furnished, how poor a gratification would it receive from all the pleasures and gewgaws that fascinate the worldly minded and the gay? Are the pleasures derived from rich viands, delicious wines, costly apparel, stately mansions, splendid equipages, fashionable parties and diversions, an enjoyment adequate to the sublime faculties, and the boundless desires of an immortal mind? How many of those who make such pleasures the grand object of their pursuit, are found the slaves of the most abject passions, with hearts overflowing with pride, rankling with envy, fired with resentment at every trivial affront, revengeful of injuries, and hurried along, by the lust of ambition, into every folly and extravagance? Where such passions are

continually operating, along with all their kindred emotions, and where benevolence is seldom exercised, it is impossible that true happiness can ever be enjoyed. And hence, we find, among persons of this description, more instances of suicide, and more numerous examples of family feuds, contentions, and separations, than among any other class of general society. So that there is no reason to desire the enjoyments of covetousness in whatever channel it may run, or whatever shape it may assume.

4. The folly and irrationality of Covetousness appears, *when we consider the immortal destination of man.*

There are thousands of misers and other worldlings who are governed by the lust of ambition and covetousness, who admit the doctrine of a future state of punishments and rewards. Independently of those arguments which may be drawn from the nature of the human soul, its desires of knowledge and capacious intellectual powers, the unlimited range of view which is opened to these faculties, throughout the immensity of space and duration, the moral attributes of God, the unequal distribution of rewards and punishments in the present state, and other considerations,—there is a *premonition* and a powerful impression in almost every human mind, that the range of its existence is not confined to the present life, but that a world of bliss or woe awaits it beyond the grave. And, as vast multitudes of worldly and avaricious characters are to be found connected with the visible church, or frequenting its services; by this very circumstance, they formally admit, that there is another scene of existence into which they enter at the hour of dissolution.

Now, how irrational and inconsistent is it for a man to admit, that there is a world beyond the present which is to be the scene of his *everlasting* abode, and yet continue to have his whole thoughts and affections *absorbed* in pursuing the riches and transitory gratifications of the present life, without casting a serious glance on the realities of the invisible state, or preparing to meet them? If we had just views of all the momentous realities, and the scenes of glory, and of terror, connected with the idea of an eternal world, and could contrast them with the vain and fleeting enjoyments of this mortal scene, we should perceive a *folly* and even a species of *madness* in such conduct, more astonishing than what is seen in any other course of action pursued by human beings. If a man have an estate in a distant country, on the proceeds of which a considerable portion of his income depends, he will not forget that he has an interest in that country; he will correspond with it, and will be anxious to learn intelligence respecting its affairs from periodical journals and other sources of information. If a person, on the expiration of ten years, has the prospect of entering on the possession of a rich inheritance, he will look forward to it, with longing expectations, and will employ his thoughts in making arrangements for enjoying it, though perhaps he may not live to take possession. Nay, we shall find many individuals spending weeks and months in melancholy and chagrin for the loss of a few guineas or dollars, and, at other times, deriving their chief pleasure from the prospect of a paltry gain. Yet strange to tell, many such persons remain altogether insensible to the joys and sorrows of a future world, and never make the least arrangement in reference to that state; although there is an absolute *certainty* that it awaits them, and that it is possible they may be ushered into it before tomorrow's dawn. Can any species of folly with

which men are chargeable, be compared with such apathy and indifference about *everlasting* things, when such things are admitted to have a real existence?

It is a dictate of wisdom, and even of common sense, that when a person has a prospect of occupying any office or condition in life, he ought to engage in that course of preparation which will qualify him for performing its duties and enjoying its comforts. But what preparation does the covetous man make for enabling him to *relish* the enjoyments, and to engage in the exercises of the eternal world? Will heaping up silver as the dust, and filling his bags with sovereigns and dollars, and *concentrating* his thoughts and affections on such objects, *prepare* him for the sublime contemplations of the spirits of just men made perfect, and the hallelujahs of the heavenly host? Will his hard gripping disposition, which never permitted him to drop the tear of sympathy, or to relieve the widow and the orphan, render him meet for associating with the inhabitants of that world, where *love* and the purest affections, in all their varied ramifications, forever prevail? Will his anxious desires and his incessant toils from morning to night, to add to the number of his guineas, and the extent of his property, qualify him for surveying the wonderful works of God, and contemplating the glory of Him “who was slain and hath redeemed us to God by his blood?” Can any man, who has the least spark of rationality within him, imagine that such conduct and such dispositions, are at all compatible with preparation for the felicities of the heavenly state? Or, does the poor degraded miser really believe that heaven is filled with bags of gold and silver, and that there is no employment there but “buying and selling, and getting gain?” If the mansions of heaven, and the exercises of its inhabitants, be such as the Scriptures delineate, then, there is an utter incompatibility between the employments of the celestial state, and the train of action, and the temper of mind, of the covetous man, which renders him altogether *unqualified* for its enjoyments. And, if he be unprepared for the joys and the services of the heavenly state, he cannot, in consistency with the constitution of the moral world, be admitted into its mansions, but must necessarily sink into “the blackness of darkness forever.”

Nor are the pursuits of the worldling, who spends his wealth in vanity and luxury, more compatible with the joys of the celestial world. This will appear, if we consider some of the ingredients which enter into the essence of heavenly felicity. From the representations of this state given in the Scriptures, we learn, that it is a state of perfect purity and holiness; that the minds of its inhabitants are irradiated with divine knowledge, and adorned with every divine virtue; that *love* pervades and unites the hearts of the whole of that vast assembly; that *humility* is one of their distinguishing characteristics; that they are forever engaged in *beneficent* services; that the contemplation of the works and ways of God forms a part of their employment; and that they are unceasingly engaged in sublime adorations of the Creator of the universe, in contemplating the glory and celebrating the praises of Him “who hath loved us, and washed us from our sins in his own blood.” But what resemblance is there between such a state and such employments, and the pursuits of the gay worldling whose heart is set upon his riches as the chief object of his affections? Would the man who spends his wealth in hounding, horse-racing, cock-fighting, and gam-

bling, find any similar entertainments for his amusement in the upper world? Would the proud and ambitious, who look down on the vulgar throng as if they were the worms of the dust, and who value themselves on account of their stately mansions and glittering equipage, find any enjoyment in a world where *humility* is the distinguishing disposition of all its inhabitants? Would the warrior, who delights in carnage and devastation, expect to have cities to storm, towns to pillage, or armies to maneuver, or would he think of rehearsing in "the assembly of the just," the deeds of violence and slaughter which he perpetrated upon earth? Would the fine lady who struts in all the gayety and splendor of dress, who spends half her time at her *toilette*, and in fashionable visits, whose chief delight consists in rattling dice and shuffling cards, in attending balls, masquerades, and plays; who never devotes a single sovereign to beneficent purposes, or to the propagation of religion; whose life is one continued round of frivolity and dissipation; would such a character meet with any similar entertainments in the society of the angelic hosts, and of the spirits of just men made perfect? In short, can it be supposed, in consistency with reason, that such dispositions and pursuits have a tendency to produce a *relish* for the enjoyments of the celestial world, and to prepare the soul for joining, with delight, in the exercises of its inhabitants? If

not, then such characters would find no enjoyment, although they were admitted within the gates of paradise; but, like the gloomy owl, which shuns the light of day, and the society of the feathered tribes, they would flee from the society and the abodes of the blessed, to other retreats, and to more congenial companions.

Thus it appears, that covetousness, whatever form it may assume, is utterly inconsistent with any rational or scriptural ideas we can entertain in relation to man's eternal destiny. He is a poor, pitiable fool who makes the slightest pretenses to religion, while his heart is the seat of avaricious desires, or who makes riches, gay apparel, foolish amusements, and the gratification of pride and vanity, the chief object of his pursuit. He subjects himself to unnecessary distress by the compunctions of conscience, which the denunciations of religion must occasionally produce; and, if he has any measure of common sense, he must plainly perceive, that any hopes of happiness he may indulge in relation to a future state, are founded on "the baseless fabric of a vision." The only *consistent* plan, therefore, which he can adopt—if he is determined to prosecute his avaricious courses—is, to endeavor to prove religion a fable, to abandon himself to downright skepticism, to scout the idea of a Supreme Governor of the universe, and to try, if he can, to live "without God, and without hope in the world."

CHAPTER III

ON THE INCONSISTENCY OF COVETOUSNESS WITH THE WORD OF GOD.

THERE is no vicious propensity of the human heart more frequently alluded to, and more severely denounced in the scriptures of truth, than the sin of covetousness. For it strikes at the root of all true religion, saps the foundations of piety and benevolence, and is accompanied with innumerable vices and evil propensities, which rob God of his honor and glory, and "drown men in destruction and perdition." It would be too tedious to enter into all the views which the word of God exhibits of the nature and tendencies of this sin, of the threatenings which are denounced against it, and of its utter inconsistency with the benevolent spirit of the religion of Jesus; and therefore, I shall select for illustration, only two or three prominent particulars.

In the first place, this propensity is branded in Scripture with the name of *Idolatry*. "Let not covetousness," says Paul to the Ephesians, "be once named among you, as becometh saints. For this ye know, that no covetous man, *who is an idolater*, hath any inheritance in the kingdom of Christ and of God." And, in his Epistle to the Colossians, he enumerates, among the vices which bring down the wrath of God upon the children of disobedience, "*covetousness which is idolatry*."^{*}

Idolatry is one of the greatest crimes of which a rational being can be guilty; for it is that which is the source of all the ignorance, superstition, cruelties, immoralities, and obscene abominations of the heathen world. It is to idolatry we are to

ascribe the burning of widows in Hindostan, the cruel rites of Juggernaut, the exposing of the sick and dying on the banks of the Ganges, the murder of infants, the infernal sacrifices of the Mexicans, the making of children pass through the fire to Moloch, the human butcheries which are perpetrated in almost every pagan land to appease imaginary deities, the abominations of the ancient Canaanites, the murders and obscenities of the South Sea Islanders, the degradation of intellect which is found in every heathen country, and the innumerable vices and moral pollutions of all descriptions which abound among the tribes and nations that are ignorant of the living and true God. So that idolatry may be considered as a *comprehensive summary* of every species of malignity, impiety, and wickedness.

It was for this reason that the children of Israel were separated from the nations around, and so strictly interdicted from the least intercourse or communion with idolaters. So "jealous" was the God of Israel in reference to idolatry, that the least approach to such worship, either in word or action, or even in imagination, was pointedly forbidden:—"In all things that I have said unto you be circumspect; *make no mention of the name of other gods*, neither let it be heard out of thy mouth. Thou shalt not bow down to their gods nor serve them, nor do after their works, but thou shalt utterly overthrow them and quite break down their images; ye shall destroy their altars and cut down their groves. Neither shalt thou make marriages with them; for they will turn away thy son from following me, and

^{*} Ephes. v. 3, 5. Colos. iii. 5.

the anger of the Lord will be kindled and destroy thee suddenly.”*

If idolatry had not been strictly forbidden and undermined, the knowledge and the worship of the true God would never have been established in the earth. In accordance with these injunctions, the first and fundamental precept of the moral law was given, which has a reference not only to the Jews, but to all the inhabitants of the world, “*thou shalt have no other gods before me;*” and the *second*, which forbids any visible representations of Deity, has this strong and impressive sanction, “for I, the Lord thy God, am a jealous God, visiting the iniquity of the fathers upon the children unto the third and fourth generation of them that hate me.”† For this reason, likewise, the nations of Canaan were devoted to utter destruction. For they not only worshiped a multitude of strange gods, but offered human victims on their altars, and sacrificed even their sons and daughters to devils; and such practices led to adultery, incest, sodomy, bestiality, and other kindred crimes, by which these nations were distinguished; so that, by these abominations, they rendered themselves unworthy of a place within the precincts of terrestrial existence; they were blotted out as a stain upon the creation of God; and their doom was intended as an awful warning to the Israelites, of the evil and danger of turning aside from the true God to idolatry. Hence the curses and denunciations that were threatened against the least tendency of the heart to idol-worship. “Cursed be the man that maketh any graven or molten image, an abomination to the Lord, the work of the hands of the craftsman, and putteth it in a secret place.” “Every one of the house of Israel, or of the stranger that sojourneth in Israel, who separateth himself from me, and setteth up his idols in his heart, and cometh to a prophet to inquire of him concerning me, I the Lord, will answer him by myself, and I will set my face against that man, and will make him a sign and a proverb, and *I will cut him off from the midst of my people*, and ye shall know that I am Jehovah.”‡ Hence the *punishment of death* which was uniformly denounced and inflicted upon the idolater. “If there be found among you man or woman that hath gone and served other gods and worshiped them, either the sun or moon, or any of the host of heaven; then shalt thou bring forth that man or that woman, who have committed that wicked thing, unto thy gates, and shalt stone them with stones until they die.”§ Such denunciations may be seen running through the whole of the prophetic writings in reference to Israel; and almost every judgment of God, either threatened or inflicted, is ascribed to the abounding of idolatry, and the sins connected with it, as its procuring cause.

These circumstances, therefore, may be considered as stamping upon idolatry a higher degree of opprobrium and malignity than upon any other crime; and consequently, as representing the idolater as the most depraved and degraded of human beings. We are, therefore, apt to recoil from such a character, as one who labors under a peculiar mental and moral derangement, in virtually denying the first principle of human reason, and “the God that is above”—as one whom we would almost shudder to receive into our company, and would think unworthy to enjoy the common sympathies of human creatures. But, wherein lies the great difference between “the covetous

man who is an idolater,” and him who falls down to Moloch or Juggernaut, or worships the sun, and moon, and the host of heaven? There is the same mental derangement, the same malignity of affection, and the same dethronement of God from the heart, in the former case as in the latter, though they are manifested by different modes of operation. Let us consider, for a little, the resemblance between these two modes of idolatry.

Covetousness may be considered in two points of view: as consisting either in the inordinate love of money on *its own account*, or in the love of those *sensitive gratifications* which it procures; and in both these respects it may be shown to partake directly of the nature of idolatry. In what does the essence of idolatry consist, but in the estrangement of the heart from God, and setting up, in competition with him, any other object, as the *supreme* object of our affections and the ultimate end of all our pursuits? While the pious soul joins in unison with the Psalmist, and says, “whom have I in heaven but thee, O Lord, and there is none on earth that I desire beside thee;” the covetous man says of his gold, “thou art my hope, and to the fine gold, thou art my confidence. I rejoice, because my wealth is great and my hands have gotten me much.” And such mental idolatry is no less irrational and hateful in the sight of the Most High, than that of the blinded pagan who prostrates himself before a block of wood or the figure of a crocodile.

Pagan idolatry consists either in worshipping the sun, moon, or stars, or in paying homage to a statue of gold or silver, brass or stone. Mental idolatry consists in paying a similar homage to gold and silver, either abstractly considered, or to those sensual objects and pleasures which they are the means of procuring. The idolater bows down before the shrine of a splendid image; perhaps one formed of the richest materials, such as the golden image set up by Nebuchadnezzar, in the plain of Dura, which was ninety feet high, and contained a thousand Babylonish talents of gold, or about four millions of British money. To this splendid image he pays his homage in the midst of assembled multitudes, and at the sound of the cornet, flute, harp, sackbut, psaltry, dulcimer, and all kinds of music. The glittering pomp and splendor of such a scene fascinates his affections and overpowers his reason, so that he may be led for a moment to imagine that it is a fit representation of the unknown God. But the covetous idolater worships an image, or an imaginary *idea*, still more degrading. He adores, or, in other words, *he concentrates his affections* upon a circular piece of gold which he can carry in his pocket, or a thousand such pieces tied up in a bag, or locked in his coffers. On such objects his mind incessantly broods, even when they are not present to his senses; and when he is deprived of them by any accident, he is overwhelmed with anguish, and exclaims in despair, “my gods are taken away, and what have I more?” There can be no *essential* difference between gold and silver shaped into statuary, adorned with splendid trappings, and set up for the worship of Pagan nations, and the same metals shaped into the form of guineas, crowns, and dollars, to which a similar homage is paid by the inhabitants of an enlightened land. The *forms* of the idol and the *modes* of adoration are somewhat different; but the *idolatry*, in all its main points and bearings, is substantially the same. Which of these species of idolatry, then, is most irrational and debasing? There can be no apology whatever made for idol-worship, in any shape or under any circumstances. But, in

* Exod. xxiii. 13, 24, &c. Deut. vii. 3, &c.

† Deut. xxvii. 15. Ezek. xiv. 7, 8. ‡ Deut. xvii. 2, 5.

the case of the Pagan idolater, there may be certain extenuating circumstances. The ignorance and superstition in which he has been trained from early life, the opinions of his relatives and of society around him, the strong prejudices and the numerous associations connected with the religion of his country, the importance he has been taught to attach to his superstitious rites, and the apparent splendor of the idol he adores, and of the ceremonies connected with its worship, might lead us to commiserate, while we cannot but condemn, the idolatrous heathen. We might almost cease to wonder that a rude savage should mistake the glorious sun in the firmament for his Almighty Maker, and the silver moon and the radiant stars for the ministers of his kingdom. When we consider the splendors they exhibit, the light they diffuse, and the general utility of their influence on terrestrial objects, we can scarcely be surprised that fallen reason should have mistaken them for their Divine Original. But what sympathy can we feel, or what apology can we make for those who are trained in a civilized and Christian country, who are freed from Pagan prejudices, who have the free use of their reasoning powers, and who have been instructed in the existence and attributes of an Almighty and Eternal Being, and yet practice an idolatry even more degrading than that of the *Lama* of Thibet, or of the most untutored savage? "Be astonished, O ye heavens, at this, and be ye horribly afraid! For my people (saith God) have forsaken the fountain of living waters,—hewn out to themselves broken and empty cisterns, and have gloried in their shame."

The other species of covetousness—namely, that which consists in gratifying the lust of the flesh and the pride of life, while God is banished from the heart, partakes no less of the nature of idolatry, than that which consists in the love of money, abstractly considered. He who is incessantly engaged in the pursuit of money for the purpose of increasing the extent of his property, living in luxury and splendor, dashing along in his chariot, holding intercourse with the higher ranks of society, spending his time in fashionable diversions, or in laying up a fortune for his descendants, to render them independent, while he has no higher ends or aims, is as much an idolater as the votary of Bacchus, or the worshipper of Baal. For, if such pursuits be considered as the great ends of our existence; if they occupy the greatest share of our thoughts and affections; if our chief happiness is placed on the enjoyments they afford; if everything else is estimated only in so far as it contributes to such ends, and "if we trust in the abundance of our riches, and make not God our confidence," we frustrate the great ends for which we were brought into existence, and are guilty of everything that enters into the essence of idolatry. The first duty of every rational creature is to love God supremely and affectionately, to render him the highest homage of our hearts, and to serve him throughout every period of our existence, in preference to every other object or being. In this manner we testify that he is Divinely Great and Excellent, worthy of our highest reverence and regard, and that we are under obligations to Him for every enjoyment we possess. Angels, and the holy inhabitants of all worlds, are obedient to his laws, and make his glory the great end of all their actions. They bow in cordial submission to his allotments, "they do his pleasure and hearken to the voice of his word," and he is the supreme object of their affection and adoration. But, when we per-

mit any other object to occupy our supreme regard, affection or esteem, we virtually dethrone Jehovah from our hearts, and banish him from his own universe. "If we make gold our hope, and fine gold our confidence," if the favor of the great, the honor that cometh from men, the vain pageantry of life, the richness of our dress, the elegance of our furniture, the independence of our fortune, and the greatness of the inheritance we provide for our children, are the objects that stand highest in our affections; these are the gods at whose shrine we worship, and whose attributes we adore. In so doing, we are guilty of the grossest *falsehood*; for we practically deny that Jehovah is possessed of those attributes, which demand the highest tribute of homage and affection from his intelligent offspring. We are guilty of *injustice*; for we violate the rightful claim of the Deity to the obedience of rational agents, and render to creatures the service and regard which is due to Him alone. We are guilty of the basest *ingratitude*; for, to his Power and Wisdom we owe our very existence, and to his boundless Benevolence, all the rich variety of comforts we enjoy. In short, by such conduct, we give evidence that pride, rebellion, selfishness, hatred of moral excellence, and all their kindred emotions rankle in our breasts, and sway their scepter over all our moral faculties.

This sin is not only peculiarly malignant in itself, but *lies at the foundation of every other species of impiety and wickedness*. The commencement of moral turpitude in any intelligent being, wherever existing throughout creation, is found in the alienation of the heart from God, and the preference of any other object to the Eternal Jehovah. Hence the fall of Lucifer, and the malignity of his designs, and the dismal effects which have followed in the moral order of our terrestrial system; and hence the anxiety which this arch enemy of the moral universe displayed in order to tempt the Saviour of the world to *covetousness, ambition, and distrust* in the care of Divine Providence. In proportion as this spirit prevails, will wickedness of every kind reign triumphant. Wherever God is acknowledged, and loved, and adored, all divine virtues flourish and shed their benignant influence. But wherever the affections are alienated from the original source of felicity, every heavenly virtue declines and dies, and its place is usurped by every species of moral abomination.

Hence the monstrous iniquities and cruelties, flowing from their religion, which have distinguished every nation of the heathen world. As they had gods of all descriptions and characters; as almost every being, real or imaginary, was included in the list of deities; as every degree of stupidity, folly, impurity, revenge, and other species of moral turpitude, was attributed to such beings,—so the moral conduct of their votaries corresponded with the character of the idols at whose shrines they paid their adorations. Hence the unnatural *cruelties* connected with their worship; the various species of torture enjoined for obtaining remission of sins; the thousands of human victims which have bled and are still sacrificed on their altars; the murder of female infants as soon as they breathe the vital air; the burning of widows on the bodies of their deceased husbands; the crushing to death of the worshippers of Juggernaut, and the want of humanity and natural affection which forms a striking characteristic of the rites of Paganism. Hence the spirit of daring *falsehood* displayed in their lying oracles and modes of divination, their pretended cures of diseases, their selection of human vic-

tims, their representations of the future world, their fallacious predictions, dreams, and visions, which pervade the whole of their mysteries and systems of mythology. Hence the obscene pollutions and abominations incorporated with the ceremonies of idolatry, by which both matrons and virgins, with the most revolting rites, are consecrated in an idol-temple, to a life of impurity and prostitution; and hence the wars of revenge and devastation, with all the enormities, immoralities, and revolting atrocities, which have followed in their train.

Now, the *idolatry of covetousness, as having its origin in the same alienation from God*, and the same depravity of the affections, is the source of similar evils and immoralities, wherever its influence extends, as appears from certain facts and illustrations already stated, and which I shall more particularly elucidate under another department of this subject. When the objects on which the mind is fixed, are low, debased, and impure; and when they are connected with pride, falsehood, ingratitude, inhumanity and injustice, being destitute of higher conceptions and nobler aims, it conforms all its views and affections to the character of such objects, and, therefore, nothing can flow forth in the conduct but what is immoral and impure. God is the sun of the human soul, and of every intelligent being. Wherever he displays his radiance, there is moral day, spiritual life, and holy energy; and, under his quickening beams, every divine virtue springs up with vigor and beauty. But, where the light of this divine Luminary is excluded, and the eyes of the understanding shut to its glorious excellencies, darkness and desolation ensue; a moral winter chills every faculty, and the genuine fruits of righteousness can never appear. And hence the world has become little else than a suburb of Pandemonium, the greater part of its inhabitants "being filled with all unrighteousness, fornication, wickedness, maliciousness, envy, deceit, and malignity;" and bearing the character of "backbiters, haters of God, proud, boasters, covenant-breakers, inventors of evil things, disobedient to parents, without natural affection, implacable, and unmerciful. Who knowing the judgment of God, that they who do such things are worthy of death, not only do the same, but have pleasure in them that do them."

Again, *Covetousness bears another resemblance to idolatry, in that it is essentially connected with ATHEISM.*

Idolatry, strictly speaking, is not atheism; for it recognizes the existence of superior beings as the objects of adoration. But, although in theory, there appears a shade of difference, it is substantially the same, as to all its practical results. For, in banishing the idea of the *true God* from the understanding and the affections, it virtually deposes the Divinity from the universe; and all the immoralities and enormities which would flow from atheism, were its influence universal, result from heathen idolatry, wherever it abounds. The same thing may be said of covetousness: it is a virtually, and to all intents and purposes, a species of atheism. For, if atheism throws off all confidence in God, and trust in his Providence, so does covetousness in all its multifarious transactions. Look at the man whose highest object is to make a fortune, and to fill his coffers with gold. He devotes his time, his affections, the powers of his understanding, and his acquired knowledge and experience, with a steady and persevering aim to secure this ultimate end. He sits all day long in his shop or counting-house, poring over his

ledgers, examining his bills and securities with unremitting attention; devising plans of profit, selecting every mean that ingenuity can suggest, and seizing on every opportunity, however deceitful the means employed, for driving a profitable bargain, and increasing his store. No hopes transport him but the prospect of gain, and no fears torment him but the risk of loss, except, perhaps, the chance of accidents or the fear of death. When he has placed his treasures in proper security, whether in his bags or coffers, in the bank or the stocks, in title deeds or books of registration, he feels himself as independent upon God, and the movements of his Providence, as if a Supreme Moral Governor had no existence.—Without such securities, he feels no more dependence on an Invisible Power, than the confirmed and avowed atheist. I appeal to every one who knows the world, and to the consciences of multitudes, if there are not thousands of characters of this description in the church, the state, and every department of the commercial world. And what is the great difference between such dispositions and conduct, and downright atheism? Suppose the idea of a Deity to be a mere chimera, and the notion of his existence forever banished from their thoughts, would their conduct be much altered, or would it be altered in the least? except perhaps that they would deem it unnecessary, in compliance with custom, to attend the external forms of worship. Would they be more gripping, deceitful or penurious, more eager and persevering to lay up treasures on earth, and to add house to house and field to field, or trust more confidently in their riches, or feel more independent of a Supreme Being, than they do at present? It cannot be supposed; for they have already carried these propensities and practices to the highest pitch, which their ingenuity and energies would permit; and, therefore, the existence or non-existence of the Deity may be considered in relation to such characters, as a matter of mere indifference. Their wealth stands to them in the place of God, on which they depend, and to which they look as the fountain of their enjoyments, and the foundation of all their future prospects, both for themselves and their descendants. Even although the whole course of nature were deranged, the earth turned into a dry and parched desert, "the windows of heaven" never opened to pour down fruitfulness upon the earth, and, consequently, money cease to be of any utility for procuring the means of enjoyment; still, such are the associations connected with this irrational propensity, that they would cling to gold and silver, and houses and landed property as their darling object, "their high tower and rock of defence."

The same things may be affirmed in regard to those who covet money for the sole purpose of self-gratification, and indulging in luxury and sensual enjoyments. They drink of the streams, but forget the fountain. They store up from the rich abundance of nature, whatever treasures they can collect for contributing to their splendor and giving a relish to the pleasures of their senses; but they forget the benevolent operations of Him "who giveth rain from heaven and fruitful seasons, and filleth the hearts of men with food and gladness." They buoy themselves up with the idea that *their own* wealth and power and influence have procured them these enjoyments, while they regard not the Hand and Power of that Almighty Being who superintends the minutest agencies of the material system, and who "giveth to all, life and breath and all things." They

enjoy the comforts of splendid mansions, and delightful gardens; they relish the juice of the strawberry, the peach, and the nectarine, and regale themselves with the fruit of the vine; but to Him "who giveth them all things richly to enjoy," and to the intimations of his will, they pay no more regard than they do to a breath of wind, or to what is going on in the upper regions of the atmosphere. Now, what would be the difference, in the feelings and practice of such persons, although it could be proved to a demonstration that a Supreme and Eternal Mind had no existence? Although the world had sprung from a fortuitous concourse of atoms, and were going forward through interminable changes without the direction and control of an all-pervading Spirit, and although every individual were to consider himself as a part of an *independent* system of material existence unconnected with mind or moral error, would there be less of true adoration or gratitude to an invisible Creator, or less reliance on a superintending Providence, in the case of such, than there is at present? Would the hunter after places and pensions be more keen in his aspirations after posts of opulence and honor? Would the gambler be more eager in prosecuting his demoralizing pursuits? Would the pride of rank and dress and equipage be carried to a higher pitch than it now is? Would the votary of fashionable dissipation pursue his giddy course with more rapidity and vehement desire? Would there be more horse-racing, cock-fighting, hounding, balls, masquerades, and other frivolous and vicious diversions, or less money bestowed by those who are absorbed in such entertainments for the relief of the widow and the orphan, for the propagation of religion, and for the general improvement of mankind? We have no reason to believe that any *essential* difference would be perceptible in the general pursuits of the worldlings to whom I allude. For, as it is evident, from their governing disposition, and the general train of their conduct, that "God is not in all their thoughts," that "they live without God in the world," and that many of them have already "run to the utmost excess of riot," and licentiousness—so we have no valid reason to conclude, that any considerable change would take place, although they acted on the full belief, that the visible world, and its several elementary parts are all that we have to do with, and all that exists in the universe.

In the train of thought and action of such individuals, there is a certain resemblance to the *atheism* (if I may so express it) of the *inferior animals*. "The hart panteth after the brooks of water, and quenches its thirst at the flowing stream; the ox browses on the grass, and lies down and ruminates, until he is satisfied; the lion roars after his prey; the goats clamber among the high hills and rocks; the wild deer gambol through the lawn and forests, and the fowls of heaven wing their flight through the air, and rejoice to perch and 'sing among the branches.'"

In such gratifications and exercises, every sentient being finds its peculiar enjoyment, and looks no higher when its wants are supplied and senses gratified. The worldling, too, finds enjoyment in the exercise of his physical powers, and in the rich and diversified bounties of nature; and the keenness with which he rushes forward to participate of his viands, his delicious wines and other sensual pleasures, bears a certain resemblance to that of the inferior tribes when they rush to their peculiar food or beverage, and satiate their desires. But, in both cases, the *physical materials*

of the enjoyment, or the pleasures arising from the adaptation of the senses to the objects of external nature, are all that they recognize; while the Great Author of their enjoyments is unheeded and unacknowledged. In the one case, it is owing to the *want* of faculties capable of appreciating the existence and character of a Supreme Benefactor; in the other, to the perversion of rational powers adequate for tracing every comfort to its original source. The one, from the original constitution of its nature, is, so far as we know, incapable of perceiving or acknowledging God; the other "does not like to retain God in his knowledge." He might raise his thoughts to his Almighty Benefactor, if he chose, and acknowledge his bounty; but he chooses to shut his eyes to the evidences of his unceasing agency and beneficence, and to harden his heart against him. Though he has been endowed with more knowledge than the beasts of the field, and made wiser than the fowls of heaven, yet his superior powers have carried him no nearer to the fountain of happiness, than the instinct of the brutes. In short, his atheism is nearly as complete as theirs—with this difference, that while they fulfill their destination and act up to the constitution of their natures, he degrades the moral and intellectual faculties with which he is invested, by rendering them instrumental for promoting sensuality and alienating his heart from God. What a pitiful picture does this representation present of the great majority of our species, and of many even of those who profess the religion of Jesus, and who display a fiery zeal in defense of the Christian church! Alas! that man who is made only a little lower than the angels, and is allied by his intellectual nature with the highest orders of created beings, should thus pervert and prostrate his noble powers, in attempting to banish the Creator from his own universe, and to deprive him of that gratitude and adoration which are due from all his rational offspring! Such, however, is the atheism of covetousness; and that the conclusions we have deduced are not groundless, appears from the following passage of an inspired writer: "If I have made gold my hope, or have said to the fine gold 'Thou art my confidence;' if I rejoiced because my wealth was great, and because mine hand had gotten much,—if I beheld the sun when it shined, or the moon walking in brightness; and my heart hath been secretly enticed, or my mouth hath kissed my hand; this were an iniquity to be punished by the Judge; *for I should have denied the God that is above.*"

This subject deserves the serious consideration of every professing Christian. Many who are members of the visible church, and regularly attend the dispensation of its ordinances, because they do not run to the same excess in covetousness as others, or as such characters as we have alluded to above, are apt to imagine that no principles either of idolatry or of atheism lurk in their hearts. They hug themselves in the belief that they love God and man, and desire to deal justly toward their neighbors, while their affections are alienated from God, and their hearts going after their covetousness. "Their riches are their strong city, and as an high wall in their imagination," and their trust in the Most High extends no farther than to the *visible* means of supply which they think their own means and wisdom and industry have provided. There is no mental propensity, or subject, in regard to which men are more apt to deceive themselves than that under consideration. It is the last thing a professed religionist will be apt to suspect, that he is

acting on the principles either of atheism or idolatry; and he would consider it nothing short of an insult, were even a suspicion to this effect insinuated. But, it becomes every one, on this point, "to search and try his ways." Let me ask you, O professor of religion, have you never come to the house of God, under the profession of adoring his perfections and giving thanks at the remembrance of his mercy and goodness, while, during almost the whole of the public services, your thoughts and desires have been wandering abroad among your shops, your counting-houses, your ledgers, your gains, your losses, your commercial projects, and other objects of covetousness, while "the God in whose hands your breath is, and whose are all your ways, you have not glorified," although "your hands were lifted up in the sanctuary?" Have you not repeatedly, yea, times without number, neglected to adore God in your families, and "to show forth his loving kindness in the morning;" from your hurry to engage in the bustle of the world, and in the acquisition of gain? Do you seldom or never lift up your hearts to God in the midst of your worldly business, and implore his direction, and his assistance to guard you from worldly-mindedness and every temptation? If your conscience bears witness against you, that such dispositions are indulged, and such duties neglected, you have too much reason to suspect, that your heart is not right with God, and that a principle intimately connected with idolatry, holds the ascendancy over your affections. In such a case, it becomes every one to exercise a holy jealousy over himself, and to examine the secret springs of his actions, lest, peradventure, he may be found among those who are "without God in the world." If he is in doubt or perplexity about this important point, he will apply to Him "who searcheth the hearts and reins of the children of men," and will say with the Psalmist, "Search me, O God, and know my heart; try me, and know my thoughts, and see if there be any wicked way in me," and discover it to me, "and lead me in the way everlasting." For if the principles and affections which constitute the essence of idolatry and atheism shall at last be found to have pervaded the heart, and to have been formed into a habit, the doom which awaits the idolater and the atheist will be pronounced by Him who is "a discernor of the thoughts and intents of the heart," at that solemn day when "he shall come to judge the world in righteousness."

Having dwelt with some particularity on the above topic, I shall take only a cursory view of a few more particulars connected with this department of the subject.

2. Covetousness is declared to form an impassable barrier to the kingdom of heaven.

"Be not deceived," says the apostle of the Gentiles, "for neither fornicators, nor idolaters, nor thieves, nor covetous, nor drunkards, nor revilers, nor extortioners, shall inherit the kingdom of God." This is the law of the God of heaven—a law which is eternal and immutable—a law more steadfast and unalterable than that of the Medes and Persians. The laws of earthly sovereigns may be changed, or their designs frustrated, but the moral laws of the Most High are absolutely immutable, and no created being can attempt to violate them, and prosper. As soon may we expect to unhinge the fabric of the universe, to toss from their foundations the everlasting mountains, to pull the sun from his place in the firmament, or to quench the stars of heaven in eternal night, as to expect admission into the kingdom of

the just, while covetousness holds the ascendancy over the heart. For the declaration is *express*, and is repeated in another epistle, and similar declarations are interspersed throughout the volume of inspiration, that "no covetous man who is an idolater hath any inheritance in the kingdom of Christ or of God." Now the laws of God are not to be considered as the dictates of an arbitrary sovereign, but as founded on the nature of things, and the general constitution of the moral world. Although, in some instances, we are unable to perceive the precise reason of certain laws or injunctions, contained in Revelation, yet we may rest assured, that, in every instance, God has *the highest reason* for what he declares, and for what he does; since His wisdom is infinite, and since his eyes comprehend, at one glance, all the objects and relations which exist throughout the universe. In the present case, there are obvious reasons why the covetous must be excluded from the kingdom of heaven.

For, in the first place, *they are unqualified for its enjoyments*. The pleasures of heaven are pure and spiritual, but the pleasures of the covetous are "earthly, sensual, and devilish." The pleasures of heaven flow from a principle of universal benevolence, which pervades the minds of all its inhabitants, and without which it would be a place of misery; but the pleasures of the covetous, if they may be so called, are derived from principles connected with envy, deceit, falsehood, injustice, apathy in regard to the wants and happiness of others, and with almost every species of malignity. It is, therefore, impossible that covetous characters should either contribute to the happiness of fellow-associates in the realms of bliss, or find any enjoyment for themselves in the perpetual exercise of heavenly virtues.

In the next place, they are unqualified for engaging in its employments. Heaven being a social state, and consequently, a scene of moral action, its inhabitants are, of course, perpetually employed in *beneficent services* corresponding to the nature and circumstances of that happy world. As to the nature of some of these services, and the manner in which they are performed, we must necessarily remain in ignorance in our present state. Although, in that world, there are no poor to be relieved, no sinners to be reclaimed, nor distressed to be consoled—there are, doubtless, innumerable ways in which benevolence exerts its noblest energies, in communicating happiness and augmenting the joys of surrounding associates. Angels are "ministering spirits" to the saints on earth, and have, in numerous instances, contributed to their preservation and comfort; and, in the celestial state, "just men made perfect," may, in a thousand ways incomprehensible to us, be ministering spirits to one another. They may deliver lectures to each other on the works and the ways of God—direct the attention to those scenes and objects in which the glory of their Almighty Creator is most conspicuously displayed—relate the history of Divine dispensations toward them in the present state—seize upon every circumstance by which ecstatic joy may be diffused throughout the hearts of each other; and as knowledge is necessarily progressive, even in that world, and in every region of happy existence, the benevolent principle may be exercised in various ways in communicating and diffusing it among the numerous hosts of heavenly intelligences. But in whatever *benevolent* services "the saints in light" may engage, it is evident that the covetous are altogether unqualified for entering on such employments. They are uncongenial to the train

of thought they pursue, and to their leading dispositions. For either *selfishness*, apathy, pride, sensual gratification, or other *malignant* propensities, constitute the prominent features of their character; and as these are directly opposed to the benevolence of heaven, such predominating principles must render them entirely unfit for mingling in "the general assembly of the first-born, whose names are written in heaven," or for taking a part in those labors of love for which they are distinguished.

Some of the other employments of heaven consist in the celebration of the divine perfections. "They worship him who liveth forever and ever," saying, "Thou art worthy, O Lord, to receive glory, and honor, and power, for thou hast created all things, and for thy pleasure they are and were created." They are likewise engaged in contemplating the glory of the Divine administration in the works of creation and providence, for such is the subject of their song: "Great and marvelous are thy works, Lord God Almighty, just and true are thy ways, thou King of saints." But all such sublime exercises, being uncongenial to the ruling passions and pursuits of avaricious worldlings, could afford them no pleasure; and, consequently, for the reasons now suggested, they must be absolutely unfitted for participating in "the inheritance of the saints in light." And, if they are found *unqualified* for the pleasures and enjoyments of the celestial world, "they cannot, 'in the nature of things,' enter into the kingdom of God." They will be banished from that blessed world, not in consequence of any arbitrary decree of the Almighty, but in virtue of the constitution of the intelligent system, and the fundamental laws of the moral universe. And the very circumstance, that they are *unqualified* for relishing the exercises and felicities of the heavenly world, will add a peculiar poignancy to those bitter reflections which will be felt when they find themselves forever excluded from the New Jerusalem.

What should we think of the degraded worshippers of Juggernaut, who prostrate themselves before the car of that abominable idol—of the priests of Baal, who cut themselves with knives and lancets until the blood gushed out upon them, and cried aloud, "O Baal, hear us!"—of the votaries of Moloch, who threw their children into the burning arms of their idol, while drums beat and trumpets sounded to drown their cries—of the South Sea islanders, who sacrifice human victims to their wooden gods, accompanied with rites the most horrid and obscene; what should we think of such debased and wretched idolaters, with their minds polluted with every moral abomination, being admitted into the society of saints and angels in the upper world. Would they be fit companions of the heavenly inhabitants, or could they join with intelligence and fervor in their sublime and holy employments? The supposition would be utterly repugnant to every idea we ought to form of the associations of heavenly intelligences, or of the arrangements of the Divine government. But, we have already seen, that every covetous man is an *idolater*, with a mind as groveling and impure, as that of the votaries of Paganism, to whom we have alluded, and, consequently, equally unfitted for the society of blessed spirits in the mansions above.

The same impressive truth was announced by our Saviour, when he commanded the young man who inquired the way to eternal life, to sell all that he had and give to the poor, and come, and follow him! "Verily I say unto you, that a rich

man shall hardly enter into the kingdom of God."

And again; "I say unto you, that it is easier for a camel to go through the eye of a needle, than for a rich man to enter into the kingdom of God." These declarations plainly imply the following things: 1. That a rich man, considered as such, or, as it is elsewhere expressed, one who "*trusts* in his riches," cannot be admitted into the kingdom of God; for such a trust partakes of the nature of idolatry, which necessarily excludes its votaries from the celestial kingdom. 2. That it is *extremely difficult* for a man who abounds in wealth, and has large possessions, not to trust in such uncertain riches, and to bring his mind to submit to the self-denying requisitions of the gospel, so as to be ready to resign his worldly treasures, when the laws of the gospel kingdom require it. The truth of this is apparent in the comparatively small number of rich men who have devoted themselves to the cause of evangelical religion, as humble and self-denied followers of the meek and lowly Jesus. There are men at this moment in the higher places of society, abounding in riches, ten times more than sufficient for all the lawful purposes of sensitive enjoyment, whom it would be as difficult to induce to give the *tenth* part of their incomes, for the support and propagation of true religion, as it would be to drain the caverns of the ocean, or to hurl the mountains from their bases, and toss them into the depths of the seas, notwithstanding their pretended zeal for the external interests of the church.

Such is their pride, and their attachment to the pomp and splendors of wealth, that nothing short of Divine power could detach their hearts from trusting in their uncertain riches, and induce them "to count all things but loss that they may win Christ." Such is the powerful influence of wealth and external grandeur over the human heart, that none but those who have attained a strong and permanent conviction of unseen and eternal realities, can look down upon them with becoming indifference or contempt. And this consideration should form a powerful argument to the lower ranks of society, to encourage them to submit with contentment to the allotments of Providence, for their circumstances do not expose them to the same temptations as the rich to neglect the gospel and those things which belong to their eternal peace. Were the riches, after which they are sometimes apt to aspire, to be granted them, it might prove, as it has often done, the greatest curse that can befall them, and lay the foundation of their eternal ruin. "For they that will be rich fall into temptation and a snare, and into many foolish and hurtful lusts which drown men in destruction and perdition."

3. Covetousness is *inconsistent with the idea of our being redeemed by the blood of Christ.*

The apostle Peter declares, in reference to all Christians, that "they are not redeemed with corruptible things, as silver and gold, but with the precious blood of Christ, as of a lamb without blemish and without spot." And he brings forward this consideration as an argument against worldly lusts, and in support of universal holiness, that, "as obedient children, we ought no longer to fashion ourselves according to the former lusts in our ignorance; but as he who hath called us is holy, so we ought to be holy in all manner of conversation." And Paul, in his epistle to the Galatians, declares, that one end of the death of Christ is, "*that he might deliver us from this present evil world,*" and consequently

from all its covetous affections and lusts. The work of our redemption is one of the most astonishing displays of Divine perfection, and the most glorious manifestation of Divine love toward the sons of men. Preparations for its accomplishment were going on in every preceding period of the world. Prophets, in different ages, were raised up to announce it; the ceremonial law was instituted, and thousands of victims were slain on the Jewish altars to prefigure the sufferings of Messiah and the glory that should follow; the various events of Providence, the rise of empires, the fall of kings, and the revolutions of nations, were all directed in such a manner as to accomplish the purposes of the Almighty, and to bring about that great event—the death of Christ—in all the circumstances in which it actually happened. Celestial messengers descended from heaven to earth to announce the birth of the Saviour to man; a series of august and striking miracles, such as had never before been exhibited, gave attestation of the Divine mission of the promised Messiah; and at length, our great High Priest humbled himself, and became obedient to the death of the cross, when the sun was darkened in his habitation, the earth did quake, the rocks rent, the veil of the temple was rent in twain from the top to the bottom, the graves were opened, and many of their inhabitants arose to life. Our Redeemer at length burst the bonds of death, arose to an immortal life, ascended to heaven amidst a choir of angels, and is now set down at the right hand of the Majesty on high. The great end of all these solemn preparations in prophecies, in providences, in sacrifices, types, and shadows, and of the astonishing events which have accompanied and followed the death of Christ, was to *counteract sin* in all its various bearings and aspects—to emancipate the soul from the thralldom of the world and its affections and lusts, and “to purify” for the service of God, “a peculiar people zealous of good works.”

Now, it is evident, that such noble designs would be entirely frustrated, were a principle of covetousness to hold the ascendancy over the human mind, however fair a character its votaries might exhibit in the sight of men. If we are not determined to “mortify the flesh with its affections and lusts,” and to make God the supreme object of our desires and affections; if, on the contrary, we are determined to give loose reins to avaricious propensities, to make wealth and grandeur, and worldly honors and distinctions the chief object of our pursuit, then Christ “has died in vain” with respect to us, and we have no interest, and ought to claim no interest in the benefits which he died to procure. It is presumption in the highest degree, for any man to claim an interest in the blessings of salvation, whose conscience tells him that this world and its enjoyments are uppermost in his affections. For, can we for a moment suppose, that the Most High God would form a design which is the admiration of angels, that the most solemn preparations should be made for its accomplishment, that all the events connected with his moral administration should be so arranged as to have a special bearing upon it, that the laws of nature should be suspended and controlled, and a series of astonishing miracles displayed, that the Prince of Life would suffer the agonies of an accursed death—that He “who thought it no robbery to be equal with God, should take upon him the form of a servant, and become obedient to the death of the cross;” that angelic messengers should take so deep an interest in such transactions, and wing

their flight from heaven to earth in embassies connected with such events—can we suppose that such an astonishing train of events would have been arranged and brought into effect, if a principle, which, above all others, has a tendency to estrange the affections from God, were to be permitted to rule in the human heart? The thing is impossible, and, therefore, the covetous, whatever show of religion he may exhibit, cannot, with any consistency, lay claim to any of those eternal blessings which the Son of God came into the world to procure; since those effects which his death was intended to accomplish, have never been produced on his heart.

4. Covetousness is inconsistent with Love to God.

Love to God is the foundation and the first principle of universal holiness. In every renewed soul it reigns triumphant and supreme. This holy affection includes in it reverence, admiration, humility, and gratitude, and is uniformly accompanied with adoration of the perfections of God, and an unlimited dependence upon him, in reference both to our temporal comforts and our eternal destination. It pervades the hearts of all holy beings wherever existing throughout the amplitudes of creation, and inspires them with permanent and rapturous delight. It assimilates us to angels and other pure intelligences, and prepares us for associating with them and bearing a part in their labors of universal benevolence. Hence, we find, that this sacred emotion has formed the distinguishing characteristic of the saints in every age. We find the spirit of the Psalmist, in his devotional exercises, continually rising toward God, as his hope and confidence and the source of his felicity: “Whom have I in heaven but thee, and there is none upon earth that I desire beside thee. As the hart panteth after the brooks of water, so my soul panteth after thee, O God. My heart and my flesh shall fail, but God is the strength of my heart and my portion forever. He is my refuge and my fortress, my God; in him will I trust. In God is my salvation and my glory; the rock of my strength, and my refuge is in God. Who in heaven can be compared with the Lord? who among the sons of the mighty can be likened to Jehovah? Behold as the eyes of servants look to the hands of their masters, so our eyes wait upon the Lord our God. My soul trusteth in thee; yea, in the shadow of thy wings will I make my refuge until these calamities be overpast. Blessed is the man who maketh the Lord his confidence, and whose hope is in the Lord his God.”

Throughout the whole range of Divine revelation such sentiments are expressed, and such affections displayed by the people of God. But is it possible to be conceived, that either the niggardly miser or the vain worldling can enter into the spirit of such sublime sentiments, or elevate his soul to such holy affections, however much he may attempt to mimic the external forms of devotion? Though he should affect humility by bowing down his head like a bulrush, and profess to join in adoration of the Most High, “in the place of the holy,” yet God is not in all his thoughts, “and his heart is still going after his covetousness.” Those eternal respects which are due to God, and that hope and confidence which his people repose in his perfections, are to him altogether unheeded and unknown. The world, with its riches and splendors, is the deity which he worships, while the attributes of the true God are seldom present to his mind. While the true Christian exclaims with exultation, “Thou art

my *portion*, O Lord, therefore will I trust in thee," the worldling overlooks the Eternal Source of felicity, and "trusts in the abundance of his riches." While the Christian hopes in God for everything requisite to his happiness, both in the life that now is and in the life to come, the worldling makes "*gold* his hope, and says of the fine gold, 'Thou art my confidence.'" While the Christian, in the view of every calamity that may befall him, boldly declares, "God is my refuge and strength, my high tower and fortress, a present help in the time of trouble;" on the other hand, "the rich man's *wealth* is his strong city, and a high wall in his own conceit." Hence, the love of riches and the love of God, are altogether incompatible; and hence the positive declarations and injunctions of Scripture on this head: "Love not the world, neither the things that are in the world. *If any man love the world, the love of the Father is not in him.* For all that is in the world, the lust of the flesh, the lust of the eyes, and the pride of life, is not of the Father, but is of the world." Such declarations are plain and explicit, and ought forever to set at rest the question—whether covetousness and the love of God be consistent with each other?—whatever form, either of avarice or ambition, the covetous principle may assume. And if covetousness is inconsistent with love to God, it necessarily excludes those who are under its influence from a participation of the joys of heaven. For the inhabitants of that world have their minds completely pervaded with this sacred principle, in testimony of which "they cast their crowns before the throne, saying, 'Thou art worthy, O Lord, to receive glory, and honor, and power, for thou hast created all things, and for thy pleasure they are and were created.'" "Blessing and honor, and glory and power be unto Him that sitteth upon the throne, and to the Lamb forever and ever."

The evils of covetousness, and its inconsistency with religion, appear from the *numerous cautions and exhortations delivered in Scripture on this subject.*

Our Saviour frequently took occasion to admonish his disciples and the multitudes who attended him, on this point: "*Take heed,*" said he, "*and beware of covetousness;*" and he enforces the admonition from this argument, "For a man's life consisteth not in the abundance of the things which he possesseth;" that is, neither the happiness of our present existence, nor the *continuance* of that existence, depends upon the abundance of earthly riches. For a moderate portion of them will suffice for all the purposes of human enjoyment; and where great riches are possessed, they usually bring along with them encumbrances, snares, and temptations, which foster vicious lusts, and affections, and not unfrequently lead men into destruction and perdition. Beside, they form no security against the diseases and accidents of life, from which nothing can secure us but the providential care of our heavenly Father. They cannot shelter us from the stroke of lightning, the shock of an earthquake, the fury of a hurricane or tempest, from palsy, consumption, sickness, or the hand of death. In regard to such accidents and diseases, the poor man is as secure as the rich. Our Saviour illustrates this truth by a very striking example: "The ground of a certain rich man brought forth plentifully; and he reasoned within himself, saying, what shall I do; for I have not room to store up my crops. And he said, this will I do; I will pull down my old barns and build larger ones, and there will I bestow all my fruits

and my goods. And I will say to my soul, thou hast abundance of goods laid up for many years, eat, drink, and be merry." But God said unto him, thou fool, this night thy soul shall be required of thee; then whose shall those things be which thou hast provided?" How often is this impressive representation realized, in the case of worldly men who abound in wealth and are not rich toward God! How many are there at this moment as deeply engaged in ambitious schemes of hoarding or aggrandizement as the fool in the parable, to whom God will, in a few weeks or months, or perhaps this very night, declare, by the voice of his Providence, "Thy soul is required of thee." The sin of the rich fool, denounced in this parable, did not consist so much in his being a niggardly miser, or being altogether void of charity to the poor; for none of these things are charged against him; but it consisted chiefly in his forgetfulness of God, and want of dependence upon him—in an irreligious presumption and confidence in himself, imagining that he had a sufficient security in his own hands against the accidents and calamities of life, and forgetting that the continuance of his existence depended upon the will and the power of his Creator. This is the natural tendency of riches when not counteracted by a principle of religion; and it is this tendency which renders riches so dangerous to their owners, so that a man who has any regard to his eternal interests, ought rather to *fear* lest riches should be forced upon him, than to make them the object of his pursuit.

There are numerous injunctions of this kind interspersed throughout the Scriptures; but instead of illustrating them separately, I shall only select a few passages which bear upon this subject, recommending them to the serious attention of every professing Christian.

The following are some of those passages which denounce the sin of covetousness, the vanity of riches, and the dangers which attend them. "Beware that thou forget not the Lord thy God; lest when thou hast eaten and art full, and hast built goodly houses, and thy silver and thy gold is multiplied—then thine heart be lifted up, and thou forget the Lord thy God, and say in thine heart, 'My power and the might of my hand have gotten me this wealth.' But thou shalt remember the Lord thy God, for it is he that giveth thee power to get wealth.* The wicked hath swallowed down riches, but he shall vomit them up again. God shall cast them out of his belly. In the fullness of his sufficiency, he shall be in straits; when he is about to fill his belly, God shall cast the fury of his wrath upon him while he is eating. Though he heap up silver as the dust, and prepare raiment as the clay; he may prepare it, but the just shall put it on, and the innocent shall divide the silver.† Deliver my soul from the mass of the world who have their portion in this life. Every man walketh in a vain show; surely they are disquieted in vain; he heapeth up riches and knoweth not who shall gather them. They that trust in their wealth and boast themselves in the multitude of their riches, cannot by any means redeem their brother, or give to God a ransom for him. Be not thou afraid when one is made rich, and when the glory of his house is increased; for when he dieth he shall carry nothing away, his glory shall not descend after him to the grave.‡ These are the ungodly who prosper in the world and increase in riches. Lo, this is the man who made not God

* Deut. vii. 11—17.

† Psalm xviii. xxxix. xlix.

† Job xx. 15, 22 and xxvii. 16, 17.

his confidence, but trusted in the abundance of his riches. If riches increase, set not your hearts upon them. Riches profit not in the day of wrath. Their silver and their gold shall not be able to deliver them in the day of the wrath of the Lord; they shall not satisfy their souls, neither fill their bowels, because it is the stumbling-block of their iniquity. Wealth gotten by vanity shall be diminished. There is that maketh himself rich, and yet hath nothing; there is that maketh himself poor, and yet hath great riches. Better is a little with the fear of the Lord than great treasures and trouble therewith. An inheritance may be gotten hastily at the beginning, but the end thereof shall not be blessed. Labor not to be rich; cease from thine own wisdom. Wilt thou set thine eyes upon that which is not? for riches certainly make themselves wings and fly away.* There is one alone, and not another, yea, he hath neither child nor brother; yet there is no end of his labor, neither is his eye satisfied with riches; neither, saith he, for whom do I labor and bereave my soul of good; this is also vanity. He that loveth silver shall not be satisfied with silver, nor he that loveth abundance with increase. Woe unto them that join house to house, and lay field to field until there be no place, &c. Let not the wise man glory in his wisdom, neither let the mighty man glory in his might, let not the rich man glory in his riches. He that getteth riches and not by right shall leave them in the midst of his days, and in the end shall be a fool.†

"Lay not up for yourselves treasures on earth, where moth and rust doth corrupt, and where thieves break through and steal. No man can serve two masters; ye cannot serve God and Mammon. Take no anxious thought for your life, what ye shall eat or what ye shall drink, nor yet for your body what ye shall put on. Woe unto you who are rich, for ye have received your consolation. Woe unto you that are full, for ye shall hunger: woe unto you that laugh now, for ye shall mourn and weep. Verily I say unto you that a rich man shall hardly enter into the kingdom of God. What is a man profited, if he shall gain the whole world and lose his own soul? Take heed and beware of covetousness. Take heed to yourselves lest at any time your hearts be overcharged with surfeiting and drunkenness, and the cares of this life, and so that day come upon you unawares. Labor not for the meat that perisheth, but for that meat which endureth to everlasting life."‡ "Make no provision for the flesh to fulfill the lusts thereof. The time is short; it remaineth that they who buy, be as though they possessed not, and they that use this world as not abusing it, for the fashion of this world passeth away. Let not covetousness be once named among you, as becometh saints; for this ye know, that no covetous man, who is an idolater, hath any inheritance in the kingdom of Christ and of God. Set your affections on things above, and not on things on the earth. Mortify therefore your members—inordinate affection, evil concupiscence, and covetousness which is idolatry. Let your conversation be without covetousness, and be content with such things as ye have."§ "Love not the world, neither the things that are in the world; if any man love the world, the love of the Father is not

in him. They that will be rich, fall into temptation and a snare, and into many foolish and hurtful lusts that drown men in destruction and perdition. For the love of money is the root of all evil, which while some coveted after, they have erred from the faith, and pierced themselves through with many sorrows. Charge them that are rich in this world, that they trust not in uncertain riches; but in the living God who giveth us richly all things to enjoy. Go to, now, ye that say, To-day or to-morrow, we will go into such a city and continue there a year, and buy and sell, and get gain; whereas ye know not what shall be on the morrow; for what is your life? It is even a vapor that soon passeth away. Go to, now, ye rich men, weep and howl for the miseries that shall come upon you. Your riches are corrupted, your gold and silver is cankered, and the rust of them shall be a witness against you, and shall eat your flesh as it were fire. Behold, the hire of the laborers which have reaped down your fields, which is of you kept back by fraud, crieth, and the cries of them who have reaped, have entered into the ears of the Lord of Sabaoth. They are enemies of the cross of Christ, whose end is destruction, whose God is their belly, whose glory is in their shame, who mind earthly things.*

Such are a few of those divine admonitions, interspersed throughout the Scriptures, both of the Old and New Testaments, which are addressed to us on the subject of covetous affections and worldly grandeur. They are the solemn and explicit declarations of Him who hath all power and authority in heaven and on earth, and by whom the actions of men are weighed; and, therefore, they ought to sink deep into the heart of every professor of religion, and be pondered with the most profound seriousness and attention. If they produce a suspicion that the covetous principle lurks within, every one of them ought to strike the mind, as if it were spoken from the heavens in a peal of thunder, and to alarm the convicted worldling to flee from the wrath to come. For such declarations not only set before us our duty in the plainest terms, but pronounce the present and everlasting doom of every one who allows his affections to be enthralled with the riches of the world, and who passes into the eternal state under their malign influence. In such passages of sacred writ, the intimations of our duty and our danger in regard to wealth, are as clear and perspicuous as words can make them, and set aside every doubt in regard to the inconsistency of covetousness and religion. And, therefore, every man who makes a religious profession, if he will but take a moment's leisure to examine his own heart, and his train of affections, and to compare them with the declarations of our Lord and of his holy prophets and apostles, will at once perceive his true state and character before God. Yet it is amazing, how easily men flatter and deceive themselves in this point. Nothing, perhaps, is more difficult than to make an impression upon the minds of those whose affections have been long riveted to earthly objects. In many cases, you might as soon expect to cut through the Alpine rocks with a quart of vinegar or the stroke of a razor, as to cut a passage through the adamantine hearts of the covetous, by any arguments or denunciations which the reason of man, or the word of God can suggest. We have a most striking example recorded in the Gospel of Luke, of the inefficacy of Divine admonition and instruction

* Psalm lii. lxii. Ezek. vii. 19. Prov. xi. xiii. xv. xx. &c.

† Eccles. iv. 3. v. 10. Isa. v. 8. Jer. ix. 23; xvii. 11.

‡ Matt. vi. 19; vii. 26; xix. 21. Luke vi. 24; xii. 15; xxi. 34. John vi. 27.

§ Rom. xiii. 14. 1 Cor. vii. 30. Ephes. v. 3. 2 Cor. vi. 10. Col. ii. 2. Heb. xiii. 5.

* 1 John ii. 15. 1 Tim. vi. 9. James iv. 14; v. 1. Philip. iii. 9.

on this subject, even when delivered by the highest authority. Our Saviour, in the presence of a multitude of Pharisees, publicans, and sinners, spake a parable, intended to convince his hearers, of the necessity of making a right use of their worldly enjoyments; and he enforced his instructions by the consideration, that if they should employ their wealth in purposes of piety and benevolence, at the hour of death, they would receive their reward, in being introduced "into everlasting habitations." He concluded his discourse with these emphatic words: "No man can serve two masters; for either he will hate the one and love the other, or else he will hold to the one and despise the other; *ye cannot serve God and Mammon.*" Immediately after which, we are told that, "the Pharisees who were covetous, *heard of all these things, and they derided him.*"* Instead of opening their minds to receive the admonitions of heavenly wisdom, which were so appropriate to their characters, the instructions of the divine Saviour rebounded from their hearts, as an arrow from a wall of adamant. Instead of retiring to commune with their own hearts, and to reflect with seriousness on the admonitions they had received, they sneered with contempt at the Great Instructor, as if he had been a visionary who did not understand the nature of human enjoyments,

and who despised wealth only because he could not acquire it. They were as fixed in their avaricious principles and resolutions, as a rock in the midst of the tempest, and were determined to pursue their courses at all hazards, whatever might be the consequence, and they are now reaping the rewards of their unrighteousness. We have too much reason to fear that, in the present day, there are in the visible church, multitudes of characters as hardened in their covetousness as the ancient Pharisees. And, therefore, it becomes every one to exercise a holy jealousy over his heart in regard to this deceitful, hardening and soul-ruining propensity. "For many strong men have been wounded and cast down" by it; many who entered on active life, giving high hopes of their Christian attainments, have, through the influence of worldly cares, and worldly grandeur, made shipwreck of faith and of a good conscience, disgraced their profession, conformed themselves to the corrupt maxims and pleasures of the world, and fallen into many snares and temptations which drown men in destruction and perdition. O that every one would ponder aright these emphatic words of our blessed Saviour: "What shall it profit a man if he shall gain the whole world and lose his own soul? or what shall a man give in exchange for his soul?"

CHAPTER IV.

ON THE EVILS WHICH FLOW FROM COVETOUSNESS.

WHILE the rational and pious distribution of wealth might be made the source of innumerable benefits to mankind, the inordinate "love of money," we are told, "*is the root of all evil.*" There is scarcely a moral evil connected with the present or past condition of the human race, but may be traced, in a greater or less degree, to this unhallowed affection. It has even exerted a powerful influence in producing the greater part of those physical evils which are felt in every land, and among every rank of society. Were we, therefore, to attempt a full illustration of this topic, it would be requisite to take a review of the state of the human race in every age, and to write a history of wars and devastations, and of the animosities and contentions, the sorrows and sufferings of mankind,—so that, instead of a few pages, many volumes would be requisite for recording the revolting details. But, as it is not necessary in the present essay to enter into details, I shall advert, in a concise manner, only to a few prominent particulars.

1. As covetousness naturally leads to dishonesty, so *the covetous man is, to all intents and purposes, a thief and a robber.*

In the first place, *he robs his Maker.* This might appear a very odd representation, if we had not the authority of God himself to sanction it. The prophet Malachi, in the name of Jehovah, charges the people of Israel with this crime. "Will a man rob God? Yet ye have robbed me; but ye say, wherein have we robbed thee? In tithes and offerings; for ye have robbed me, even this whole nation." The Jews were commanded

to bring certain animals to the altar of burnt-offering, to be slain as sacrifices, and a portion of "the first-fruits of their increase," as a testimony of their dependence upon God and their devotion to his service, that they might honor the Lord with their substance. But, their covetousness, in many instances, induced them to withhold the sacred tribute; and, when they professed to bring their offspring to his altar, instead of bringing the pure and perfect offerings which the law required, they offered polluted bread upon his altar, and brought the blind, the lame, and the sick for sacrifice, which they would have thought unworthy of being presented to their governor. In consequence of such conduct, the curse of God was pronounced on the guilty individuals, and on the priests who winked at such robbery and profanation. "Now, O ye priests, this commandment is for you. If ye will not hear, and if you will not lay it to heart to give glory to my name, saith the Lord of Hosts, I will even send a curse upon you, and I will curse your blessings; yea, I have cursed them already, because ye do not lay it to heart. For ye have profaned my name in that ye say, the table of the Lord is polluted, and what you offer thereon, contemptible. Ye brought also the torn, the lame, and the sick; thus ye brought an offering; should I receive this at your hand, saith the Lord? But cursed be the deceiver who hath in his flock a male, and voweth and sacrificeth to the Lord a corrupt thing; for I am a Great King, saith the Lord of Hosts, and my name is dreadful among the heathen." Such were the sacrilegious practices of multitudes of professed worshippers among the Jews, even after they were restored from the Babylonish captivity;

* See Luke xvi. 1—14, compared with chap. xvi.

and which brought down upon their heads Divine judgments, and the severest curse of the Most High.

The same crimes are still prevalent under the Christian dispensation, though they assume a different form. Both the avaricious miser and the splendid worldling, rob God of his offerings, when they withhold that portion of their substance which he demands for his worship and service.—It is true, indeed, that the Deity is, and ever *must* be absolutely independent of all his creatures, either in heaven or on earth. Our giving cannot enrich *Him*, nor our withholding impoverish him. All the treasures of the universe were created by him, and are subject to his sovereign disposal.—“Every beast in the forest is his, the fowls of the mountains, and the cattle on a thousand hills; for the world,” said Jehovah, “is mine, and the fullness thereof.” But, he has given the world we inhabit, as a *gift* to the children of men, with this reservation, that, while one portion of its treasures is exclusively allotted for the enjoyment of man himself, and another for the inferior animals, a third portion is to be applied for the maintenance of the ordinances of religion, for diffusing divine knowledge throughout the world, and for the purposes of universal benevolence. And this reservation, so far from being a burden, or an oppressive tax, is, in reality, one of the mediums through which happiness is communicated and enjoyed. When man complies with such a requisition, and acts uniformly according to its spirit, he secures to himself the highest honor and happiness of which his nature is susceptible. It assimilates him, in a certain degree; to angels and the higher orders of pure intelligences, who are continually employed in acts of voluntary beneficence. It assimilates him to the Divine Saviour, “who went about doing good,” and hath left on record a *Divine maxim*, which deserves to be emblazoned in letters of gold, and engraved on the hearts of all the inhabitants of the universe—“IT IS MORE BLESSED TO GIVE THAN TO RECEIVE.” This is a maxim which is seldom recognized, even by Christians, in all its practical bearings. But were it universally acted upon, it would completely change the character of this world, and transform it from a scene of sin and suffering, into a moral paradise. In heaven, where this noble principle expands and governs the hearts of all its inhabitants, it is one of the chief sources of that “fullness of joy,” and those “pleasures which are at God’s right hand forevermore.”

The covetous, therefore, in refusing to recognize, and to act on this divine principle, both violate the commands of God, *rob him of the tithes and offerings he demands*, and prevent themselves from enjoying the felicity of superior natures. The miser robs God, when he either contributes nothing to his service, or such a pitiful sum as amounts to little short of an insult offered to the cause of religion. The rich worldling who lives in splendor, robs God of his due when he expends fifty guineas on a splendid but useless piece of furniture, a hundred guineas on some trifling amusement, or a thousand pounds to gratify a vain desire after worldly honor or distinction; while he either gives nothing at all, or contents himself with contributing two, five, or ten guineas for the propagation of knowledge and Christianity through the world. When a man who lives in luxury and elegance, who does not hesitate to subscribe hundreds or thousands of pounds to Conservative clubs or Orange societies, or who wastes similar sums in gratifying his pride or his appetites, contributes only such paltry portions

of his wealth to the most noble object that can engage the attention of the human mind, he virtually pours contempt on such an object, by placing it in the very lowest ranks, and thus robs his Maker, from whom he derived his wealth, of the tribute which is due for the promotion of His glory.

Every professing Christian, likewise, in whatever station he is placed, when he regards the interests of religion as merely a secondary object, and refuses to come cheerfully forward with a fair proportion of his substance, according as God has prospered him, for promoting the advancement of the Redeemer’s kingdom, must be considered as a sacrilegious robber, depriving the Most High of the tithes and offerings he demands, and consequently subjects himself to the infliction of a *curse*, similar to that which was denounced upon the covetous Jews in the days of Malachi.

In the next place, the covetous man *robs the poor, the distressed, the widow and the fatherless*. He robs them of their enjoyments, by withholding that assistance which is requisite for enabling them to procure the comforts and necessities of life. The Creator has displayed his boundless liberality in the abundant treasures of the earth and seas, in the ample space afforded for the habitations of man, and for the production of food and the materials for clothing, and in giving rain from heaven and fruitful seasons, that the hearts of men may be filled with food and gladness. The earth, if properly cultivated, and its productions impartially distributed, would be more than sufficient to supply every sensitive comfort to *twenty times* the present number of the population of our globe.* Even as matters now stand, there is far more produced from the rivers, the ocean, and the dry land, than is sufficient for the abundant sustenance of man, and every species of animated existence, were it distributed by the hand of equity and beneficence. But covetousness interposes between the Creator and his creatures, and attempts to intercept the streams of Divine Goodness, and prevent them from flowing to every order of his sensitive and intelligent offspring. It either hoards up the treasures of Nature that few may enjoy them, or wastes them in vanity and extravagance, regardless of the privations and sufferings of countless multitudes who are pining in affliction and indigence. Instead of acting as the *Almoners* of the Creator, in distributing the bounties he has put into their hands, the covetous do everything in their power to *counteract* the incessant operations of Divine Beneficence—and thus *rob* the poor, the distressed and the helpless, of those comforts which his care and providence had provided. They likewise rob them by an unceasing course of injustice and oppression, defrauding them of their rights, and, in the language of Scripture, “grinding the faces of the poor, beating them to pieces, and taking the spoils of the indigent into their houses.”†

Again, the avaricious man *robs his own family*. He frequently denies them the comforts of life, and even its necessities. Though his coffers are overflowing with wealth, and the means of every sensitive and rational enjoyment are within his power, yet his wife and children are virtually

* Allowing only one fourth of the area of the globe to be capable of cultivation, and that twelve acres of land are sufficient for the maintenance of a family, it is easily proved by calculation, that the earth would support *sixteen thousand millions* of inhabitants, which is about twenty times the number of its present population.

† Isaiah iii 14. 15.

sunk into the depths of poverty. Their food is mean, and measured out with a sparing hand. Their clothes are of the coarsest stuff, and wear the appearance of the garb of poverty; their education is stinted or altogether neglected, because it would prevent him from adding a few more shillings to replenish his bags and coffers. In short, all their comforts, instead of flowing in copious streams proportionate to his treasures, are measured out to them in the smallest quantities, like the small drops of medicine from an apothecary's vial.

He likewise *robs general society* of those improvements and comforts which he is the means of preventing.

Were it not for avarice, we should have our towns and cities divested of every nuisance, our streets broad and spacious, the light of heaven and the refreshing breeze visiting every dwelling, our narrow lanes demolished, our highways clean and smooth, and adorned with refreshing bowers, asylums for the industrious poor, seminaries for the instruction of all ranks and ages in useful knowledge, and innumerable other improvements for promoting the happiness of the social state. But covetousness interposes and raises an almost insurmountable barrier to the accomplishment of such designs; and, when they are partially effected, in particular cases, it steps in and says, "hitherto shalt thou come, but no farther, and here halt all improvements be stayed."

In short, he robs every philanthropic society of its treasures, by withholding those gifts which God has put in his power to bestow; and he robs *himself*, by depriving himself of contentment and serenity of mind, and of those external comforts which God has liberally provided for all his creatures. "Although he wanteth nothing for his soul of all that he desireth, yet he deprives himself of the power to eat thereof." Such are the robberies committed by every one in whose heart covetousness sits enthroned.

If this species of robbery were viewed, by Christian and civil society, in its proper light, as delineated in the word of God, the covetous extortioner, and the gay worldling would be as much shunned and hissed from society, as the sharper, the thief, or the midnight depredator.

2. Covetousness uniformly *leads to falsehood and injustice*.

The heart being set upon the acquisition of wealth as its highest object, the worldling seizes upon *every mean* by which it may be acquired. Among these means, falsehood and misrepresentation are particularly conspicuous. When he is buying an article, he endeavors to depreciate its properties and its value; and when he is to dispose of a similar commodity, he overrates its qualities, and attempts to procure a price for it far beyond its worth. If there is a prospect of the price of any commodity rising, he denies that it is in his possession, and if he has a deteriorated article which he wishes to dispose of, he will varnish it over with a fair outside to deceive the unwary. If he is tying up a bundle of quills, he will place four or five in the center, not half the value of the rest, and thus, he sends forth hundreds of liars with a fair outside, to proclaim as many falsehoods to the world. If he have money in the *stocks*, he will sometimes endeavor to propagate false intelligence to produce their rise or fall, according as he finds it his interest to sell out or to purchase. He misrepresents the state of the markets, and the commodities of his neighbors, in order to enhance his own. When he covets his neighbor's property, he takes the advantage of either poverty

or ignorance, and resorts to falsehood and every deceitful mean, in order to obtain it at half its value; and when it comes into his possession, its defects are immediately transformed into valuable properties, and it is rated at a price far superior to its intrinsic worth. In this way, his whole life becomes a course of systematic falsehood; and, if he can accomplish his designs by such means without directly violating the civil laws of his country, he regards himself as a man of uprightness and honesty—although the principle of *truth*, which is the basis of the moral universe, is violated in almost every transaction. And, as he is a liar and deceiver, so he is, almost as a matter of course, guilty of injustice and oppression. For, instead of relieving the poor and unfortunate, when calamities befall them, he greedily seizes upon such occurrences, in order to acquire the remains of their property at an under value. He drives from their long accustomed dwellings, the industrious cottager, and mechanic, whose ancestors had for generations occupied the same habitation or plot of ground, in order that he may have a chance of adding three or four pounds more to his already overflowing treasures. The bargains he drives, are all *hard*, and the poor who are indebted to him for loans of money, are sure to be fleeced of a double rate of interest. He is generally a usurer who lends to the necessitous, at an exorbitant rate, and when payments have been delayed beyond their proper period, he seizes upon their properties, like a furious wolf, and frequently obtains them at a small fraction of their value. All such acts of oppression, which are direct violations of natural justice, he can commit, and does commit, in the open face of day, and hugs himself in the idea that he can do so without directly violating the statute law of his country.

Dr. Reed, in his late "Narrative of a visit to the American Churches," presents a sketch of a female character he met with in one of his journeys, that bears a certain resemblance to what we have now described: "Crowded and almost suffocated [in our vehicle], we had an old lady who did not fail to amuse us. She sat opposite me, and would force a conversation, and as her voice was sharp and shrill, what was meant for me went to all. 'As for religion, she thought one as good as another, if we did our duty; and her notion of duty was to mind our own business. For her part, she had always done so; she ridiculed those who had employed others to do it for them; she could always do hers best for herself; she could make *fifteen per cent.* on money—had small sums out now at *fifteen per cent.*' She felt that this was not approved. 'Oh! she was not hard with the poor creatures; if they were pressed, she waited, and lent them a little more, so that they could pay at last. She had always been unmarried, not for want of offers, but she liked her independency, and would resent the offers of any man who would want to get her property.' I remarked, that she had done well not to marry; as a person, like herself, who could do everything so well, could have no need of a husband. 'Right, right, sir,' she cried, laughing. Then getting thoughtful, she continued: 'But I have a great deal of care, and I often think, I should like to retire and be quiet; and then, I feel as if I could not be quiet, and then I should have no friend.—I should want a friend, if I retired, else I could afford it, you know.' 'Oh, I had no doubt of her having a handsome property.' 'Oh no, sir, your joke is very pretty, but I did not mean to say I was rich. I have somewhere or other about

7000 dollars; but I guess that you have more money than all of us put together.' And thus she continued throughout the journey, never embarrassed, always prepared to meet you in reply, and always satisfied with her own shrewdness.—She was really a character,—person, features, dress and all, but a most pitiable one. *A great usurer on a small scale*; the love of money had become in her the root of all evil; it made her indifferent to a future world, and destroyed all that was feminine, tender, and benevolent.”*

This is truly a graphic picture of an old female miser, whose heart appears to have been long wedded to the Mammon of unrighteousness. Her moral sense appears to have been completely blunted by her love of money; for she appears to have had no impression of the *injustice* of taking fifteen per cent. from “poor creatures.” Yet, it is evident from her declaring that “she had a great deal of care,” and from her wish and hesitation about retiring from the world, that she was *an unhappy mortal*, as all such characters must necessarily be. As the doctor would doubtless intersperse in his conversation, some rational and scriptural arguments against covetousness, it is rather a defect in his narrative, that he does not state what impressions they made, or how they were received; for the lady, he informs us, “was always prepared to meet you in reply.” Alas! that so many such characters should be found in a Christian land, who think, like this wretched female, that they have done their duty, “when they mind their own avaricious business.”

3. Covetousness *destroys natural feeling* and tenderness of conscience.

There are few vicious dispositions that have a greater tendency to harden the natural feelings of the human heart, and to produce a complete apathy in regard to the wants and sufferings of others, than the inordinate love of money. The tale of woe, the houseless wanderer shivering in rags amidst the blasts of winter, the wants and distresses of the surrounding poor, and the claims of indigent friends and relatives, make no impression on that heart which is encircled, as by a wall of adamant, with the immoderate love of gain.—On such a heart, the tears of the unfortunate, and of the widow and orphan, will drop in vain. Its eyes are blind to spectacles of misery, its hands are shut, and its ears deaf to the calls of poverty and the cries of distress. Such unhappy petitioners, instead of meeting with pity or relief, are driven from the door of avarice, with growls and insults, and the haughtiness of a tyrant. Even domestic affliction, and the death of parents, wives, or children, will scarcely affect the heart that is rendered callous by covetousness. Of this we have a striking example, in the case of Edward Nokes, some of the particulars of whose avaricious conduct were formerly stated. (See p. 19.) In his younger days, he used, at the death of any of his children, to have a deal box made to put them in; and, without undergoing the solemn requisites of a regular funeral, he would take them upon his shoulder to the place appropriated for their reception, as if he had been carrying a common burden, or a young pig to the market, and with similar apathy and unconcern.—When once deposited in the grave, he appeared to give himself no further thought about the matter, and seemingly coincided with the old maxim, “out of sight, out of mind,” and appeared as unconcerned as if nothing had happened. A simi-

lar want of feeling seems to have characterized the old American lady, whose features are delineated above. To be “without natural affection,” is a disposition which, in the word of God, is ranked with that of “a reprobate mind, maliciousness, envy, murder, and other abominable crimes,” and is a plain proof of the *malinity* of the avaricious principle from which it flows. And, as natural feeling is destroyed, so the *conscience is benumbed* by the covetous principle, and even “seared as with a hot iron.” Its remonstrances are gradually overcome by the daily increase of the avaricious appetite; and, in the course of time, its “still small voice” is altogether disregarded.—Neither the promises nor the threatenings of the divine word, however frequently they may be heard, nor the joys and terrors of the unseen world, can arouse the conscience to a sense of duty or of danger. Such, in many instances, is its insensibility, that all the arguments and motives on the necessity of faith, repentance, and amendment of life, become as ineffectual for awakening consideration, as if they were addressed to the beasts of the forest, or the stones of the field. No situation in which man can be placed is more dismal and alarming than such a state; and since it is the natural result of inveterate covetousness, it should make every one tremble lest he should be left to fall into those hurtful lusts which drown men in destruction and perdition.

4. Covetousness leads to the indulgence of murderous wishes, and even to murder itself.

As the lives of certain individuals frequently stand in the way of the gratification of the covetous appetite, the avaricious worldling naturally wishes that they may be removed as speedily as possible from the world; and when a relative dies, at whose decease an inheritance is expected, he can scarcely refrain from expressing his satisfaction and joy. Hence the anxiety with which such persons look forward to the death of any one from whom a legacy or an inheritance is to be derived; and hence the very common expressions of such, in reference to an uncle, an aunt, or even a parent—“The old fellow has surely lived long enough. When will he get out of the way?” “I wish that old dame who gives away so much money for religion, were safely landed in heaven. If she continues here much longer, I shall have a sorry chance of enjoying her possessions.” But covetousness does not always content itself with such unhallowed and diabolical wishes. Strong desires and ardent wishes generally lead to corresponding actions. In the presence of the Omniscent, and in defiance of his positive laws and his Almighty power, it not unfrequently takes into its hands the power of life and death, and, by an insidious murder, rids itself of those who were considered as obstacles to its gratification. The poisoned cup is administered, or the sword and blunderbuss prepared, or the assassin hired to poniard or to suffocate the unsuspecting victim, that avarice may glut itself with the wages of unrighteousness and the spoils of violence. Cases of this kind are so numerous that many volumes would not be sufficient to record them. Perhaps it would not be going beyond the bounds of fact to affirm, that one-half of the murders committed in the world have had their origin in this abominable affection. Almost every daily newspaper that comes into our hands contains some revolting details of this description. It is seldom that a week passes in the police offices and other criminal courts in London, in which cases of violence, or of murders, arising from this cause are not exhibited to public view. And

* Narrative of a visit, &c. by Drs. Reed and Mattheson, vol. i. p. 103, 104.

when we consider the secrecy and dexterity with which such atrocious acts are generally conducted, we may easily conceive how many such deeds may be perpetrated unknown to any human being, except the perpetrator, and to which the eye of Omniscience alone is a witness.

Among all ranks of society, such atrocities have been committed. Not only the lower but the very highest order of men have been implicated in the commission of such enormities. Even princes and nobles connected with the British throne, under the influence of avarice and ambition, have committed crimes of this description, at which humanity shudders. Richard III, of England, when duke of Gloucester, and *protector* of England, after the death of his brother, Edward IV, prepared his way to the throne, by causing the earl of Rivers and other noblemen, who had charge of the legitimate heirs, to be beheaded, without any trial or form of process, and on the very day in which these men were murdered at Pomfret, he treacherously caused a number of armed men to rush in at a given signal, and seize Lord Hastings, when he was attending a council at the Tower—whom they instantly beheaded on a timber-log which lay in the court. And, when he had, by such atrocities and the basest treacheries, seated himself on the throne, to secure its stability, as he imagined, he hired a principal assassin and three associates, to murder the two young princes, his nephews, whom his brother had committed to his protection. They came in the night time to the chamber where the young princes were lodged. They found them in bed, and fallen into a profound sleep. After suffocating them with a bolster and pillows, they showed their naked bodies to the principal assassin, who ordered them to be buried at the foot of the stairs, deep in the ground, under a heap of stones. But this atrocious monster, notwithstanding the splendors of his court, appeared never afterward to enjoy repose. His eyes were always whirling about on this side and on that; and he was always laying his hand upon his dagger, looking as furiously as if he were ready to strike. By day he had no quiet, and by night he had no rest; but, molested with terrifying dreams, would start from his bed and run about the chamber like one distracted. He enjoyed the fruits of his wickedness only two short years, and was killed at the battle of Bosworth, where his body was found in the field covered with dead enemies and all besmeared with blood. It was thrown carelessly across a horse, and carried to Leicester, amidst the shouts of insulting spectators. How many such murders may have been committed, under the influence of covetousness, by ambitious statesmen, by kings and conquerors, by guardians and wardens, and even by the nearest relatives, God only knows; but history, both ancient and modern, is full of such revolting details; and such details relate only to such as were detected and exposed to public view. When we seriously consider this dreadful tendency of the covetous and ambitious principle, it should form a powerful motive to every one, and particularly to every professing Christian, for counteracting the *first risings* of such depraved affections. For, if they be harbored and cherished for any length of time, they may lead to atrocities from which the mind would have previously shrunk back with horror. As a few small sparks will sometimes produce an appalling conflagration, so a few covetous affections, nursed and fostered in the heart, may lead to the most appalling murders, and to the destruction of soul and body, both in regard to our-

selves, and to the victims of our unhallowed propensities.

5. Covetousness has, in numerous instances, *perverted the administration of the law, and frustrated the ends of public justice.*

Courts of Judicature were instituted for the purpose of dispensing justice between man and man, for punishing the guilty and protecting the innocent; and therefore, those who are appointed to preside in such cases, ought, in an especial manner, to be men of uprightness and impartiality, and inflexible in their adherence to the side of truth and justice. Hence, the propriety of the advice of Jethro to Moses, that, in appointing judges for Israel, he should make choice of "able men who fear God and *hate covetousness.*" Without the fear of God before his eyes, a judge will be liable to be biased in his decision by selfish and worldly motives, and the influence of proffered bribes. And, how often does it happen that *gold*, or something equivalent to it, turns the scales of justice, and makes them preponderate on the side of iniquity and oppression?—when the cause of the rich is preferred, and the poor deprived of their rights—the innocent condemned, and the guilty acquitted—"the persons of the wicked accepted, and the cause of the widow and the fatherless turned aside!" By such unrighteous decrees in courts of Judicature, the most distressing and melancholy effects have frequently been produced. Families have been robbed of every earthly comfort, and plunged into the depths of poverty and despair. The stranger and the destitute, the widow and the orphan, have been oppressed and forsaken, and denied the common rights of justice and humanity. The wicked have been left to triumph in their wickedness, while the righteous have been condemned to imprisonment, to exile, or to death. Men of integrity and piety "of whom the world was not worthy," have been doomed to dungeons, to racks, to tortures of every kind, and to be consumed in the flames, while their accusers and judges have been permitted to riot and fatten on the spoils of iniquity. Hence the frequent and pointed declarations of Scripture in reference to judges, "They shall judge the people with just judgment." "Thou shalt not respect persons, *neither take a gift*; for a gift doth blind the eyes of the wise, and pervert the words of the righteous." "Thou shalt not respect the person of the poor, nor honor the person of the mighty, but in righteousness shalt thou judge thy neighbor." And hence, the threatenings denounced against the rulers of Israel by the prophet Isaiah: "How is the faithful city become a harlot! righteousness lodged in it, but now murderers. Thy princes are companions of thieves; *every one loveth gifts*, and followeth after rewards; they judge not the fatherless, neither doth the cause of the widow come unto them. Therefore saith the Lord, the Mighty One of Israel,—Ah! I will ease me of mine adversaries and avenge me of mine enemies."

History, both civil and sacred, is full of examples of this description. We have a striking instance recorded in the first book of Kings, in relation to Ahab, and the vineyard of Naboth. The king desired to have the vineyard to add to the gardens belonging to his palace. But Naboth was prohibited, by the law of Moses, from alienating from his family and posterity, the inheritance of his ancestors. Jezebel the queen was determined, however, to effectuate her purpose, and she found ready instruments among the judges

of the land, to carry into execution her diabolical scheme. With the basest effrontery and hypocrisy, she wrote letters in Ahab's name to the nobles and the elders of the city in which Naboth dwelt, and hired two "men of Belial" to witness against him that he had "blasphemed God and the king." It is truly lamentable, that, in every age, in all such cases, princes have never wanted instruments to accomplish their most atrocious designs, when they made an appeal to the principle of ambition and avarice. In this case, it would appear, there was not one of all the judges of this city that abhorred such a piece of villany, or was proof against the flatteries and bribes of the wicked Jezebel. For, in obedience to her order, and without the least remonstrance, "they proclaimed a fast," they set the virtuous Naboth "on high among the people," condemned him on the false witness of two atrocious characters, and "carried him forth out of the city and stoned him with stones that he died." And, in order to display their sycophancy to this atrocious woman, and to gratify her pride and revenge—and to show that they deserved her favor for the deed they had committed, they *immediately* sent information to Jezebel, saying, "Naboth is stoned, and is dead." This is but one instance, out of many thousands of similar crimes which have been committed under the show of justice, through the influence of selfishness and avarice. The records of the Inquisition, of the conclaves of popes and cardinals, of the star chamber, of the high commission court, and even of many other courts deemed more just and honorable, by whose decrees, men innocent of any crime, have been fined and imprisoned, robbed of their earthly possessions, tortured with racks and thumb-screws, and doomed to ignominious deaths, would afford ten thousands of striking examples of unrighteous decisions, proceeding from a principle of ambition and covetousness, sufficient to make "the ears of every one that hears them to tingle."

It is related of that pious and upright judge, Sir Matthew Hale, that, when a gentleman who had a cause to be tried at the assizes, sent him a *buck* for his table; as soon as his name was mentioned, he asked him, "if he was not the same person who sent him venison," and finding he was the same, he told him, "he could not suffer the trial to go on, until he had paid him for his buck." To which the gentleman answered, "that he had never sold his venison, and that *he had done nothing to him that he did not do to every judge that had gone that circuit.*" But this excellent judge had learned from Solomon that "a gift perverteth the ways of judgment," and therefore he would not suffer the trial to go on until he had paid for the present: upon which the gentleman withdrew the record.

On another occasion, at Salisbury, the dean and chapter, having, according to the custom, presented him with six sugar-loaves, on his circuit, he made his servants pay for the sugar before he would try their cause. These anecdotes, while they illustrate the uprightness and impartiality of this eminent person, also prove, that it was customary for those who had causes to be tried, to give presents to the Judges of assize; and that, in all probability, they frequently acted under the influence of such bribes.

Another story is told of Judge Hale, in reference to a case between two brothers, the younger of whom had endeavored to deprive his elder brother of an estate of £500 a year, by suborning witnesses to declare that he died in a foreign land. Under the guise of a *miller*, he was chosen one of

the jury on this cause; and as soon as the clerk of the court had sworn in the jurymen, a little dextrous fellow came into their apartment and slipped ten golden Caroluses into the hands of eleven of the jury, and gave the miller five, while the judge, at the same time, was known to be bribed with a great sum. The judge summed up the evidence in favor of the younger brother, and the jury were about to give their assent, when the supposed miller stood up and addressed the court with such energetic and manly eloquence, as astonished the judge and all present—unraveled the sophistry to the very bottom, proved the fact of bribery, evinced the elder brother's title to the estate, from the contradictory evidences of the witnesses, and gained a complete victory in favor of truth and justice.

The well-known Judge Jeffreys, who was as avaricious as he was unjust and cruel, reduced many innocent victims to beggary, by his rapacious exactions. A gentleman of Devonshire, of the name of Prudeau, having been thrown into prison, and dreading the severe and arbitrary spirit, which at that time met with no control, was obliged to buy his liberty of Jeffreys, at the price of *fifteen thousand pounds*, though he could never so much as learn the crime of which he was accused.

And, as judges have perverted judgment, so advocates and pleaders in courts of justice, under the influence of avarice, have endeavored to "turn aside the cause of the needy in judgment." How often have such persons, by means of sophistry, misrepresentation, and false eloquence, supported a bad cause, and robbed the fatherless and the widow of their just rights and their dearest enjoyments—while the very moment they were doing so, they were *conscious* of the injustice of their procedure! thus subjecting themselves to that terrible denunciation, "Woe unto them that call evil good, and good evil, that put darkness for light, and light for darkness, that *justify the wicked for reward*, and take away the righteousness of the righteous from him." Nothing is more common, among such persons, than to undertake a cause of any description, however untenable, provided, they are paid for defending it. In opposition to such conduct, which is directly opposed both to reason and the word of God, it is said of Sir M. Hale, that "if he saw a cause was unjust, he would not meddle farther in it; but to give his advice that it was so; if the parties after that were to go on, they were to seek another counselor, for he would assist none in acts of injustice." "In his pleadings, he abhorred those too common faults of mis-reciting evidence; quoting precedents or books falsely, or asserting things confidently, by which, ignorant juries or weak judges are wrought upon and deceived." Would to God, that all our pleaders were animated by such upright and honorable principles!

6. Covetousness has transformed many of the ministers of religion into courtly sycophants, and hunters after places of honor and worldly gain.

The apostle Peter solemnly enjoins Christian pastors to "feed the flock of God, taking the oversight thereof, not by constraint, but willingly, not for filthy lucre, but of a ready mind." Neither to act as "lords over God's heritage, but to be examples to the flock." But, how often do we find that professed ministers of the gospel appear to have a greater respect to the pecuniary rewards of their office than to accomplish the great ends for which it was appointed. Otherwise, how should it ever happen, that men would have the effrontery to receive five, or ten, or fifteen hundred

pounds a year, under pretense of "feeding the flock of God," over which they were solemnly appointed, and yet spend their time in fashionable dissipations in distant countries, without ever caring for the souls of their parishioners, or imparting to them the least portion of divine instruction? Such ministers, when at any time they do preach to their people, will naturally frame their sermons according to worldly motives, and for selfish designs. If it may promote their secular interests, they will appear like Apostles, full of ardent zeal for the truth, and in opposition to error and abounding sins. But, if the doctrines of the cross be not palatable to their fashionable hearers, they will amuse them with Pagan morality, smooth down the threatenings of the divine word, and endeavor to gratify the corrupt humors of their audience. The standard of their religion changes with the changes of the State; and they will not scruple, when their worldly interest is at stake, to defend all that is odious in tyranny, and to extol the most wicked and unprincipled characters. Of this we have a striking example in the case of the Reverend Dr. Shaw, who lived in the time of the protectorship of the Duke of Gloucester, who afterward usurped the crown, under the title of Richard III. Among other pleas to gain his ambitious designs, Richard attempted to maintain what had not the shadow of a foundation in truth—that both Edward IV, his own brother, and the Duke of Clarence, were equally illegitimate, and that the Duchess of York had received different lovers, who were the fathers of these children. Nothing was considered more impudent and unfounded than this assertion, which threw so vile an imputation on his own mother, a princess of irreproachable virtue, and then alive. Yet the place chosen for first promulgating this shameful falsehood, was the *pulpit*, before a large congregation, in the protector's presence; and a Reverend Doctor of Divinity was base enough to prostitute the sacred office for this purpose. Dr. Shaw was appointed to preach at St. Paul's; and having chosen this passage for his text, "*Bastard slips shall not thrive*," he enlarged on all the topics which could discredit the birth of Edward IV, the Duke of Clarence, and of all their children. He then broke out into a panegyric on the Duke of Gloucester, and exclaimed, "Behold this excellent Prince, the express image of his noble father, the genuine descendant of the house of York; bearing no less in the virtues of his mind, than in the features of his countenance, the character of the gallant Richard, once your hero and favorite; he alone is entitled to your allegiance; he must deliver you from the dominion of all intruders; he alone can restore the lost honor and glory of the nation." Such was a part of the fulsome oration of this *Reverend* sycophant, in favor of a despicable tyrant and atrocious murderer. It was previously concerted, that as the doctor should pronounce these words, the Duke of Gloucester should enter the church; and it was expected that the audience would cry out, "*God save King Richard!*" which would immediately have been laid hold of as a popular consent, and interpreted to be the voice of the nation. But Providence, not unfrequently, turns the schemes of the crafty into foolishness. By a ridiculous mistake, worthy of the whole scene, the Duke did not appear until after this exclamation was already recited by the preacher. The Doctor was therefore obliged to *repeat* his rhetorical figure out of its proper place: the audience, less from the absurd conduct of the discourse, than from their detestation of these

proceedings, kept a profound silence; and the protector and his preacher were equally abashed at the ill success of their stratagem. For, "He who sits in the heavens," and whose eyes "behold the children of men," "holds in derision" all such deceitful schemes, and disappoints the devices of the crafty, so that their hands cannot perform their enterprise.

It is to be hoped, that there are, in our times, few persons connected with the sacred office, who would go all the length with the despicable sycophant to whom I have alluded. But there is no one who reads the daily journals, and has his eyes open to what is passing around him, but must perceive that there are characters within the limits of the British Empire, invested with the office of ministers of the gospel, who make a near approximation in their temper and conduct, to such political parasites. It becomes ministers of religion in general, to be particularly on their guard against such unhallowed propensities, so degrading to the office of ambassadors of Christ, and with the indulgence of which they have been so frequently charged. If their great object be merely "to please men," they "cannot be the servants of Christ;" and, in flattering the great, and pandering to their pride, from ambitious motives, they will be found subjecting themselves to that awful denunciation of our Saviour, "He that is ashamed of me, before men, of him will I be ashamed before my Father and his holy angels." And a more awful situation can scarcely be conceived than that of an ambitious and worldly-minded minister standing before the bar of God, and commanded "to give an account of his stewardship," and of the souls committed to his care. The prospect of such a scene, and its appalling consequences, ought to make every such character *tremble*, if he really believes in a future retribution; and either throw aside all pretensions to the sacred office, or "break off his sins by righteousness," and "flee for refuge from the wrath to come."

In short, what was addressed by the prophet Malachi, in the name of Jehovah, to the priests of the Jews, might be addressed with propriety to many of the ministers of the New Testament Church, and ought to excite their solemn consideration: "Ye have departed out of the way; ye have caused many to stumble at the law; therefore have I made you contemptible and base before all the people; as you have not kept my ways, but have been partial in the law. Now, therefore, O ye priests, this commandment is for you—if ye will not hear, and if ye will not lay it to heart, to give glory to my name, saith the Lord of hosts, I will even send a curse upon you, and I will curse your blessings, yea, I have cursed them already, because ye do not lay it to heart."

7. Covetousness inclines men to *presumption and self-sufficiency*, as if they could live independently of their Maker, and consequently leads to a *virtual denial of a superintending Providence*.

God is the original source of existence and happiness. On him all creatures, from the archangel to the worm, depend for every enjoyment they now or ever will possess. Throughout every region of the universe; all the laws of nature, and all the movements of the material system connected with these laws, are absolutely dependent upon Him "who spake, and it was done," who gave the command, "and all things stood fast." Consequently, all the orders of intelligent beings, wherever existing throughout creation, are every moment dependent upon his superintendence and care, for the continuance of their

existence, and for every comfort they enjoy. Were he to withdraw his supporting hand, their existence and enjoyments would cease, the wheels of nature would stop, and the vast fabric of the universe would soon be transformed into one frightful and universal ruin. "For in Him we live and move, and have our being;" his visitation sustains our spirits, and in his hand is the soul of every living thing, and the breath of all mankind. It is, therefore, one of the first duties of every rational creature, to look up to God for every blessing, to *confide* in him for every earthly comfort, and to acknowledge his goodness for every *sensitive* as well as spiritual enjoyment he confers. To act otherwise, is virtually to call in question his existence, and his over-ruling providence.

But *riches*, to which the covetous appetite is directed, incline men to presume on their own *self-sufficiency*, and to rob God of that homage and confidence which is due to him as the Supreme Dispenser of every blessing. In many cases, they virtually depose God from his throne, and set up the world as the object of adoration and confidence. Instead of directing the soul to trust in the Most High in the midst of dangers and distress—"the rich man's *wealth* is his strong city, and as a high wall in his own conceit," to which he looks for defense in the prospect of whatever may befall him. Hence, it is declared of Israel, after they were filled with abundance, "their heart was exalted, therefore have they forgotten me, saith the Lord;" and hence the declaration of the Psalmist in regard to such, "they trust in their wealth, and boast themselves in the multitude of their riches." This confidence in wealth, and forgetfulness of dependence upon God, form some of the chief reasons why so many pointed injunctions are given in Scripture in reference to the evils of covetousness, and the danger attending the accumulation of wealth. It was on this account, chiefly, that the rich man "who had goods laid up for many years," was condemned. He *trusted* in these riches as the source of his happiness, and as a security in his own hands against every calamity; and he presumptuously calculated on the enjoyment of many years to come, forgetting that he was every moment dependent for existence on that Almighty Being, "in whose hand our life is, and whose are all our ways." This was likewise the characteristic sin of the rich voluptuary, "who was clothed in purple and fine linen, and fared sumptuously every day." He was not a miser, neither were the poor driven with insolence from his door; for Lazarus lay at his gate, and was fed with the crumbs from his table. But he was forgetful of God; his riches were his confidence; and led him to skepticism and irreligion, and to overlook and even deny the great realities of the eternal world. This is evident from his request, that Lazarus would go, in the capacity of a prophet, and testify to his brethren the truth and reality of a future state of existence.

This confidence in riches has, in thousands of instances, been a snare to professors of religion, especially when the open profession of genuine Christianity exposed to hazard their worldly possessions. Trusting more in their wealth than in the promise of divine protection, and looking more earnestly on the things which are seen and temporal, than on those which are unseen and eternal, they have turned aside from the profession of their faith, and virtually "denied the Lord who bought them." Eusebius, the ecclesiastical historian, relates, that "in the time of the severe

persecution of the church by the Emperor Decius, the rich men among the Christians were the most easily and miserably foiled." The love of the world vanquished their Christian fortitude, and led many of them to relapse into the profession of Pagan idolatry. In the time of the Arian persecution, many of the rich who occupied offices which should have led them "to contend earnestly for the faith once delivered to the saints," accommodated their profession to their desires after ambition and avarice. Like too many in our day, they had a political faith which was either orthodox or Arian, according as the State should determine, and as public favor and emolument should smile on the one or the other. The history of the church is full of examples of this kind, and there is too much reason to fear that there are many in our times, both among the clergy and the laity, following in their footsteps. It therefore becomes every one, and especially those professors of religion who are possessed of wealth, carefully to examine the state of their hearts on this point, and ascertain whether they are "trusting in the Lord," or "putting confidence in princes." In order to the exercise of confidence in God, it is necessary that we should sometimes be brought into straits and difficulties. When the poor are in want, or enjoy but a scanty portion of the good things of the world,—if they be Christians, it naturally leads them to a sense of dependence, and to look up to Him from whom all comforts flow; and it is highly expedient for the exercise of faith and hope, that we should frequently *feel* that we are dependent creatures. But riches have a *tendency*, if we be not every moment upon our guard, to make us forget our dependence upon the Most High, and to beget a spirit of pride and self-sufficiency, as if we were able to guide ourselves through the world, without being beholden to the care of Divine Providence. But, let such learn to know, that they stand as much in need of the care and protection of heaven, as the poorest wretch that wanders houseless and forlorn. They have food and drink of every quality, and in abundance. But can food ward off calamities or death? A tile falling from a house, the oversetting of a chariot, or a flash of lightning from the clouds, will kill a rich man as well as a poor. They have changes of costly raiment, while the poor are covered with rags. But will the gout, the palsy, the stone, or the burning fever, pay any respect to costly attire? or will the patient feel less agony under them, because he is covered with purple and scarlet? Beside, an earthquake, an inundation, a tempest, a conflagration, a shipwreck, the perfidy of friends, the midnight robber, or the convulsion of nations; all which events are under the direction of God—may, in a few days, sweep from them all their earthly possessions, reduce them to a state of indigence, and lay all their earthly glory in the dust. Hence the propriety of attending to the admonition of the Psalmist: "Trust not in oppression, become not vain in robbery; if riches increase, set not your heart upon them. Trust in Jehovah at all times, ye people, pour out your heart before him, God is a refuge for us."

8. Covetousness has produced *all the public evils, wars, and devastations which have happened in every age of the world.*

The records of history, as I have had occasion to notice, contain little else than disgusting details of the mischiefs and the miseries inflicted on the world, by the ambition and rapaciousness of mankind. The earth, which might long ago have been transformed into a scene of fertility and

beauty, by the benevolent agency of human beings, has, in most of its regions, been turned into a scene of desolation, by destroying armies prowling over every country in quest of plunder. Such is the insatiable appetite of *avarice*, that, not contented with "devouring widows' houses," spoiling the weak and defenseless in her native land, she has aimed at enriching herself with the plunder of Empires. Like hell and the grave, "she has enlarged her desire, and opened her mouth without measure, and the glory, the multitude and the pomp" of temples, cities, states, kingdoms, and continents, have become a prey to her ever-craving appetite, and been swallowed up and devoured. Yet, after all, she is never satisfied, and the whole earth becomes too narrow a theater for her rapacity and ambition. Alexander, in the mad career of his conquests, subdued and plundered the greater part of the known world, and had the riches and splendor of its most magnificent cities at his command; yet when he had finished his course, he sat down and wept like a crocodile, because he had access to no other world, that might serve as a theater for warfare and plunder. Thus it is that avarice would never curb her boundless desires, until she had glutted herself, not only with the spoils of this terrestrial region, but with the treasures of the universe; yet, like hell and destruction, she would never be satisfied. Nor would ambition—her kinsfellow and companion—ever cease its career, until it had subdued every order of intellectual existence, ascended the throne of the Most High, and seized the reins of universal government.

It would be needless to bring forward illustrations of this topic, or to attempt to show that the covetous and ambitious principle, has been the main cause of the wholesale destruction of mankind, and the wide spread of human misery, for almost the whole of the records of history contain little else than a continued series of illustrations on this point; and I have already, under the first head, selected a few examples, which might be multiplied a thousand fold.

But I cannot help pausing a little, to reflect on the numerous evils, and the incalculable misery which this unholy affection has produced in the world. Could we take only a bird's-eye view of its operations and effects, beginning at the first apostasy of man, and tracing them down the stream of time to the present day—and could we, at the same time, stretch our eyes over the globe, from north to south, and from east to west, and contemplate the miseries which have followed in its train in every land—what an awful and revolting picture would be presented to the view! But there is no eye, save that of Omniscience, which could take in the thousandth part of the widely-extended miseries and desolations which it has in every age produced. During the period which intervened from the fall of man to the deluge, this principle appears to have operated on an extensive scale, for we are told, that "the wickedness of man was great," and that "*the earth was filled with violence*,"—evidently implying that the strong and powerful were continually engaged in seizing on the wealth and possessions of the weak and defenseless, oppressing the poor, the widow, and the fatherless, plundering cities, desolating fields, and carrying bloodshed and ruin through every land—until the state of society rose to such a pitch of depravity, as rendered it expedient that they should be swept at once, with an overflowing flood, from the face of creation.

After the deluge, it was not long before the lust

of ambition began again to display itself by an inordinate desire after wealth and aggrandizement; and hence, wars were recommenced among almost every tribe, which have continued, in constant succession, throughout every generation to the present day. Wherever we turn our eyes over the regions of the globe, whether to the civilized nations of Europe, the empires of Southern Asia, the frozen regions of Siberia, the sultry climes of Africa, the forests and wilds of America, or even to the most diminutive islands, which are spread over the Pacific Ocean, we behold Covetousness, like an insatiable monster, devouring human happiness, and feasting on the sorrows and sufferings of mankind. But who can calculate the amount of misery which has thus been accumulated? It is more than probable, that the eighth part of the human race has been slaughtered by the wars and commotions which ambition has created; and consequently, more than *twenty thousand millions* of mankind have become its victims; that is, twenty-five times the number of human beings which compose the present population of the globe. Along with the destruction of such a number of rational beings, we have to take into account the millions of mangled wretches whose remaining existence was rendered miserable, the numberless widows and orphans who were left to mourn the loss of everything dear to them, the thousands of infants that have been murdered, and of females that have been violated, the famine and pestilence, and the frightful desolations which destroying armies have always left behind them. Many spots of the earth, which were beautiful as Eden, have been turned into a hideous wilderness. The most splendid and magnificent cities have been set on flames or razed to their foundations, and "their memorials have perished with them." Even the lower animals have been dragged into battles, and have become sufferers amidst the fury of combatants and the wreck of nations. Such are some of the hideous desolations, and the vast amount of human misery which covetousness has created; for to avarice, leagued with ambition, is to be attributed all the wars, commotions, and devastations, which have ever visited the world.

Beside such wholesale robberies and murders, covetousness is accountable for numerous *public frauds and mischiefs committed on a smaller scale* by the public agents and others connected with the governments of every country. In the management of taxes, the collection of national revenues, in contracts for the supply of armies and navies, in claims for undefined perquisites, in the bestowment of places and pensions, in soliciting and receiving bribes, in the sale and purchase of government property,—in these and numerous other instances, frauds and impositions are so frequently committed, as to have become notorious to a proverb. On such exuberant sources of wealth, multitudes are rapidly enriched; and while nations are ground down under a load of taxation, and the industrious laborer and mechanic groaning under the pressure of poverty, a comparatively few are rolling in the chariots of splendor, fattening on the sweat and blood of millions, and feasting on the sufferings of mankind.

It is amazing with what ease and apathy, men calling themselves Christians, will talk of the prospect of war, in the view of enriching themselves with such public plunder. Scarcely anything is more common, and yet nothing is more diabolical. To wish for war, that trade may revive and flourish, is to wish the destruction of ten thousands of our fellow-creatures, that we may

add a few pounds to our hoarded treasures, or have the prospect of embarking in a profitable speculation. Yet such wishes have been indulged a thousand times, by many who *profess* to be the followers of Christ.

9. Covetousness prevents the extension of the Christian Church, and the general improvement of Society.

It is by means of the proper application of money, that the gospel is promulgated, sinners converted, the Bible circulated, and the tidings of salvation conveyed to heathen lands. Much still remains to be done in these respects; for more than 600,000,000 of mankind still remain enveloped in pagan darkness. If all the members of the Christian Church were to contribute according to their ability, this object (the conversion of the world), however arduous and extensive, might ere long be accomplished. But avarice interposes, and withholds those resources which are requisite for carrying the plans of Divine Mercy into effect. If wealth were not hoarded by covetous professors of religion, or expended on their lusts, our Missionary and other Philanthropic Societies would soon have at their disposal, revenues twenty times, at least, their present amount. How many professed Christians are there, who are wallowing in wealth, and yet contributing nothing but the smallest fraction of their substance (and sometimes nothing at all) to the service of God and the extension of the Gospel Church! And how many others are there, who, at their death, leave twenty or thirty thousand pounds to their friends, and even to distant heirs, without bequeathing a single hundred—sometimes not a single guinea, for promoting the conversion of sinners, and the extension of the Redeemer's kingdom! Such persons evidently belie their Christian profession, and appear to have no Scriptural idea of their obligation to "honor the Lord with their substance," and of the great end for which wealth has been bestowed.

By such conduct, they virtually prevent the conversion of thousands, the reformation of the world, and the approach of that period, when "the knowledge of the Lord shall cover the earth, and all flesh see his salvation." They declare, in point of fact, that the hoarding of thousands of pounds (of which they do not stand in need), is a matter of more importance in their eyes, than the universal propagation of religion, and the eternal happiness of thousands of immortal beings. Whatever profession they may make, whatever show of piety they may assume, they place a barrier in the way of the progress of Christianity, and too plainly indicate, that the love of the world occupies a higher place in their hearts, than the love of God.

By such conduct, the general improvement of society is likewise prevented.

Before society arrives to that state of perfection, of which it is susceptible, much exertion and manifold reformations are required. The universal instruction of all ranks requires to be established on a more extensive and permanent basis than it has ever yet been. Seminaries for the education of the young, and likewise for those more advanced in life, require to be multiplied at least tenfold. Colleges and academies, of different descriptions, still remain to be established in such numbers as to afford an adequate supply of intelligent teachers and ministers of the Gospel, for diffusing both general and scriptural knowledge among all ranks of the community.

The physical condition of mankind, likewise requires to be meliorated and improved. Many

of our towns and villages require to be new-modeled, and rendered clean, airy and salubrious; and the condition of the mechanic and the laboring poor, rendered more comfortable, and more conducive to moral and mental improvement. All which objects might, at no distant period, be fully accomplished, were the superfluous wealth of the professing Christian world properly directed, and applied to its legitimate objects. But all such designs are prevented from being brought into effect, by the avarice of those who *profess* to have renounced the world and its vanities, and to be looking forward to a heavenly inheritance. There can scarcely be a more glaring contradiction, than that which such conduct and such professions imply. But as this is a topic of peculiar interest, I shall take occasion to enter into more minute detail on another branch of our subject.

10. The evil of Covetousness, will further appear, if we consider, *what would be the consequences were this impure affection UNIVERSALLY to prevail.*

Every principle and every affection in human beings, ought to be tried by the ultimate consequences to which it naturally and necessarily leads. On this ground, it might be shown, that every violation of the Divine law leads to misery, in one shape or another, both to the violator himself, and to all with whom he is connected. And farther—that if any one commandment of the law of God were reversed, or set aside, or *universally* violated, not only would the most appalling consequences ensue, but it would lead to the subversion of all order among intelligent agents, and would ultimately produce the extermination of the race of man.

The same, of course, may be affirmed of the covetous principle. Were it to reign supreme in the human heart, and to be *universally* acted upon, it would soon lead to the utter destruction of society. It would lead, in the first instance, to universal fraud, deceit and falsehood; so that no domestic nor public business, nor commercial arrangements of any description, could be carried on with the least degree of confidence. It would next lead to universal rapacity and plunder, which would produce a scene of turbulence and horror in which no human being could enjoy for any length of time, either happiness or repose. The strong would seize upon the possessions of the weak and defenseless, without the least remorse, and deprive them of everything that tends to enjoyment. Every one's covetous eye would be directed to the possessions of his neighbor; and, by a thousand insidious and malignant schemes, or by open violence, everything would be seized upon, and appropriated for the purpose of gratifying the covetous appetite. No one's life would be secure for a single week, and murders would be daily committed for the purpose of obtaining the wealth and possessions of the opulent. Of course, peace, and harmony, and kindness, would be unknown among men; every man's covetous heart be filled with malignity, and set against the interests of his neighbor. In the progress of such rapacity and plundering, wars of the most ferocious nature would take place. One nation would invade the territories of another, for the purpose of plunder; and, in the midst of the contests for spoil, cities and towns would be demolished; fruitful fields transformed into a scene of desolation, and myriads of the human race slaughtered in every land. Amidst such dreadful commotions, the fields would be permitted to lie waste and uncultivated, and human beings would be gradually diminished by slaughter, and universal famine, until, in the course of a generation or

two, the whole race would be extirpated from the earth.

Such would evidently be the progress and the dreadful effects of the covetous principle, were it to operate *universally and unrestrained*. Such effects, indeed, it has already, to a certain degree, produced; and the annals of every nation under heaven, bear witness to the melancholy truth.—And, were it not, that it is counteracted and restrained in its operations by the overruling Providence of God, by the force of natural conscience, and by the influence of Christian principles and motives, it would soon transform this globe into an immense sepulcher, overspread with desolation and dead men's bones, and fit only for a habitation to the beasts of prey. The very circumstance, that it has never yet produced such a terrible effect, is an evident proof that a moral governor superintends the affairs of this world, and by his wise and merciful arrangements, sets "restraining bounds" to the passions of men, that his benevolent purposes in relation to our race, may in due time be accomplished.

It is evident, then, that an affection which produces such debasement of mind, and which naturally leads to such dismal and appalling consequences, must embody within it the *essence of almost every evil*, and of every species of moral turpitude; and, although it may appear comparatively harmless, when confined to a narrow sphere, and covered with a cloak of hypocrisy, yet it only requires to burst its confinement, to be blown into a flame, and to have free scope for its destructive energies, in order to undermine and overturn the whole fabric of the moral universe. This consideration deserves the serious attention of every one who feels the least rising of such an unhalloved passion, and should induce him to exercise holy jealousy over himself, and to use every Scriptural means to repress and counteract its first emotions. His prayer to God should be like that of the Psalmist, "Search me, O God, and know my heart; try me, and know my thoughts. Turn away mine eyes from beholding vanity; incline my heart unto thy testimonies, and not to covetousness, and lead me in thy way everlasting."

I might likewise have enumerated among the evils produced by covetousness, the host of vices, and the anxious fears, and tumultuous passions connected with this affection—its baneful influence on friends and relatives, and on general society; that it incapacitates the individual in whose heart it reigns for enjoying substantial happiness; that it was one of the impulsive causes of the death of Christ; that, when fostered through life, it becomes *inveterate* in old age, and retains its strength and vigor, when almost every other vice has withered and decayed; and, that it has, to a certain extent, prevented the *union* of the Christian church, and the affectionate intercourse of its members. But without dwelling on these and such particulars, I shall only observe,

In the last place,—that Covetousness indulged and persisted in through life, *infallibly leads to misery in the life to come*.

"Be not deceived," says an ambassador of heaven, "neither idolaters, nor thieves, nor covetous, nor revilers, nor extortioners, shall inherit the kingdom of God." What a terrible and appalling denunciation, when contemplated in all its extent, and its eternal consequences! Such characters *shall not inherit the kingdom of God*. And we expressly told, that they who are banished from this kingdom, "shall be cast into the lake of fire which burneth forever and ever;" and that "they

shall be punished with everlasting destruction from the presence of the Lord, and from the glory of his power." A covetous man is, therefore, in as direct a course to eternal misery, as the most licentious profligate, or the most atrocious characters. If men really believed in the realities of an eternal world, and in the certainty of such terrible denunciations being accomplished, how would it make their whole frame tremble at the awful prospect! But no hearts are harder than the hearts of the covetous. They are surrounded as with a wall of adamant, and fortified against every admonition, so that neither the voice from Mount Zion, nor the threatenings from Sinai, can make the least impression; and the longer they live in the world, the more impenetrable do they become, until, in the righteous judgment of God, they are sometimes given up to a hardness which nothing will penetrate but the sharpness of "unquenchable fire." This is a consideration which demands the serious attention of the young, and of those in the prime of life. It shows, with what care and holy caution, they ought to guard against the first emotions of every vicious passion, and particularly against the emotions of covetousness; for, if they be indulged, they will grow with their growth, and strengthen with their strength, until they become *inveterate* habits, which no human power can eradicate.

I have already shown (see page 33), that the covetous must necessarily be banished from the kingdom of the just, because they are altogether unfit for relishing its pleasures, or engaging in its employments. But exclusion from the society and the joys of heaven, is not the only punishment they will suffer. They will be subjected to positive misery; and, among other sources of misery, they will be tormented with restless and insatiable desires, which will always be raging, and which will never be gratified. In the present life, while covetous desires were raging, they were *partially* gratified. But, in the future world, gold, and silver, and splendid possessions, such as are now the object of desire, will be forever beyond their reach; and, consequently, they must suffer all that is included in boundless desires and craving appetites, which are never to be gratified. Beside, all that is included in those striking representations of Scripture—"the worm that never dies; the fire that is never quenched; weeping and wailing, and gnashing of teeth; and the blackness of darkness forever," will be the portion of the ambitious and avaricious sinners, who are banished from the glories of the New Jerusalem. What will it then avail the covetous sinner, that he had heaped up gold as the dust, and silver as the stones of the field? or the ambitious sinner, that he rolled on the wheels of splendor, and fared sumptuously every day? Will riches profit in the day of wrath? Will the *recollection* of bags of gold, and chests of dollars treasured up in this fleeting world for profligate heirs, alleviate the anguish of the miser's soul in the place of punishment? Will the gay and licentious worldling find his torments assuaged by *revolving the idea*, that he was transported to hell in a splendid chariot? and that he left his degenerate offspring to be conveyed with the same pomp and equipage to the place of misery? Alas! such recollections, instead of alleviating, will only enhance the unutterable anguish of the inhabitants of Tophet, and add new fuel to the fire which is never to be quenched. Oh, that the sons of avarice and ambition, "were wise, that they understood these things," and that they would consider the eternal consequences of their present affections and con-

duct? Nothing can be more foolish than to prefer shadows to realities, trifles to the most momentous concerns, fleeting baubles to an enduring substance, riches that perish in the using to "a treasure in the heavens that fadeth not," the fashion of the world that passeth away, to an "incorruptible inheritance, and an exceeding great and eternal weight of glory." What is the hope of the hypocrite when God taketh away his soul? Yea, "what will it profit a man, though he should

gain the whole world, and lose his own soul? or what shall a man give in exchange for his soul?" It is, therefore, the dictate of true wisdom, and accordant with every rational principle, to mortify every unholy affection, to despise the vain blaudishments of the world, that lieth in wickedness, to exercise contentment under the allotments of Providence, and to aspire after the enjoyment of that inheritance "which is incorruptible, and that fadeth not away."

CHAPTER V.

ON THE PRINCIPLES BY WHICH CHRISTIANS SHOULD BE DIRECTED IN THE APPLICATION OF THEIR WEALTH.

THERE are, perhaps, few things connected with the social state, of more importance than the proper distribution and application of wealth; yet there is no subject about which so many foolish and erroneous conceptions are entertained. Every man seems, in this respect, to consider himself as a kind of independent being, and to imagine that he has full power, both physical and moral, "to do with his own as he pleases." That he is invested with a sovereign right, either to give or withhold his money, as he thinks fit, and that no one has authority to say to him, "what dost thou?" Even Christians have not yet learned the legitimate use and application of riches, notwithstanding the pointed injunctions and the specific principles on this subject laid down in the word of God; and hence it has too frequently been considered as no way inconsistent with the profession of Christianity, for Christians to act, in this respect, in accordance with the maxims of general society, and the common practices of the men of the world.

It is now more than time that other and nobler views were entertained and acted upon by those who profess to be followers of the lowly Jesus—views accordant with the instructions of their Divine Master, and the admonitions of his holy prophets and apostles. In order to a slight elucidation of this subject, I shall, in the first place, offer a few general remarks, connected with this topic,—and, in the next place, inquire what proportion of their worldly substance, Christians ought to consecrate to the good of society, and the promotion of religion.

I. In reference to the first department of this subject, the following general principles, among many others, require to be recognized:

1. *God is the original source of all the riches we enjoy.*

"The earth belongs to Jehovah, and the fullness thereof, the world and they that dwell therein. Every beast of the forest is his, and the cattle upon a thousand hills." "The silver is mine, and the gold is mine, saith the Lord of Hosts." All the treasures of the universe were brought into existence by His creating power, and distributed, in certain proportions, to all the ranks of sensitive and intellectual existence which people the amplitudes of creation. To man he assigned the productions of the field, the wealth of the mineral kingdom, and the treasures of the deep; and it is owing to his benevolent care and overruling Providence, that any one is per-

mitted to procure such riches, and to enjoy those comforts of which they are the sources. Hence, it is declared by an inspired writer, "Thine, O Lord, is the greatness, and the power, and the glory; for all that is in the heavens and in the earth, is thine. Thine is the kingdom, O Lord, and thou art exalted above all. Both riches and honor come of thee, and thou reignest over all and in thine hand is power and might; and in thine hand it is to make great, and to give strength unto all." These are truths connected with the very idea of the existence of an Eternal and Independent being, from whom creation derived its origin; and yet they are overlooked by the greater part of mankind, as if they were a species of independent beings, and as if their own powers alone had procured them the treasures they possess. The full recognition of this fundamental truth, that "God is the original source of all riches," would introduce a most important change in the views of men with regard to wealth, and to the purposes to which it ought to be applied; and would produce a benign influence on all the movements of the Christian and the moral world.

2. *Riches are given as a trust to be employed in the service of God, and for the good of men.*

It is evident, from the very nature of the Divine Being, that wealth, when bestowed, was intended to be used in accordance with his will, and in subserviency to the accomplishment of his designs, in the moral government of the world. In conducting the affairs of the moral system, human beings are the agents he most frequently employs; and the wealth he has put into their hands has a powerful influence in accomplishing purposes either good or bad, according to the disposition of the agents. If he has intended, as his word declares, that the revelations of his will should be made known throughout the world, and that "the gospel should be preached to every creature," money is one of the grand means by which this important object is to be accomplished; and, in the present state and constitution of the world, or according to the fixed principles of the Divine Government, it is impossible that, without this mean, such a design can be brought into effect.* If he has distributed wealth in different proportions, to different individuals, and, if it is his intention to communicate happiness to his

* From what we know of the plan of the Divine Government, we have no reason to believe that any *miraculous* interposition will take place to effectuate the objects to which I allude. See Chapter VI.

creatures, and that a certain proportion of his bounty should be enjoyed by all, then it must evidently be his will, that those who abound in riches, should "be ready to communicate," and to impart a certain portion of them to those who are in need. Hence it is commanded, "if thy brother be waxen poor, and fallen into decay, then thou shalt relieve him. Thou shalt open thy hand wide, and shalt surely lend him sufficient for his need in that which he wanteth." "He that hath pity upon the poor, lendeth unto the Lord; and that which he hath given, will he repay him again." "Blessed is he that considereth the poor, the Lord will deliver him in the time of trouble." "Charge them that are rich in this world, that they do good, that they be rich in good works, ready to distribute, and willing to communicate." Such injunctions are laid upon the wealthy, not as a tax or a burden, but for the purpose of calling forth into exercise the principle of benevolence; of promoting a reciprocal interchange of kindly affections and good offices between man and man; and for demonstrating the truth and efficacy of our Saviour's Divine maxim, "it is more blessed to give, than to receive."

Now, if riches, instead of being applied, in part, to such purposes as now stated, are devoted solely to base and selfish ends, to sensual gratification, to foster a passion for worldly splendor and aggrandizement, or to subserve the purposes of bribery, political rancor, or party spirit—they are consecrated to objects *directly opposite* to those which God has commanded, and determined to accomplish; and, consequently, have a tendency to frustrate, if it were possible, the plan of Divine Benevolence, and the regeneration of the world.

Since riches, then, are committed to us, as a trust from God, to be employed in his service and according to his will, every one who dares to devote them solely to such sinister purposes, must be considered as trampling on the authority of his Maker, and setting at defiance the laws of Him, whose sovereign will all the elements of nature, and all the hosts of heaven obey; and, consequently, subjects himself to the infliction of the threatenings denounced against such in the Divine word.

Our Saviour illustrates these positions in the parable of the nobleman, who delivered to his servants ten pounds, with the charge, "occupy until I come," and in the parable of the "talents," which were given to "every one according to his ability." These pounds and talents evidently denote the powers, genius, *wealth*, or authority, with which men are intrusted by their Creator, and which ought to be consecrated to the promotion of his glory and the benefit of mankind. That we are accountable for the use we make of such gifts, appears from the high rewards conferred on the faithful servants, and from the condign punishment inflicted on those who abused or misapplied the talents committed to their trust; "Cast ye the unprofitable servants into outer darkness, there shall be weeping and gnashing of teeth. These mine enemies, who would not that I should reign over them, bring hither and slay them before me." These are words of the most awful import; and the sufferings inflicted on them will be felt in all their appalling and eternal consequences, by those to whom they refer; and therefore, they deserve the most serious consideration of all those, who, in the spirit of pride and independence, imagine, that "they can do with their own as they please." And, if riches be a trust committed to us by God, to be employed in

his service, we are as much bound to apply them to their legitimate use, as a servant to whom money is intrusted by his master, is bound to apply it to the purpose for which it was intended, and for which he must render an account. And, at that important day when the Son of man shall appear in his glory, to call his professed servants to give an account of their stewardship—the manner in which the wealth committed to our care was expended, will then undergo a solemn and impartial scrutiny in the presence of an assembled world. And happy only will they be, who shall be enabled to "give in their account with joy, and not with grief," and receive the approbation of the Great Master, "well done, good and faithful servants, enter ye into the joy of your Lord." In the description which our Saviour gives of the solemnities of the final judgment, the eternal destiny of the human race is represented as depending upon the manner in which they employed the wealth and influence, with which they were intrusted: "depart from me, ye cursed; for I was an hungered, and ye gave me no meat; I was thirsty, and ye gave me no drink; I was a stranger, and ye took me not in; naked, and ye clothed me not; sick and in prison, and ye visited me not: verily, I say unto you, inasmuch as ye did it not to the least of these, my brethren, ye did it not to me. And these shall go away into everlasting punishment, but the righteous into life eternal."

3. Christians are bound to dedicate their substance to the Lord, *from a consideration of the love of Christ in laying down his life for their redemption.*

The apostles, in all their writings, delight to expatiate on the love of Christ, as comprising within its range a height and a depth a length and a breadth, "which surpasses the grasp of human comprehension, and as being the most glorious display of Divine mercy and benevolence, ever made to our world." Enraptured with this sublime idea, the apostle John exclaims, "Behold! what manner of love the Father hath bestowed upon us, that we should be called the sons of God! In this was manifested the love of God toward us, because he sent his only begotten Son into the world that we might live through him. Herein is love, not that we loved God, but that He loved us, and sent his Son to be the propitiation for our sins." This love demands the noblest sacrifices we can make for the honor of God, and for testifying our gratitude for the unspeakable favors conferred upon us through the death of his Son. Hence, the apostle Paul, in his own name and in the name of all true Christians, declares, "The love of Christ constraineth us, because we thus judge, that if one died for all, then were all dead, and that he died for all, that they who live, should not henceforth live unto themselves, but unto him who died for them and rose again." In this passage, the phrase "constraineth us" imports, being carried along, or borne away as with a strong and resistless impulse, like that of a torrent which sweeps away everything before it. The first Christians were so carried aloft as it were on the wings of love and holy desire, that all selfish aims and worldly considerations were completely overpowered and subdued. They considered their wealth and influence as wholly consecrated to the service of their Redeemer; they forsook all their earthly possessions from love to his name, and that they might promote the interests of his kingdom. They took joyfully the spoiling of their goods, knowing, that in heaven they had a better and more enduring

substance; they accounted "all things as loss in comparison of the excellency of Christ Jesus," and reckoned the sufferings of the present life as unworthy to be compared with the glory which is to be revealed. Every Christian ought to be animated with such noble principles and such elevated views and affections, if he claims a right to be distinguished by that sacred name. And, if he is inspired with such hallowed emotions, he will not "henceforth live unto himself," for the mere gratification of his own appetites and passions, or for his own ease, aggrandizement, or secular interests, as if these were the chief objects of their pursuit. But "he will live unto Him who died for him and rose again." He will consecrate his moral and mental powers, his wealth and influence, and all the talents he possesses, to the furtherance of the kingdom of Messiah, and the extension of his glory through the world; and, whatever has a bearing, however remote, on this grand object, will meet with his cordial approbation and *pecuniary* support. In promoting such objects, he will not be guided by the narrow and selfish principles of commercial policy, but by the ardor of his love to the unseen Redeemer, and by the consideration, that all he possesses was derived from the Divine bounty; and will say with David, when he distributed his treasures for rearing the temple of the Lord; "All things come of Thee, and of *thine own* have we given thee."

II. Let us now inquire more particularly what proportions of our worldly substance should be directly consecrated to the service of God.

This is a point, which, in many cases, is difficult to determine; and in some instances, it must be left to the consciences of professed Christians to decide, as in the sight of God, and as amenable to him—what portion of their riches should be directly appropriated to his service. But there are certain general principles which may be laid down, by which, every one who has expansive views of the importance of salvation, and the nobleness and generosity of the Christian character, may be directed in this matter; and by which it may be made to appear, that ten times more than has generally been allotted ought to be exclusively consecrated to the honor of God, and the regeneration of man. In addition to the three propositions noticed above, the following general maxims may be stated;—1. Wealth is of no use only according to the manner in which it is employed. 2. It is by means of riches that the poor are provided for, that the salvation of the gospel is brought into effect, and that the moral world will ultimately be enlightened and regenerated. 3. That we ought to give a portion of our substance, in some measure corresponding to the importance and the magnitude of the object to which it is devoted. 4. That a comparatively small portion of wealth is adequate to procure everything that is requisite to the true happiness of man. 5. That all useless luxuries, and splendid equipage, intended only for mere pomp and show, should be discarded by every Christian. 6. That all, or, at least, the greater part of the wealth which remains, after providing in a decent and Christian-like manner for the comfort of our families, should be devoted to the interests of the Redeemer's kingdom, and the general improvement of the social state, in subordination to this grand object. 7. That our chief object in acquiring riches should be, that we may have it in our power to consecrate a large portion of it to the furtherance of the grand objects to which I allude. Taking the above and similar principles

for granted, we may now descend to the consideration of a few particulars.

1. The proportion of wealth commanded to be dedicated to the service of God, under the Jewish economy, may be considered as involving a certain principle, by which we may be directed in similar allotments under the Christian dispensation.

It is well known, that the *tenth part* of the produce of the Land of Canaan was required from the people for the maintenance of the priests and Levites. "Behold," saith God, "I have given the children of Levi all the tenth of Israel for their inheritance, for their service which they serve."* This tithe the people paid both from the animal and vegetable produce of their estates, from the seed of the lands and the fruit of their trees, from their goats, sheep, and cattle.† Out of this tithe the Levites paid a tenth part to the priests, for their services connected with the tabernacle or temple.‡ Beside this tithe which the people were ordered to pay to the Levites, they were also to pay a tenth part of the remaining nine parts of that tithe to make a feast in the court of the sanctuary, or in some apartment belonging to it. At this feast, which was kept as an expression of their gratitude to God for the bounties of his providence, they were to entertain, along with their own families, some of the Levites.§ The priests were the ministers of Jehovah, who superintended the offerings at his altar, and conducted the worship of the sanctuary. The Levites were dispersed among the other tribes throughout every part of Canaan, and had forty-eight cities allotted them, of which thirteen belonged to the priests. Their principal office was, to instruct the people in the law of God, and to preserve and teach knowledge throughout the whole land. So that the tithe of the produce of the land was appointed not only for the support of the *priests*, but for the *instructors of youth, and of all classes of the people throughout the tribes of Israel.*

Beside this regular tithe, the Jews were obliged to abstain from all the fruits that grew on trees new planted, for the first three years, which were accounted as uncircumcised, and it was a crime for the owners to appropriate them.|| The fruits of the *fourth* year were devoted to the Lord: they were either sent to Jerusalem, or, being valued, they were redeemed by a sum equivalent paid to the priest, so that the people did not begin to enjoy the produce of their fruit trees until the fifth year. They were likewise obliged every year to offer to God "the first of all the fruits of the earth."¶ "When the head of a family," says Saurin, "walked in his garden and perceived which tree first bore fruit, he distinguished it by tying on a thread, that he might know it when the fruits were ripe. At that time, each father of a family put that fruit into a basket. At length, all the heads of families who had gathered such fruit in one town, were assembled, and deputies were chosen by them to carry them to Jerusalem. These offerings were put upon an ox, crowned with flowers, and the commissioners of the convoy went in pomp to Jerusalem singing these words of the 122d Psalm, 'I was glad when they said unto me, let us go up to the house of the Lord.' When arrived at the city they sang these words, 'Our feet shall stand within thy gates, O Jerusalem.' At length, they went into the temple, each carrying his offering on his shoulders,

|| Lev. xix. 23.

¶ Deut. xxvi. 2—18.

the king himself not excepted, again singing, 'Lift up your heads, O ye gates, and be ye lifted up, ye everlasting doors. Lift up your heads, O ye gates, and be ye lifted up, ye everlasting doors.'" The Jews were also obliged to leave the corn "on the corners of the fields;" for the use of the poor,* and in order to avoid the frauds which might be practiced in this case, it was determined to leave the *sixtieth* part of the land as a just proportion for the poor. The ears of corn which fell from the hands in harvest, were devoted to the same purpose; and the Jews held themselves obliged by this command of God, not only to leave the poor such ears of corn as fell by chance, but to let fall some freely, and of purpose for them to glean. The produce of the earth, every seventh year, belonged to the poor, at least the owner had no more right than those who had no property.† This command is express, and the Jews have an idea of this precept, that they pretend the captivity in Babylon was a punishment for the violation of it. All debts contracted among the Jews were released at the end of every seven years; so that a debtor that could not discharge his debts within seven years, was, at the end of that time, released from all obligation to discharge it.‡ To all these offerings and expenses are to be added extraordinary expenses for sacrifices, oblations, journeys to Jerusalem at the solemn feasts, the half-shekels to the sanctuary, and various other items connected with the political state and ceremonial worship of the Jews, so that more than one-fourth, and perhaps nearly *one-half* of their incomes was, in such ways, devoted to public and religious purposes.

Now, if the tenth part, at least, of the income of every Israelite was to be devoted to such purposes, it would seem to follow, that *nothing less* than this proportion should be allotted by every Christian under the gospel dispensation, for similar or analogous purposes. But it does not limit us to this proportion; as there are obvious reasons why it should be much greater under the New-Testament economy. If the propagation of divine knowledge within the narrow limits of Judea required such a proportion of the income of every individual, while no missions were appointed to surrounding nations; much more, it is evident, is required under the present dispensation, when we are commanded to "Go into all the world, and preach the gospel to every creature," and when more than six hundred millions of the earth's population are still immersed in Pagan and Mahometan darkness, ignorant of "the true God and of Jesus Christ whom he hath sent." The exertion now required ought to be in some measure proportionate to the magnitude and extent of the work to be accomplished, and would require an expansion of heart, and the manifestation of a spirit similar to that which was displayed on the day of Pentecost, when "all that believed were together and had all things common, and sold their possessions and goods," and devoted them to the cause of their Redeemer. If Christians be really in earnest, as they ought to be, why should they hesitate a moment on this subject? If they see misery everywhere around them, and multitudes perishing in their sins, if they behold hundreds of millions of the heathen world, overspread with moral and intellectual darkness, and perishing for lack of knowledge, if even the rude inhabitants of the Navigator's isles, are sending their urgent petitions from afar, saying, "Send over missionaries and help us;" if they are saying, almost

in an agony, as they lately did to Mr. Williams, when he promised to come to Britain for a supply,—"We shall perhaps die, we shall die, we shall die, before you can return;" if Christians believe that "the redemption of the soul is precious," and that the eternal happiness of immortal minds so far surpasses in value, the fleeting honors of the world, as the heavens in height surpass the earth, why should they remain in apathy or halt between two opinions on this point? Let wealthy Christians come forward with a noble spirit, and either consecrate a liberal portion of their riches, with cheerfulness, for such objects, or take the only consistent alternative—*throw aside altogether the Christian name*; for a covetous Christian is a nuisance in the church of God, and a *contradiction in terms*.

Let us now consider the sums that might be raised, supposing only one-tenth of income to be set apart for the purposes of philanthropy and religion. Supposing the population of Great Britain to amount to 16,000,000, and reckoning only 2,000,000 heads of families, or the eighth part of the population to be connected with a Christian church; and supposing, farther, that only one-fiftieth part of these, or 40,000, have incomes averaging £500; the tenth of these incomes would produce a sum of £2,000,000. Supposing the tenth part of the remaining population, 196,000, to have incomes of £200 a year, the annual tithe would be £3,920,000. Suppose the remaining 1,764,000, to have, at an average, £80 per annum, its tithes would amount to £14,112,000, so that the whole of this supposed annual tithe of income would amount to above *twenty millions* of pounds, which is more than forty times the amount of the annual funds of the Bible, Missionary, and other philanthropic societies in Great Britain, which do not amount to *half* a million. In this calculation, I have not taken into account a million or two of grown-up individuals, belonging to the different families in the kingdom, who have separate establishments from their parents, and who might be supposed to contribute several millions of pounds. Nor have I taken into the calculation several thousands of the nobility and gentry, who occupy the highest places of society—some of whom could afford from one to ten thousand pounds annually, and which would add a considerable number of millions to the sum above stated. If such sums could be raised, without subtracting any substantial comfort from a single individual, how small is the number of Christians worthy of the name, to be found in our country? since the fiftieth, or even the hundredth part of this sum can scarcely be raised among all the ranks and denominations of Religious society. But much more than even the above stated proportion ought, in numerous instances, to be devoted to religion and philanthropy. If, for example, a person has an income of £900 a year, I have no hesitation in saying, that, if he wished to act as a steward under God, for the distribution of his bounty, he ought to consecrate, at least, £400 annually to the promotion of Christianity and general improvement. And will any one aver, that the remaining £500 is not sufficient to procure every comfort that a rational or Christian character ought to desire. But the whole £900, it may be said, is requisite for the individual to keep up the dignity of his station. If keeping up the pomp and dignity of a station, is to be set in competition with the demands of religion, then let the individual take the world on his back and march off as far as he can from Christian society; for such persons have too frequently been a pest to

* Lev. xix. 9.

† Lev. xxv.

‡ Deut. xv. 2.

religious associations. Verily I say unto him, he shall have his reward; but a reward after which, I trust in God, I shall never aspire. Let such remember the Divine admonition, "Ye cannot serve God and Mammon." There is an absolute incompatibility between the service of the one and of the other; and he who is not prepared to give up worldly maxims, pomp, and splendor, and to devote his influence and his superfluous wealth, to the cause of religion, ought not to assume the Christian name.

2. The *voluntary contributions* made at different times under the *Jewish economy* may be considered as a guide to direct us in the liberality which should be displayed among Christians.

When the tabernacle was about to be reared in the wilderness, there was a noble display of liberality on the part of the people. "They came, both men and women, as many as were willing-hearted, and brought bracelets, and ear-rings, and tablets, all jewels of gold; and every man that offered, offered an offering of gold to the Lord.—And every man with whom was found blue, and purple, and scarlet, and fine linen, and goats' hair, and red skins of rams and badgers' skins, brought them. Every one that did offer an offering of silver and brass, brought the Lord's offering; and all the women that were wise-hearted did spin with their hands, and brought that which they had spun, of blue, and of purple, and of scarlet, and of fine linen. The rulers brought onyx stones, and stones to be set for the ephod, and for the breastplate, and spice, and oil for the light, and for the anointing oil, and for the sweet incense," &c.* Such was the holy ardor of both sexes, and of all ranks of the people, in bringing forward these voluntary offerings, that it was judged expedient to issue a proclamation to restrain their liberality. "The people bring much more than enough for the service of the work which the Lord commanded to make. And Moses gave commandment, and it was caused to be proclaimed without the camp, saying,—Let neither man nor woman make any more work for the offering of the sanctuary."† On this occasion, the amount of the offerings of gold and silver alone, was twenty-nine talents, and 730 shekels of gold, and 100 talents, and 1775 shekels of silver;‡ which, reckoning according to the *present value* of British money, would nearly equal the sum of four hundred thousand pounds.§ To this sum must be added the value of the vast quantity of brass which was used in the construction of the court and furniture of the tabernacle—the rich embroidered curtains which covered it, and which surrounded the court; the jewels that were set in the High Priest's ephod and breastplate, and various other materials and utensils which are stated in the description of the sacred edifice—all of which must have amounted to an immense sum. Yet all this treasure was brought forward with the greatest alacrity, by a nation that numbered little more than half a million of males, from twenty years old and upward, and whose whole population must have been inferior to that of Scotland.

At the *dedication* of the tabernacle, some time afterward, the offerings of the twelve princes, or heads of the tribes of Israel, were likewise mun-

ificent amounting in silver vessels to 2400 shekels of the sanctuary, and in gold vessels to 120 shekels, which (reckoning the silver shekel at five shillings, and the gold shekel at £30,* according to the *present value* of British money), would make £4200, or £350, for each of the princes.—Beside these, there were likewise offered thirty-six bullocks, and 216 sheep, goats and lambs, which would amount to about £800 more. At the dedication of the *Temple*, Solomon offered a sacrifice of 22,000 oxen, and 120,000 sheep,† which, in value, was equal to more than £460,000, a sum which is greater than the amount of the whole funds of the "British and Foreign Bible Society," during the first nine or ten years of its existence. When Hezekiah commenced a work of reformation among the people of Judah, similar costly sacrifices were voluntarily brought forward by the people. "The number of burnt-offerings which the congregation brought, was 70 bullocks, 100 rams, 200 lambs; and the consecrated things, 600 oxen, and 3000 sheep;" which would equal in value about £13,000. These, and other consecrated things, the people offered with the greatest cheerfulness and alacrity: "For as soon as the commandment came abroad, the children of Israel brought, in abundance, the first-fruits of corn, wine, and oil, and honey, and all the increase of the field, and the tithe of holy things, which were consecrated to the Lord their God, and laid them by heaps,"‡ so that Hezekiah and his princes, when they saw the heaps which had been collected from every part of the land, for four months, were filled with gratitude, and "blessed Jehovah and his people Israel." All these offerings flowed from the voluntary contributions of the people; and, although the Almighty does not need "to eat the flesh of bulls, or to drink the blood of goats," yet we are commanded to offer unto God thanksgiving, and to pay our vows to the Most High. These offerings, in connection with their typical references, were intended as a manifestation of the gratitude of the people to God for all his goodness, and an evidence of their desire to co-operate with him in promoting his merciful and gracious designs; and, with similar views ought all the contributions and offerings of Christians to be brought forward.

When Josiah, the great-grandson of Hezekiah, made preparations for a solemn passover to the Lord, "he gave to the people for the passover offerings, 30,000 lambs and kids, and 3000 bullocks." "And his princes gave *willingly* to the people, the priests and the Levites. Hilkiah, Zechariah and Jehiel, rulers of the house of God, gave to the priests, for the passover offering, 2600 small cattle and 300 oxen. Conaniah also, and She-maiah and Nathaneel, his brethren, and Hashabiah, and Jehiel, and Jozabad, chief of the Levites, gave to the Levites for passover offerings, 5000 small cattle, and 500 oxen." The expense of all these offerings, according to the value of such property in the present day, would amount to about *one hundred thousand pounds*, of which 60,000 was given by the king. The offerings of the three rulers of the temple amounted to £13,400, or £4350 to each; and those of the six chiefs of the Levites to £25,000, which is about £4166 to each

* Exod. xxxv. 22-29

† Ib. xxxvi. 5, 6.

‡ Ib. xxxviii. 24, 25.

§ Bishop Cumberland calculated the amount in English coin, to be £182,568. But as this calculation was made about a century ago, this sum requires to be more than doubled to express the *present value* of British money.

* About the beginning of last century the Jewish silver shekel was valued at 2s. 6d. and the gold shekel at £15, corresponding to the value of money at that period; but as British money has increased in value since that time more than one-half, the silver shekel ought not to be valued at less than 5s. nor the gold one at less than £20 of British money at its present standard.—See Num. vii. 85-88.

† 2 Chron. vii. 5.

‡ 2 Chron. xxix. 32; xxxi. 5-7.

individual, which must certainly be considered as munificent donations, when we consider, that they were contributed only for *one particular* solemnity.* And let it also be remembered, that they were all *voluntary* offerings, independent of the regular tithe and other contributions required from Jewish worshippers. Where have we such munificent donations from those members of the Christian church who have incomes of several thousands a year? If two or three philanthropic individuals, in the course of a generation, bestow such contributions for the interests of religion, it is considered as a kind of phenomenon in the Christian world. When the Israelites returned from Babylon to Jerusalem in the days of Ezra, we are informed by that sacred historian, that, "when he weighed the silver and the gold, and the vessels, the offering of the house of the Lord, which the king and his lords and all Israel there present had offered," it amounted to "650 talents of silver, and silver vessels an hundred talents, and of gold an hundred talents; also twenty basins of gold, of a thousand drams, and two vessels of fine copper, precious as gold." The whole value of this dedicated treasure, calculated at the rate formerly stated, would amount to £761,250.†

But, the most munificent donation of this kind anywhere recorded, is that of David for the purpose of rearing a temple for the worship of Jehovah. In chapter xxii, of the first book of Chronicles, verse 14, we are informed, that David "in his trouble prepared for the house of the Lord an hundred thousand talents of gold, and a thousand thousand talents of silver; and of brass and iron without weight;" and in chapter xxix, 3-9, it is stated, that beside this sum there were given "three thousand talents of gold, of the gold of Ophir, and seven thousand talents of refined silver to overlay the walls of the houses." His princes, captains, and the chief of the fathers likewise "offered willingly" to the amount in gold of "five thousand talents and ten thousand drams, and of silver ten thousand talents, and of brass eighteen thousand talents, and one hundred thousand talents of iron." The whole of these offerings, beside the brass, and iron, amounted to 108,000 talents of gold, and 1,017,000 talents of silver. Now, as the talent of gold has been estimated by some at £5425, and the talent of silver at £342—the whole of this treasure would not be much less than a *thousand millions of pounds sterling*. And we are told, that, in so far from being given with a grudge, "the people rejoiced, for that they offered willingly; because with perfect heart they offered willingly to the Lord; and David the king also rejoiced with great joy, and blessed the Lord before all the congregation," ascribing the whole of this treasure, and the liberal dispositions of the donors to Him who is the creator of heaven and earth, and the original source of every blessing. "All things come of thee, and of *thine own* have we given thee. All of this store we have prepared to build thee an house, for thy holy name cometh of thine hand, and *is all thine own*."

Several other examples might have been produced to illustrate the liberality which was displayed under the Old Testament economy, especially when the people were stirred up to engage in a work of reformation; but the above may suffice to show that much more liberal offerings

were voluntarily brought forward in the Jewish church than have generally been contributed under the Christian dispensation. And will any one presume to deny, that the liberality displayed by pious worshippers among the Jews, ought to be imitated by the faithful under the New Testament economy? The examples of the pious Israelites, in this respect, were undoubtedly intended as a pattern to the Christian church, and the offerings then made may be considered as typical or emblematical of the more splendid offerings which would be exhibited by New Testament saints, when "God shall appear in his glory to men, and build up the walls of his Jerusalem," and cause "Zion to appear beautiful and glorious in the eyes of the nations." Let it not, however, be imagined, that we are *merely to imitate* the Old Testament saints, and to rise no higher in our contributions than what was requisite under that economy. For Christians are called to a *much more arduous and extensive work* than the nation of Israel. THE FIELD of Divine labor in which Christians are called to be employed, "is THE WORLD;" and the tenth part of this field has not yet been subdued or cultivated. And the call addressed to the church by Him who hath all power and authority in heaven and on earth, is, "Preach the gospel to every creature." In proportion, then, to the superior grandeur and magnificence of the enterprise should be the munificence of the contributions by which it is to be accomplished. In this enterprise, Christian *females* as well as males ought to be actively engaged; and a noble example is set them by the female Israelites, who took an active part in preparing materials for the tabernacle in the wilderness. "All the women that were wise-hearted, did spin with their hands, and brought that which they had spun of blue and of purple and of scarlet and of fine linen. They came both men and women, as many as were willing-hearted, and brought bracelets and ear-rings and tablets, all jewels of gold, and offered them to the Lord." In this work of faith and labor of love, every human being, male and female, young and old, ought to take a part, until the fabric of the Christian church be completely reared, and established in every region of the globe.

3. The *proportion of wealth* which Christians should appropriate for the service of God, and the renovation of the world, may be deduced from the *predictions of the ancient prophets*.

In those prophecies which have a respect to the future glory of Messiah's reign, there are frequent references to the treasures which will be brought forward to promote the prosperity of his kingdom. In the seventy-second Psalm, which contains predictions respecting the prosperity and universal extension of the kingdom of the Redeemer, we are told, that "the kings of Tarshish and of the Isles shall bring presents; the kings of Sheba and Seba shall offer gifts," and that "the gold of Sheba" shall be brought as an offering to his service—evidently implying that the converts from among the Gentiles would consecrate a portion of their wealth for the promotion of his kingdom, and that the treasures, thus devoted, would be large and munificent in proportion to the rank and riches of the donors. In the sixtieth chapter of Isaiah, this subject is introduced, and exhibited in every variety of aspect. That portion of prophecy has for its object to delineate the prosperity of the gospel church in the latter days, its universal extension, the joy of its members, and the rich and diversified gifts which would be voluntarily brought forth and devoted to

* In the estimate of the value of the offerings here given, £10 is allowed for the price of a bullock, £4 for each of the small cattle, £2 for a sheep, and £1 for each of the lambs and kids. See 2 Chron. xxx. 7-10.

† Ezra viii. 25-27.

its interests. "The abundance of the sea," or the wealth conveyed in ships, "shall be converted unto thee, the forces;" or, as it should be rendered, "the *wealth* of the Gentiles shall come unto thee; the multitudes of camels shall cover thee, the dromedaries of Midian and Ephah; all they from Sheba shall come; they shall bring gold and incense, and shall show forth the praises of the Lord." Camels and dromedaries constitute the principal riches of a portion of Arabia, where the descendants of Midian and Ephah resided; and the country of Sheba was distinguished for its gold. Hence we are told by the prophet Ezekiel, "the merchants of Sheba traded at the fairs of Tyre in spices, in gold, and in all precious stones."* "The flocks of Kedar shall be gathered together unto thee; the rams of Nebaioth shall minister unto thee; they shall come up with acceptance upon mine altar, and I will glorify the house of my glory."† As the chief wealth of the Arabians consisted in their camels and dromedaries, so the wealth of the inhabitants of Kedar consisted chiefly in their flocks, in which they traded with the merchants of Tyre as stated by the prophet, "The Arabians and all the princes of Kedar traded with thee in rams and lambs and goats."‡

These descriptions plainly intimate, that in whatever commodities the riches of any people consist, the converts of Zion will bring a large portion of these treasures, as an expression of their gratitude, to promote the honor of God, and the extension of his kingdom; and that they will consider it as a matter of course, when they make a profession of their faith in the Redeemer and enter the gospel church, that they will bring along with them their worldly substance to be devoted to his service. This is likewise stated in the following passage: "Surely the isles shall wait for me, and the ships of Tarshish first, to bring thy sons from far, *their silver and their gold with them* unto the name of the Lord thy God, and to the holy One of Israel, because he hath glorified thee." The grand motive which will animate the hearts of these converts is here expressed:—"Because he hath glorified thee." Their hearts will be so inflamed and expanded with a sense of the grace and condescension of the Redeemer, with the importance of the great salvation, and with the high dignity to which they are exalted as "the sons of God," that they will consider the consecration of their earthly treasures as nothing more than a small expression of their gratitude "to him who loved them and washed them from their sins in his own blood, and who hath made them kings and priests to God and his Father." It is farther stated as a display of the munificence of Zion's converts at that period, and of the eternal and spiritual grandeur of the church:—"The glory of Lebanon shall come unto thee, the fir-tree, the pine-tree, and the box together, to beautify the place of my sanctuary, and I will make the place of my feet glorious." This description may denote, that the temples reared for the worship of Jehovah, and everything connected with his service, will be beautified with every chaste ornament befitting the sanctity of his ordinances, and the enlightened views and improved condition of the citizens of Zion. And it may likewise intimate, that persons endowed with splendid accomplishments, extensive knowledge, persuasive eloquence, and with heavenly dispositions, will be raised up to adorn the Church of God, and to display the beauties of holiness, as the timber of the

different kinds of trees here mentioned, adorned the sanctuary and the most holy place in the temple of Solomon. In both these respects, the riches of Zion's citizens will be required, and it will be abundantly supplied.

The above stated predictions, and several others which might have been quoted, evidently show, that, in New-Testament times, when God is about "to appear in his glory to men," and "to repair the desolations of Zion," immense treasures of all descriptions will be voluntarily contributed by her converts to promote her prosperity and to accomplish the purposes of Divine benevolence. All that has hitherto been given for the support of the true church of Christ, will bear no proportion to the vast treasures which will then be appropriated for promoting her extension and glory; for they will then be increased at least a hundred fold. Hence it is declared in a subsequent passage of this prophesy: "For brass I will bring gold, and for iron I will bring silver, and for wood brass, and for stones iron." It is added, "I will also make thy officers peace, and thine exactors righteousness." The superintendents or overseers of the church will be "men fearing God and *hating covetousness*," and "not given to filthy lucre," so that the wealth consecrated to its use will be properly distributed, and faithfully applied to the ends for which it is appropriated. In this respect, they will form a striking contrast to many office-bearers that have appeared in the church at different periods, who are characterized by the prophet, as "greedy dogs that can never have enough, and shepherds that cannot understand, who look to their own way, every one for his gain from his quarter." And whether this character may not apply to many in our day, demands the serious consideration of some of those who have been invested with the sacred office.*

Now, if it is clearly predicted, that in the latter ages of the church a vast proportion of wealth will be devoted to the interests of religion, it becomes us seriously to consider, whether we ought not, at this moment, to realize the accomplishment of such predictions, by coming forward, with enlarged hearts and munificent offerings, to accomplish the gracious designs of the Most High. What a high honor would it be, far surpassing every earthly distinction, to be considered as the special objects to which ancient prophesy refers, and that the Omniscient Jehovah should have us in his eye when he communicated his will, in the days of old, to the inspired prophets! What a dignified privilege is it that the great God who has all the treasures of the universe at his command, should condescend to make us "workers together with him" in accomplishing his merciful and beneficent designs, and to accept of the wealth we possess, as the means by which his eternal purposes are to be brought into effect! Can any other application of our riches procure us higher

* Dr. Mosheim states, with regard to the conduct of the bishops and presbyters of the third century, that "though several yet continued to exhibit to the world illustrious examples of primitive piety and Christian virtue, yet many were sunk in luxury and voluptuousness, puffed up with vanity, arrogance, and ambition, possessed with a spirit of contention and discord, and addicted to many other vices, that cast an undeserved reproach upon the holy religion of which they were the unworthy professors and ministers." The same author, in his history of the sixteenth century, states, "that the greatest part of the bishops and canons passed their days in dissolute mirth and luxury, and squandered away in the gratification of their lusts and passions, that wealth which had been set apart for charitable and religious purposes."

* Ezek. xxvii. 22.

† Ibid., ver. 21.

honor or felicity, either in time or through eternity? And it is only our *superfluous* wealth which he demands, while he leaves us everything requisite to all the sensitive enjoyments which a rational and immortal soul ought to desire. If we had right views of the true use of riches, and of the noble ends that may, and *ought to be* accomplished by them, we should esteem it our highest privilege and delight to consecrate all we possess to the glory of God, and the promotion of the best interests of mankind. We should feel a pleasure, not to be compared with selfish gratification, in beholding the Divine plans gradually accomplishing, in witnessing the diminution of moral evil and wretchedness, the expansion of the human mind by the propagation of Divine knowledge, and happiness diffusing itself among all ranks, and in every region of the globe. Let Christians, then, seriously consider these things, and arouse themselves from that apathy and indifference into which they have been so long sunk, with respect to the legitimate application of their worldly treasures. Let them consider whether the transitory pomp of this world, and "the honor which cometh from men," ought to be set in competition with the prosperity of Zion, and "the honor which cometh from God alone." Let them consider whether "the lust of the eye and the pride of life," costly furniture and splendid equipages, ought to be preferred to "beautifying Jehovah's sanctuary, and making the place of his feet glorious;" in short, whether selfish gratifications, and "things seen and temporal," ought to be exalted above an incorruptible inheritance, and "those things which are unseen and eternal."

Let us consider, for a moment, the gross amount of what might be, and what ought to be raised, in Great Britain alone, for the purposes of religion and philanthropy. I have already stated, on the ground of a very low estimate (p. 58), that more than twenty millions of pounds might be raised by devoting *one-tenth* of income to such objects. But as there are multitudes of individuals who ought to devote the one-half of their incomes, when large, to the service of God—on the principles now recognized and adverted to in the language of ancient prophecy—we ought not to expect less than a *hundred millions* of pounds annually, were wealthy Christians to consider themselves as stewards for God, and to act in a manner worthy of the Christian name. It is a disgrace to that sacred name that so little has hitherto been raised for the great objects to which money should chiefly be devoted. Shall *fifty millions* of pounds be annually wasted, within the limits of the British Isles, in the purchase of intoxicating liquors? Shall hundreds of millions be raised for carrying forward the purposes of ambition and warfare? and shall only a *few droppings* of overflowing wealth, the mere *lees or scum* of abundant riches, be devoted to the noblest and most important objects that can engage the attention of man? Forbid it heaven! That such has hitherto been the case, that such is the case at the present moment, is perhaps one of the most glaring inconsistencies, and one of the foulest blots that disfigures the Christian character and the Christian church.

It is now time that such inconsistencies and such stains were wiped away from the face of the religious world, and that the followers of Jesus begin to act in consistency with their high character and their heavenly calling. If we refuse to come forward with our treasures at the call of God, he may be provoked to realize, in our experience, that denunciation recorded in the chapter to which we have adverted. "The nation and kingdom that will not serve thee (namely, the church), *shall perish*, yea, those nations shall be utterly wasted." This denunciation immediately follows upon this declaration, "Thy gates shall be open continually, that men may bring unto thee the *wealth of the Gentiles*, and that their kings may be brought." If we hesitate long in coming to a decision on this point, God may soon confer the honor of accomplishing his designs upon other tribes and nations whom we now despise. Many of the Christians in the Northern States of America, are now beginning to exert themselves with a noble generosity in the cause of Christian improvement. Even the inhabitants of the Society Isles—so lately immersed in all the ignorance, superstition, and vices peculiar to the savage state, are contributing of their oil and other productions of their country, instead of money, for carrying forward missionary enterprises among other unenlightened tribes; and they are perhaps at this moment contributing more in this way, in proportion to their numbers and their wealth, than the inhabitants of Britain. The natives of the Navigators' islands, lately deemed so ferocious that mariners were afraid to land upon their coasts, are now lifting up their voices from afar, and imploring missionaries to instruct them in the knowledge of salvation, and offering whatever they can afford of their substance for this purpose. And, ere long, these and other inhabitants of the Isles of the Pacific, may bring their valuable treasures "to beautify the sanctuary of God," and to promote the extension of his kingdom. For, such persons, and such localities come within the range of prophetic description "Surely the isles shall wait for me—the *isles afar off* that have not heard my fame, neither have seen my glory, and they shall declare my glory among the Gentiles." "Sing unto the Lord a new song, and his praise from the ends of the earth, ye that go down to the sea, the isles, and the inhabitants thereof; let the inhabitants of the rock sing; let them give glory to the Lord, and declare his praise in the islands." Let British Christians, then, rouse themselves from their lethargy, and shake themselves loose from every covetous affection; let them come forth with cheerfulness and alacrity, with their treasures in their hands, to be consecrated to the glory of God and the renovation of the world; let them trample under foot, with a noble heroism, every selfish maxim, and the fashion of this world that passeth away, and account it their highest felicity and honor to be instrumental in furthering the plans of Divine mercy and beneficence; and great shall be their reward. For they who are the instruments of turning many to righteousness, "shall shine as the brightness of the firmament, and as the stars forever and ever."

CHAPTER VI.

ON THE BENEFITS WHICH WOULD FLOW TO THE WORLD, WERE COVETOUSNESS UNDERMINED AND AN OPPOSITE PRINCIPLE PREVAILING IN CHRISTIAN SOCIETY.

WERE the covetous principle completely undermined, and, consequently, were wealth applied to its legitimate objects, according to the intention of the Creator,—everything requisite to promote the physical comfort, and the moral and intellectual enjoyment of man in this world, and his preparation for a future state of happiness, might, at no distant period, be speedily effected. Even the physical aspect of the globe might be renovated, and its barren deserts transformed into a scene of fertility and beauty, so that “the wilderness and the solitary place” might be made “to rejoice and blossom as the rose.” Although the inordinate love of money is “*the root of all evil*,” yet the proper distribution of it, on the foundation of Christian principles, may be pronounced to be *the source of all good*.

We have already shown, that the almost universal prevalence of covetousness, has been the cause of most of the wars and devastations which have convulsed the world, and the source of most of the evils and sufferings under which the human race have groaned in every age. And it might likewise be demonstrated, that the proper application of wealth would go far to undermine, and ultimately to destroy all such evils, and to diffuse among all ranks, a degree of happiness and comfort which has never yet been enjoyed in any period, since man first violated the law of his Creator. It is scarcely conceivable, at first view, what innumerable benefits, of every description, might be conferred on our fellow-men, and on the world at large, by an application, on liberal and Christian principles, of the riches which we at this moment possess. And, we may rest assured, that while we refuse to apply our treasures to the objects to which I allude, we do everything in our power to frustrate the designs of our Creator in bestowing upon us such treasures, and to counteract the benevolent operations of his moral government.

A work of immense magnitude, however, requires to be accomplished, and vast exertions are indispensably requisite, before physical and moral evil can be undermined, and the way prepared for the universal improvement of mankind, and the spiritual regeneration of the world. But man has moral and intellectual powers and treasures of wealth, fully adequate to the enterprise, arduous and expensive as it is; and, under the agency of the Divine Spirit, who is promised to work in us both “to will and to perform the good pleasure of God,” he is able to accomplish everything to which we allude, provided he is willing to consecrate his energies and his treasures to this work of faith and labor of love.

But, let us now attend more particularly to some departments of the *work* to be accomplished, and to the *means* to bring it into effect.

1. Were covetousness undermined, and an opposite principle acted upon, *abundant provision*

would be made for the external comfort of the poor and destitute.

The God of nature has displayed his exuberant goodness toward our world in every age, in “giving rain from heaven, and fruitful seasons,” and in supplying the inhabitants of every clime with what is requisite for their subsistence and comfort; though the earth has yielded the harvests of six thousand years, it has never yet lost its fertility, but pours forth its fruits, every autumn, in rich abundance; and could afford sustenance for hundreds of millions more than have ever, at any one time, traversed its surface, since the days of Noah. Yet we find thousands and ten thousands pining in poverty and want; not only in bleak and barren deserts, but in the most fertile countries, and in the midst of plenty and splendor; and, in some instances, absolutely perishing for lack of the *necessaries* of life, while pride and opulence are rioting within their view in luxurious abundance.

At this very moment in Ireland, and especially in the county of Limerick, the poor are literally dying of want by hundreds. “The present state* of the poor in Ireland,” says a member of Parliament, “is terrible not only to behold, but even to contemplate. In this neglected country, the poor are thrown on the industrious classes for relief in their wretchedness, as the rich not only guard their mansions by high walls and surly porters, but actually drive the poor creatures away with dogs. In America, clearing the estates, means cutting down the timber, but here it means, cutting down human life. The poor, when driven from their homes, have no asylum to fly to, but to leave their country, or lie down and die.”

Mr. Ingles, in his “Journey throughout Ireland, in 1834,” gives the following description of the wretchedness he witnessed, in the same district, to which we now allude.

“Some of the abodes I visited, were garrets, some were cellars, some were hovels on the ground-floor, situated in narrow yards or alleys. I will not speak of the filth of these places; that could not be exceeded in places meant to be its receptacles. Let the worst be imagined, and it will not be beyond the truth. In at least three-fourths of the hovels, which I entered, there was no furniture of any description, save an iron pot, no table, no chair, no bench, no bedstead—two, three, or four little bundles of straw, with, perhaps, one or two scanty or ragged mats, were rolled up in the corners, unless when these beds were found occupied. The inmates were, some of them, old, crooked, and diseased, some younger, but emaciated, and surrounded by starving children, some were sitting on the damp ground, some standing, and some were unable to rise from their little straw heaps. In scarcely one hovel, could I find even a

* November, 1835.

potatoe. In one which I entered, I noticed a small opening leading into an inner room. I lighted a piece of paper at the embers of a turf which lay in the chimney, and looked in. It was a cellar, wholly dark, and about twelve feet square: two bundles of straw lay in two corners; on one sat a bed-ridden woman; on another lay two naked children—literally naked, with a torn rag of some kind thrown over them both. But I saw worse than even this. In a cellar which I entered, and which was almost quite dark, and slippery with damp, I found a man sitting on a little sawdust. He was naked; he had not even a shirt; a filthy and ragged man was around him. This man was a living skeleton; the bones all but protruded through the skin; he was literally starving.

"In place of visiting forty hovels of this description, I might have visited hundreds. In place of seeing, as I did, hundreds of men, women, and children, in the last stage of destitution, I might have seen thousands. I entered the alleys and visited the hovels, and climbed the stairs at a venture; and I have no reason to believe that the forty which I visited were the abodes of greater wretchedness than the hundreds which I passed by. I saw also another kind of destitution. The individuals I have yet spoken of were aged, infirm, or diseased; but there was another class fast approaching infirmity and disease, but yet able and willing to earn their subsistence. I found many hand-loom weavers, who worked from five in the morning until eight at night, and received from a task-master, from half a crown to four shillings a week. Many of these men had wives and families; and I need scarcely say, that confinement, labor, scanty subsistence, and despair, were fast reducing these men to the condition of the others, upon whom disease and utter destitution had already laid their hands. The subsistence of these men consisted of one scanty meal of dry potatoes daily." "To keep the bodies and souls of these miserable creatures together, many a humane citizen contributes more than the noble owner of all the property."

Yet all this happens in a *Christian land!* where thousands are wallowing amidst overflowing wealth!

In the city of Naples, there are above 30,000 persons, distinguished by the appellation *Lazzaroni*, the greater part of whom have no other home than the earth for a floor, and the sky for a ceiling, who sleep every night under porticoes, piazzas, or any other kind of shelter they can find.—Although they are the objects of detestation to travelers, yet they are in fact merely the poorer class of laborers, who, attached to no particular trade, are yet willing to work, and to take any job that is offered. If they are idle, it is not their own fault; since they are continually running about the streets begging for employment. If they are ignorant and debased, and frequently addicted to pilfering, it is more their misfortune than their crime; for no provision has been made for their instruction, nor arrangements for supplying them with the work they are willing to perform; although they are surrounded with 12,000 ecclesiastics living in opulence and splendor, and with numerous nobility rioting in extravagance upon princely fortunes. Those of them who have wives and families live in the suburbs of Naples, near Pensilippo, in huts, or in *caverns or chambers dug out of that mountain.*

These people, however, wretched as they are, have had a certain degree of moral influence. In opposition to the measures of the court, they prevented the establishment of the inquisition; and

such was their disinterested patriotism, that they generously offered their services to save their sinking country from the French invasion, while the nobles had meanly abandoned the breach and forsaken their sovereign; and, it was merely owing to the want of leaders, that they reluctantly submitted to inaction. To what causes, then, but to criminal apathy and *avarice*, are to be imputed the destitute and miserable state of these *Lazzaroni*,—since the surrounding country is fertile and delightful; since wealth is flowing in streams around them, and the glitter of pomp and equipage is continually before their eyes.*

Even in the British metropolis, and other cities of the empire, scenes not altogether dissimilar to the above, are frequently to be found. According to the statements of Dr. Colquhoun, there are in London upward of 20,000 persons who rise every morning without employment, and rely for maintenance on the accidents of the day.

Were we to inspect all the narrow lanes, the cellars, garrets, and hovels, connected with Liverpool, Manchester, Bristol, Newcastle, Dublin, Cork, Edinburgh, Glasgow, Dundee, and other British towns and cities, we should find the most appalling scenes of destitution and wretchedness, of which three-fourths of our population, and especially the higher ranks, can form no conception. Indeed, wherever we turn our eyes, whether in the country, the village, or the crowded city, we never fail to behold multitudes of the blind, the lame, the diseased, and even the healthy, in a state of penury and destitution—many of them only half-covered with rags, and exposed, houseless and forlorn, to the nipping frosts, and to all the inclemencies of the season. Many of these wretched creatures are immoral and depraved; but the cause of this is not so much to be attributed to the individuals themselves, as to the arrangements of general society. Society has never yet provided for such, the means of education, of moral training, of employment, or what is necessary for their comfortable subsistence; and general society is, therefore, accountable in part, both for the misery they suffer, and the crimes they occasionally commit.

An American writer, who very lately visited Italy, and other countries in Europe, makes the following statements in reference to the city of Naples. "I have been struck repeatedly with the little value attached to human life in Italy. I have seen several of these houseless *Lazzaroni* literally dying in the streets, and no one curious enough to look at them. The most dreadful sufferings, the most despairing cries, in the open squares, are passed as unnoticed as the howling of a dog. The day before yesterday, a woman fell, in the Toledo, in a fit, frothing at the mouth, and livid with pain; and though the street was so crowded that one could make his way with difficulty, three or four ragged children were the only persons seen looking at her."†

It is easy, therefore, to perceive, that were covetousness undermined, and a godlike generosity substituted in its place—no such miserable and revolting scenes would disgrace our world. We should no longer behold the houseless and benighted wanderer hung with rags, shivering amidst the blasts of winter, and reposing under a hedge, or in the streets under the open canopy of heaven, nor the blind and the dumb, the halt and the maimed, wandering along our streets and highways friendless and forlorn, and destitute of

* It is a proverbial saying among the other Italians, that "Naples is a paradise inhabited by devils."

† "Pencilings by the Way." By N. P. Willis, Esq., 1835

the comforts which every human being ought to enjoy. But, on the other hand, those whom God has blessed with abundance, would, like Job, be "eyes to the blind, feet to the lame, and a father to the poor. The blessing of them who are ready to perish would come upon them, and they would cause the widow's heart to sing with joy."

It is not, however, by bestowing money directly on the poor, except in certain urgent cases,—nor even by endowing almshouses, or asylums, except for the blind,* the aged, and the infirm, who are unable to work; but by affording employment, and a proper remuneration for labor, to all who enjoy health and vigor of body and mind. For every human being ought to be actively employed in something which contributes to his own benefit, and the good of others. An absolutely idle person, is both a burden to himself, and a nuisance in society; and he never can feel the sweets of true enjoyment. It is contrary to the evident design of the Creator, in bestowing upon us both physical and moral powers, that any class of these powers should remain dormant or unemployed. And, therefore, the plan of cooping up hundreds of healthy persons in hospitals and poorhouses, without being employed in regular mental and bodily exercises, is evidently contrary to nature, and consequently subversive of true happiness.

The true method of promoting the comfort of the poor, is to furnish them with the means of instruction and employment, to provide them with comfortable habitations, and to teach them the rules of economy, temperance, and moral order, and to see that their children be properly educated in the different branches of useful knowledge, and in the doctrines and duties of religion. There are many ways by which such objects might be accomplished, either by opulent individuals, or by society at large. In the building of churches, schools, lecture-rooms, and workshops, throughout the country, wherever they are required; in the cultivation of waste grounds, the draining of land, the formation of roads, and comfortable foot-paths throughout every part of the country; in forming public walks round villages and towns; in erecting new towns and villages on spacious and improved plans; in erecting workshops and manufactories for all kinds of clothing and furniture; in distributing gaspipes throughout villages, and along the highways, for illuminating the country, and cheering the traveler under the cloud of night;—in these, and many other operations, all the poor who now infest our streets, and burden our public charities, and pass a miserable and useless existence, might be comfortably employed. And, while misery would thus be prevented, and happiness diffused, improvements might be carried on to an indefinite extent, the physical aspect of our globe might be transformed into a scene of beauty and fertility, and "the desert made to rejoice and blossom as the rose."

In the cases now alluded to, and in many other respects, much requires to be effected, before society be thoroughly improved, and before the

scene of external nature be decorated with all the beauties and conveniences of which it is susceptible. But such improvements ought not to be engaged in, merely from the sordid views of deriving pecuniary profits; but from a desire to do good to our fellow-men; to remove nuisances both from the physical and moral world, to embellish the city, and the country, and to promote the general advancement of society, in knowledge and virtue.

It is evident, then, that were such views of the application of wealth to pervade general society, or were even a few opulent individuals to act in accordance with them, an important change would soon take place in the aspect, both of the physical and the moral world. Those scenes of squalid misery and destitution, which are now to be seen in every city, town, and village; those pitiable objects that swarm in our markets and fairs, in our streets and highways; and those wretched cellars and hovels, unfit for the abodes even of the lower animals, now inhabited by human beings, would ere long disappear from the world. The cries of misery, and the voice of mourning and sorrow, would be changed into the voice of cheerfulness, and into songs of thanksgiving and joy. Every returning year, new beauties, conveniences, and improvements, would be seen rising to view in every corner of the land; and harmony and moral order would gradually pervade the various ranks of society.

And, is hoarding up wealth in bags or coffers, or wasting it in vain show and extravagance, to be set in competition with such scenes of beauty and general enjoyment? Surely every philanthropic heart, and every sincere Christian possessed of riches, in contributing to such objects, would feel a pleasure in beholding such results, far surpassing what can ever be experienced in indulging in "the pride of life," and in chiming in with "the fashion of the world which passeth away." And, we have already proved, in the preceding chapter, that it is *in the power* of thousands, to be instrumental in bringing about "a consummation, so devoutly to be wished;" and, it is to be hoped, that with the power, the will will not be wanting, and that, ere long, they will "shake themselves from the dust," and arise to vigorous exertion in the cause of God, and in promoting the best interests of men.

2. The subversion of covetousness would prepare the way for *remedying many physical evils, and promoting improvements for the convenience and comfort of general society.*

To some of these improvements, I have alluded above; but it may not be inexpedient to enter a little more particularly into the consideration of this topic.

This world, when it was first arranged by the hand of the Almighty, was completely adapted as a habitation for a creature formed after his image. Its arrangement was the result of Infinite wisdom and goodness; and, therefore, must have presented to view everything that was harmonious, beautiful to the eye, and adapted to the sensitive and intellectual enjoyment of man. Hence we are told, that, upon a survey of all his works, in this lower creation, "God saw everything that he had made, and behold, it was very good." This beautiful arrangement of the face of nature, in all probability, continued during the greater part of the period which intervened between the creation and the deluge. But, when the flood came, "the fountains of the great deep were broken up,"—the interior strata of the earth were disrupted, mountains and rocks were hurled "into the midst

* Even the blind may, in many cases, be usefully employed. We have had several celebrated lecturers and teachers of science, who had been either blind from their birth, or had lost their sight at a very early period, such as Prof. Sanderson, Dr. Moyes, Mr. Davidson, Mr. Gough, and others, who were the means of communicating popular instruction in science, to many thousands in different countries. Such persons, among the lower ranks, have been usefully employed in basket-making, weaving, and other occupations; and in such exercises, have felt enjoyments which they could not otherwise have experienced.

of the sea," and rolled from one continent to another; the whole solid crust of the globe appears to have been shattered, and thrown into confusion, and its surface transformed into one wide and boundless ocean. After the waters of the deluge had abated, the earth was left to Noah and his descendants, as one vast and frightful ruin, overspread with immense deserts and marshes, and rugged mountains disrobed of their verdure. For, we have reason to believe, that the greater part of the dry land which existed before the flood, now forms the bed of the ocean. This ruin of a former beautiful world, since that period, has been, in many of its parts, brought into a certain state of cultivation, in proportion as its inhabitants have risen from barbarism to civilization. But a great portion of the globe is still covered with immense deserts and almost interminable forests, fit only for the habitation of the beasts of prey; and even those countries which have been partially cultivated by the more civilized class of human beings, are far short of that improvement of which they are susceptible; or, of what must have been their appearance, when the earth was fresh from the hands of its Creator, and smiled with all the beauties of Eden.

The sin of man was the cause of the original structure of the earth being deranged, and its beauty defaced; and, in proportion as man advances to a conformity to the Divine image, after which he was originally created,—will his habitation approximate to the beauty and order which appeared in the first creation. But, "this sore travail hath God given to the sons of men to be exercised therewith," that they must now exert their own genius and physical energies, in beautifying their habitations, and reducing the globe to an approximation to its original state. And, in proportion as Christianity and civilization have prevailed, such objects have been partially accomplished. But the greater part of the world still remains as a desolate waste, or a majestic ruin; and, even where the hand of civilization has begun to operate, little comparatively has been effected; for the fields are scarcely half cultivated, and there is not the fifth part of the conveniences and comforts provided for the great mass of the world's inhabitants which they ought to enjoy. It is possible to transform the earth into a terrestrial paradise, or at least into something approaching it. What has already been done is an earnest and a prelude of what may still be achieved, were wealth applied in accordance with the intention of God, and were all the physical and intellectual energies of man concentrated upon such an object. Let us look at New England, which, only about two centuries ago, was one immense forest, without the least cultivation, inhabited by a few savages. From a small colony of only a hundred individuals, these states have increased to two millions of souls. Most of the forests have been cut down, the fields cultivated and adorned, and hundreds of towns, temples, seminaries, and splendid public buildings now diversify and adorn a scene of activity which was formerly "a vast howling wilderness," where none but rude Indians and the beasts of the forests roamed for their prey. Even in our own country, in the days of Julius Cæsar, the inhabitants were rude and barbarous; they painted their bodies; they were clothed in the skins of beasts; they dwelt in huts and caves, in the forests and marshes; the land was overspread with thickets and barren wastes, and no towns, cities, or splendid edifices, such as we now behold, were to be found in any quarter of Britain, which now stands

in the first rank of Christian and civilized nations. It only requires a little more beneficent exertion, and the whole British Islands might be changed into a scene of beauty and fertility little inferior to that of Eden. Nay, in a very short period, all the uncultivated wastes of the globe might be adorned with every rural beauty, and every wilderness made to bud and blossom as the rose. The money which has been spent in *warfare*, during the last century, by Great Britain alone, amounting to nearly *two thousand millions of pounds*, would have gone a great way toward defraying the expense of everything requisite for transforming almost all the desolate wastes of the globe into scenes of beauty and vegetation. And, it is in the power of the European nations—nay, almost in the power of Britain herself—were wealth directed into its proper channels, to accomplish nearly all that is now stated, during the next half century, if they would at this moment shake off the trammels of *ambition* and *avarice*, and arise to holy and beneficent exertions. If ever such a period as the scripture-millennium arrives, it will be ushered in by such physical improvements, in simultaneous combination with the instruction of all ranks, the energetic preaching of the gospel, and the universal extension of the revelation of God among all nations.

Let us now consider for a moment, some of the evils of the social state which should be remedied, and the improvements which should be carried into effect.

If we look into our cities and towns, we shall find them abounding with many nuisances and inconveniences—narrow streets, dirty lanes, wretched cellars, and hovels crowded with human beings, whole families with their miserable shreds of furniture, cooped up in one narrow apartment, amidst gloom, filth and disorder—no conveniences for washing, bleaching, or for enjoying the cheerful light of heaven and the refreshing breeze. In such situations, numerous diseases are engendered, the true enjoyment of life prevented, and the period of human existence cut short, by nearly the one-half of its average duration. If we inspect many of our villages, we shall find similar evils tending to human wretchedness and debasement. And, if we cast our eyes over the country, we shall find a glaring deficiency of comfortable roads, and foot-paths, and of comfortable dwellings for the industrious poor, a want of bridges for regular intercourse between villages, and a want of bowers or places of shelter to the weary traveler, either from the heat of the sun, or from rains and storms, beside marshes that might be drained, moors that might be cultivated, and many desolate wastes that might be turned into fertility and verdure, and become the seats of an industrious and happy population.

Now, all these and similar evils might be removed, and the requisite improvements carried forward, were the principle of avarice undermined, and a noble generosity to pervade the minds of the opulent and influential class of the community. Were societies formed for promoting such objects—not for the purpose of gain or the mere employment of superfluous capital, but for the purpose of general improvement, and affording employment to the industrious laborer, we might have roads and foot-paths intersecting the country in every direction, broad, smooth, and cleanly, and adapted for comfortable traveling and pleasure-walks, at all seasons of the year—cottages and garden-plots, furnished with every requisite convenience for the accommodation of the industrious classes—our marshes drained and covered with

corn—our heath-clad hills adorned with evergreens and fruitful trees—our narrow dirty lanes, where men are huddled together like rabbits in their cells, completely demolished—our confined streets expanding into crescents and spacious squares—new towns and villages arising on ample and improved plans—canals and railways intersecting the country in every direction, where they are required—schools and seminaries of all descriptions, churches, lecture-rooms, workshops, manufactories, and asylums for the aged and infirm—diversifying the rural landscape—and the once barren desert rejoicing amidst luxuriant verdure, and with the hum of human voices and of ceaseless activity.

That such improvements will be carried forward in the days of the millennium, or prior to its commencement, appears from certain predictions which have a reference to that period. "In those days," says the prophet Isaiah, "they shall build houses and inhabit them, and plant vineyards and eat the fruit of them. They shall not build and another inhabit; they shall not plant, and another eat; for *as the days of a tree* are the days of my people, and they shall *long* enjoy the work of their hands. They shall not labor in vain, nor bring forth for trouble; for they are the seed of the blessed of the Lord, and their offspring with them.*" "Then shall the earth yield her increase, and God, even our own God, shall bless us." "Then shall he give thee rain of thy seed, that thou shalt sow the ground withal, and bread of the increase of the earth, and it shall be fat and plenteous; and in that day thy cattle shall feed in large pastures. The seed shall be prosperous, the vine shall give her fruit, and the ground shall give her increase, and the heavens shall give their dew; the evil beasts shall cease out of the land; and they shall sit every man under his vine and fig tree, and none shall make him afraid; for behold, I create Jerusalem a rejoicing, and her people a joy." The same thing may be intimated in the following passages which refer to the same period:—"Let the fields be joyful, and all that is therein, let the hills be joyful together; then shall all the trees of the wood rejoice before the Lord; for he cometh to judge the earth."† "I will open rivers in high places and fountains in the midst of the valleys, I will make the wilderness a pool of water, and the dry land springs of water. I will plant in the wilderness, the cedar, the shittah tree, and the myrtle, and the oil-tree. I will set in the desert the fir tree and the box together; that they may see and know, and consider that the hand of the Lord hath done this."‡ "I will make a way in the wilderness and rivers in the desert." "Sing, O heavens, and be joyful, O earth, and break forth into singing. O mountains, ye forests, and every tree therein." "Ye shall go out with joy, and be led forth with peace; the mountains and hills shall break forth before you into singing, and all the trees of the fields shall clap their hands. Instead of the thorn shall come up the fir tree, and, instead of the brier shall come up the myrtle tree."§ "And they shall build the old wastes, they shall raise up the former desolations, and they shall repair the waste cities, the desolations of many generations."

Although several of the last quoted passages may be considered as having, a reference to the *spiritual* renovation of the world, yet the *literal* meaning is not to be altogether excluded. For the external comforts of mankind and the natural embellishments of the earth go hand in hand

with the reception of Divine truth, and the manifestation of Christian virtues. Whenever the gospel comes in its power and renewing influence upon the heart, it sooner or later brings along with it the blessings of civilization, and leads to the abandonment of rude and savage practices—to the improvement of the soil, and to the rearing of cleanly villages and comfortable habitations. This may be seen in the progress of Christianity in Southern Africa, where the narrow and filthy kraals of the Hottentots have been changed into substantial and commodious dwellings; and in the Society Isles, where gardens, villages, spacious churches, seminaries, and stately mansions, now beautify and adorn that once savage territory, so lately the seat of idolatry and "the habitations of cruelty." In these respects, "the fields" may be said to "be joyful," and "the mountains and the hills to break forth into singing, and the desert to rejoice and blossom as the rose." Such predictions, too, seem to intimate, that the extensive deserts and tracts of barren sand now lying waste and uncultivated, and seldom trodden by the foot of man, will be brought under cultivation, and changed into a scene of delightful verdure; and that, upon the hideous wilds where Nineveh, Babylon, and other famous cities once stood, other splendid cities will be reared, congenial to the holy and elevated views of a renovated population. The following and similar passages may be fairly interpreted in this sense. "I will make the dry land springs of water, and I will plant in the wilderness the cedar, the shittah tree, and the myrtle. They shall *build the old wastes*, they shall raise up the former desolations, and they shall *repair the waste cities*, the desolations of many generations."

How, then, are such glorious transformations to be effected? Are we to suppose, that God, by a direct act of his Almighty power, as at the first creation, is to sweep the dense forests from the earth, level the mountains, prepare highways for its inhabitants, and plant with his own hand "in the wilderness, the cedar, the shittah tree, and the myrtle?" Or are we to suppose, that angelic beings are to be sent down from heaven to perform such material operations? If not, then they must be effected by the genius and energy of man. For, whatever man is enabled to perform, under the arrangements of the Divine government, is uniformly ascribed to God as the Supreme mover and director of every operation; and a miracle was never performed, when human agents, by the ordinary laws of nature, were able to accomplish the object intended.

And how is man to accomplish such improvements, but by employing his treasures, and his physical and mental energies in such beneficent operations? Hitherto, covetousness has prevented such desirable improvements from being effected. When requested to embark in any undertaking which has for its object the melioration of the social state, its uniform language is, "will it pay?" "will it pay?" "will it produce a proper *per centage* for the outlay of money?" implying that the acquisition of more money, is the grand stimulus which should excite us to embark in any undertaking. It is stated, for example, that certain marshes, mosses, and heath-clad hills, can never be cultivated, *because* the expense of cultivating them would outrun the profit." This is an argument which may be allowed to a man who worships mammon as his God, and who has his portion only in the present life; but such an argument ought never to proceed from the mouth of a Christian. The grand question to be deter-

* Isaiah lxx.

† Psalm xcvi.

‡ Isaiah xli. 18.

§ Isaiah lv. 12.

mined is, "is it expedient and requisite that such improvements should be attempted, and is it consistent with the will and purposes of God, that they should be accomplished?" If such questions can be answered in the affirmative, then all other considerations ought to be laid aside, and it ought to be deliberately considered, and laid down as a maxim, that money was bestowed by God for just such purposes, and not to be put in a bag, or "laid up in a napkin." Were such views generally recognized, and acted upon, a new impulse would be given to human activity, and a new aspect would begin to appear throughout the scene of nature, and of general society. How many thousands are to be found in our cities and populous towns, and even in our hamlets and villages, who are living in the midst of filth and wretchedness, either altogether unemployed, or eking out a scanty pittance, scarcely sufficient to keep soul and body together, or employed in pilfering, or other criminal pursuits, who would rejoice in the prospect of being employed in rural improvements!

Now, were some hundreds of such persons distributed, under proper superintendents, in different parts of the country, to drain a marsh, to cultivate a desert, to form new roads, to drive soil to sandy or rocky wastes, and to direct rivulets and streams of water to flow through such places; were small towns and villages, on spacious plans, to be reared in such places, and comfortable habitations for the industrious laborers; were schools established for the instruction of the young, and churches, and lecture-rooms for the instruction of adults in religion, and in every branch of useful knowledge, what an amount of enjoyment might be communicated to thousands of miserable creatures, now in a state of penury and degradation? and what a beautiful transformation would appear on the aspect of "the wilderness, and the solitary place," now covered with briars and thorns, and untrodden by the foot of man! Nothing prevents such scenes from being realized, but the principle of avarice; and it becomes Christians to whom God has granted riches and property, seriously to consider, whether they be not called upon by the word and providence of God, to embark in such undertakings, although, instead of making five per cent. for their money, they should lose twice that sum in accomplishing such designs. The question with a Christian, ought not to be, what is the per centage of *money* to be acquired; but what is the per centage of *happiness* that will be gained to mankind, and of improvement on the face of nature. Let such consider what I say, and "may the Lord give them understanding in all things!"

3. Were covetousness undetermined, *we might soon have institutions established for the intellectual and religious instruction of persons of all ranks and ages.*

This is a most important consideration—a subject the most momentous of any that can engage the attention of the Christian, or of members of general society. It is a subject, however, which has been most unaccountably overlooked by all ranks, and even by professed Christians and philanthropists. Innumerable facts which have lately come to light, in our own land, abundantly prove, that *ignorance and crime* are almost inseparably connected; and the same position is confirmed by the experience of almost every other country. Notwithstanding the severity and the multiplicity of our penal statutes, and the new enactments which are issued, year after year, against crimes, they have multiplied almost in proportion

to the increase of our criminal statutes. It has been calculated, that in and about London alone, there are above fifty thousand thieves and pick-pockets. And no wonder, when we learn from the Report of the "British and Foreign School Society" for 1833, that "in the Metropolis alone, there are above 150,000 children growing up to manhood without education." In Nottingham, it is found that more than a thousand children, of an age suitable for school, are growing up in total ignorance; and, in Herefordshire, out of 41,000 individuals, only about 24,000, or little more than one-half, were able to read. Instead of one out of every four attending instruction, it is estimated, that throughout Great Britain and Ireland, there is not above one out of twelve or fourteen of the population, at an average, enjoying the means of regular instruction; paltry, and inefficient, as they generally are. Without a thorough *intellectual and religious* education, universally extended, commencing at a very early period of life, and continued until manhood, the root of crime will never be extirpated; and although its branches may be occasionally lopped off by the sword of the law, they will always be ready to break out in fresh luxuriance. So long as the principle of crime, and those affections which lead to it, are suffered to remain without moral counteraction; human laws, however severe, will be altogether inefficient, either for eradicating, or repressing it.

An efficient education is likewise essentially necessary for preparing men to listen with attention and intelligence, to the declarations of the gospel. For want of that intelligence which education should produce, neither rational nor moral arguments make the least impression on the mind. We cannot, in many instances, persuade such persons to attend a place of worship where Scriptural instruction is communicated; and when they are constrained to enter a religious assembly, they are incapable of fixing their attention on spiritual subjects, or of understanding and appreciating the nature and importance of the truths delivered; so that the most solemn considerations and admonitions produce no more effect in exciting to repentance and serious reflections, than "a sounding brass or a tinkling cymbal."

Hence, likewise, the confused and distorted conceptions of Divine truth which are entertained by many of the regular hearers of the gospel; hence the little effect produced on their moral characters, and hence the want of holy energy, and of that noble spirit of Christian heroism and generosity, which ought to distinguish every member of a religious community.

Again, universal education is essential for *preparing the way for the arrival of the predicted millennium*. Such a period cannot possibly be ushered in, until a moral, intellectual, and religious education be universally established, and the benefits of it enjoyed by all ranks and conditions of men. It is in this and the effects which flow from it, that the *essence* of the millennium will chiefly consist. For, at that period, "all shall know Jehovah from the least to the greatest," in consequence of which "all the ends of the world shall remember and turn to the Lord, and all kindreds of the nations worship before him."

At present, we have little or nothing that truly deserves the name of *education*. In the system of education which has hitherto prevailed in our country, almost everything that is interesting to a rational and immortal being has been overlooked and omitted. *Words* have been substituted in place of *things*; the elements of *language* instead

of the elements of *thought*; the *key* of knowledge, instead of *knowledge itself*; Pagan maxims instead of Christian principles and precepts; a farrago of trash selected from Heathen Orators, Poets, old plays, fables, romances, and novels, instead of the grand and interesting facts of sacred history, the scenes of domestic life, the useful arts and sciences, the beauties of creation, and the sublime and magnificent scenery of the universe. Man has been considered rather as a kind of machine, than as a rational intelligence, and our systems of education have treated him as if he had been little else than a puppet, formed for mechanical movements. The idea that he is a being destined to future and eternal existence, and that his training ought to have a respect to his ultimate destination, has been almost entirely overlooked in our scholastic arrangements; and the government of the temper and conduct, according to the maxims and precepts of Christianity, has never formed a prominent object in our seminaries, either for the higher or the lower ranks of society. Beside, our scholastic instructions, deficient as they are, are not enjoyed by the one-half of our population. We, therefore, require a system of education to be established, commencing at two years of age, and continued until twenty, which shall communicate to young minds the *elements of thought*, and which shall comprehend all those useful branches of knowledge in which man is interested as a rational and social intelligence, and as a candidate for a blessed immortality. Our grand object ought now to be, that there shall no one of our population who stands in need of instruction, be without the means of education,—so that, in the course of another generation, there shall not be an *ignorant*, and scarcely a vicious individual found in our land.

In order to accomplish such a grand and beneficial object, we must have infant schools established for all classes, and throughout every corner of the land; schools for the intellectual and religious education of the young, from the age of six to the age of fourteen years; seminaries for instructing apprentices, journeymen, clerks, shopkeepers, and other classes of young men and women, from the age of fourteen to twenty, or upward, accommodated to their convenience, and calculated to convey to them instruction in the higher departments of knowledge and religion; and *colleges* for the moral and intellectual training of *teachers* fitted to conduct such institutions.

These, with similar institutions, and courses of lectures on every branch of knowledge, human and divine, require to be established in every district throughout the length and breadth of our land.

These are objects not only of vast importance, but which would require for their accomplishment a *vast expense*. For the island of Great Britain alone, there would require to be established no less than about *sixty thousand seminaries* of the description to which I allude; every one of which, including an apparatus, museum, and everything else which an intellectual seminary should contain, would require at least £1200 to be devoted to its erection and establishment, which would amount to *seventy-two millions of British pounds!* Great as this sum may appear, it is only a mere *item*, when compared with the hundreds, or rather thousands of millions which, during the last century, were spent in the folly and madness of warfare. But, by what means are such sums to be raised, so long as covetousness holds its sway, as it has hitherto done, over the human mind? Neither governments, com-

munities, nor individuals, will come forward to lend their aid in promoting such objects, until the principle of avarice be undermined, and the legitimate use of wealth, on the principles of Christianity, be generally appreciated. But, were this object in some measure effected, and a principle of Christian generosity beginning to gain the ascendant, there would not be the least difficulty in accomplishing everything which has now been proposed. We have the *means* in our power, if we have the *will* to apply them; for there is more money spent every year in folly, extravagance, and vice, than would be amply sufficient to establish every institution requisite for the intellectual, moral, and religious instruction of persons of every age and sex, and of all ranks of the community. And, if they were once established, four or five millions annually would be sufficient for conducting their operations, and carrying forward every requisite improvement. And what a bright and enlivening prospect would then be gradually unfolding to our view! the young rising up in wisdom and knowledge, and in favor with God and man; useful knowledge and Christian principles extending their influence throughout all ranks; the principle of crime undermined and almost eradicated; property secure from the inroads of the pilferer and depredator; improvements of every description carried forward with alacrity and vigor; and harmony and order introduced into every department of the moral world.

All these and similar effects would undoubtedly be accomplished, in a greater or less degree, were we now to concentrate all our physical and mental energies on such objects, and consecrate a fair proportion of our wealth toward their accomplishment. It is by such means, we may rest assured, that God will accomplish his eternal purposes, and the predictions of his word in reference to that period when “the glory of Jehovah shall be revealed, and all flesh shall see it together,” and “when all shall know him from the least to the greatest.”

4. *The progress of science and art would be promoted*, were covetousness counteracted, and a spirit of generosity diffusing itself throughout society.

The progress of the sciences and arts has generally kept pace with the progress of Christianity. They are intimately connected with religion, and have been instrumental in its propagation and extension. Without the aid of printing, the revelations of heaven could never have been so extensively circulated as they now are, by the millions of Bibles, and other books on theology, that have issued from the press. Without the mariner's compass, and the art of navigation, we could never have visited the “isles afar off” in the midst of the ocean, to communicate to their benighted inhabitants the knowledge of salvation. Without a knowledge of the globular form of the earth, which science has demonstrated, many regions of our world could never have been explored, and we should have remained in ignorance of America, Australasia, and many other countries with which we now regularly correspond. Without a knowledge of this fact, and of the *extent* of the earth's diameter, we could not have measured the distances and magnitudes of the heavenly bodies; and, without the use of the telescope, we could never have explored the magnificent scenes of the universe which it has laid open to view, and consequently could never have formed such enlarged conceptions, as we can now do, of the attributes and operations of the Creator.

It is, therefore, of importance, in a religious point of view, that science and art should be improved, and carried forward toward perfection. For the more minutely the wonders of nature are explored, the more distinctly do we perceive the traces of Infinite wisdom and intelligence, and the boundless power and goodness of Him "whose kingdom ruleth over all." In proportion, too, to the extent and accuracy of our views of the system of creation, shall we be enabled to perceive the general *harmony* which subsists between the operations of God in the visible universe, and the revelations of his word.

And, as *art* has, hitherto, facilitated the progress of the Gospel, and the extension of Christianity to distant lands, so we have reason to believe, that it will contribute still more extensively to its propagation in future ages, than it has ever yet done in the ages that are past. Great improvements are still required, both as to the *safety* and the *rapidity* of our modes of conveyance, from one place to another, whether by sea or land. Ships require to be constructed on improved plans, less liable to be endangered by the billows of the deep, or even when striking against a shoal, and from the recent progress of invention, it is not unlikely that contrivances may be suggested for impelling them across the ocean with a greater degree of velocity than has hitherto been attained, and which may enable them to glide, *with more safety*, through the foaming billows. Locomotive engines, by land, may be brought to a still greater degree of perfection; and even balloons may be constructed with apparatus adequate to conduct them, in any direction, through the regions of the atmosphere. Agricultural instruments may be contrived for facilitating rural operations and the cultivation of the soil; and new inventions brought to light for the quick performance of all kinds of labor, so that the laboring classes may, ere long, have abundant leisure for the enjoyment of the bounties of the Creator, and for storing their minds with all kinds of knowledge, both human and divine. Our knowledge of the powers of nature, and of the functions of the animal system, may be so increased as to enable us to prevent diseases of every description; and instruments or contrivances of various kinds may be invented to ward off those disasters and fatal effects, which now so frequently flow from the operations of lightning, noxious gases, storms, and tempests, and other agents in the system of nature, which have so frequently been the cause of many accidents and calamities.

Now, it might easily be shown, that all such improvements in science and art, are intimately connected with religion, and have a bearing upon the happiness of man, and upon the propagation, and the universal establishment of Christianity throughout the world. But, *without money*, such improvements cannot be effected. Many persons of genius, who have hit upon useful inventions, have been obliged to drop the prosecution of their plans, when they were nearly ripe for execution, for want of pecuniary means to carry them into effect. And, in numerous instances, when a model, or small machine has been constructed to illustrate the operation of a certain principle or theory, the want of money or patronage has prevented its being exhibited on a large scale, so as to demonstrate its practical utility; and all the labor, anxiety, and expense, previously incurred, have been wasted to no purpose.* But

if avarice were transformed into generosity, and generosity directed to patronize and assist schemes which are praiseworthy, and of practical utility, many useful contrivances, which are now in embryo, might soon be brought to perfection, and rendered subservient to the good of mankind.

Those who are possessed of wealth, have it not only in their power to patronize persevering genius, but to establish lectures on science, and every branch of useful knowledge; to build lecture-rooms, to provide apparatus, to erect observatories, to found museums in towns, villages, and all parts of the country; and, in proportion as science is extended, and the number of rational inquirers and experimenters is increased, may we expect, that new facts will be elicited from the system of nature, and new inventions brought to light for the improvement of the social state of mankind. The sums wasted in extravagance and luxury, in gambling, horse-racing, and hounding, or hoarded for the purpose of gratifying a covetous propensity; might, when applied in this way, draw forth the latent sparks of genius, and prove a powerful stimulus to inventions and enterprises, which might contribute to the advancement of society, and to the counteraction both of physical and moral evil.

5. *The progress of Christianity through the world would be rapidly promoted*, were the inordinate love of wealth thoroughly subdued.

It is evident, from the general tenor of the Scriptures, and particularly from the writings of the prophets, that the blessings of salvation are intended to be enjoyed by all the nations of the world. "It is a light thing" (saith God, when addressing Messiah), "that thou shouldst be my servant to raise up the tribes of Jacob, and to restore the preserved of Israel; *I will also give thee for a light to the Gentiles, that thou mayest be my salvation to the ends of the earth.*" Hence, it was among the last instructions that Christ delivered to the apostles, and to all their successors in their name: "Go ye into all the world and preach the gospel to every creature; and lo, I am with you always, even to the end of the world." Notwithstanding the lapse of 1800 years since this commission was given to the followers of the Redeemer, it has only been very partially fulfilled. Darkness still covers the greater part of the earth, and gross darkness the people. The greater portion of the vast continents of Asia and Africa, a great proportion of America, and even of the southern parts of Europe; almost the whole of Australasia, the immense islands of Borneo, Sumatra, Madagascar, the Kuriles, Japan, and hundreds of other islands, inhabited by millions of human beings, still lie within the confines of Pagan darkness, where scarcely a ray of Divine

light may be obtained from electricity, and has already exhibited an apparatus and experiments on a small scale, which prove, that the object intended is likely to be effected, could funds be procured to encourage the ingenious and persevering inventor, and enable him to go forward with his experiments on a larger scale. A nobleman in the neighborhood, distinguished for his "liberal politics," lately paid a visit to the inventor, and was gratified in witnessing some of the experiments. He told him to persevere, and if the plan succeeded, as was expected, he would have his mansion illuminated by this electrical light. But although he must have known that the inventor's income was extremely limited, and that he must have denied himself most of the comforts of life, from having laid out so much expense in conducting his experiments, he never thought of saying to him, "I'll give you a hundred guineas to enable you to perfect your invention, and to bring it forth for the good of mankind;" although he could well afford it, and has, doubtless, spent ten times that sum for a worse purpose. Such, however, is the conduct of avarice, combined with indifference to the promotion of the good of society.

* A scientific gentleman, of very limited income, had, for several years, devoted a considerable portion of his time in experiments, tending to prove, that a beautiful and perma-

light has yet penetrated "to guide" their benighted inhabitants "in the way of peace." Even in those nations where the religion of Jesus is known and established, the inhabitants are not yet half christianized, and multitudes "are perishing for lack of knowledge," even where the sound of the gospel is heard, and its light shining around them, for want of proper instruction to arouse their attention.

To fulfill the commission of Christ, and to bring into effect the purposes of God in the conversion of the nations, will therefore require vast and long-continued exertions. If our future movements be as slow, and our energies as feeble as they have been for 300 years past, we could not expect to behold the glory of the millennium until after the lapse of two thousand years. Yet it is in our power, as agents under the guidance of the Divine spirit, to hasten the approach of the blissful era, within little more than half a century, if we, at this moment, arouse ourselves from apathy and spiritual slumber, and bring forth all the treasures at our command to carry forward the enterprise. But without wealth, and that, too, to a vast amount, nothing of any great importance can be achieved. If the principle of covetousness shall still hold possession of the soul, as it has done for ages past, and if even Christians will entammel themselves in the cords of avarice, and refuse to come forward with that noble generosity which becomes their character, and lay down their wealth "at the feet" of the messengers of salvation, as was done on the day of Pentecost, our hopes of the *speedy* conversion of the world will be miserably disappointed.

What is all that has been done hitherto, in propagating the gospel, compared with *what might have been done*, had we been deeply impressed with the *importance* of such enterprises, and acted in the character of devoted servants of the Redeemer, "who count all things but loss," in comparison of the interests of his kingdom? All that has hitherto been raised for missionary purposes within the last twenty years (and it is chiefly within this period that such enterprises have been in operation), is little more than two or three millions of pounds, when at least five times such a sum might have been raised every year, had we been animated with anything like the spirit and the holy zeal of the primitive Christians. This is evident from what has been stated in the preceding chapter. Were thousands of Christians, on whom God has bestowed property and riches, to consecrate—not the whole of their estates, as was done at the period alluded to—but only the one-half, what immense sums for rearing the spiritual temple might speedily be raised! And such sums are almost indispensably requisite. We have a work of immense extent and importance to accomplish. We require thousands, and ten thousands of preachers, missionaries, catechists, linguists, translators, schoolmasters, lecturers, and other laborers, to be trained for their respective departments of sacred labor. We require them to be *more thoroughly trained* than they have ever yet been for the services to which they are devoted. It is not enough that a missionary, of any description, be a man of piety, though this qualification is essentially requisite. He should, if possible, be a man of universal knowledge, having his mind richly imbued with all the information he can acquire on sacred and civil history, mythology, science and art, and the system of nature, in all its departments; for he will find abundant scope for all his acquirements, wherever he may labor in the heathen world, and particu-

larly among those tribes that have made certain advances toward a state of civilization. From such sources, he must occasionally draw his illustrations of Divine subjects, and his proofs of the facts and doctrines of revelation; and endeavor to make general knowledge on every useful subject, go hand in hand with his expositions of the Christian system. In particular, he should be thoroughly acquainted both with the theory and practice of the most efficient modes of intellectual and moral instruction, to which I lately alluded; in order that he may seize on the first opportunities of imbuing the minds of the young with general knowledge, and with the facts and principles of religion. I am fully convinced that far more converts will be made from among the heathen, by the early and judicious instruction of the young, than by preaching to the adult population, though both plans should be attended to, and go hand in hand. By arranging a judicious system of education for the young, we may strike at the root of those heathenish opinions, practices, and prejudices, which have so powerful an influence over adults in preventing the reception of Divine truth; and have it in our power to prepare the youthful mind for listening with attention to the truths and historical details of Christianity, when they arrive at riper years. Such seminaries would undoubtedly prove "nursing mothers" to the church, from which the greater part of the young would come forth to consecrate themselves to the service of the Redeemer, and to the promotion of the prosperity of his kingdom.

Now, in order to accomplish such objects, we require colleges to be founded, and professors appointed for instructing students and intended missionaries, in all those branches of knowledge with which they ought to be acquainted. We require, as their instructors, men of general information, of talent and piety, who will render their lectures and other instructions, as popular and perspicuous as possible; and who, on every branch of science, will point out the moral and religious purposes to which it may be applied, and direct their students to render every department of human knowledge subservient to the interests of Christianity. We require, that our missionaries be possessed of vigorous mental powers, and that they be instructed in the best modes of infant education, and that they actually practice as teachers of such institutions, as well as in conducting those of a higher order, that they may be quite familiar with all the details connected with such seminaries, and be competent to superintend them wherever they can be established in heathen countries. We require that they should have a competent acquaintance with the construction of the instruments connected with science, and modern improvements, and the manner of applying them to practical purposes, so that they may be enabled to explain and exhibit them in the countries whither they are sent, and to introduce among their inhabitants whatever may tend to gratify a rational curiosity, or to promote their physical comfort. For all such purposes, funds to a considerable extent are required, for creating seminaries—for salaries to professors—for supporting students—for sending out missionaries—for supporting them for a season—for apparatus for infant-schools and other seminaries—for books on general knowledge, and the instruments connected with science, husbandry, and the mechanical arts. And whence are funds to be supplied if the spirit of covetousness is not counteracted and subdued?

We have, hitherto, been parsimonious in the extreme, in our contributions for missionary pur-

poses, and we have been almost equally parsimonious in the training and preparation required for our missionaries, and in the equipment and encouragement afforded them. We ought to serve God, in all cases, and in this in particular, "*with our best*;" with the highest talents, and the greatest measure of acquired knowledge we can command; and with all the auxiliaries for facilitating the work in view, which Christian wisdom can devise; and then we may go forth with confidence, trusting in Him "who hath the residue of the spirit," that he will render our endeavors, when conducted with wisdom, successful for promoting the extension of his spiritual kingdom. Let Christians, then, seriously ponder on this subject, and consider whether there be not an *urgent call* addressed to them in the providence of God, to awake from their slumbers, and come forth with their treasures, in a far more liberal manner than they have ever yet done, to assist in rearing the spiritual temple of Jehovah.

Some years ago, I was conversing with a shrewd and intelligent gentleman on the subject of missionary operations, who seemed to think that there was too much fuss and bustle about such enterprises, when so much is required to be done at home with the money expended on such objects. "I do not think," he said, "that the heathen are in so wretched and *dangerous* a state as many of our religionists represent, and would have us believe;—but, if I really thought, that they were perishing for lack of knowledge, and exposed to everlasting misery on this account, and if preaching the gospel to them would prevent their destruction—then I admit, that we all ought either to embark as missionaries, or sell the greater part of our property in order to send messengers for their deliverance. We ought even to sell all that we have, to our last coat, if such an object might thereby be accomplished." And does not every Christian, at least theoretically, admit that the heathen nations are in a *dangerous* situation, as here supposed, and exposed to misery in the life to come? Whatever opinions we may form of the salvable state of any small portion of the Pagan world, it is a *fact*, that the great majority of heathens, by the malignant passions and ferocious tempers they display, appear altogether *unfitted* and *unprepared* for the enjoyments of the celestial world; and consequently, cannot in such a state, be admitted into the mansions of bliss, and if their existence be prolonged, when they pass from this earthly scene, it must of necessity be an existence connected with misery. It must, therefore, be an object of the *greatest moment* to embark in an undertaking which has for its grand aim, to enlighten "the people who are sitting in darkness and the shadow of death, to guide their feet in the way of peace," and to prepare them for glory and immortality. And although we were "to sell the half of our goods," and devote it to such objects, we should do no more than the importance and the eternal consequences of such enterprises evidently require.

There is now a call, and an *urgent call*, from tribes and nations in every quarter of the globe, to send to them the messengers of peace and salvation. "The wilderness and the solitary places, the isles and the inhabitants thereof are lifting up their voices" from afar to the people of Britain and America, to send to them the revelations of heaven, and missionaries to expound them. India alone, at this moment, requires at least a thousand enlightened and devoted men to sow the seed of the Divine word, and to refresh the spiritual wilderness of that vast heathen territory with the

streams of salvation. Ethiopia is beginning to stretch out her hands to God, and many of her sable sons are now waiting for his salvation, and hailing the arrival of the messengers of peace. The inhabitants of the frozen regions of Greenland, Labrador, and Siberia, are imploring Divine instruction from Christian nations, and thousands of Negroes under the scorching suns of the West Indies, are ardently longing to be furnished with copies of the book of God. The Chinese are now beginning to inquire after the Oracles of heaven, and the arts and sciences of Christian nations. Even from "the ends of the earth," from the distant barbarous isles of the Pacific, the cry is now heard in our land, "Britons, come over and help us!" Their inhabitants are trembling lest the messenger of death should seize them, before the ships that convey British missionaries appear in their horizon, and lest a sufficient number should not arrive. They are "lifting up their voices from their rocks, and shouting from the tops of their mountains," in expectation of the heralds of the prince of peace, and are ready to receive them with open arms. And will *Christians*, who profess to be infinitely indebted to the Redeemer who purchased them with his blood—who profess to regard SALVATION as of all things the most desirable and *momentous*, and who would tremble at the thought of the possibility of their own eternal destruction—will Christians, to whom God has given wealth, suffer their minds to be so governed by the "mammon of unrighteousness," that they will refuse to bring forth their treasures at his call, as the means of "delivering those who are ready to perish," and rescuing their souls from destruction? If so, where is their love to the Saviour? where is their benevolence toward men? where is their belief of the importance of eternal realities? and where is the evidence they give that they ought to be distinguished by the Christian name?

O! into what a blissful scene might this ruin of a world yet be transformed, were covetousness thoroughly subdued, and were only those who profess to be Christians, to come forth with unanimity, and lay down their superfluous treasures at the foot of the cross! In the short space of little more than half a century to come, we might behold celestial light diffusing its radiance over the most distant and benighted regions of the globe; the idols of the nations abolished; the savage raised to the dignity of his moral and intellectual nature, and his mind adorned with the beauties of holiness; the instruments of warfare broken to shivers, and peace shedding its benign influence over the world; temples erected in every land for the worship of the God and Father of our Lord Jesus Christ; the minds of the young irradiated with Divine knowledge, and rising up in wisdom, and in favor with God and man; the principle of crime extirpated, and poverty and wretchedness banished from the earth; the moral wilderness of the heathen world cultivated and adorned with every heavenly virtue and grace; the wastes and wilds of the globe transformed into fertile regions, and arrayed in all the beauties of Eden; the hatred and jealousy of nations, changed into benevolence, and a friendly and harmonious intercourse established between all the tribes and families of the earth!

And is not the prospect of the mere *possibility* of accomplishing such objects, sufficient to quicken every Christian activity and to draw forth every generous emotion? more especially when we consider that such events are predicted in the records of ancient prophesy; that the certainty of their

being realized is confirmed by the declaration and the oath of God; and that the energies of the Divine Spirit are promised to accompany our endeavors and to secure their ultimate success? Let us then, arise and "shake ourselves from the dust"—from the dust of carnal maxims and worldly views; and be "strong in the Lord, and in the power of his might." "For as the rain cometh down and the snow from heaven, and returneth not thither, but watereth the earth, and maketh it bring forth and bud, so (saith Jehovah) shall my word be that goeth forth out of my mouth; it shall not return unto me void, but it shall accomplish that which I please, and it shall prosper in the thing whereto I sent it." "I have sworn by myself, the word is gone out of my mouth in righteousness and shall not return, that unto me every knee shall bow and every tongue shall swear. For Zion's sake I will not hold my peace, until the righteousness thereof go forth as brightness, and the salvation thereof as a lamp that burneth. And the Gentiles shall see thy righteousness and all kings thy glory. For, behold I create new heavens and a new earth, * and the former shall not be remembered nor come to mind. But, be ye glad and rejoice forever in that which I create; for, behold, I create Jerusalem a rejoicing, and her people a joy. And there shall be nothing to hurt or destroy in all my holy mountain, saith the Lord."†

6. We might expect the speedy arrival of the millennial era, were a spirit of Christian generosity universally to prevail.

To this topic I have already had occasion to allude, particularly in the preceding section, and I shall therefore offer only a few additional remarks.

That a period is about to arrive when the physical and moral condition of the human race, is to be greatly meliorated, when the ignorance and idolatry of the heathen world are to be abolished, and when Divine truth shall extend its influence over all nations, is clearly predicted in the writings of the Jewish prophets. In these writings it is declared, that "the glory of Jehovah shall be revealed, and all flesh shall see it together"—that "all the ends of the earth shall remember and turn to the Lord"—that "*the earth shall be full of the knowledge of the Lord*"—that "Jehovah shall make bare his holy arm in the eyes of all the nations, and all the ends of the earth shall see the salvation of our God"—that "the heathen shall be given to the Redeemer for his inheritance, and the uttermost parts of the earth for his possession"—that "all kings shall fall down before him, all nations serve him, and the whole earth be filled with his glory."

Predictions of this description, run through most parts of the inspired writings, and are embodied in numerous passages which we are apt to overlook, particularly in the Book of Psalms. All the calls, or commands to praise God, which are addressed to the inhabitants of the world at large, may be considered as including predictions of such events; as in the following and similar passages: "Make a joyful noise to the Lord all

the earth, make a loud noise, and sing praise." "Sing unto the Lord a new song, sing unto the Lord all the earth. Worship the Lord in the beauty of holiness, fear before him all the earth. Sing unto God, ye kingdoms of the earth, O sing praises to Jehovah." "O praise the Lord all ye nations, praise him all ye people," &c.

And, since God has given a universal call to all people to engage in his service, we may rest assured, that this call will, at some future period, be universally responded to by the inhabitants of every clime. For the word which has proceeded out of the mouth of Jehovah, shall not return to him void, but shall accomplish the purposes of his will. "His counsel shall stand, and he will do all his pleasure." In accordance with such calls, we find likewise, in the Book of Psalms, many positive declarations on this subject. "*All the earth shall worship thee, they shall sing to thy name.*" "The people shall praise thee, O God, all the people shall praise thee. God shall bless us, the fields shall yield their increase, and all the ends of the earth shall fear him." "The heathen shall fear the name of the Lord, and all the kings of the earth thy glory." "All nations whom thou hast made, shall come and worship before thee, O Lord, and shall glorify thy name." "All the kings of the earth shall praise the Lord, when they hear the words of thy mouth." "From the rising of the sun to the going down of the same, God's name is to be praised." "Kings of the earth and all people, princes and all judges of the earth, both young men and maidens, old men and children, shall praise the name of the Lord; for his name alone is excellent, and his glory is above the earth and heavens." *Our duty*, in reference to the promotion of such events, is likewise plainly declared. "O bless our God, ye people, and make the voice of his praise to be heard." "*Declare his glory among the heathen; his wonders among all people.*" "Thy saints shall speak of the glory of thy kingdom, and talk of thy power, to make known to the sons of men his mighty acts, and the glorious majesty of his kingdom."

The above passages, although there were no others recorded in the book of God, on this subject,—clearly point to a period, when the moral state of the world shall be regenerated, when persons of all ranks shall do homage to the Redeemer, and when the light of Divine truth shall shed its radiance on every land. It is of importance that a clear conviction of the certainty of such events should be deeply impressed upon the mind of every professor of religion; as some who call themselves Christians, have not only insinuated, but openly declared, that the state of the world will never be much better than it is; and, consequently, that we need give ourselves little trouble in making exertions for the regeneration of society—which is just, in other words, an apology for indulgence in covetousness. But nothing, I presume, can be more decisive, in reference to the approach of the millennial era, than the passages we have now quoted, if the word of God is not to be deemed fallacious.

This period, we trust, is now fast approaching, and our duty in reference to it, is clearly pointed out! "declare his glory among the heathen, and his wonders among all people. Prepare ye the way of the Lord, make straight in the desert a highway for our God. O thou that bringest good tidings to Zion, lift up thy voice with strength; lift it up, be not afraid; say unto the cities of Judah," and to the tribes of the heathen, "behold your God." While we engage in our duty in reference to such events, we have full assurance of

* The "new heavens and new earth" here mentioned, evidently denote the renovation of the physical, moral, and spiritual world, at the period when the gospel shall be universally extended, by which, a change, in these respects, will be effected, which, in prophetic language, may be very properly compared to a new creation, on account of the contrast it will exhibit to the state of the world in preceding ages. That the passage does not refer to the period of the resurrection, appears from what is stated in the sequel of this chapter. Isaiah lxx.

† Isaiah lvi. 10, 11; xlv. 23; lxii. 1, 2; lxx. 17, 18, 25.

direction and support from Him, who is the moral governor of the world, and the Supreme disposer of events. When it is declared that "all the ends of the earth shall turn to the Lord, and all kindreds of the nations worship before him"—it is added, "for the kingdom is the Lord's, and He is the Governor among the nations." And, consequently, he can remove every obstruction out of the way, and arrange every event in such a manner as to facilitate the progress of Divine truth through the world, until, "the everlasting gospel shall be preached to them that dwell upon the earth, and to every nation, and kindred, and tongue, and people."

The only thing to be determined, is, whether that renovated and happy state of the world, which we call the *millennium*, shall be introduced by some astonishing miracles, such as happened at the creation, and the deluge; or, by the agency of Christian men under the influence of the Divine spirit, devoting all their talents, energies, and treasures, to the accomplishment of this object. For the former supposition, I know no arguments grounded either on reason, or the dictates of revelation.

To suppose the Almighty, to interpose by such miracles to accomplish such events, would be contrary to everything we know of the principles of the Divine government, or of its operations during the lapse of more than four thousand years. At the introduction, indeed, of the New Testament economy, miracles were wrought by Jesus Christ, to demonstrate to the world his Messiahship, and a similar power was conferred on his Apostles, to convince their hearers, wherever they traveled, that they were the messengers of heaven, and that they had authority for the truths they declared. But no miraculous change was effected in the general order, either of the physical or the moral world. It might be asserted, without fear of contradiction, that, throughout the whole train of the Divine dispensations toward our world, *there was never a miracle performed to accomplish any object, when that object could have been effected in consistency with the established laws of nature.*

Now, men, "as workers together with God," are adequate to accomplish all that is predicted respecting the happiness and glory of the millennial era, provided they arouse themselves to holy energy and activity, and are willing to consecrate their mental powers, and their worldly *riches* to the promotion of this noble object. Beside, were the millennium to be introduced by a sudden miracle, it would deprive the saints of God, both of the *honor* which will be conferred upon them, in being instrumental in preparing the way for its arrival, and of the *happiness* they will feel in beholding the Divine plans gradually accomplishing, and their own exertions crowned with success.

For, since the physical and moral state of the world has been deranged by the sin of man, and since God in his mercy has determined to effect its regeneration, it ought to be considered as a high honor conferred upon his people, that he has been pleased to select them as agents in accomplishing his benevolent designs; and all who are "right hearted men," will enroll themselves in the service of the Redeemer, as Christian heroes, to increase the number of his subjects, and to extend his kingdom over the world; and to this service, they will account it their greatest happiness to devote all their wealth and treasures. "This honor have all the saints;" and it is to be hoped, they will now come forward, with cheerfulness, and alacrity, in numerous bands, casting their

treasures at his feet, "and give him no rest until he establish, and until he make Jerusalem a praise in the earth."

If, then, it be admitted, that the millennium will be ushered in by the exertions of the friends of the Redeemer, in conjunction with the agency of the Spirit of God; the most *energetic means* ought now to be employed, and with unremitting activity, in order to accomplish this desirable *end*. And, as those means involve a consecration of a far greater portion of wealth than has ever yet been devoted to the service of God, the principle of covetousness, in all the shapes it assumes, must be almost completely extirpated, and new principles acted upon, in relation to the appropriation of riches, before we can expect to behold those arrangements going forward, which are requisite to bring about this "consummation so devoutly to be wished." Christians may *wish*, and *hope*, and *pray* with apparent fervor, for the coming of the kingdom of Christ, and the glory of the latter days—they may profess to celebrate his death, to celebrate his praise, and may make a great stir and bustle about adhering to his cause and testimony; but unless they put their hands in their pockets to supply the means requisite for accomplishing the benevolent purposes of God, our expectations of the *near* arrival of the millennium will be frustrated; and their conduct can be considered as only a mockery of God, while, under profession of serving him, "their hearts are still going after their covetousness."

The arrangements requisite for preparing the way for the approach of the millennium, have already been stated in the preceding sections.

Abundant provision requires to be made to promote the external comfort of the poor, and other ranks of society; many physical evils require to be remedied; improvements of every description carried forward; the wastes and deserts of the earth, cultivated and adorned; old cities and towns cleared of every nuisance; and new towns and villages erected on spacious and improved plans, adapted to health, cheerfulness, and comfort. Seminaries require to be established for the instruction of all ranks, in every department of knowledge, connected with the life that now is, and the life to come, without which the foundations of the millennial state cannot be laid. All the useful arts and sciences must be promoted and carried toward perfection, as auxiliaries to the extension of the gospel and the renovation of the world. Missionary enterprises must be carried on with more vigor, and on a scale far more extensive than they have ever yet been, before we can expect to behold the dawns of the millennial glory.

In order to accomplish such objects, it is evident, that vast resources of wealth are absolutely requisite; resources a hundred times greater than have hitherto been consecrated to the service of God, and the benefit of man. But, I have already shown, that we have wealth adequate to every purpose now suggested, if we choose to employ it in such achievements. Instead of a quarter of a million, we might raise fifty, or even a hundred millions of pounds *annually*, to promote the extension of the Messiah's kingdom, the improvement of society, and the regeneration of the world. And, while such sums are raised, and employed in such operations, no want of real comfort would be felt, but on the contrary, a degree of rational and sensitive enjoyment, far superior to what has ever been experienced in the world.

It was lately stated, in some of our periodicals, that there are in and about London, about two or

three hundred individuals, whose fortunes, combined, would be nearly sufficient to pay off the whole of our National debt, now amounting to above £800,000,000. What would the half, or even the tenth part of such wealth not accomplish, were it applied in consistency with the dictates of reason and religion? But where do we ever find such an appropriation of such abundant riches? Is it not a proof, or something approximating to it, that we might be characterized rather as a nation of atheists and infidels, than as a nation of *Christians*, when so little of our national wealth flows into Christian and philanthropic channels? Let us no longer boast of Britain being by way of eminence a *Christian* land, until we display more Christian principle in our actions, and a more noble spirit of Christian liberality than we have done for ages past. If we wish to lay claim to this sacred name, let us show by our Christian virtues, our Christian generosity, and our heavenly aims, that we are entitled to this distinguished appellation.

For raising such contributions as those to which I allude—I, in the meantime, look to *Christians alone*, and not to nations or communities, that have assumed that name. As for those who are governed by carnal maxims, and the fashion of the world, we might as soon attempt to control the laws of nature, or to reason with the tornado, or the whirlwind, as to expect that any arguments, however powerful, will make the least impression on their hearts, or induce them to alter the conduct they have hitherto pursued.

But, I trust, that amidst all the apathy that prevails in regard to this subject, there are still many thousands in our land, who only require to have their duty clearly set before them, in order to excite them to the noblest displays of Christian beneficence. And, if they were once aroused to devote their wealth to the cause of the Redeemer, and to come boldly forward as Christian heroes, in the face of the world, "counting all things but loss," in comparison of the prosperity and extension of Messiah's kingdom—their example, I doubt not, would prove a powerful stimulus to thousands of Christians in other parts of the world, to embark in the same glorious undertaking.

It is strange, it is passing strange—it is passing wonderful! that Christians should have been so long sunk into a state of apathy on such a subject, and that they should never yet have come forward with treasures corresponding to their high and heavenly character, and to the greatness of the work they are called upon to achieve.—Had God commanded us to forsake houses and lands, and friends, and country—to sell all that we have, and to devote it to his service, and to depend every day for our sustenance on whatever his providence might supply, it would have been our duty cheerfully to have acquiesced in such an arrangement, in gratitude for the spiritual benefits he had conferred; "for the sufferings of the present time are not to be compared" with the glories of futurity. But when he requires from us only the superfluities of our wealth, which are not essential to our comfort, and which are generally devoted to "the lust of the eye, and the pride of life," why should we hesitate a moment to devote all we can spare from moderate personal enjoyment, to the service of the Most High? Is it consistent with a man's being a Christian, in deed, and in truth, to hesitate for any length of time on this subject? Were Christ now to demand of wealthy Christians what he once demanded of the young man who came to inquire the way to eternal life, "Go sell all that thou hast

and give to the poor, and come and take up thy cross and follow me," how would many of them reply to such an injunction? We are in the habit of *condemning* the choice of this rich man, in having his heart so much glued to the world, and in preferring *temporal* enjoyments to *eternal* realities. But, let me ask, how many British professing Christians, were the same requisition addressed to them, would act in a different manner? And, if there be any who can lay their hands upon their hearts, and say, as in the presence of God, that they would be willing "to forsake all" at his command, let them now come forth, in the face of the church and the world, and consecrate to the service of the Redeemer, all that they can possibly spare in consistency with rational enjoyment.

Let none imagine that the views now stated are utopian, or inconsistent with reason or revelation. To accomplish every object which has been adverted to, we require nothing more than the *faculties*, and the *wealth* which now exist in society.—The only *desideratum* lies in the human will. Will men come forward with all their energies and riches in this glorious cause? Secure the co-operations of the human *will*, and I should have no fear of the grand result, nor of any arguments that could be brought forward to show its impracticability. I defy any believer in revelation to *prove* that the grand objects alluded to are *impracticable*. Is it impracticable to cultivate barren wastes, and to turn the wilderness into fruitful fields? Have not Britain and the Eastern States of America been cleared of their ancient forests, and been transformed into gardens and cultivated plains? and where savages once roamed among caves and thickets, are there not splendid cities, palaces, temples, and seats of learning everywhere to be seen? Is it impracticable to arrange and establish a system of moral and intellectual instruction for all ranks of men? Are there not thousands of seminaries, both in Europe and America, and millions receiving instruction at them, where, a century ago, no such institution existed? Is it impracticable to convert savage nations to the Christian faith, and to bring them into a state of civilization and social comfort? Have not thousands and ten thousands of rude Hottentots, and the idolatrous savages of the Isles of the Pacific, been turned from heathen darkness, to the light of the gospel, and raised from a state of degradation, to the enjoyment of the blessings of civilized life, within the course of the last thirty years? In such instances, we behold at least a *partial* accomplishment of the objects to which we allude; and on the principle that "whatever man *has* done, man *may* do," it requires nothing more than an indefinite *increase* of the same energies we have already put forth, and a greater proportion of wealth to assist in carrying forward such energies, in order to bring into effect everything requisite for the regeneration of the world.

Above all, can we say, that it is impracticable to bring about what God has positively declared shall be realized in our world? He hath given forth his decree, and "sworn by his holiness," and "by the right hand of his strength," to secure its accomplishment—that "the whole earth shall be filled with his glory, and all flesh see it together"—that "the heathen shall fear the name of the Lord, and all kings of the earth his glory"—that "there shall be nothing to hurt or destroy, in all his holy mountain,"—and that "righteousness and praise shall spring forth before all nations." And we know, that "his counsel shall stand, and he will do all his pleasure," for "the kingdom is

the Lord's, and he is the Governor among the nations," and "all his saints are in his hand," as instruments to execute his designs.

Shall it then be said, that the physical and moral renovation of the world is impracticable? or that it is impossible to raise a hundred millions of pounds, every year, for such an object, when no less than *fifty millions* are annually expended in Great Britain and Ireland *for ardent spirits alone*. It is calculated, that there are in the British metropolis alone, upward of *one hundred thousand* confirmed dram-drinkers, who drink, on an average, two glasses of spirits a day, which allowing only $1\frac{1}{2}d.$ per glass, makes £1250 daily spent in dram-drinking, which, in a single year, amounts to the enormous sum of £456,250, or nearly half a million pounds, which is nearly double of what is contributed by all the Bible and Missionary Societies of Britain. And shall less than the twelfth part of the population of London spend such an enormous sum in such vicious and degrading practices, and shall the whole inhabitants of Bri-

tain not raise the one-half of it for promoting the most glorious and important object to which our aims can be directed? A most glaring deficiency in Christian principle and liberality must exist, where such incongruities occur; and, it is now more than time for Christians to ask themselves, what they have been doing with their money. A laboring dram-drinker can devote two shillings a week, or nearly five guineas a year, to his demoralizing habits, while a wealthy Christian, with five times his income, contents himself, perhaps, with the contribution of a single guinea, or even less, for promoting the kingdom of Christ, and the eternal salvation of men! Such an inconsistency ought no longer to exist among those who assume the Christian name. Let them either take their stand at once, among the men of the world, who attempt to serve both God and mammon, or come forward like noble champions of the cross, and consecrate to the honor of God, treasures worthy of the sublime and glorious undertaking, which they are called upon to achieve.

CHAPTER VII.

ON THE MEANS TO BE EMPLOYED FOR THE COUNTERACTION OF COVETOUSNESS.

EVERY improvement in society is brought about by exertion, and by the diligent use of those means which are best calculated to promote the end intended. Christianity was introduced into the world, and rapidly extended over many nations, by the unwearied labors of the apostles, who traveled into remote countries, submitting to numerous hardships, dangers, and privations, and "counted not their lives dear to them, so that they might testify the gospel of the grace of God," and promote the salvation of men. Had the same holy ardor which animated those first ambassadors of the Prince of Peace, been displayed by their successors, the world would have been in a very different state from that in which we now behold it. It is owing to our apathy and inactivity as Christians, that so many immoralities and unholy principles are to be found displaying their baneful effects around us, and that so little has been done for the advancement of society, and the evangelization of heathen nations. If we wish to behold a work of reformation going forward, and Zion beginning to appear "beautiful and glorious in the eyes of the nations," we must arouse ourselves from our indolence, and seize upon every means by which vice and every malignant principle may be counteracted and thoroughly subdued. And as covetousness lies near the foundation of most of the evils connected with general society, and with a profession of Christianity, it becomes us to use every rational and Christian mean, which may have a tendency to crush its power, and to promote the exercise of opposite affections. Some of the means by which this unholy principle may be subdued, have already been alluded to, and embodied in the form of motives and arguments addressed to the consciences of professors of religion. In addition to these, I shall suggest only two or three particulars.

1. *Frequent preaching on this subject, and occasional public sermons for the purpose of illustrating*

it, should be resorted to for the purpose of counteracting this malignant affection.

There is, perhaps, no mode by which so powerful an impression may be made on any subject, on the minds of Christians in general, as by the *viva voce* discourses of a respected, eloquent, and enlightened preacher, especially if his discussions be enlivened by vivid representations of sensible objects, and appeals to striking facts connected with his subject. Such appeals can scarcely be altogether resisted by persons impressed with religious principle; and it is to be regretted that Christians have not more frequently, in this way, been stirred up to a performance of their duty. Nor ought it to be considered as deviating from the *preaching of the gospel*, when such subjects are introduced into the pulpit. For they are intimately connected with the progress of Divine truth; and the gospel can never *extensively* take effect, nor its principles be fully acted upon in Christian society, until such subjects be pointedly and publicly brought forward, and undergo the most serious and solemn consideration. But it requires to be carefully attended to, that no preacher come forward publicly to denounce covetousness, and to attempt to stir up Christians to liberality, who is himself known, or *suspected* to be under the influence of a worldly or avaricious disposition. The most vivid representations, and the most pathetic appeals of such a preacher would only rebound from the hearts of his audience, like an arrow from a wall of marble. For how can a man who is continually aspiring after wealth, living in splendor, yet grumbling on account of the smallness of his income, and who seldom gives in proportion to his ability to any philanthropic object; how could such a one expect, by the most splendid oration, to produce a deep and moral impression upon his hearers?—For example, in this, as well as in every other case, would have a more powerful effect than precept.

A few months ago, I was conversing with a gentleman on this subject, who mentioned several honorable examples of liberality connected with the congregation of which he is a member; some of whom, who only occupied a medium station in life, contributed to the amount of twenty and thirty pounds yearly for public religious purposes, so that the whole congregation raised £500 or £600 annually, for missionary and other purposes; beside the regular maintenance of the gospel among themselves. His minister, he said, maintained the principle, that every Christian should, at least, devote the one-tenth of his income for religious purposes. I asked him the amount of the minister's stipend, and was informed that it was at least £450 per annum. I then inquired if his minister set an example to his hearers, and by acting in accordance with his own principle, and if it was a fact that he devoted £45 per annum to religious and philanthropic objects? The reply was, "I am sure he does not." "To what amount, then, does he contribute for such purposes?" "About eight or ten pounds annually, at the utmost." "If this be the case," I replied, "I should scarcely have had the effrontery to inculcate such a principle upon others;" and I was given to understand, that, in this case, the discrepancy between his conduct and the principle admitted, was beginning to be particularly marked. Why should ministers, particularly those who have handsome incomes, consider themselves as exceptions to a general rule? If they do not set an example of liberality in their conduct, all their instructions on this point will go for nothing, and be only as "a sounding brass or tinkling cymbal."

2. Christian churches should strictly investigate the conduct of their members, in relation to the portion of wealth they devote to religious objects.

Those members of a Christian church whose incomes are generally known, and who are remiss on this point, ought to be calmly reasoned with as to their duty in this respect, on scriptural grounds, and in accordance with the principles and obligations they admit as Christians. And if they obstinately resist every argument and admonition addressed to them, and refuse to give a fair proportion of their substance to the service of Him from whom they derived it, they ought to be suspended from the peculiar privileges of Christian society. The church of Christ has undoubtedly a right to take cognizance of its members, as to this point, as well as when they are chargeable with a breach of duty in any other respect, or found guilty of a direct violation of the laws of God. We are too apt to imagine (and custom has long sanctioned the opinion) that the censures of the church are only to be inflicted on those who are guilty of what the world terms *scandals*; and many professors of religion are thus led to consider themselves as acting a dutiful part in Christian society, if no such scandals can be proved against them. But the non-performance of duty is equally sinful, and as regularly denounced in scripture, as the direct commission of vicious actions. "If thou forbear to deliver them that are drawn unto death, and those that are ready to be slain; doth not he who pondereth the heart consider it?" "Whoso hath this world's good, and seeth his brother have need, and shutteth up his bowels of compassion from him, how dwelleth the love of God in him?" The unprofitable servant who hid his talent in the earth, is not accused of drunkenness, uncleanness, licentiousness, or any similar crime, yet, because he misimproved the

talent committed to his trust, he is doomed to the same punishment as the most flagrant workers of iniquity. "Cast ye the unprofitable servant into outer darkness, there shall be weeping and gnashing of teeth." It is by the regular performance of duty, more than by freedom from vicious practices, that the reality of Christian principle is displayed. There is, perhaps, nothing that brings a man's Christian character to a more decisive test, both to his own conscience, and in the eyes of others, than the circumstance of his *voluntarily* and perseveringly devoting a fair proportion of his wealth to the service of God, and the benefit of mankind. A worldly-minded man may continue for a considerable time to attend Divine ordinances, and make a fair *profession* of religion, while no regular demands are made upon his purse; but when called upon to contribute regularly, at least the tenth part of his income, it is more than probable he would display the latent avarice of his heart, by mustering up a host of carnal arguments against such a demand, and would soon take his station, where he ought to be, among the men of the world. But, if a man of wealth devote one-third, one-fourth, or even one-tenth of his riches to the cause of God and religion, and act a consistent part in other respects, a Christian church possesses, perhaps, the most tangible evidence they can demand of such a man's religious principle.

There is a certain false delicacy which some religious communities seem to feel in meddling with the pecuniary affairs or allotments of individuals, and especially of those who are wealthy, and who move in the higher spheres of society. They are afraid lest the pride of such persons should be hurt by such plain dealing—lest they should fly off at a tangent from their community, and lest the funds of their society should be injured by their withdrawal. But, although it is proper to use the greatest prudence and delicacy in such matters, yet, if such persons refuse to listen to calm reasoning and scriptural arguments and admonitions, they give evidence of a spirit which is inconsistent with Christian principle; and it is no honor to any church to have such enrolled among the number of its members. A church of Christ is a society whose members are animated by holy principles and affections; but most of our churches require to be sifted and purified—to be purified from the communion of those who are actuated by a worldly spirit, and who have little more of religion than the name; and, I know no better external test that could be applied for this purpose, than that which is stated above. A church composed of eighty "right-hearted" Christian men, generous, ardent, harmonious, and persevering in their efforts to promote the extension of Messiah's kingdom, would do far more to advance the interests of true religion, than if they were mixed up with 500 men of a carnal spirit, who are chiefly guided in their religious professions by the opinions of the world. Such a select band would move onward in harmony and peace, without interruption from men of proud and carnal dispositions, "their light would shine before men," and others would "take knowledge of them that they had been with Jesus," and might be induced to follow their example and walk in their steps.

As Christian churches should be zealous in inculcating the duty of liberality, so they ought to take special cognizance of acts, and general conduct which display a spirit of avarice.

When a church member has been found guilty of uncleanness, of an act of drunkenness, or of

pilfering an article from his neighbor, a hue and cry is instantly raised; and he is separated from the society, or at least, brought under the discipline of the church. And the purity of Christian communion requires that censure should be inflicted on all such delinquencies, and the offender, if possible, brought to a sense of his guilt, and to the exercise of repentance. But, it is not a little strange and unaccountable, that while strict attention is paid to such *insulated* acts of moral delinquency, which, in some instances, are only *exceptions* to the general character of the individuals, and not *habits* of vice; men should be permitted to remain in the church, without the least censure or admonition, who are guilty not only of *acts* which indicate the predominance of avarice, but go on in a *systematic course* of such conduct. Although there is scarcely anything that so clearly designates the character of an individual, as habitual avarice, yet, in many cases, it is scarcely considered as a scandal, because general society is disposed to wink at it—as if an avaricious Christian were not a contradiction in terms.

For example, a member of a church becomes bankrupt and compounds with his creditors, some of whom are poor people, for seven shillings in a pound. He resumes business, lives as luxuriously as formerly; and, in the course of eight or nine years, purchases property and enlarges his domestic establishment; but never thinks of paying off even a *fraction* of his former debts, because he knows that the civil law cannot compel him. Yet, he may hold his places in Christian society, and even in churches that profess a peculiar strictness as to Christian communion. Take another example: A person who enjoyed a lucrative trade, and who was known to be possessed of a certain portion of property or wealth, went to a friend, when lying on her death-bed, *in the absence of her husband*; and, instead of conversing with her on the important realities of religion and the eternal world—endeavored to inveigle her to subscribe an instrument, conveying to his family the whole of her property; which would have reduced her husband to something approaching to absolute poverty, although they were all members of the same religious community. What shall we think of such a person going from one attorney to another,* to endeavor to ascertain, whether he could, by *legal* means, inflict an act of injustice on his Christian friend and brother, and rob him of his worldly substance, and so far as in his power, reduce him to a state of indigence? Or, what shall we think of one who has a flourishing business, in conjunction with a certain degree of wealth, who is extremely fastidious about certain disputed points of religion, and who assumes an air of peculiar sanctity, yet will condescend, in the regular course of trade, to sell over his coun-

ter gills of ardent spirits to emaciated and debauched females and others, merely for the sake of the paltry gains which such a demoralizing practice procures?

The instances of avarice, as displayed among members of the Christian church, are so numerous, that volumes might be filled with the details. What should we think of a clergyman selling a quantity of victuals to a baker, and finding immediately afterward, that the prices were rising, importuned the purchaser to give up the bargain, under pretense of his requiring the whole of it for seed—which was no sooner done than he immediately sold it for an advance of several pounds? What should we think of the same individual receiving from a friend an article of dress, and immediately offering it for sale to gratify his disposition for hoarding? pilfering quantities of nails from the workmen employed on his premises—*cheapening* every article he intended to purchase, until he could acquire it, if possible, at half its value, and manifesting duplicity and falsehood in many of his transactions? Yet, although such conduct was somewhat notorious, and even talked over throughout all the country around, no public notice was ever taken of it by the judicatories of the church to which he belonged.

Many who make the most glaring profession of religion, and are extremely fastidious in respect to evangelical views and orthodox opinions, are not unfrequently distinguished by selfish and avaricious dispositions. There would be no end in specifying all the particular instances, and circumstances connected with the manifestation of covetousness, even by persons who are continually talking about union with Christ, spiritual-mindedness, and their own and others' conversions. Some of these, and I state it with deep reluctance and regret, have been known, on many occasions, to practice duplicity and deceit in many of their dealings, in order to secure a good bargain or an extraordinary profit—to traduce the characters of their brethren in order to gain a lucrative situation—to injure most seriously the pecuniary interests of others by not fulfilling a verbal agreement, because the civil law could not *compel* them—to rob the widow and the fatherless, under the pretense of legal right and power—to condescend to every low and squeezing means of deriving profits, and increasing their riches—to deny contracts and obligations, when they could not be legally proved—and, when solicited to contribute to a religious or philanthropic object, have either refused with a sneer, or a shuffling promise, or bestowed with a grudge the most insignificant sum. Now, it is not a little unaccountable, that such practices should be overlooked, especially by Christian communities that profess a strict adherence to the principles and precepts of the New Testament. Yet it is a fact, that all the cases I have now stated, or alluded to—although some of them excited the attention and reprobation of a few individuals, were never thought worthy of being brought under the discipline of the church. There is an indifference, and a bluntness of moral perception among the members of many Christian societies, which prevents them from perceiving the malignity and unscriptural character of such dispositions and practices, because they are not generally considered as scandals by the world around them. But, if we wish to preserve purity in the church, to promote the extension of Christianity, to undermine the spirit of avarice and to encourage a principle of Christian generosity—it becomes religious societies to look more narrowly into the disposition and practices of their members

* A friend of mine lately informed me, that when conversing with a young lawyer of an upright disposition, on a late occasion, he remarked to him, "that he had never been so deeply impressed with the evil dispositions which abound in society, as since he commenced business as a legal practitioner. He had been applied to by persons of all ranks, and of almost all *religious persuasions*—by persons who rank as respectable characters in society, for the purpose of ascertaining whether, by any legal quirk or maneuver, they could manage to get wills altered or canceled, and deeds and contracts broken or evaded, in order to enrich themselves at the expense of others, and in violation of natural justice. So little moral and Christian principle is yet to be found even in religious society, that many who name the name of Christ, think all is right if the civil law cannot interpose to punish their deceitful and nefarious practices. A gentleman who is an elder in a Presbyterian church, lately averred to me, in strong language, "that no man should be considered as acting improperly or unchristianly, if he acted in accordance with the *civil law*."

and by every scriptural means, to endeavor to wipe away the disgrace which has been cast on our holy religion, by the worldly-mindedness of those who "have crept in unawares" into the bosom of the church.

3. The churches of Christ should now begin to distinguish themselves from other societies, by exhibiting to the world such displays of liberality as Christianity requires.

If we ever expect to behold society advancing in its progress, the knowledge of Divine truth rapidly extending through the world, and a noble generosity, in respect of money, displayed for accomplishing such purposes; it is to the church we must look in the first instance, to set an example, to all others, of its disinterested and godlike liberality. The true church is "a city set upon a hill;" it is an object of attention, and minutely surveyed by surrounding spectators, many of whom have their eyes directed so as to mark its defects, and to expose the conduct of its citizens to public view. According to the aspect it presents, and the virtues or vices displayed by those who enjoy its privileges, will be the opinion formed by those who are without its pale, and who may wish to enroll themselves among the number of its citizens. It is, therefore, incumbent upon every one of them, that they "let their light so shine before men, that others may see their good works, and glorify their Father who is in heaven." If its light shine with brilliancy, it will attract the eyes of surrounding spectators; if the heavenly virtues of its citizens are conspicuous, and uniformly displayed in all their actions and arrangements, it will have a tendency to lead them to inquire into their principles and to join their society. Now, this virtue of *Christian liberality* is perhaps one of the most *visible* and *tangible* modes by which the light and efficacy of heavenly truth are made manifest to all. In the display of this virtue, hypocrisy cannot continue long to wear the veil. A worldly-minded man may be induced, in an instance or two, to make a display of generosity for the sake of character; but his ruling principles will soon induce him to muster up numerous arguments against the continuance of such exertions, and to retire from the field of Christian benevolence. Other virtues and displays of religious principle may sometimes be construed into superstition or fanaticism; but a perseverance in the path of Christian liberality, and a visible exhibition to the world of its benignant and extensive effects, can scarcely be imputed to such causes, but to the influence of higher principles which have been impressed with powerful conviction upon the mind. And I am strongly convinced, that Christianity will never make a powerful and universal impression upon the inhabitants of any land, until its *beneficent effects* be thus visibly displayed in the conduct of those who profess an adherence to its cause. So long as selfishness and worldly-mindedness are displayed by the majority of its professors, so long as many of its ministers are beheld aspiring after its wealth and emoluments more than after the performance of its duties, it will continue to be despised by those whose hearts have never been brought under its influence.

In order to induce Christians to come forward and display their liberality on a larger scale than they have ever yet done, I shall lay before them a few recent instances of generosity in promoting the cause of learning and religion, which, I trust, will prove a stimulus to those on whom God has bestowed riches and affluence, to "go and do likewise." Some of the following statements are

taken from Drs. Reed and Mattheson's "Narrative of a visit to the American Churches."

"*Grenville* is a small town which is considered as wholly religious. The settlement was formed by a party of ninety persons from New England. On arriving at this spot, they gave themselves to prayer that they might be directed in choosing their resting-place in the wilderness, and enjoy the blessing of God. At first they rested with their little ones in their wagons, and the first permanent building they erected was a church for Divine worship. The people retain the simple and pious manners of their fathers. They all go to church; and there are 400 in a state of communion. They give a thousand dollars a year to religious institutions. One plain man, who has never allowed himself the luxury of a set of fire-irons, beside what he does at home, gives a hundred dollars a year to religious objects. In this settlement, the drunkard, the fornicator, and the sabbath-breaker are not found; and, what is yet better, in the last report, there was only one family that had not domestic worship.* In this instance, we behold a select band of Christian men, voluntarily devoting their wealth to the cause of God; and as an evidence of the effect of such a principle, almost the whole community is distinguished for the practice of Christian virtues.

"The Theological Seminary at Andover, which contains a chapel, a set of elegant and commodious buildings, a philosophical apparatus, a library of 11,000 volumes, and embracing a portion of land of 150 acres, was founded not many years ago, at the suggestion of the Rev. Dr. Spring, father of the Rev. Dr. Spring of New York, in concert with Messrs. Bartlett and Brown. When they met to engage in free conversation on the subject, and had considered the nature of the object to be accomplished, 'Well,' said Mr. Brown, 'I will give 10,000 dollars.' 'Why,' said Mr. Bartlett, 'did you not say 20,000, and I would too.' Dr. Spring went to Salem, and saw his friend Mr. Norris there, told him what it was proposed to do, and obtained another ten thousand dollars, and thus the work proceeded. Mr. Bartlett, in addition to his first gift, built the chapel connected with the institution, which cost 50,000 dollars, afterward one of the wings, and several houses for the professors, as well as endowed several professorships. It is thought, that in several ways he has given to this object, not less than 200,000 dollars (about £45,000), and there is reason to believe, that all his benevolent intentions are not yet fulfilled.† Here is an example of truly Christian liberality, which deserves to be imitated by our wealthy professors of religion. "Had we only a thousand Christian men such as Mr. Bartlett among us, we might raise fifty millions of pounds from them in the course of a few years; and what immense benefits might thus be conferred on mankind! Mr. Bartlett, however, did not receive this wealth by inheritance, but by his own energies. He was first a shoemaker in Newbury, and became, in the end, for talents and success, a first-rate merchant. He occupies a good house, but lives in a very plain style, and has evidently more pleasure in bestowing than in consuming his property.‡ And is it reasonable to suppose that this gentleman is less happy than others, because he has parted with so great a proportion of his wealth for the good of mankind?

* Narrative, vol. i, pp. 168, 169.

† Ibid., vol. i, pp. 425-6.

‡ Reed's Narrative, vol. i, p. 488.

On the contrary, I am certain, he enjoys a serenity of mind, and a satisfaction infinitely superior to the groveling mortals who either hoard their wealth for no useful purpose, or who waste it in gratifying a taste for worldly splendor and extravagance.

After a revival in a church in Geneva, State of New York, in 1830, it is remarked that the appropriations of religious charity were nearly doubled the succeeding year. That church sustains one foreign missionary, at an expense of 666 dollars—thirteen home missionaries, at one hundred dollars each—nine scholarships of the American Education Society, at 75 dollars each; which, in addition to the appropriations for the Bible, Tract, Sabbath-school, and other objects of benevolence, amounts to more than 4,500 dollars during the first year.* This fact demonstrates, what we have alluded to, that wherever the principles of true religion and sterling piety take a thorough possession of the mind, they lead to acts of noble generosity; and that a perseverance in such conduct, is one of the strongest proofs of the power of religion upon the heart.

At Dorchester, a village six miles from Boston, Dr. Reed observes, "there are Sabbath-schools and an Academy for superior education. The ignorant are taught, the sick find medicine and sympathy, and the poor are promoted to adopt methods of domestic thrift and decency. The whole village presents an example of the effect of religion so administered. No children are left to grow up in ignorance; few persons abstain from a place of worship; and here, where everything else is on a small scale, the schools and churches assume an imposing character." How many villages of this description can be pointed out in Great Britain and Ireland? and is it not owing to our apathy and avarice, that so few scenes of this description should meet our eye?

"I know of no country," says Dr. Reed, "where there are more examples of beneficence and magnificence [than in America]. The rich will act nobly out of their abundance, and the poor will act nobly out of their penury. There are refreshing instances of individuals sustaining schools, professorships, missionaries, and evangelists. Ministers are repeatedly making movements, in which it was evident that everything was to be sacrificed to usefulness. I have seen the pastor, at sixty, beloved and happy in his people, give up all to go forth into the wilderness, because he thought that his example more than his labors, might bless the West,—while the church has been as ready to relinquish him, though with tears, when she has been satisfied that it was for the good of the church Catholic. I have seen a band of students, careless of ease and reputation at home, forsake the college at which they had passed with honor, and covenant to go forth together, some 2000 miles, to rear a kindred institution in the desert. And I have seen the aged man kindle at their enthusiasm, and support them with his purse, when unable to be their companion.†

As an evidence of the liberality displayed in the Northern States of America, there are no less than twenty-one Theological colleges, all of which have been instituted since the year 1808; they contain 853 students, and have accumulated 57,000 volumes. There are seventy-five colleges for general education, most of them with professional departments; and they have 8136 students; and forty of these have been erected since 1814. Altogether there are ninety-six colleges and 9032 students. In the State of New York alone, beside all the private seminaries, there are 9600 schools, sustained at a yearly expense of 1,126,482 dollars! Most of the above-mentioned seminaries, with the stately edifices connected with them, have been reared and established by voluntary donations. The "American Sunday School Union" is likewise a noble example of Christian activity and beneficence. In 1832, the eighth year of its existence, it had 790 auxiliaries; 9187 schools were in connection, having 542,420 scholars and 80,913 teachers. The expenditure for that year was 117,703 dollars:—for 1833, it was 136,855. The most vigorous efforts of this society have been directed to the valley of the Mississippi. In 1830, it was resolved unanimously,—"That in reliance upon Divine aid, they would endeavor within two years to establish a Sunday-school in every destitute place where it is practicable, throughout the valley of the Mississippi," that is, over a country which is 1200 miles wide, and 2400 in length. There are thirty-six agents wholly employed in this service; and, during 1833, they established 500 schools and revived a thousand.

The following examples of covetousness and liberality are extracted from an American periodical, entitled "The Missionary," for May 2, 1835; published at the Missionary Press, Burlington, New Jersey, by Members of the American Episcopal Church.

"A gentleman having called the preceding Autumn, to obtain aid for hiring a missionary in Tennessee, I thought I would go and introduce him to our congregation; and we called first on Squire L——, as he is the richest man in town, although I had little hope of success from that quarter. He put us off, as usual, with an account of his numerous family expenses, the frequent calls upon him for money, the duty of seeing our own church free from debt, and our clergyman well provided for, before we assisted others, and concluded with his old, threadbare proverb, '*Charity begins at home.*' We then called on his neighbor, Mr. S——, a man of considerable wealth, and no children to inherit it. He read the paper, said that it was a deserving object, but that he felt too poor to contribute. He colored slightly as he said this, and then, as if ashamed to give nothing, and anxious to rid himself of such troublesome visitants, handed us 25 cents (two shillings), and we took our leave. We met with various success; some gave cheerfully and liberally; others, grudgingly, and not a few declined altogether. Our last call was on Mr. R——, the shoemaker; we found him, as I expected, busily engaged at his work. He received us kindly, made inquiries about the state of the church in Tennessee, which showed that he felt a lively interest in the subject, lamented his inability to do much, but said he would do something. He then stepped into the house, and returned immediately

of Christian society, and consequently forms a barrier to the general diffusion of knowledge. Has covetousness on the part of the publishers, any share in this matter?

* Reed's Narrative, vol. ii, p. 19.

† "Narrative," &c., vol. ii, p. 282. While returning thanks to Drs. Reed and Mattheson for the entertainment and the valuable information which their "Narrative" affords—the writer of this cannot but express his regret that their work was not published in a more economical style. Had it been published, as it might have been, at half its present price, and comprised in two neat 12mo volumes, it would have been purchased by three times the number, and have been read by ten times the number of individuals who will be likely to peruse it in its present state. The price of such books prevents their being generally read by the mass

with two dollars, which he begged my companion to accept, as an expression of his good-will. Knowing him to be what is called in the language of the world, a *poor man* [though in gospel phrase he is eminently rich]; I asked him how he contrived to subscribe to each one of our benevolent institutions, to take a weekly religious newspaper, to contribute liberally to the support of our clergyman, and yet have so much to spare for a distant church? He told me, it was easily done, by obeying St. Paul's precept in 1 Cor. xvi. 2. In other words, he was *systematically charitable*. He made it a point of duty always to consecrate a *portion of his weekly income* to the Lord. 'I earn,' said he, 'one day with another, about a dollar a day, and I can, without inconvenience to myself or family, lay by five cents of this sum for charitable purposes; the amount is thirty cents a week (half a crown). My wife takes in sewing and washing, and earns something like two dollars a week, and she lays by ten cents of that. My children, each of them, earn a shilling or two, and are glad to contribute their penny; so that altogether, we *'lay by us in store'* forty-five cents a week. And if we have been unusually prospered, we contribute something more. The weekly amount is deposited every Sunday morning in a box kept for that purpose, and reserved for future use. Thus, by these small savings, we have learned, *that it is more blessed to give than to receive*. The yearly amount saved in this way, is about twenty-five dollars; and I distribute this among the various benevolent societies, according to the best of my judgment.' Now this man is a consistent Christian, a bright example of Christian benevolence. He looks upon his little earnings as a *talent* lent him of God, a part of which should be sacredly appropriated to his service.

In the same "Missionary Tract," it is stated, that the Treasurer of the "Domestic and Foreign Missionary Society," on April 10th, received 477 dollars and 41 cents,* of which 5 dollars are the avails of needle-work by *four little girls*, from four to eleven years of age, for the church at Jacksonville, Illinois; and 35 dollars from the Sunday-school of St. Luke's church, New York; 15 of them in redemption of a pledge for the education of an Indian child, named *Levi Silliman Ives*, in honor of their former rector, now the excellent bishop of North Carolina.

In our own country, we have likewise many characters distinguished for Christian beneficence. Mr. John Lloyd, of Nelson square, London, who died in June, 1835, was a liberal contributor to the cause of religion, under the signature L. He was civil engineer, employed at the government dock yards. He retired from business four years before his death, devoting his large fortune to the glory of God, and the good of men, both at home and abroad. More than £2,000 are known to have been distributed among different societies under the letter L.; nor was he unmindful of them in his will, having bequeathed to the Missionary Society £4000; the Home Missionary Society £4000; the British and Foreign Bible Society £3000; Religious Tract Society £3000; the South-west Sunday School Society £1000; Surrey Chapel Benevolent Society £1000; the Christ church Surrey School in Marlborough street, £500; the London Hibernian Society £500; † in all £29,000! What an example to wealthy Christians! and how much good may such an individual be instru-

mental in communicating to the church and the world! The concealment of his name in the numerous donations bestowed in his lifetime, arose from his retiring habits, and a desire "not to let his left hand know what his right hand did," and a hope that others would follow his example.

The Rev. Richard Knill, in the Evangelical Magazine for November, 1835, mentions a Welsh gentleman who has 200 sovereigns ready to be given for introducing more of the piety and talent of our churches into the work of the ministry; and a minister, once a student at Homerton, who proposes to assist four, six, or eight students in their preparatory studies, gratuitously. In the same number of this Magazine, Mr. Rathray of Demerara, mentions that the negroes are beginning to make monthly contributions for the purchase of Bibles, and other religious purposes, and that their first monthly collection amounted to 123 guilders, or £8 15s., and that they make a point of giving something for their children. A woman, says Mr. R., gave me 3½d. one day, saying, "This is for *Jane*, a child about two years old; I gave with the other people for *Kitty* and *Yaha*, when we gave the money to Jacob; but I had nothing to give for *Jane*; and, Massa, take this for her." This idea, suggested by poor negroes, of giving a sum for every child of the family, deserves the consideration and imitation of thousands of those who are better instructed, and who move in a far higher grade than the despised sons of Africa.

The name of Thomas Wilson, Esq., which stands in the front of most of our religious and philanthropic institutions, will recall to the mind of every one acquainted with that respected gentleman, the many hundreds and even thousands of pounds he has generously devoted to the rearing of chapels, to missionary and other benevolent purposes, the effects of which will be felt and appreciated in future generations, and "many will rise up to call him blessed." For, to those whom God has enlightened in the knowledge of the true use of wealth, "it is more blessed to give than to receive." In addition to his many other munificent donations, he has lately given £100 to the New Chapel, Albany street, London. G. F. Agnes, Esq., well known for his benevolent plans and exertions to promote the best interests of British Seamen both at home and abroad, has likewise distinguished himself by his liberal contributions to various religious and philanthropic objects. In addition to his labors and donations in behalf of the "British and Foreign Sailor's Society," and as a member of the committee of the "New Australian Colonization Association," he has lately subscribed £50, in behalf of the mission to the colony to be planted in the south-western quarter of New Holland.* Various similar instances of British generosity might be stated were it expedient, although it is much to be regretted that their number is so small.

It is one of the hopeful signs of our times, and a prelude that "God is about to appear in his glory to men"—that Christian churches and congregations are now beginning to come forward with far more liberality, than formerly, in the cause of missions, and of the extension of religion both at home and abroad. The churches under the inspection of the Rev. Dr. Brown and Mr. Gilchrist, in Edinburgh, and of Drs. Mitchell, Hough, and others, in Glasgow, have lately distinguished themselves by raising from five to eight, or ten hundred pounds annually, for domes-

* A dollar is equal in value to about four shillings and six pence, and a cent to one half-penny English.

† See Evan. Mag. for August, 1835.

* Evan. Mag. for Dec., 1835.

tic and foreign missions, beside affording a handsome support to their respective pastors. The church under the pastoral care of the Rev. Dr. Wardlaw, Glasgow, is said to have raised for such purposes, during last year, no less than £1700, beside supporting their pastor.

Mr. Williams, missionary from the South Sea Islands, in one of his interesting addresses to the public, on a late occasion, stated, that a certain congregation in England, mentioned to him with a certain degree of satisfaction, as if it had been a great and unlooked for effort, had raised the sum of £50, during the preceding year, for missionary and other purposes, beside maintaining the gospel among themselves. He told them, they ought to do much more; for such an exertion did not amount to a half-penny a week, to every individual. They began to bethink themselves on the subject, and next year raised, without much difficulty, above four hundred pounds. Mr. Williams also stated, that, at a late public breakfast, in a certain town in England, a sum of nearly £200 was collected in a few minutes, from a very limited number of individuals—one subscribing £20, another £10, another £5, &c., with the utmost frankness and animation.

The following experiment in behalf of missions, deserves attention, and might be tried, in reference to any philanthropic object. Mr. Clayton, of Walworth, proposed to his congregation, that a thousand of them should take up the subject, and each of the thousand subscribe one farthing a day to the missionary cause. This was recommended to be done immediately after morning prayer, that as soon as they rose from their knees, they might make an offering to the Lord of one farthing. This will raise more than a guinea a day, and, consequently, more than three hundred and sixty-five guineas a year (or £370 4s. 2d.), which sum would support six missionaries in the South Seas.

Having such noble examples as above stated, set before us, Christians of every name should now begin to arouse themselves from their apathy and inordinate attachment to the world, and to consider that they cannot bestow their wealth on a more honorable and important object than in promoting the glory of God, and the best interests of the human family, wherever they are dispersed over the surface of the globe. Were such liberal offerings becoming general throughout the universal church (and why should they not?) we might, ere long, have the near prospect of beholding the light of Divine truth irradiating every land, the moral wilderness turned into a fruitful field, and righteousness and praise springing forth before all the nations.

It may not, perhaps, be improper to remark, that the contributions of Christians should not be chiefly confined to missionary purposes, or to the support of the stated ordinances of the gospel. These objects, indeed, ought to be supported with far more liberality, and carried forward with more vigor than they have hitherto been. But, while we look abroad to distant tribes, and provide missionaries for their instruction, we are sometimes apt to forget the duty we owe to our countrymen at home; and, while we pay some attention to the religious improvement of the adult population, we too frequently overlook the rational and religious instruction of the young. On the proper moral and intellectual tuition of every class of the young, from two years old until twenty, the whole frame of civil and Christian society almost entirely depends. This grand object has been too much overlooked in all our Christian and philan-

thropic arrangements; and while it is so, all our other schemes of improvement will be partially frustrated. They will have a tendency only to lop off the twigs and branches of immorality and crime, while the roots of evil are left to break forth in fresh luxuriance. Christian society, therefore, should not rest satisfied, until every human being, from two years old until manhood, be brought under the influence of an efficient system of intellectual, moral, and Christian tuition, both in our own country, and, so far as our influence extends, in other lands; and a very considerable, if not the greatest portion of our Christian contributions ought, in the meantime, to be devoted to this object, which lies at the foundation of all those arrangements which are calculated to introduce the expected millennium. But, as I have already adverted to this subject, it is unnecessary to enlarge.

4. *Associations might be formed, particularly among Christians, for the purpose of encouraging liberality and counteracting avarice.*

As the spirit of covetousness is so extensively prevalent, and as it stands as a barrier to every noble and Christian enterprise, no means should be left unemployed to counteract its tendencies and effects. And, as societies have been formed for less important purposes, there appears no reason why an *Association* should not be entered into for promoting the cause of Christian liberality and beneficence. Such a society might be composed of persons who are willing to devote the *one-tenth*, or any other portion of their incomes to philanthropic objects. Such a society, if it could be formed, would set an example of liberality to the church and the world around them, and might prove a stimulus to many who might not otherwise have thought of it, to devote a portion of their superfluous wealth to rational and religious purposes. It might establish, in particular districts, systems of education on new and improved plans, as specimens of what ought to be set on foot for the improvement of society in every place. It might purchase barren tracts of land, and make arrangements for their cultivation and embellishment. It might rear small towns and villages, on spacious and improved plans, with every requisite accommodation and embellishment, and calculated for the promotion of health, convenience, and comfort. It might provide employment for the industrious poor, and commence new enterprises for civilizing and christianizing rude and uncultivated tribes, whether in our own country, or in other lands, and accomplish many other objects which an enlightened benevolence would readily dictate. The frequent publication of the operations of such a society, might be the means of exciting the attention of mankind in general to such beneficent pursuits, and leading to the promotion of similar associations.

However romantic such a project may appear to some, I have no doubt that there are hundreds of benevolent individuals in various districts of our own country, who would rejoice to have it in their power to co-operate with other congenial minds in promoting the best interests of their fellow-creatures in the above, or in any other modes that a rational or religious mind might devise—and that they are only waiting for such openings, in order to give vent to their Christian liberality.

It is an evil, or at least a defect, in many of our Christian arrangements, that, in the first instance, we aim too high, beginning at the top of the scale, when we should commence at the bottom. This is the case when our attention is almost solely devoted to the improvement of the adult

population, while the young are, in a great measure, neglected;—and when our efforts are entirely directed to the promotion of the *spiritual* interests of mankind, while their *temporal comfort* is overlooked or disregarded. We have hitherto laid much stress on merely *preaching* the gospel to adults, while we should have been equally active in *preparing the minds of the young* for the reception of Divine truth, by all the rational and religious arrangements which Christian wisdom can devise. We likewise profess great zeal for the spiritual and eternal interests of the poor; while we not unfrequently leave them to pass their existence in the most abject hovels, and to pine away in the midst of filth, penury, and wretchedness.

If we wish that they may appreciate the truths of religion, we must endeavor, at the same time, to meliorate their external condition, and render it pleasant and comfortable. To tell a poor wretch that he may have spiritual blessings, and eternal

treasures, by coming to Christ, while he is destitute of both food and clothing, and we refuse to supply his wants when we have it in our power, is something approaching to a species of insult. By endeavoring to meliorate the condition of the poor, while we offer them Christian instruction, we prepare the way for the reception of Divine truth. For, in so doing, we exhibit a visible proof that Christianity is a *beneficent system*, and tends to promote our happiness, both in the life which now is, and in the life to come.

Now, such societies as suggested above, while they have for their ultimate object, the spiritual and eternal happiness of men, might be instrumental in promoting the external comfort of all ranks, particularly the lower, in furnishing them with employment, in providing them with comfortable habitations, in securing the proper instruction of their families, and directing them in such a course of conduct as will infallibly lead both to present and future enjoyment.

CHAPTER VIII.

CONSIDERATIONS, ADDRESSED TO PROFESSING CHRISTIANS AND OTHERS, AS TO THEIR AFFECTIONS AND CONDUCT IN RELATION TO COVETOUSNESS.

HAVING, in the preceding chapters, embodied a variety of motives and considerations, to direct the views of professing Christians, in reference to this subject, it would be inexpedient to dwell on this topic, and, therefore, I shall only offer a few additional arguments and considerations.

I. To *professing Christians in general*, we would call attention to the following considerations.

1. Consider, *what* God claims the *Supreme* affection of the heart.

He is possessed of every attribute calculated to excite the adoration and love of all holy intelligences. He inhabits eternity and immensity, and is near to them who fear him, and hope in his mercy. His power and wisdom gave birth to the innumerable worlds which fill the universe, and all the streams of happiness which gladden the hearts of their inhabitants, flow from Him as the uncreated source of felicity. To the inhabitants of this lower world, he has displayed his love and mercy in a way that "passeth comprehension"—in the mission of his Son for the purpose of procuring our salvation—an event which ought to draw forth our highest affection, and gratitude, and praise. And he is "daily loading us with his benefits, giving us rain from heaven, and fruitful seasons, and filling our hearts with food and gladness."

Hence we find the inspired writers, and other holy men, expressing their emotions in such language as this:—"The Lord is my portion, saith my soul, therefore will I hope in Him;" "Whom have I in heaven, but Thee, and there is none upon earth, I desire in comparison of Thee. Who in the heaven can be compared to Jehovah? who among the sons of the mighty, can be likened unto him?"

Now, this supreme affection toward God, is altogether inconsistent and incompatible with the indulgence of a principle of covetousness. For, such an affection ruling supreme in the heart, virtually deposes God from his throne, and robs

him of the glory of his perfections. As soon may we expect to make the north and the south points of the firmament to meet together, or the light of the heavenly world to mingle with the darkness of the infernal pit, as to reconcile the service of God and mammon. For, while the true Christian, in all his movements, privations, and afflictions, puts his confidence in God, and looks up to him as his portion and deliverer, "the rich man's wealth is his strong city," and "he trusts in the abundance of his riches." The one joins with the heavenly host, in ascribing "wisdom and power, and glory, and thanksgiving to Him who sits upon the throne;" the other is an *idolater*, who says to gold, "thou art my hope, and to the fine gold, thou art my confidence," and thus, in effect, "denies that God is above."

Let Christians meditate deeply on this important point, and consider whether their affections toward the treasures of this world be at all compatible with supreme love to their God and Redeemer. What is it that conscience tells you is uppermost in your hearts? What are among your first thoughts in the morning, and your last in the evening? What is it that gives you most pain, the loss of a portion of your wealth, or the apprehension of the loss of the Divine favor? Are your desires more ardent after the increase of riches than after the treasure in heaven that fadeth not, and the incorruptible inheritance that shall last forever? Is your joy greater in the acquisition of riches or of a great estate, than in the consideration, that God is your Father, and your everlasting portion? It was a convincing evidence of Job's heavenly temper, that "he did not rejoice when his wealth was great, and his hand had gotten him much." Are you affected with deeper sorrow, when you lose your substance, than when you lose the benefit of Divine instructions, or although you were to lose a sense of the mercy of God? Would you rather be stripped of all your earthly possessions, and go

naked into Paradise, than to be laden with gold and jewels, although you should run the risk of falling into the pit of perdition? Do you make it your great and ultimate object to gain riches or an estate—rising early, lying down late, and eating the bread of carefulness? Do you grudge your families the necessary comforts of life, and, when requested to devote an offering for promoting the cause of religion, and the benefit of mankind, do you bestow it with a grudge, or with the spirit of a cheerful giver? In all the arrangements you make as to your lot in this world, are you chiefly directed by the prospect of worldly honor and gain, or by the opportunities you may have of glorifying God, and being useful to mankind? If you regard God as your supreme portion, and the rock of your salvation, you will consider all that you have as too little to be consecrated to his service, and will make the advancement of his kingdom, the object of all your arrangements, and will come cheerfully forward at his call to contribute for this end, according as he hath prospered you, saying with the Psalmist, "What shall I render unto the Lord, for all his benefits toward me?"

2. Consider the obligations you are under to Him who procured your redemption.

You profess as Christians, to be under infinite obligations to the mercy and love of our Redeemer, "who died and rose again," that your souls might be rescued from destruction. You profess to believe, that you were "redeemed not with corruptible things, as silver and gold, but with the precious blood of Christ," and that it was one great end of his death, that "you might be delivered from this present evil world, and its affections and lusts," and consequently, from the dominion of covetousness, which is the ruling passion of the men of the world, and which is utterly inconsistent with the character of the redeemed. While you, then, virtually acknowledge these truths, can you allow the love of the world to predominate in your hearts? Can you think it a hard demand that God makes upon you, when he requires a portion of the wealth which he himself has bestowed, to be devoted to the extension of the Redeemer's kingdom, and the promotion of his glory? He might accomplish all his gracious designs without your assistance; for all the treasures of the universe are at his disposal. But he has condescended to put an honor upon Christians, in selecting them in particular, to be "workers together with him," that by their voluntary and liberal oblations, they may exhibit themselves in the face of the world, as "followers of the Lamb," and contributors to "the prosperity of Zion." Can you, then, in consistency with your professions, refuse to come forward with munificent and god-like offerings, according to your ability, for every enterprise that has for its object the promotion of the Divine glory, and the present and everlasting happiness of men? For, it is by such conduct, that your avarice, or your Christian principle will be detected. The latent principle of covetousness, in its workings in the heart, though open to the inspection of Omniscience, cannot be directly traced by human eyes.

But, if you be hypocrites in religion, your hypocrisy will be laid open, and your true character determined by your refusing to contribute to the service of God, what is in your power to bestow. And this is a characteristic of the sense we entertain of our obligations to the Redeemer, which ought to be more attended to than it has hitherto been in the visible church.

If, then, Christians in general, and especially wealthy Christians, admit that they are under inexpressible obligations to him "who came in the name of the Lord, to save them"—is it compatible with such obligations, "to walk according to the course of this world," and to prevent, by their niggardly offerings, the gracious purposes of God from being brought speedily into effect? If you profess to celebrate the praises of him, "who loved us and washed us from our sins in his own blood, and hath made us kings and priests unto God and his Father"—shall you consider it as *too great an expression* of your gratitude, to devote a hundred or even a thousand pounds, at a time, for carrying forward the grand design of the death of Christ, and the regeneration of the world—when you have hundreds or thousands at your command? If God were calling you to devote *all* your worldly possessions to his service, would you consider it as too great a sacrifice for the gift bestowed? If not, how can you stand aloof and grudge a mere *tithe* of your earthly estate, when it is called for at your hands, and when every needful comfort is still secured for your enjoyment?

Let Christians seriously pause on such considerations, and judge, whether the general conduct of professors of religion, in regard to the dedication of their wealth, be consistent with the obligations they profess to Him who hath procured for them all spiritual and eternal blessings.

3. Consider that *all the privileges and prospects of Christians are incompatible with the indulgence of covetousness.*

Believers are brought by the gospel into the high and honorable relation of "*Sons of God*," and consequently, "joint heirs with Christ Jesus" of the blessings of his mediatorial kingdom.—They are under the special care of the Providence of God, who has promised, that "their bread shall be given them, and their waters shall be sure," and that "He will never leave them, nor forsake them." But a spirit of conformity to the world, a covetous disposition, and an eager desire after earthly honors and splendor, are evidently inconsistent with such exalted privileges. The sons of God must resemble the moral character of their Father in heaven, particularly in the display he has given of his benevolence. But, "if any man love the world, the love of the Father is not in him," and consequently, he can lay no claim to the prerogatives of sons. "Whosoever is born of God, overcometh the world," and, of course, he whose soul is absorbed in its pursuits and vanities, has never been brought into this Divine relation, but remains among "the children of the wicked one."

The *prospects* to which the saints look forward in the future world are glorious and magnificent, beyond anything which this world can present, or which human imagination can depict. In that world, there are scenes and objects calculated to gratify the sublimest faculties of the immortal spirit; an enlarged sphere of contemplation—the beatific vision of God in the effulgence of his glory—"fullness of joy"—a treasure in the heavens that fadeth not—an incorruptible inheritance,—and "an exceeding great and an eternal weight of glory."

If Christians, then, believe in the existence of such grand and substantial realities, and have the lively hope of entering, ere long, into their full possession,—is it consistent with such exalted hopes, and such animating prospects, to have their chief affections placed on the vain and transitory objects of this earthly mansion, which must soon

be snatched from their embrace? And how can they say it is otherwise, if they are found grasping their worldly treasures so firmly, that nothing but a small fraction can be squeezed from them for the cause of God and the renovation of the world? What should we think of a man come to his full stature, devoting the greater part of his time and attention to amusing himself with tops, marbles, and cherry-stones, as when he was a child, and setting a higher value upon them than upon all the serious employments of life! We should immediately denounce him as a fool, or a maniac, or, at least, as one who acted with the most glaring inconsistency. What should we think of a set of mariners, sent to circumnavigate and explore a large continent, stopping in the midst of their course in an insignificant island, and employing themselves in catching musquitoes, or fishing for shrimps, without attempting to prosecute their course? or of a traveler, on an important embassy to a large city, taking up his abode at an inn, in the midst of his journey, and amusing himself for days and weeks with gathering shells, or with the humors of a fair, instead of prosecuting the object of his expedition? It is equally preposterous and inconsistent for a man who professes to be "born from above," and to be traveling to heaven, as the place of his ultimate destination, to have his heart glued to the treasures of this world, and "to boast himself in the multitude of his riches."

Let Christians, then, throw off every earthly incumbrance, and arise and act in a manner befitting their celestial pedigree, and their high destination. For what are the treasures of time to him who is begotten to the lively hope of an incorruptible inheritance? What are the frowns of fortune to him who claims the celestial world as his eternal portion? What are thousands of guineas, or dollars, to an exceeding great and an eternal weight of glory? What are the honors, the titles, and the pageantry of this passing scene, in comparison of the riches and grandeur of the New Jerusalem, and the dignity of being "kings and priests" to the "Father of glory," in the mansions not made with hands, eternal in the heavens? As heaven in its height far surpasses the circle of this lower world, as the earth is but a point in comparison to the wide extended universe, and as time, with its circling years, is but a moment to the ages of eternity; such ought to be the hopes and affections of Christians, in comparison of earthly possessions, and of every sublimity of earthly misfortune. Were such views fully realized, and duly appreciated; were we living under the powerful influence of that faith, which is "the confident expectation of things hoped for, and the conviction of things which are not seen;" were the great realities of the eternal world, as they ought to be, ever present to our view, in all their grandeur and importance, a very different display would be made of riches from what we now behold, and multitudes, who now stand aloof when called upon for contributions to the service of God, would come cheerfully forward, "bringing their gold and incense, and showing forth the praises of the Lord."

II. I shall next offer *a few considerations* to the covetous, whether professing or rejecting Christianity.

From what has been stated in the preceding pages, and particularly in the preceding article, it will not be difficult for any one to discern whether covetousness or an opposite affection rules in the heart. To those whose consciences declare that they are under the influence of this debasing pas-

sion, I would earnestly call their attention to the following considerations.

1. Consider that *wealth*, however great, *cannot secure you from misery and calamity*. The rich man is as much exposed to the afflictions and accidents of human life as the poor, and sometimes his very riches, in which he trusts, are the means of exposing him to diseases and dangers. A chimney top, or even a tile falling from a house, will kill a nobleman as well as a beggar. When infectious fevers are raging around, when the cholera is sweeping away hundreds in the course of a day, can wealth prevent its ravages, or secure you from its attacks? When the thunders are rolling along the clouds, and the lightnings flashing amidst the dismal gloom, can riches secure you from the lightning's stroke, or prevent your hay or corn from being set on fire? When you are crossing the ocean in pursuit of gain—when you behold the tempest raging, and the waves rolling mountains high, can your treasures still the stormy ocean, or prevent your being engulfed in the devouring deep? In such cases, the king and the peasant are on a level, and equally impotent to control the laws of nature, or to counteract the operations of the Most High. How many instances do we see of persons in the prime of life, possessed of wealth and honors, and in the midst of all their earthly hopes and schemes, cut off in a few days, and sometimes in a moment, by a burning fever, by a fall from a horse, the overturning of a chariot, or by an unexpected conflagration? It was but a little while ago, that a lady of noble rank, of great wealth, adorned with the richest jewels, distinguished for her splendid entertainments, and, while she was preparing for a magnificent fête, on the ensuing day, was involved, while sitting in her apartment, in a sudden and mysterious conflagration, and her body and jewels reduced to an invisible gas, so that no trace of them except a few small burnt fragments of bones has yet been found. But accidents apart—riches cannot ward off those diseases which may prevent all comfortable enjoyment from their possession. The greatest wealth you can accumulate leaves you still liable to the attacks of the gout, the epilepsy, the palsy, the asthma, the burning fever, the gravel, the ague, and the loss of sight, hearing, tasting, and feeling, and to innumerable other disorders, so that the most splendid spectacles, the most exquisite music, or the most costly viands, may be unable to convey any real enjoyment. Under such diseases, to which all are liable, the most splendid estate can afford little or no alleviation; and the possessor of thousands or millions of pounds may feel far less enjoyment than the poorest peasant;—nay, may smart under pains of body and agonies of mind, to which the beggar expiring on a dunghill is an utter stranger. Wealth, with all its gorgeous trappings, cannot prevent the pain of surgical operation, the bitter taste of nauseous medicines, the agonizing throes of suffering nature, the terrors of a guilty conscience, or the fearful forebodings of a future judgment. And, therefore, the man who, in such circumstances, has no better comforter than the *idea* of the greatness of his richness, is one of the most miserable objects in creation.

2. Consider the *uncertainty* of riches. It is only during the continuance of life that earthly possessions can be enjoyed. "For when you die, you can carry nothing hence, your glory cannot descend after you to the dust." "But what is your life?" It is only "like a vapor," which a small breath of wind may soon blow away. In a

moment, in the twinkling of an eye, while you are hoarding up treasures, and trusting in the abundance of your riches—or even you are aware—the decree of heaven may go forth, as in the case of the rich man in the parable, “This night thy soul shall be required of thee.” Almost every newspaper that comes to our hands, and almost every returning day, bear witness to such sudden transitions from time to eternity. While mortals are reclining on the lap of ease, their hearts overcharged with surfeiting and drunkenness, running the giddy rounds of fashionable dissipation or working all manner of uncleanness with greediness—while imagining themselves secure, and foreboding no evil—death interposes, at a day’s or even a moment’s warning, cuts down their mortal frames, and summons their spirits to appear before the Judge of all. But although life be continued, the wealth in which you place your confidence may soon be snatched from your possession. The providence of God has many ways by which to change the greatest prosperity of this world into the greatest misery and adversity, and, in a moment, to throw down the fortune of the proudest aspirer after wealth, in order to make him contemplate his sin in his punishment. Such a change in your fortune may be produced, either by the rapine of enemies, or the treachery of friends, by your own avarice or folly, or by the malice or revenge of your enemies, by the prodigality of your children or the unfaithfulness of your servants. The elements of nature, the hurricane, the tempest, the overwhelming deluge may conspire for your ruin. Your ships may be dashed to pieces on rocks or shoals, or a sudden conflagration may lay all your boasting hopes prostrate in the dust. And wilt thou place thy confidence in such uncertain possessions? “Wilt thou set thine eyes upon that which is not; for riches certainly make themselves wings; they fly as an eagle toward heaven.”

3. Consider the *folly and unreasonableness of covetous affections*. This will appear, in the first place, if you consider, that *riches considered in themselves, without regard to their use, are of no value whatsoever*. Suppose a man could lay up a stock of clothes and provisions sufficient to last him for 300 years, what would it avail him, if he is certain that he cannot live above seventy, or, at farthest, above a hundred years? Suppose he laid ‘up in a storehouse 70,000 pairs of shoes, to what end would it serve, if he could make use, during his whole life, of only the one-hundredth part of them? He would be in the same condition as a man who had a hundred dishes placed before him at dinner, but who could only partake of one, or of a person who had a hundred mansions purchased for his residence, but who could occupy only one. The same thing may be said of pounds, shillings, and dollars, which are of no use in themselves, but only as they are the representations of articles of necessity and luxury which they may be the means of procuring. How ridiculous would it appear, if all that could be said of a man while he lived, was simply this—that his whole life was occupied in collecting and laying up in a storehouse 60,000 mahogany chairs, which were never intended to be used for the furniture of apartments, or 80,000 pairs of trowsers which were never to be worn? And where is the difference in point of rationality and utility, between such absurd practices, and hoarding thousands of guineas or bank-notes which are never brought forth for the benefit of mankind? There is no conduct, connected with the pursuits of human beings, that appears more *mean, con-*

temptible, and absurd, than such practices (however common) if examined by the dictates of reason and the word of God.

The folly of covetousness likewise appears in this, that its objects cannot afford solid satisfaction to the mind. Wealth can neither convey new senses, or open new avenues to pleasure, nor block up the passages of pain and anguish. It cannot produce inward peace, equanimity, domestic comfort, or a delightful self-consciousness of virtue, or of the Divine approbation. On the contrary, the passion of covetousness is uniformly attended with mental anxiety, inquietude, restless and insatiable desires, and keeps its votaries in continual fear of losing what they have acquired, so that they are generally fretful and discontented, and in a kind of hell of their own creating. However much they may have acquired, they are still in the pursuit of more; and the riches of the whole world, were it possible to obtain them, would be inadequate to satisfy their desires. In their mad career of gain, they will rush forward with the utmost impetuosity, even at the hazard of losing all that they had formerly toiled for and amassed. Marcus Crassus, a celebrated Roman, surnamed *the Rich*, had above 500 talents left him to begin the world with, and by his excessive covetousness, scraped together vast sums of money. Being desirous to know at a certain period, what his estate amounted to, it was summed up at *seven thousand one hundred talents*, or about seven millions nine hundred and eighty seven thousands of British pounds. But it appears, this immense treasure was not sufficient to satisfy his avaricious passion; for, casting an evil eye upon the treasure of the Parthians, he marched with a great force against them, and, being defeated, and taken prisoner, the Parthian general gave orders to cut off his head, and pour melted gold down his throat, to upbraid his excessive covetousness, that never thought he had enough. Such are, not unfrequently, the results of excessive avarice, and such the termination of all the desires and passions, the hopes and fears, the anxieties and pursuits, which are engendered by covetousness. Happiness never would have been expected to result from the pursuits and enjoyments of avarice, if man had retained the full exercise of his reason, and had never fallen from his original estate.

The misery and *folly* of avarice may be illustrated by the following recent occurrence, extracted from the “Sunday Times,” of Oct. 4, 1835. “A few days since, an old miser, named Webb, who has, for several years, resided in an obscure lodging in Barrack court, Woolwich, called upon Mr. White, a broker, residing in Powis street, in the same parish, to inquire whether he would allow him to lodge with him, as he had been *uncomfortable* for some time past. The request was complied with, and, in the course of the evening, he took possession of his new apartments. He had retired to rest but a very short time before he was taken ill, and at his request, two medical men were sent for. Upon the arrival of Messrs. McDonald and Gaul, they pronounced him to be in a dying state, which was no sooner communicated to the patient, than he ordered an attorney to be sent for, as he wished to make his will. An attorney was speedily in attendance. The old man raising himself upon the bed, bequeathed to his daughter £100, to three nephews, £30, £40, and £50 each. Upon being asked if he had a wife, he replied ‘Yes,’ but he had been parted from her three times; that she had been in a workhouse near Stroud, in Kent,

for a number of years, and that he did not intend to leave her a single penny. He had also two brothers and another daughter, who had all (he said) behaved ill toward him, and he would leave them nothing. Upon being asked to whom he left the residue of his property, he replied, 'To Mr. White for his kindness,' at the same time handing the attorney a paper, which, upon being opened, was found to contain securities for upward of £800 in the Bank of England, so that Mr. White (who is sole executor), will, after paying the respective legacies, clear upward of £500 by his lodger, who continued to get worse and died on Sunday. It is a remarkable fact, that the deceased (who was 75 years of age) has been frequently seen to pick up bones and rags in the street, and put them in his pocket; and at the time of his death he was in a most filthy condition."

Here we have a picture of a poor wretch, who appears to have spent the greater part of a long life in scraping together £800, and, at last, bestowing the greater part of it upon an entire stranger. We behold him neglecting his own family, and his nearest relatives; and, almost in the very agonies of death, indulging implacable resentment against his own daughter, and the wife of his bosom, and leaving her to be maintained on public charity, when he had enough and to spare. He displayed himself to be little short of a thief and a robber, as most misers are. He robbed the *public* in leaving his wife to be maintained in a poor-house, he robbed his *wife and children* in depriving them of what they had a natural right to, and giving it to a stranger: he *robbed God* of his tithes and offerings, in bestowing no portion of his substance in his service, and he robbed *himself*, in depriving himself of the good opinion of his fellow-men, and of those enjoyments which might have rendered him comfortable and happy. It is more than probable, that all his domestic broils and contentions, and the alienation of affection he experienced, were the results of his niggardly and avaricious disposition. Who that enjoyed peace and contentment would envy either the life or the dying hours of such a wretched being? Yet such are the rewards, such the *folly* and wretchedness of those who surrender themselves to the power and dominion of covetousness. If riches could procure true happiness, even in the present life, there might be some apology for pursuing them with eagerness; but even this, they are inadequate to confer; for experience demonstrates, that their votaries are frequently among the most wretched of the human race—a prey to restless and malignant passions, and despised by their fellow-men.

The folly of covetousness will further appear, if we consider, that the *objects which it pursues are not to be compared, in point of grandeur and enjoyment, with those which are within the reach of all.* Wealth can command stately buildings, splendid apartments, gorgeous apparel, marble statues, curious pictures, gold and silver vessels, spacious gardens, and other objects which the world calls noble and magnificent. But "what good is there to the owners thereof, saving the beholding of them with their eyes." Every spectator that has a taste for such objects may enjoy the pleasure arising from the sight of them as well as the possessor. Every gardener and laborer on a nobleman's estate may participate of the pleasure of viewing his improvements, as well as the owner himself. But, what are all the gorgeous toys and trappings of art, or the beauties which genius can invent, or riches purchase, compared with the

beauties and magnificence of Nature? What are the glitterings of the most pompous procession, or the splendor of a Vauxhall, in comparison of the august spectacle of the vernal sun rising in unclouded majesty, diffusing his beams over surrounding worlds, gladdening the animal tribes, and shedding a radiance on every object in our terrestrial sphere! There is not a scene, though finished with the most costly refinements of art, comparable to the splendor and magnificence of the sun rising in his glory. All on earth appears a dreary waste until the aurora brightens up the East, as the harbinger of the orb of day:—then the plains are arrayed in verdure, the flowers put forth their colors, the glittering spires appear, the birds warble from spray to spray, and renewed life, activity, and beauty, appear throughout our lower creation—as if a new world had emerged from chaotic darkness. What are the finest varnishings of art compared with the polishings of the bodies of insects, or of sea-shells—or the most exquisite pieces of machinery to the mechanism of a plant, a gnat, or a microscopic animalcula? Above all, what can be compared to the glories of the unclouded firmament, where suns unnumbered shine, and myriads of mighty worlds run their ample rounds? Yet all such august and splendid scenes, with all the variety of beauty and magnificence, with which the Almighty has adorned his vast creation—which are open to the contemplation of all are overlooked by the worldling as unworthy of his regard.

In short, the folly of covetousness appears in its most striking light, in *preferring objects which are seen and temporal to those which are unseen and eternal.* We can scarcely have an adequate idea of the *extreme folly* implied in such conduct, unless we could form some adequate conception of what is included in the word *ETERNAL*. To enable us to form some faint conception on this point, some of our old writers have suggested the following illustration: Suppose the whole earth to be made up of particles of sand, and suppose a bird to come every thousand years to pick up and fly away with *one* grain, how immense must be the duration before the whole sands which compose the earth, could, by this slow process, be removed! as many thousands of years as there are particles of sand in the whole globe of the earth,—which would amount to the following number of years, 30,000,000,000,000,000,000,000,000,000,000, or thirty thousand septillions of years! Yet this immense period of duration is still but as a point, or a moment, when compared with eternity! On such a supposition, the Schoolmen stated the following question. "Suppose that you had it in your choice to be happy all the while this prodigious mass of sand was consuming, by this slow method, until there was not a grain of it left, on condition you were to be miserable forever after;—or, supposing you might be happy forever after, on condition you would be miserable, until the whole mass of sand were removed or annihilated, at the rate of one grain of sand in a thousand years—which of these two cases would you make your choice?" It must be confessed, that, at first view, considering the extreme length of the period—which, to our limited view, appears like an eternity itself—we should be apt to choose the former in preference to the latter. But our reason tells us, that the latter ought to be our choice, since there is no comparison between the one duration and the other, any more than there is between a unit, and the greatest number of figures or sums we can possibly suppose. What, then, must be the extreme folly of those who for

the sake of enjoying a few fleeting baubles, for 20, 30, or 40 years, or at the utmost, for "three-score years and ten," will run the risk of experiencing all that is included in the idea of a *miserable eternity*! How can we sufficiently denounce the stupidity and madness of those who, resolutely and determinately, make so absurd and irrational a choice? especially, when we consider, that even in this life, the path of contentment, and the ways of wisdom and holiness, are ways of pleasantness and peace! To prefer trifles to the most momentous objects, shadows to realities, the toys of time to the treasures of eternity—if anything may be termed folly and madness—such conduct ought to brand every one who is guilty of it, in whatever sphere he moves, with the appellation of a *fool* or a *maniac*.

If, then, riches are only valuable in proportion to their *use*—if they cannot afford solid satisfaction to the mind—if the objects which the worldling pursues are not to be compared in point of grandeur to those which are within the reach of all—and if he prefers shadows to realities, and fleeting objects to eternal enjoyments—it must be folly in the extreme for a rational being to have his affections placed upon them as the ultimate object of his pursuit.

4. Consider in what light the objects of covetousness will be viewed, and what comfort they will afford at the approach of death.

When your soul, which has long been immersed in the cares of the world, feels itself hovering on the verge of life, and about to take its flight into the world unknown,

In that dread moment, when the frantic soul
Raves round the walls of its clay tenement,
Runs to each avenue, and shrieks for help,
But shrieks in vain—

in what a very different light will you view the perishing treasures of time from that in which you now behold them? You now trust in uncertain riches, and refuse to place your confidence in the living God, who alone is the source of felicity. But, "will riches profit you in the day of wrath," or amidst the agonies of dissolving nature? Will they smooth your dying pillow, or assuage the bitter anguish of your spirit, when heart and flesh begin to faint and fail? Will they then be viewed as a sufficient compensation for the dismal forebodings of future woe which may then assail your conscience, and render you a terror to yourself and to all around you? Alas! they will only tend to plant thorns on your dying couch, to sharpen every pang, and to augment the horrors of despair. Conscience, now lulled asleep amidst earthly vanities, may then awake, "like a giant refreshed with wine," and pierce your hearts through with unutterable sorrows. Many striking instances of this kind have been witnessed by the ministers of religion, when called upon to attend the death-bed of the worldly and profane. "Had I now a thousand worlds," said a certain worldling, who bore a fair character, "Had I a thousand worlds, I would give them all for one year more, that I might present to God one year of such devotion and good works as I never before so much as intended." The noble Altamont,* who had spent his life in all the fashionable dissipations of the world, a little before his death, on hearing the clock strike, exclaimed with vehemence, "O Time! Time! it is fit thou shouldst thus strike thy murderer to the heart. How art thou now fled forever! A month! O for a single week! I ask not for years—though

an age were too little for the much I have to do." And a little afterward, "This body is all weakness and pain, but my soul, as if strung up, by torment, to greater strength and spirit, is full powerful to reason, full mighty to suffer." Cardinal Wolsey, whose grand a'm through life was worldly aggrandizement, a little before he died, declared with anguish, in the midst of his disgrace, "Had I but served God as diligently as I have served the king, he would not have given me over in my gray hairs." In like manner, many a one at the hour of dissolution will have to exclaim, "If I had been as anxious to attend to the eternal interests of my immortal spirit, as to lay up treasures which I can never use, I would not have been left to suffer the pangs of remorse which I now feel."

Such considerations demand the most serious attention of those who have *grown old* in the habits of covetousness, and whose gray hairs and infirmities warn them that they are on the confines of the grave. It has been remarked, that, as in winter, the roots of plants retain the sap, when the branches have lost their leaves and verdure, so, in old age, the winter of life, covetousness, "the root of all evil," retains its vigor, when other vices have withered, and fallen into decay. It is strange, indeed, but not more strange than true, that the nearer such men approach to the earth, they become more earthly-minded, so that, at the evening of life, they appear as if they were providing for a long and prosperous day. No one is more fearful of want, and more hard and gripping, than the old miser, who is just about to step into the grave. While other vicious propensities are weakened by the lapse of time, covetousness derives new life and vigor, as age increases. Like a patient in the dropsy, whose thirst is inflamed by drinking, the desires of the covetous are augmented by increasing riches, and they are never more tainted with earthly affections, than when their bodies are about to be reduced to their original dust.

The difficulty of subduing such a woeful propensity, especially in the decline of life, is great, and, in most cases, insurmountable. It is like tearing the skin from the flesh, or the flesh from the bones. There are not, perhaps, twenty out of a thousand, on whom the most cogent or alarming arguments will have the least effect in awakening them to consideration, or turning them from their covetousness. The vicious principle they indulge is so subtle, that you cannot lay hold of it, so as to render it tangible. It is so deeply seated, that you cannot draw it from its hiding place to make it visible in the face of day. You may convince a man who goes on in a regular course of licentiousness and intemperance, of the folly and wickedness of his conduct, by showing him the inevitable miseries to which it leads even in the present life. But we have no such hold on the covetous. In reply to every argument, he will tell you, that what we call covetousness, is only a necessary prudence to augment his estate, and secure it from danger, to provide for the wants of his family, and leave something to his children, when he is gone; and that persons of great repute for probity and wisdom, are found prosecuting a similar course. He is *unwilling* to be convinced of his sin and danger, and is like a person dying of a mortal disease, who yet perceives not the malignity of the malady which is hurrying him to his grave.

But the difficulty of curing such a distemper, though great, is not insurmountable. While there is life, there is hope. Let such as entertain the least suspicions, that all is not right with

* Supposed to be Lord Euston.—Young's "Centaur not fabulous."

them as to this matter, seriously examine their hearts on this point, and weigh the considerations which have already been adduced. Above all things, look up to God, who alone can heal your disease, and purify your affections, and say unto him, in the language of the Psalmist, "Search me, O God, and know my heart; try me, and know my thoughts, and see if there be any wicked way in me, and lead me in the way everlasting." Remember that your happiness through eternity is at stake; and give not sleep to your eyes, nor slumber to your eyelids, until you have fled for refuge to the hope set before you in the gospel—until you have renounced your idolatrous affections, and consecrated your heart to God. Your feet are already "stumbling on the dark mountains," and, ere you are aware, you may fall, at the next step, into irretrievable ruin. And if you depart from this world, under the dominion of covetous affections, you are rendered unfit for the mansions of the just, and the happiness which will be their portion forever and ever.

5. Consider, in the last place, that your covetous affections, if obstinately indulged, will necessarily exclude you from the kingdom of heaven, and involve you in eternal perdition.

This has already been illustrated in various points of view (see pp. 33-51).

It is the unalterable decree of the Most High, as recorded in his word, that "the covetous shall not inherit the kingdom of God;" and, that those who are banished from this kingdom and its honors, "shall be punished with everlasting destruction from the presence of the Lord, and from the glory of his power." In the face of such awful declarations, to continue in the lust of covetousness, grasping incessantly after riches as the highest object of desire, is the greatest folly and madness of which man can be guilty.

For what a poor compensation will men run the risk of such terrible and appalling consequences! Our Saviour tells us, that it would profit a man nothing, "should he gain the whole world, and lose his own soul." But how often does it happen, that men forfeit their eternal happiness for the merest trifle, and set their immortal souls to sale for a thing of naught? One will sell his soul merely to gratify his lust, or his revenge; another will rather go in the broad way to hell, than to be out of the fashion of the gay world.—That officer in the army, who lords over his inferiors, in all the pomp of his brief authority, what does he sell his soul for? "For the false glory of swearing expertly, and uniting blasphemy with politeness." That perjured wretch, who bears false witness against his neighbor, or robs him of his property, by fraud or deceit—what price does he put upon his soul? A few guineas, perhaps, or a house, or a few acres of land. Few men ask a throne, a kingdom, a province, or even a barony, but will hazard the loss of their immortal spirits, for the most paltry compensation that this wretched world can afford. "Be astonished, O ye heavens, at this, and be ye horribly afraid."

O, my deluded brethren, arouse yourselves to consideration; and let not the incumbrance of this world's wealth sink you down to the lowest hell. Listen to the dictates of reason, to the voice of conscience, and to the word of God. Consider the terrible reflections you will make upon yourselves, and the deep and inexpressible anguish and regret you will feel at the madness of your choice, should you fall into perdition. Your loss will then be found not only vast beyond comprehension, but absolutely irreparable. You will curse those false and flattering pleasures, and covetous lusts, which

have cheated you out of eternal life, and rendered you vessels of wrath fitted for destruction,—and would be glad to part with a thousand worlds, were it in your power, for the opportunity of making a new, and a better choice; but in that prison of despair, no price will ever be accepted for your redemption.

Could I describe to you the geography of that dismal region, where hope never enters, and over which hangs the blackness of darkness forever; could I paint the gnawings of "the worm that never dies," and the sharpness of "the fire which is never quenched;" the raging anguish, the fearful despair, the want of the least pity or commiseration; "the insolent scorn and cruelty of wicked associates;" "the weeping and wailing, and gnashing of teeth," which form only a portion of future misery; how would the folly of your conduct startle, and confound you, in hazarding such an awful, and interminable retribution, for the short-lived enjoyment of trifles light as air! Let such considerations sink deep into the heart of every worldling, and, without a moment's delay, let him take refuge from "the wrath to come," by taking himself to "the hope set before him," and by consecrating to the service of God all his riches and treasures, all his powers and affections. To all the deceitful promises and prospects, which the world and the flesh may set before you, oppose those emphatic and momentous words of Him who is Lord of the visible and invisible worlds,—*"What is a man profited, if he shall gain the whole world, and lose his own soul? or what shall a man give in exchange for his soul?"*

III. Considerations addressed to CHRISTIANS, on whom God has bestowed *wealth and influence*.

To you, my beloved brethren, who "know the truth as it is in Jesus," and who feel an ardent desire for its universal propagation, I would offer a few considerations and motives, "to stir up your pure minds, by way of remembrance."

In the first place, I would have you consider, that a far greater proportion of your substance than has ever yet been thought of by Christians in general, should be devoted to the service of God, and the promotion of the best interests of your fellow-men.

God is the original proprietor of your estates; from Him you derived them; and if, by the exertion of your own powers and activities, you have acquired the wealth you possess, you are aware, that the faculties which enabled you to acquire riches, were gifts bestowed upon you by his bounty, and that the train of circumstances which led to your success, was the result of the arrangements of his Providence. You might have been born a changeling, destitute of both bodily and mental energies; you might have been placed in other circumstances, which would have prevented your acquisition of wealth, and doomed you to perpetual poverty; or you might have commenced your existence in the center of New Holland, or the wilds of Patagonia, where you could never have experienced the blessings and privileges you now enjoy. Over all such circumstances you had no control; and, therefore, you are indebted to God for all these arrangements of his providence, which have placed you in the midst of your present comforts. It is God who "hath given you power to get wealth;" for, "both riches and honor come from Him." These are truths which the world in general, and which even Christians themselves too frequently overlook.

You are, therefore, bound by every rational and scriptural tie, to consecrate the wealth and influ-

ence you possess to his honor and glory. He does not call upon you to part with anything which is necessary to your rational and sensitive enjoyment. For the exuberant bounty of his providence is such, that there is abundance provided, in the system of nature, for supplying the wants of all his creatures, rational and irrational, when their desires are confined within the bounds which reason and nature prescribe. But, he has judged proper to demand a portion of the wealth of voluntary agents, to accomplish his benevolent and gracious purposes in the world; and, it is a high honor conferred on man, that he is invited to be "a worker together with God," in promoting the regeneration of the world.

You are not, therefore, to imagine that the wealth you have acquired, is exclusively your own, and that you may do with it as you please. You are bound, as a Christian, by the most sacred ties, to devote all that is not essential to your rational comfort, in the situation in which you are placed, to such purposes as I have stated in a preceding chapter.* And, if you entertain a lively sense of God's providential goodness toward you, and of your obligation to Him, who hath redeemed your souls from destruction, and crowned you with spiritual and heavenly blessings; you will resign to his service without a murmur, nay, with the utmost cheerfulness, a large portion of those treasures which his bounty has bestowed.

But, to come to particulars:—I shall suppose you have an income of £800 a year. What would you think of devoting £300 annually, exclusively for the purposes to which I have alluded? You will, perhaps, think it is bearing too hard upon you, to make such a demand. But, can you deny, that with the remaining £500 you can enjoy all the sensitive pleasures which a *Christian*, or any rational man ought to desire. You would perhaps require to part with some *luxury* in dress, food, clothing, or equipage, which is not essential to human happiness; but, are no *small sacrifices* to be made for the general good of mankind, and to testify your love to the Redeemer? What, if you were called upon by God, as the Apostles were, to forsake friends, and houses, and lands, for Christ's sake, and to travel into foreign countries, depending every day for supply on the providence of God? What, if you were required, as was once done, in the case of a certain rich individual, to "sell all that you have and give to the poor," as an evidence of the sincerity of your Christian profession? or what if you were required to submit to persecutions and torments, like the first Christians, or to flee to deserts, and rocks, and mountains, like the pious and persecuted Waldenses? Would you consider such sacrifices too great for the sake of your Redeemer, and for the certain prospect of an eternal weight of glory? If not, how small a sacrifice is that now demanded, compared with the privations and sufferings of those illustrious characters of whom the world was not worthy, "who wandered about in sheep skins, and goat skins, in deserts, in mountains, in dens and caves of the earth, being destitute, afflicted, tormented?" What would those Christian heroes have thought, had God thought proper to grant them the *tenth part* of your income? How would they have exulted in the Divine Beneficence? and, like Mr. Park, when he received a mess of pottage from an old negro woman in the wilds of Africa—would have exclaimed, "Thou hast prepared a table for us in the wilderness, in the presence of our enemies;

our cup runneth over; surely goodness and mercy shall follow us all the days of our lives, and we shall dwell in the house of the Lord forever."

To the proposal now made, you will perhaps object, that the station of life in which you have hitherto moved, requires you to spend nearly all your income, that you cannot think of being singular, or altogether out of the fashion; that you must forego sumptuous entertainments, and might be considered by your genteel friends and acquaintances, as mean and niggardly; that you behooved sometimes to walk, when you might ride in a carriage; that you would be obliged to occupy a house with seven apartments, instead of ten; to deny yourself the luxury of a fine painting, or an elegant piece of furniture, or a sumptuous dress, similar to those of your compeers; that you must provide portions for your children, when you are gone; along with many similar excuses which might be brought forward. But, on the slightest reflections, you will perceive that these are not *Christian* considerations, but arguments based on selfish principles and worldly views. To bring forward such excuses, is virtually to declare, that you consider the pomp and fashion of this passing world as more important than promoting the glory of Messiah's kingdom; that you would rather behold missionary enterprises frustrated, and the heathen perishing by millions, than part with the luxury of a gig, or a landau; that you would rather see the poor starving and dying of want, as they are now doing in a neighboring island,* than not enjoy with your gay friends your accustomed splendid entertainments; that you would see the industrious laborer without employment, and living in wretchedness, rather than abstract from luxury, a small sum for the melioration of human beings, and the improvement of society; that you would behold another generation rising up in ignorance and vice, rather than part with an expensive and unnecessary piece of furniture, in order to assist in laying the foundation of universal instruction; or, that you would rather see the earth overspread with deserts, and its inhabitants living in the most wretched hovels, than resign two or three apartments not necessary to your comfort, for assisting in the renovation of the world.

This is the plain English of all such selfish and fashionable excuses; and I am sure that no Christian, who has his heart deeply impressed with a sense of Divine things, and of his obligations to God, will consider them as valid.

With regard to laying up portions for children, I have already offered some remarks, which need not be repeated.

As a follower of Christ, you are called "to take up the cross," and submit to *some* sacrifices for his sake. The Christian life is a warfare against the world, and the flesh, and "spiritual wickedness in high places;" and, therefore, you must lay your account to strive against many of the passions and propensities of your nature,—to counteract, in some cases, your own taste and worldly feelings, and even to be "accounted," as the Apostles were, "fools for Christ's sake." But O, my Christian friend! how small a sacrifice is it to resign enjoyments which are little more than *ideal*, while every comfort essential to human happiness, is still retained! The consideration of the happiness you may thus be the means of diffusing in various directions, ought to be far more than a compensation for the slight sacrifice (if it

* See Chapter VI, throughout.

* Ireland—see "Report of the Commissioners," &c., and *Appendix*.

may be so called) of a portion of your pecuniary treasures. The effect, too, which your conduct, in this respect, may have to excite hundreds of your fellow Christians to follow your example, and the influence it may have, even on future generations, should be a powerful motive to constrain you to "devise liberal things," in reference to the cause of God and religion, that you may be entitled to the highest rewards given to those who improve the talents committed to their trust, "Well done, good and faithful servant, enter thou into the joy of thy Lord."

In the above remarks, I have supposed a Christian to be possessed of an annual income of £800. Were he possessed of an income of £2000 or £3000, I have no hesitation in saying, that he ought to devote at least the one half to the promotion of the great objects of religion and general philanthropy, and that one whose income is £200 or under, not descending below £50 or £60, should devote at least the *one-tenth* of it to the same purpose. This proportion is no more than what was imperatively demanded by government, as a compulsory *tax* on all such incomes, during the late war; and the same sum is now requested on a voluntary principle, for a higher and nobler object.

Let Christians seriously consider, as in the presence of God, and as indebted to him for the hope and prospects of eternal life, whether they dare or ought to refuse it. As to all lower incomes than those alluded to, a certain proportion ought likewise to be allotted for the same objects, except in the case of absolute poverty. Perhaps a twentieth, or a thirtieth at least, is the lowest rate or proportion which should in any case, be allotted to the service of God.

2. Consider, that *all the pecuniary efforts you can possibly make are essentially requisite for the enlightening and regeneration of society, and that your parsimony may be the means of retarding the universal promulgation of the gospel.*

I have already shown, in chapter VI, the vast extent of the enterprise to be undertaken, and of the work to be accomplished, and the immense sums requisite for carrying them forward; from which it will appear, that all the liberality which every Christian can display, is absolutely necessary, in order to promote the renovation of the physical and moral world, and to diffuse the knowledge of divine truth among the nations. Almost all the departments of the social state require to be remodeled—universal education, on a broad and universal basis, requires to be established in every land—the poor require to be furnished with employment, instruction, and comfortable habitations—"the face of the earth" requires to be "renewed," and the deserts, marshes, and barren wastes, transformed into fertile fields, and luxuriant vegetation—the 600 millions which people heathen nations, require to be instructed in the knowledge of the true God, and of Jesus Christ whom he hath sent—the "isles afar off" must be visited, and vast continents explored, that their inhabitants may be visited with the day-spring from on high and the knowledge of salvation." The gospel must be published to all nations, and the way prepared for the triumphant reign of Messiah over all kindreds and people. Every valley must be exalted, and every mountain and hill must be leveled, "to prepare a highway for the approach of Him "to whom is given dominion, and glory, and a kingdom, that all people, nations, and languages, should serve Him"—"whose dominion is an everlasting dominion, and his kingdom that which shall not be destroy-

ed.' All these extensive and important objects require to be accomplished by the combined efforts of the citizens of Zion, in connection with the movements of Divine Providence and the operations of the Divine Spirit, and an imperious call is addressed to every one to engage in this holy enterprise. Say not ye, therefore, as the ancient Jews, "The time is not come, the time that the Lord's house should be built." "For, thus saith the Lord of hosts, consider your ways, go up to the mountain, and bring store, and build this house, and I will take pleasure in it, and I will be glorified, saith Jehovah. Be strong, all ye people of the land, and work, for I am with you, saith the Lord of hosts. For thus saith the Lord, it is a little while, and I will shake the heavens and the earth, and the sea, and the dry land. And I will shake all nations, and the desire of all nations shall come, and I will fill this house with glory, saith the Lord of hosts. The silver is mine, and the gold is mine, saith the Lord of hosts. I will overthrow the throne of kingdoms, and I will destroy the strength of the kingdoms of the heathen, and I will give peace, saith the Lord of hosts."

Now, therefore, my brethren, listen to the admonition: "Thus saith the Lord of hosts, consider your ways;" consider whether you have yet done all that is in your power, to accomplish the purposes of the Most High. Consider whether your indifference and *parsimony* have not prevented the preparations requisite for rearing the spiritual temple of Jehovah. And if you are convinced, that, were you weighed in the balance, you would be found wanting, it is now time to make up your deficiency, and to awake to spiritual activity, and to holy enterprises. Will you allow the love of the world to prevent the extension of the gospel, and to retard the approach of the millennial era, and the full glory of Messiah's reign? Yet this ye do, if ye do not come forward, with cheerfulness, to devote all the treasures you can possibly spare, to prepare the way for the proclamation among all people of "the salvation of our God." What a sad reflection is it, should conscience arouse us, that we have been guilty of standing as *obstructions* to the progress and prosperity of the Redeemer's kingdom? It is not unlikely that a reflection of this kind may occasionally damp the joys of individuals, even in the celestial mansions. We are told of some who shall be saved, "*yet so as by fire*," implying, that, though they shall be rescued from perdition, yet a mark of disapprobation will be set upon certain parts of their conduct, which will prevent them from receiving the *higher* rewards of the heavenly state. But every Christian should so act as to render himself worthy of the highest approbation of his Lord and master, and of the higher seats in the mansions of bliss. Those to whom God has given abundant treasures, have the best opportunities of thus distinguishing themselves; and we know, moreover, that "to whom much is given," from them "much will be required." Let it never then be surmised of you, that your conduct appears as if you set a higher value on the pomp and fashion of the world, in laying up treasures on earth, in providing portions for your children, or in living in luxurious abundance, than in hastening the arrival of the millennium, or in aiming at the highest honors of the celestial kingdom. Let the promises of your God and Redeemer, the pleasure of beholding the gradual progress of the world's regeneration, and the glorious prospects presented to your faith, animate and encourage you to come

forth as a Christian hero in the cause of universal benevolence; and although you should be sneered at by the men of the world, "great shall be your reward," in that kingdom where they who have been instrumental in turning many to righteousness, "shall shine as the brightness of the firmament, and as the stars forever and ever."*

3. Consider the import of the words of your Redeemer, "*It is more blessed (or happy) to give than to receive.*"

The disposition to communicate happiness to fellow-intelligences, is one of the characteristic traits of the true Christian, by which he is distinguished from the selfish and avaricious soul, and from the world that lieth in wickedness. It is the source of all natural and moral good, the spring of all public and private happiness, and the only real excellence of moral and intelligent beings. A disposition to *receive* happiness from others, but never to be instrumental in imparting it, would create a vast blank throughout the universe; and its countless tribes of inhabitants would remain forever destitute of enjoyment. Creation might present a scene of beauty and fertility to the eye, but the affection of moral beings would be cold and chill as the frosts of winter, and their hearts would never thrill with joy amidst surrounding associates. But from the voluntary and benevolent agency of intelligent beings, beginning at the great first cause of all enjoyment, and descending through every subordinate rank of intellectual existence, flows all that happiness which is enjoyed, either in earth or heaven, by every rank of moral agents, whether men or angels, cherubim or seraphim. This is the plain import of the maxim of our Saviour: "*It is more happy to give than to receive,*" namely, that the communication of good ought to be the great object of every Christian, and that it is more desirable and honorable to *impart* enjoyment to others than to receive it from them.

I cannot conceive a source of greater happiness

on earth, than that which would flow to a Christian, whom God hath blessed with abundance of wealth, in distributing at least the one-half of his substance, in works of piety and beneficence. He might soon behold, everywhere around him, the young trained up in knowledge and virtue, the gospel preached to the poor and to every class, the ignorant instructed, the industrious laborer supplied with employment, the afflicted relieved, the wants of the destitute supplied, schools, churches, and commodious dwellings with garden plots, rising on every side; the desert cultivated, and the wilderness made to bud and blossom as the rose. Such a character would be as eyes to the blind, and feet to the lame, and would cause the widow's heart to leap for joy. Wherever he appeared misery would smile, and his presence would be hailed with gratitude and joy. How many improvements of this description might be effected, and how much happiness diffused, by judiciously distributing in every district five thousand, or even one thousand pounds annually, on such objects? But where is the man or the Christian to be found who pants for such celestial enjoyment?

In the exercise of this disposition we become imitators of God, and are assimilated to his character. When he brought creation into existence, he could have no possible view, in launching innumerable worlds into the depths of space, but to display the glories of his nature, and to confer benefits on their inhabitants. Could we wing our flight through the regions of immensity, and survey the various ranks of the population of the universe—could we mingle with the hosts of angels and archangels, and witness their enjoyments, we should find that all the arrangements of the Almighty, in reference to their situation and activities, have a tendency to contribute to their felicity—that his *benevolence* is displayed wherever matter exists, and wherever there are sentient and intellectual beings to participate of his bounty. He is not adored by the heavenly host, or by any of his creatures, "as if he needed anything" to augment his glory, "seeing he giveth to all, life and breath, and all things." He is declared in Scripture to be "abundant in goodness," "good to all," continually "doing good," and that "his tender mercies are over all his works." Now, we are commanded to be imitators of God in his universal beneficence. "Be ye merciful, as your Father in heaven is merciful; love your enemies, and do good to them that hate you; that ye may be the children of your Father who is in heaven; for he maketh his sun to rise on the evil and on the good, and sendeth rain on the just, and on the unjust." By acting in this character, we are likewise imitators of the blessed Redeemer, "who went about doing good" to all classes of men, without distinction of rank or nation. Though he was "the brightness of the Father's glory," yet, "for our sakes he became poor, and took upon him the form of a servant." His whole life was an uninterrupted series of beneficent actions. He had compassion on the ignorant and the distressed; he fed the hungry multitudes in a desert; he opened the eyes of the blind, unstopped the ears of the deaf, made the lame man to leap as a hart, and the tongue of the dumb to sing. He restored to disconsolate parents the children whom death had snatched from their embrace; he healed all manner of sickness and disease among the people, and none ever applied to him for relief, who was refused assistance or spurned from his presence. And now that "he has entered into heaven to appear in the

* It is not a little unaccountable, on Christian principles, that so many wealthy professors of religion leave the world, without bequeathing any portion of their substance for religious and philanthropic purposes. An aged gentleman, a professor of religion, who had for many years attended a respectable dissenting place of worship, died a few weeks ago, leaving money and property to the amount of £20,000. But, although he was unmarried, and had no children, nor brothers nor sisters, not a single pound of it was devoted to the public, charitable, or religious objects—while the one half of this sum might have been appropriated to such objects, without the least injury to surviving relatives, most of whom stood in no need of it. About a month ago, a lady informed me, that a gentleman in one of our populous cities had died worth £300,000. I replied, in the words of the late J. B. Wilson, Esq., "He has died *wickedly* rich." She was startled at the reply, and said "that he was a respectable character, and had acquired his wealth in an honorable way." I asked, how much of it he had left for the purposes of religion and philanthropy? She replied, "that she had heard of nothing being left for such purposes, but he had, no doubt, given during his life, something for charitable objects; and that it was very proper and dutiful for a man to provide for his family, that they may move in their proper station; for we are told, that he who provideth not for his household, hath denied the faith, and is worse than an infidel," &c. I replied, such a man ought to have left at least, £20,000, for rational and religious purposes, without in the least injuring his family, in whatever station they were brought up, and I could not but entertain a very low opinion of that man's Christianity, who could accumulate so much wealth, and leave none of it to promote the cause of religion and the best interests of mankind. But my worthy female friend could not be persuaded but that a man might lawfully do with his own as he pleased, and that his family were entitled to the whole of what he possessed. This is a fallacy which ought to be removed from the minds of professed religionists, as it implies a virtual denial of our dependence upon God, and of our obligations to consecrate our wealth and talents to the accomplishment of his benevolent designs.

presence of God for us," he is engaged in similar benevolent services. For, we are told, that "the Lamb in the midst of the throne feeds" the redeemed inhabitants, "and leads them to living fountains of water, and wipes away tears from every eye." We are, therefore, exhorted to "be followers of Christ as dear children, and to walk in love; for he hath set us an example that we should walk in his steps."

Again, in the exercise of the disposition to communicate happiness, we imitate the *angelic tribes*, who are incessantly engaged in similar services. Those glorious beings not only contribute to the happiness of each other, but rejoice to wing their downward flight to communicate messages of mercy to mankind. Although they dwell amidst the splendors of eternal day, they refuse not to descend for a season to our wretched world. They entered the lowly cot of the Virgin Mary, with a message of joy; they flew swiftly to Daniel, to explain his vision; they unbarred the prison gates to rescue Peter from his enemies; they comforted Paul with the assurance of divine protection, while tossing on the raging billows; and, in numerous ways with which we are unacquainted, "they encamp around those who fear the Lord," and are "ministering spirits to the heirs of salvation." In short, heaven, whither we profess to be journeying, is a scene of pure beneficence. In that happy world, the spirits of the just will spend an immensity of duration, in an endless diffusion of benefits among countless orders of holy intelligences; and while they derive enjoyment from blessings conferred by kindred spirits, they will still find, that "it is *more blessed to give* than to receive." For in so doing, we most nearly resemble the original source of felicity, who is "the blessed and only potentate," supreme in happiness, yet incessantly diffusing benefits among unnumbered beings, throughout the whole extent of his universal empire.

Were such dispositions to be generally prevalent among men, what a happy world should we look upon compared with that which we now behold! Were it *universally* prevalent, into what a glorious scene would society be transformed! Heaven would descend to earth, and an image would be presented of the intercourse and the joys of the blessed above. And, what should hinder such a disposition from being universally displayed, but the selfishness and depravity of man? Why may not our world be filled with intelligent beings, devoted to such noble and god-like aims, as well as with tribes of selfish demons? There is no physical impossibility to prevent such a blessed transformation. But the WILL of man stands as a barrier; he perceives not in what his true happiness consists; "he loves darkness rather than light," and misery more than happiness, and will not bend his ears to the instructions of heavenly wisdom. No man, however, ought to assume the name of a Christian in whom this benevolent and god-like disposition does not exist. Were Christianity universally diffused, and its holy principles recognized as the basis of human action, we should, ere long, behold such displays of beneficence in all the regions of the globe, and among every kindred and tribe and people; and the sighs of the disconsolate, the groans of the oppressed, and the shouts of the warrior would be heard no more.

Let me beseech you, then, my Christian brethren, to cultivate this benignant principle, and show to the world that you are actuated by higher aims than the sons of avarice, and that you are of one heart and affection with the angels of

light. To do good, and to *communicate*, forget not, for with such sacrifices, God is well pleased. And, if you are thus disposed, you will come forward, with cheerfulness, in every work of universal philanthropy, and will not grudge any of the small sacrifices we have now proposed. You will thus be instrumental in augmenting the sum of happiness on earth, and prepared for engaging in the benevolent employments of the inhabitants of heaven.

4. Consider the *fleeting nature of earthly enjoyments*, and how soon you may be called to part with everything you now possess.

You may be disposed, at first view, to think it hard to part with a hundred or two hundred pounds for the good of others, while you do not know how much you may require for yourself and family, at some future period. But you ought to recollect, that we should be directed by what appears to be *present duty*, without looking forward to mere possibilities, or contingencies which may never happen, and should trust in God, as to all the future arrangements of our lot in this world. While we perplex ourselves with anxieties about futurity, that futurity, in relation to the present scene, may never arrive. In such an hour as we think not, the messenger of death may make his appearance to summon us to the world of spirits. So numerous are instances of this description, and so frequently reported in our daily records of intelligence, that no one can, with any show of reason, flatter himself that he shall certainly live to enjoy a long succession of months or years. And, should the grim messenger arrive at a time when you have been withholding your wealth from benevolent objects, and laying it up for future use, how many painful reflections may arise to imbitter your comforts and shake your hopes, on the eve of your departure—nay, to produce painful feelings, if that be possible, even on your entrance to the world of bliss.* When you have the immediate prospect of bidding a last adieu to all earthly riches and grandeur, they will appear of a very different value from that by which they are now estimated. At that period, you will look upon them in the light in which a great man in a neighboring country viewed some extraordinary mark of distinction and honor sent him as he lay on his deathbed. "Alas! (said he, looking coldly upon it) this is a mighty fine thing here in this country, but I am fast bound for a country where it will be of no service to me." Reflect, then, my Christian friend, on the views you will have of riches, at the hour of death, and let this consideration excite you, while in the vigor of health, "to devise liberal things," in regard to the furtherance of every philanthropic object, so that no bitter regrets may disturb your last moments, and that "*an abun-*

* It is not altogether improbable, that certain painful feelings or reflections, may occasionally raise in the mind, even in heaven itself. We have no reason to believe, that it is such a state of absolute perfection, at least on our first entrance to it, as entirely to prevent some transient uneasy reflections. The saints will carry with them into that state all their *recollections* in reference to their dispositions and conduct in the present world, and, therefore, it is not unlikely, that the sins they committed in this life, and particularly, the little zeal they displayed in promoting the interests of the Redeemer's kingdom, after they were brought to the knowledge of the truth—may occasionally produce an unpleasant feeling in the midst of all their joys. This idea seems to be included in the representation given in the parable respecting the *degrees* of honor to which persons will be advanced in proportion to their zeal and activity in the cause of God, while upon earth. But all such uneasy reflections, should they arise, will only tend to lead the soul to higher admiration of the boundless and unmerited love of God which is in Christ, Jesus our Lord.

dant entrance may be ministered to you into the everlasting kingdom of your Lord and Saviour."

5. Consider the *promises and declarations of God* in reference to the certainty of temporal support.

There is scarcely anything that causes so much anxious thought and perplexity to mankind in general, as the consideration—how they are to acquire the means of subsistence? and, on this account, they have always an argument at hand, against distributing their money for public and religious objects. But there is nothing more clear and express than the promises made to the Christian in reference to his temporal support, so that while he is diligent in his business and conducts his affairs with prudence and discretion, he need never harass his mind with anxious thoughts about future subsistence. The following are a selection of those divine declarations on which his faith and hope may confidently rely, as the words of Him who is immutable, and who keepeth covenant and mercy to a thousand generations.

"The earth is the Lord's and the fullness thereof.

Every beast of the forest is mine, and the cattle on a thousand hills. *Honor the Lord with thy substance,* and with the first fruits of all thine increase; *so shall thy barns be filled with plenty,* and thy presses shall burst out with new wine. Better is a little with the fear of the Lord than great riches and trouble therewith. A little that a righteous man hath is better than the riches of many wicked. I have been young (says the Psalmist), and now am old, yet have I not seen the righteous forsaken, nor his seed begging bread. *The liberal soul shall be made fat, and he that watereth shall be watered also himself.* Thy bread shall be given thee, and thy water shall be sure.

Take no anxious thought (says our Saviour) for your life, what ye shall eat or what ye shall drink, nor yet for your body what ye shall put on. Behold the fowls of the air, for they sow not, neither do they reap, nor gather into barns, yet your heavenly father feedeth them. Are ye not much better than they? And why take ye thought for raiment? Consider the lilies of the field how they grow; they toil not, neither do they spin. And yet I say unto you that even Solomon in all his glory was not arrayed like one of these. Wherefore, if God so clothe the grass of the field, which to-day is, and to-morrow is cast into the oven, shall he not much more clothe you, O ye of little faith? The time is short,—it remaineth that they who weep be as though they wept not; and they that rejoice as though they rejoiced not; and they that buy as though they possessed not; and they that use this world as not abusing it; for the fashion of this world passeth away. He who *soweth sparingly shall reap also sparingly;* and he who *soweth bountifully shall reap also bountifully;* for *God loveth a cheerful giver.* And God is able to make all grace abound toward you, that ye always, having all sufficiency in all things, may abound to every good work. Be careful for nothing, but in everything, by prayer and supplication with thanksgiving, let your requests be made known to God. I have learned (says Paul) in whatsoever state I am, therewith to be content. I know both how to be abased, and I know how to abound; everywhere, and in all things I am instructed both to be full and to be hungry, both to abound and to suffer need. But I have all and abound, and my God shall supply all your need, according to his riches in glory by Christ Jesus. Godliness with contentment is great gain; for we brought nothing into this world, and it is certain we can carry nothing out; and having food and raiment, let us therewith be content

Charge them that are rich in this world that they be not high-minded, nor trust in uncertain riches; but in the living God who giveth us all things richly to enjoy—that they do good, that they be rich in good works, ready to distribute, willing to communicate, laying up in store for themselves a good foundation against the time to come." The ancient worthies "took joyfully the spoiling of their goods, knowing in themselves that they had in heaven a better and more enduring substance." Moses "esteemed the reproach of Christ greater riches than all the treasures of Egypt." "Let your conversation be without covetousness, and be content with such things as ye have; for he hath said, I will never leave thee nor forsake thee. Humble yourselves under the mighty hand of God, casting all your care upon him, for he careth for you. A good man sheweth favor and lendeth; he will guide his affairs with discretion. He hath dispersed, he hath given to the poor; his righteousness endureth forever. Surely he shall not be moved forever. The righteous shall be in everlasting remembrance."

Such Divine declarations as the above should have a powerful influence on the mind of every Christian, in reconciling him to his situation in life, and to the measure of wealth which Providence has allotted him; and, inspiring him with a noble liberality in the distribution of his riches, without fear of consequences. For God has pledged himself in these promises and declarations, that they who trust in Him, and conduct their affairs with discretion, shall want for nothing that is truly desirable in their pilgrimage through this world. "The young lions may lack and suffer hunger; but they that seek the Lord shall not want any good thing." All the saints, in every age, have in some measure experienced the truth of these declarations, and, in many remarkable instances, they have been strikingly fulfilled, in cases where all prospects of subsistence had disappeared, and all hopes of deliverance had nearly failed; as might have been illustrated by many interesting facts recorded in the history of the church, and of individual Christians, had our limits permitted.

I shall conclude with the following sentiments,—and an anecdote stated by Dr. Witherspoon.

There are those who are rich in their poverty, because they are content, and use generously what they have; there are those, who, in the midst of their riches, are really poor, from their insatiable covetousness, or profusion.—*Culmet.*

The prayer which Socrates taught his pupil Alcibiades, is remarkable, and deserves the consideration even of a Christian:—"That he should beseech the Supreme God, to give him what was good for him, though he should not ask it; and to withhold from him whatever would be hurtful, though he should be so foolish as to pray for it."

The following piece of private history that happened in Great Britain, is related by the late Dr. Witherspoon, in one of his sermons.

"A gentleman of very considerable fortune, but a stranger to either personal or family religion, one evening, took a solitary walk through a part of his own grounds. He happened to come near to a mean hut, where a poor man with a numerous family lived, who earned their bread by daily labor. He heard a voice pretty loud and continued. Not knowing what it was, curiosity prompted him to listen. The man, who was piously disposed, happened to be at prayer with his family. So soon as he could distinguish the words, he heard him giving thanks with great affection to God, for the goodness of his providence in giving them

food to eat, and raiment to put on, and in supplying them with what was necessary and comfortable in the present life. He was immediately struck with astonishment and confusion, and said to himself, 'does this poor man, who has nothing but the meanest fare, and that purchased by severe labor, give thanks to God for his goodness to

himself and family, and I, who enjoy ease, and honor, and everything that is grateful and desirable, have hardly ever bent my knee, or made any acknowledgment to my Maker and Preserver?' It pleased God, that this providential occurrence proved the means of bringing him to a real and lasting sense of God and religion."

APPENDIX.

THE following statements, extracted from the "Report of the Commissioners," who were sent to Ireland to investigate the state of the lower classes in that country, exhibit a picture of the effects of covetousness, combined with its usual accompaniment—*apathy* in regard to the sufferings of others, which would disgrace a *Pagan* land, and much more a *Christian* land.

These commissioners appear to have conducted their inquiries openly and fairly. They held their sittings in upward of one hundred parishes.—They were sent through the whole of the four provinces of Ireland, and obtained information from all ranks and classes, from "the highest landlord, down to the lowest beggar."

The details stated below, are only *specimens* of hundreds of similar details, equally horrible and revolting, which are scattered throughout a quarto volume of between four and five hundred pages. The answers to the questions put, taken *viva voce*, are printed *verbatim*, under the following seven heads. 1. Deserted and orphan children. 2. Illegitimate children and their mothers. 3. Widows with families of young children. 4. Impotent through age and infirmity. 5. Sick, poor. 6. Able-bodied out of work. 7. Vagrants.

1. The following extracts relate to *widows with children*.

They are seldom half fed, say a cloud of witnesses. One meal of potatoes a day, is the most they can expect, eked out with unwholesome weeds. Mr. Cotter, rector of a parish in the county of Cork, says, "One evening a parcel of workmen came to me for soup, which I was in the habit of giving. Some cabbage stumps that were thrown out of the kitchen were lying near. The pigs and fowls had picked them almost quite bare. *I saw myself six or seven of the poor women turn their faces to the wall, and eat the stumps the pigs had left.* Peggy Kiernan, a beggar woman, says, the widows get, when at work for the farmers, $1\frac{1}{2}$ d. per day. They rarely beg in public, unless when their children are so young they cannot leave them."

The Assistant Commissioners found widow Halorem working a quilt. She worked eight hours a day, and it would take her a week to finish it, and all she had bargained for, was one shilling.—A man who happened to be standing by, said he would not give two pence a day, for what any widow in the parish would earn by her labor. Parochial assistance is unknown, and the question, whether the absentee proprietors who hold nearly the entire parish, ever contribute to the relief of

those who pay them rent,—was answered with a laugh, *that expressed astonishment at the thought of such a thing being entertained.*

When the cholera appeared at Cork, a small hospital was established, and a few patients admitted into it. Notwithstanding the dread that was entertained for the disease, *three poor widows feigned sickness, in order to gain admission*; one the widow Buck, had two children. When these women were detected, they refused to go out. In the county of Limerick, there had been no widow driven by her necessities to prostitution, though one of these virtuous poor women states, that she lives in a hovel without a roof. "I have no house," says she, "but I got a few poles, and made a narrow shed, by placing them against the wall and covering them with loose weeds. The end is open to the air, and there is no door." She expects, with her boy, *to pass the winter under the same shed.*

Even in the north of Ireland, where Protestants chiefly reside, similar privations are found to prevail. The following is a picture of a *Londonderry* widow.

The Assistant Commissioners visited one widow. She lived in a wretched hovel on the road-side, about half a mile from Dungiven. There was a little straw in a corner, which, covered with a thin linen quilt, served as a bed. Over two or three kindled turf, a girl of about ten years of age, was bending, and a middle-aged woman was sitting, spinning in the center of the hut. She said that the girl was the youngest of eight children, and was only a month old, when, by her husband's death, she was left wholly dependent on her own exertions. None of the children were at that time able to assist her; and the only employment open to her was spinning, by which she could then make 4d. a day. By her spinning, which was gradually diminished to 2d. a day, she brought up her eight children, sending them out to service as they grew up. They are now married, or engaged in service. The three eldest married when they were under eighteen. "They never," said she, "got a noggin of broth in charity; nor did a handful of potatoes badly got, ever enter my house. I always kept the roof over them, and prevented their begging." She never had any land; *her landlord having taken from her, that which her husband held*; but he left her the house, *half of which was blown down*, and in the remaining half, she still lived. She seemed cheerful and contented, but said, she had gone through unutterable hardships. "Many a time," said she, "a neighbor woman that lived with me, did not

know that I had only eaten two or three potatoes that day, and, at night, I used to be up two or three times, when I could not sleep, thinking of my misfortunes, and looking out for the daylight to begin working."

Widow *M'Crow*, another inhabitant of the north, stated, "The rain comes in through the roof of my hut. I sleep on the ground, which is constantly wet, and have not so much straw as would fill a hat. I have but a single fold of a blanket to cover my whole family. I have had it for eight years. My children are naked. I have a lump on my shoulder, for which I cannot get medical assistance." It was agreed by all present, that few widows can be better than this woman.

The gentry, says the Report, *scarcely ever assist the poor widows*, but the laborers will often work a day for them gratis in building a hovel. Some of these widows have too much pride to beg, and pine in hopeless misery, in some wretched cabin. In the single parish of Killaloe, in the county of Clare, the R. C. Priest speaks of *sixty widows in this destitute state*.

"I had not," says *Mary Slattery*, "a sod of turf to warm a drink for my sick child. All I had to-day, was four cold potatoes. The rain comes down through the roof, and my lodger never slept a wink last night, trying how to keep the bed-clothes dry. As God knows my heart, I spent the night on the hearth-stone, crying and praying that God would look down on me and my children."

As to laying by anything when in employment, that is out of the question. "No man," says Mr. Donough, "could lay up anything for his old age, unless he have an old lease. In other cases, there is no chance of it."

The effect of this wretched life, and diet, is too apparent, and cuts off the sufferers before the usual period of human life. Laborers usually break down at the age of fifty-five, from the effects of scanty food, and exposure to the weather. The same is reported of mechanics. If there is a bridge to be built, there will not be a man above fifty-five upon it. Poverty bends their spirits and breaks them down. It appears from the evidence, that the custom of supporting their parents, which used to be the pride of the Irish peasants, is decaying fast, from the pressure of the times, and incapacity. Laborers supporting their parents, are often reduced to one meal of dry potatoes. It sometimes comes to counting the potatoes. Then, as the second family grows large, the daughter-in-law begins to grumble. She will not see her children starved to feed her husband's parents.—"Being always at home, she is apt to find her husband's father in the way, and you will see the old man cowering in the chimney, as if he were endeavoring to hide himself from her." An old man says himself, "the few potatoes I eat, sir, cannot do me good, for I am afraid they are grudged me, and what is more, I grudge them to myself, when I see so many mouths opening for them." One witness states, that "the turning out of the father is so common, that the contrary is the exception."

The Rev. Mr. *Gibson* mentions the following case. "The wife and family of a man who had been respectable, died here of *want*, a short time since. They could not get anything to eat at times, more than once in two days. *They died rather than beg.*" Such cases, alas! are by no means scarce. Mr. Riley says, "two months ago, I saw an old woman eighty years of age, going

over the bridge to beg her breakfast. When she got to the top, she stopped to rest herself, and, when I came up to her, she was dead." Dr. *Walsh*, M. D., states, "that in his parish in Kildare, many have died of actual starvation."

Yet, in a country where such scenes are daily passing, all the great land owners are averse to the introduction of poor laws, and for this most selfish reason, that the principal burden of supporting the poor, would [as it ought], fall upon themselves. It is curious to remark, that the farmers and shop-keepers, in a word, the middle and producing classes of the Irish community, approve of some system of poor laws, while the gentry as *decidedly set their face against any such system.*—"The gentry never give to beggars," says one of the witnesses, "high walls surround their demesnes, and a dog is kept at the gates to prevent the entrance of a beggar. Absentees, even in times of dearth, or infectious disease, send over no subscriptions." "They send over nothing but latitats and ejectments," says the Rev. Mr. Burke.—The evidence of Dr. M'Hale, R. C. Archbishop of Tuam, written by himself, is remarkable on this point. "The gentry," says the Archbishop, "scarcely ever subscribe regularly for their support: even in the seasons of appalling distress (1832 and '34), there were individuals of large fortunes, who did not subscribe one shilling. The burden is thrown by the affluent gentry on their poorer neighbors; orders are often issued by the proprietors of large mansions, not to suffer such a nuisance as a beggar, to approach the gates. I could name the persons. The general opinion is favorable to a provision for the poor, in case the burden do not fall on those classes that are already taxed for their support. It is in vain to make a provision for the poor, unless the property of the absentee, and the church lands are almost exclusively fixed with the amount; otherwise, such a provision would be no relief. All that could be gained by taxing the industrious classes, would be to make that compulsory which is now voluntary. If the properties of the absentees are taxed, and the church lands be re-appropriated to their original destination, a large fund, now lying idle, will be applied to the support of the people."

In the examinations in the county of Longford, Mr. K—— said, he represented the feelings of a great number, when he expressed himself "in favor of a support for the infirm, especially from a tax on absentees, one of whom draws £10,000 per annum, from the county, and £3000 from the parish, without contributing anything to the support of the poor."

2. Under the head of "*sick poor*," we find that no relief exists for the poor, when sick or diseased.

If the disease be contagious, they are either put out of the cabin into a temporary hut, or the rest of the family leave it and them. Any nourishment the neighbors may give them is left at the door, and the creatures crawl out to take it in. Many have been disabled for life, by scrambling out of bed to get what is left for them at the door. "The day before yesterday," says a witness, "a woman coming from Galway, was taken ill on the road. The people thought she had the cholera, and refused to let her into their houses. She lay by the side of a ditch and died in the morning." "Our diseases," says Mr. Powell, "are caused by cold, hunger, and nakedness. The poor man on regaining his appetite, finds nothing to eat. A little food would restore him, but he sinks for the want of it. People are constantly tapped for a

"dropsy arising from starvation." "I have frequently," says Dr. Walsh, "found the sick lying on the bare damp ground, straw being considered a luxury which the pig only, which pays the rent, has a right to enjoy." In some places, there are charitable loan funds; "but," says a witness, "the gentry and landlords seldom subscribe."

When we go to beg at a gentleman's house, says Pat Mitchell, beggarman, it is the wife that asks relief, and the answer frequently is, "go from the door, woman." The farmers are kinder by far. It is the humble sort that live on the roadside, that are really good to us; but half the country, God help them! have no Christianity in them at all." Molamey says, that, in the mountains of this parish, when the potatoes fail them, they bleed the cattle, and eat the boiled blood, sometimes mixed with meal, but oftener without it; he has himself known the same beast to have been bled three times in one season; they never bleed their cattle for this purpose, when they can procure any other food; he says, "the mere laborers would not get a potatoe on credit; they would gladly take credit on any terms, if they could get it; they would promise anything before they would beg, which some are obliged to do, and to leave their own place in shame. They take one journey by night before they begin, that they may save the exposure."

The assistant commissioners entered into the cabin of a woman laboring under the disease of water in the chest. She said, "I have not this morning been able to rise from that bed of straw. I felt a sort of gnawing about my heart. The only thing I had was these few potatoes (pointing to some on the ground between her and a little girl, who had the small-pox), you see they are rotten the most of them, and all are wet." "Yet these very people," says a respectable newspaper editor, "thus abandoned by wretches—fiends in human shape, who call themselves landlords,—exhibit some of the finest feelings that ever adorned the human heart." When one has a tolerable coat, he lends it to a neighbor, that he may carry something to the market, and look decent. The Rev. Mr. Gibbon says, "when I go to a village to hold a station, one man comes to me, and confesses, and when he has done, goes out and lends his coat to a neighbor, that he may come in also; the very women do the same, and lend not only their cloak but their gown."

Mary Carr, who is a widow, and who is rearing up a foundling, says, "the blanket that was on my bed, I cut up to make two little petticoats for the child. I do not know what kitchen means. I am not able to buy a ha'porth of milk in the fortnight, and have not tasted a herring these three months." This woman, says Mr. G. Gottingham, is a fair specimen of the widows of the parish.

In transcribing the above revolting statements, I have been almost led to feel ashamed of the order of intelligent beings to which I belong. It cannot but fill every feeling and well-principled mind with a holy indignation, that such scenes should be found to exist in a country that boasts of its religion, and requires so much money for its support. The facts are not the exaggerations of any political party; as they were publicly and minutely investigated, and are admitted by all parties to be substantially correct. They are corroborated by the statements of the late Mr. Inglis, in his "Journey throughout Ireland in 1834," and, by all others who have lately visited that misgoverned, and unhappy country. At this very moment,

hundreds of poor starving wretches have been ejected by their rich landlords, from the half acres and miserable hovels they occupied, in the midst of the most inclement season of the year, to wander through the country, houseless and forlorn, and to perish of hunger and cold. One of the unfeeling miscreants, who acted as factor to some of the landlords, when remonstrated with on the dismal and destitute situation of the poor people, who were deprived of every shelter, and of every means of subsistence, had the fiendish effrontery to declare, that "they might go and eat one another, if they pleased."

Even the "Quarterly Review," which is not generally very squeamish on such subjects, exhibits a becoming indignation at this picture. "The wonder surely is (says a writer in No. 109), not that men become monsters under such circumstances; that they make war upon the world, and the world's law which neglects and oppresses them; that being left to the destitution of the savage they exhibit his disposition, adopt his system of self-preservation, and disregard the first principles of society. No! the wonder is, that philosophers are found audacious enough to maintain that sufferings, such as we have related, should remain unrelieved, in order to keep up the charitable sympathies of the people for each other, uncontaminated by the odious interference of a legal provision for the destitute." And again, "the social virtues are stifled in an atmosphere of such misery and selfishness, for the instinct of self-preservation overpowers every other feeling."

Perhaps there are few instances of covetousness more palpable and odious, than are displayed in reference to the facts that have been now stated. It is a striking feature connected with these facts—that, while thousands of poor creatures are living in roofless huts, with nothing but a cold damp floor to lie upon, and not even enough of a few rotten potatoes for their food,—the nobility, gentry, and rich landlords, seldom contribute in the least, to relieve their misery, while none are more loud in their bawlings about religion, and the support of the church. It is a most unhappy and unnatural state of society, that when thousands are reveling in the midst of luxury and debauchery, there should be tens of thousands immediately around them, suffering every privation, and many of them absolutely perishing for want in the midst of plenty and splendor.—That such scenes should be daily realized in a country blessed with fertility, and a fine climate; in a country where so much wealth is lavished in folly and extravagance, and where so many enormous pensions and sinecures are enjoyed, both from the church and the state, cannot but fill every generous mind with swelling indignation. Here is surely a fine opportunity for wealthy gentlemen of benevolent feelings, to come forward and display their generosity. What might hinder them from purchasing some of the Irish moors, and mosses, and wastes, and setting thousands of the laboring poor to bring them into a state of cultivation, and to rear for themselves comfortable habitations? The blessing of thousands ready to perish would rest upon them, and their own hearts would feel a satisfaction superior to all the pleasures derived from pomp and pageantry, and riotous abundance.

What becomes of all that wealth which has been bestowed on the Bishops, Deans, and many of the Rectors of the Episcopal church; the one half of which would go a great way toward me-

liorating the condition of the lower class of the population of Ireland? When the lands and other emoluments were first allotted to the bishops, it was, on the provision, that the one-half, or at least the one-third of the proceeds should be devoted to the poor. This appears to be admitted by the benevolent Archbishop of Tuam, in his evidence stated above. "If the church lands," says the Archbishop, "be *reappropriated to the original destination*, a large fund would be supplied to the support of the people." And would not the one-half, of incomes amounting to *eight, ten, fifteen, or twenty thousand* pounds annually, be quite sufficient for *any order* of ministers belonging to the Christian church? That such an appropriation has never yet been voluntarily made, even when the most urgent demand for it existed—seems to indicate that there is a glaring want of Christian principle and benevolence, even among the ministers of the Christian church.

H. S. & J. APPLEGATE,
BOOKSELLERS,
PUBLISHERS OF STANDARD WORKS,
STATIONERS, & BLANK-BOOK MANUFACTURERS,
CINCINNATI.

"A good book is the best friend; the same to-day and forever."

H. S. & J. A., in addition to a large and varied assortment of *School, Classical, Theological, and Miscellaneous Books*, which they have constantly on hand, publish a series of valuable Standard Works, suitable for the family circle, as well as public libraries.

At this time, when the press teems so abundantly with ephemeral literature, the thinking mind experiences a need of more substantial aliment; of something which shall at the same time furnish not only enjoyment for the present, but for after thought; something on which the mind shall delight to ponder in its communings with itself; something, from the perusal of which one can arise a wiser, if not a better man; and among their publications, they flatter themselves such books will be found. It is their aim to select such works, the intrinsic worth of which will cause them to be sought after by enlightened and discriminating minds, and as worthy of gracing the shelves of their libraries.

Among their publications may be found the following, to which they would respectfully invite attention. To these it is their intention to add the best works of the Standard Historical and other authors, and they trust that their selections will be such as to entitle them to a liberal share of the patronage of the book-buying public.

ROLLIN'S ANCIENT HISTORY ; 2 vols, royal 8vo, sheep—spring back.

Illustrated with Maps and Portraits. The Ancient History of the Carthaginians, Assyrians, Babylonians, Medes, Persians, Grecians, and Macedonians, including a History of the Arts and Sciences of the Ancients; with a Life of the Author.

This invaluable work has ever maintained the first rank of Standard Ancient History. This edition is in a very handsome Library Style, and at a price that will enable all to enrich their libraries with it.

ALTISONANT LETTERS. By Rev. S. K. HOSHOUR. The object of this book is to capacitate the young to read with facility the hard and unusual words of the English language, and by the aid of the appended Vocabulary, to learn the extent of the verbiage of our language not employed in the usual intercourse with society. The contents of these Letters are various, and spiced with much good humor, affording *no common* amusement and instruction to those who study them; rendering a valuable aid to instructors of children, in assisting their pupils to acquire a *complete knowledge* of our language.

RHINEHART'S CHURCH HARP. Containing a choice selection of Hymns and Tunes, which comprise a variety of Meters, &c., well adapted to all Christian Churches and Singing Schools; affording a valuable aid in giving life and spirit both to public and private devotion.

THE COTTAGE BIBLE; 2 vols, imperial 8vo, 1440 pages. Embellished with 6 Maps and 26 Engravings. The Cottage Bible and Family Expositor; containing the Old and New Testaments, with practical expositions and explanatory notes. Also, references and marginal readings of the Polyglott Bible, notes and selections from the *Comprehensive Bible* and other standard works, and valuable Chronological Index; the whole revised and adapted to the use of *Sunday Schools, Bible Classes, and Christians generally.*

This is emphatically what its title imports; a Commentary on the Old and New Testaments. It was written for persons who read the Scriptures, not only to attain evangelical light, but also to quicken devotion, and to stimulate zeal and steadfastness in the way of godliness.

It is designed to fill up a chasm between the Bible and the voluminous commentaries of Henry, Clarke, Scott, and Gill. It has no sectarian bearing; not favoring either party or sect; neither are the opinions of others assailed; but it is an attempt to tell what the Bible means.

FLEETWOOD'S LIFE OF CHRIST; 8vo, 660 pages. Combining, with the History of Christ as furnished by the Apostles, a harmony of the Gospels, and an exposition of Scripture, so woven together as to furnish an authentic and continuous history of the blessed Saviour, from his advent to his ascension; together with the lives and sufferings of his holy Evangelists, Apostles, and Martyrs.

This production, by one of the first minds of his age, has been happily instrumental in settling the wavering, and building the Christian up in his most holy faith.

CYCLOPEDIA OF HISTORY; 8vo, 750 pages, embossed. A popular Cyclopedic of History, Ancient and Modern: forming a copious Historical Dictionary of celebrated institutions, persons, places, and things; with notices of the present state of the principal cities, countries, and kingdoms of the known world. To which is added a chronological view of memorable events, such as earthquakes, volcanic eruptions, storms, conflagrations, diseases, famines, inventions, discoveries, battles, treaties, settlements, origins of religious sects, etc. By F. A. DURIVAGE. Illustrated with engravings.

Probably no richer medium of interesting information, in relation to past events and the modern condition and divisions on the face of the globe, has ever before been offered the public, than this "Cyclopedia of History;" comprising, in one large volume, beautifully printed and illustrated, a brief but concise and complete relation of every interesting event and subject that has transpired from the creation to our own times. It is truly a "*multum in parvo*," and should be the "*vade mecum*" of every one desirous of obtaining useful knowledge.

COMPLETE WORKS OF THOS. DICK, LL. D.; 2 vols, royal 8vo, sheep—spring back, marbled edges. Illustrated with numerous Engravings and a Portrait of the Author; comprising the following eleven works:—

AN ESSAY ON THE IMPROVEMENT OF SOCIETY—THE PHILOSOPHY OF A FUTURE STATE—THE PHILOSOPHY OF RELIGION—THE MENTAL ILLUMINATION AND MORAL IMPROVEMENT OF MANKIND—AN ESSAY ON THE SIN AND EVILS OF COVETOUSNESS—THE CHRISTIAN PHILOSOPHER; OR SCIENCE AND RELIGION—CELESTIAL SCENERY—SIDEREAL HEAVENS, PLANETS, &c.—THE PRACTICAL ASTRONOMER—THE SOLAR SYSTEM; ITS WONDERS—THE ATMOSPHERE AND ATMOSPHERICAL PHENOMENA, &c.

The works of Dr. Dick are so well known and appreciated, (being such as should be in the possession of every family and made the daily study of its members, old and young), that the attempt to praise them would be like gilding fine gold.

It has been the endeavor of the publishers to get up this edition in a style worthy of their merit; and they flatter themselves that they have succeeded in so doing, as to paper, typography, and binding of the work, neither of which can be surpassed at the East or West.

THE COMPLETE WORKS OF JOSEPHUS; 1 vol., royal 8vo. The Writings of Josephus are among the most valuable publications. On account of their connection with sacred events, they are particularly interesting, not only to the ordinary reader of the Bible, but also to the student of History.

No family, or reader of History, should be without the Works of Josephus. In the publication of this edition, it has been our design so to combine cheapness and durability, as to bring it within the reach of every family.

MACAULAY'S HISTORY OF ENGLAND; royal 8vo, library edition. The History of England, from the accession of James II. By THOMAS BABINGTON MACAULAY. 2 vols, library edition.

No history in the English language has ever before been sought after and read with greater avidity than the History of England by Macaulay, the first of living authors. It is indispensable for any one who wishes to possess a reputation for ordinary intelligence, to be in a degree familiar with Old England's tumultuous, and we may say, glorious history! The distinguished reputation of Macaulay in the world of letters renders any commendation of his works unnecessary. There are many reasons that render the present work one of peculiar interest to the American reader; not the least of which is the manner in which Penn, Washington, and others associated with the early history of our Continent, are spoken of.

CHRISTIANITY, as exemplified in the Conduct of its Sincere Professors. By Rev. WM. SECKER. 1 vol., 12mo.

We would recommend this book to the attention of Christians generally, as one replete with sterling thought, and an admirable help to self-examination, being full of illustrations, and well calculated to assist Christians in "Redeeming the time," and maturing their graces.

THE YOUNG LADIES' COMPANION. 1 vol., 12mo.

"This work is designed to occupy an important place in the Christian education of young ladies. It is a *Companion*, alike for the study, the *boudoir*, and the closet. The refinement and delicacy with which it touches on those minute details of female manners, so essential to the character of woman; its judicious suggestions upon the intellectual and practical parts of education; and, altogether, its healthy religious tone, commend it to those who desire to see in the hands of the young females of our country a work at once attractive and instructive."

LYONS'S ENGLISH GRAMMAR.

This is a neat School Grammar, tastefully arranged, and admirably adapted to the convenience of both teacher and pupil. The science is forcibly illustrated by a great variety of examples and exercises, and the style is easy, flowing, and perspicuous.

**THEOLOGY LIBRARY
CLAREMONT, CALIF.**
